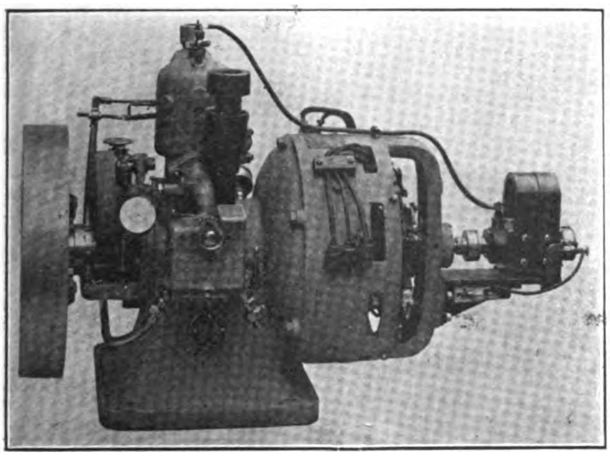
ALTHOUGH the development of the internal combustion motor may be attributed, to a certain extent, to the automobile, its industrial value was early made manifest, and today it is utilized wherever a small power plant is required. It has replaced older forms of energy, such as some types of water wheels, wind mills, etc., and even in some instances, steam. Its convenience is an established and accepted fact, as the gasoline engine may be operated as little or as much as desired, needing no other attention than fuel and lubricant. Its economic value lies in that by simply throwing a switch and turning a lever, power is developed instantly, and when not in operation no expense is involved.

Power Equipment Important.

Throughout the country the mechanically propelled vehicle is supplanting the horse drawn, both for pleasure and commercial purposes, and the rapidly increasing number of these in service affords opportunity for the establishment of garages and repair shops for their care and maintenance. Where these are located outside the zones of the central service station, the question of power is an important factor, inasmuch as it is essential that the equipment be complete to comply with the peculiar requirements of the business. In order to meet competition the garage and repair shop must include those facilities which make for reliable and prompt service, and it is reasonable to presume that the country resident will insist upon the same attention as may be obtained in the city.

Energy for operating the lathe, drilling and milling machine, compressor, water pump, etc., can be supplied by the gasoline engine, but the repair industry necessitates more or less night work. This brings up the question of proper lighting facilities. Unlike some trades, the mechanical features of the automobile require an efficient portable light. The kerosene or acetylene lamp is not suitable owing to the danger of even a small amount of gasoline being ignited by the naked flames, creating considerable damage if not total destruction of the property.



Depicting One Kilowatt Gasoline-Electric Generating Set Which Develops a Direct Current at a Steady Voltage.

Advantages of Electricity.

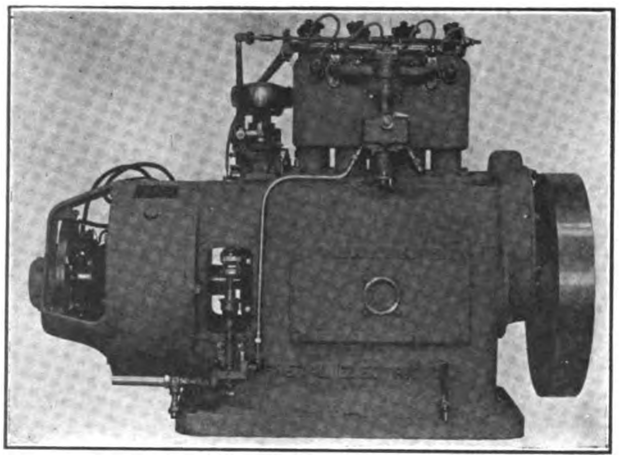
The advantages of electricity in the garage are legion. Not only is an excellent and safe light obtained but the current may be utilized for numerous purposes. It may be employed to operate a portable drill, polishing machine, air compressor, machinery, etc., and in addition the commodity has another important value in that a desirable trade may be built up in the charging of electric vehicles and storage batteries. Ignition batteries are generally employed with the motor car and the garage which is compelled to send its customer's batteries to the city for recharging receives but little recompense thereby, to say nothing of the delays and danger of injury during the transportation of the current containers.

It is only natural to presume that the garage situated beyond the zone of the central station would attract a desirable clientele if equipped with adequate facilities for the charging of electric vehicles, as it is obvious, for instance, that many summer residents would utilize electric carriages were means obtainable for charging.

The early attempts to couple the gasoline motor to the generator were not satisfactory, owing to the special conditions demanded of the unit. An efficient gasoline-electric set requires a direct or shaft drive with speed sufficiently high and with impulses frequent enough to produce the even turning movement absolutely essential to steady voltage. The motor also should be so governed as to insure the maintenance of uniform speed on both fixed and varying loads. Other necessary features are: Economical fuel consumption; high electrical efficiencies at the rated capacity of the set, with a minimum of decrease in efficiency and increase in fuel a kilowatt at slightly underloads, and ability of the unit to carry an overload without undue overheating of the generator.

Application of Service.

The United States government was one of the first to demand a unit to meet the above requirements and to conform to these as well as the demand for a lighting equipment for an installation beyond the zone of the central station, the General Electric Company, Schenectady, N. Y., began experimentations, which resulted in the manufacture of the gasoline motor driven electric generating sets illustrated herein. These are designed for the specific purpose of supplying the



Three Kilowatt Generator Is Operated by a Four-Cylinder, Four-Cycle Motor and Furnishes 2400 Candle-power.

best quality of service where electricity is not otherwise available.

These units may be employed to supply current for charging electric vehicles, and ignition or lighting batteries; to operate the machine equipment of the garage, and to light it as well. They are constructed in four sizes, ranging from one to 25 kilowatts and with the exception of the smallest the gasoline motors are of the four-cylinder, four-cycle, water-cooled type. The one kilowatt set has a single-cylinder, two-cycle engine, with three-inch bore and stroke.

The operation of these outfits is exceedingly simple. To start the set the ignition current is switched on and the engine cranked. Mounted upon an extension of the engine shaft is the armature of the generator, and as it begins to revolve between the poles of powerful magnets, the cutting of the invisible lines of magnetic force between these poles by the copper conductors of the armature produces an electric current by a process called induction. This is collected from the commutator by means of brushes and is transferred over the wire circuit, where it is always ready to be utilized for light, heat or power, or it may be stored in a battery.

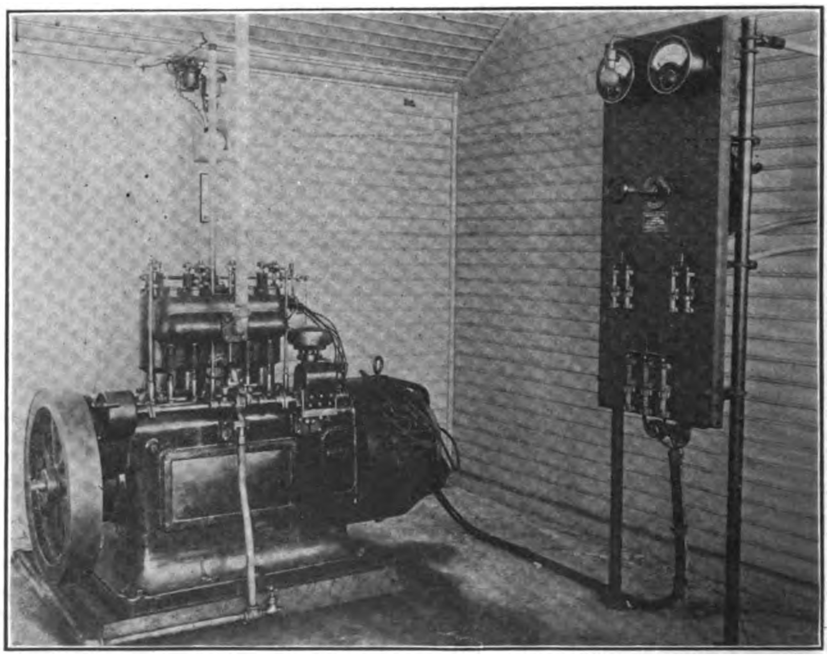
As these small power plants are installed beyond the limits of the central station and expert attendance, it is important that the materials be of the very best quality, and the design, simple. The motors built by the General Electric Company are accurate in design and standardization, being constructed in accordance with the best engineering judgment and highest mechanical skill at the service of this company. Years of experience in producing gasoline motors and generators for railroad service on rural lines and for government service, are reflected in the result, and absolute reliability and simplicity are features emphasized.

The lighting engine must operate evenly and smoothly at all loads, for any variation of speed, however slight, will be noted immediately by a flickering of the lights. Variations of speed not easily noted on a speed indicator will appear prominently upon the lamps. To insure steady and even operation the sets are provided with a centrifugal governor, located in the flywheel, this being so constructed that it is very sensitive and capable of responding instantly to changes in loads. It limits the variation in the speed of the motor from no load to full within four per cent. which, with the design of the generator, insures constant voltage.

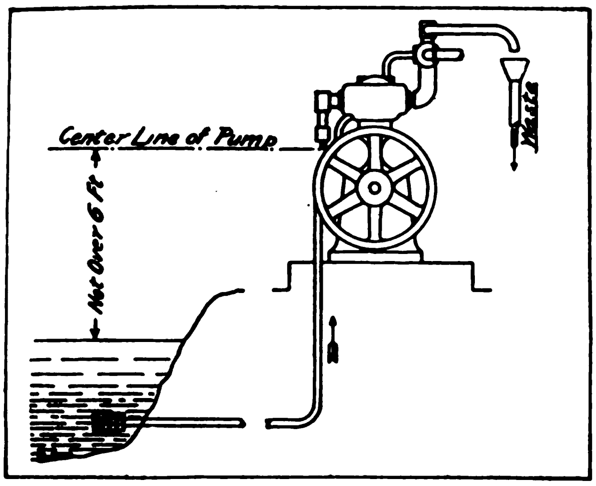
The four-cylinder motors of the three, five and 10 kilowatt sets are cast en bloc, that of the larger size having cylinders cast singly. The bore and stroke dimensions are 2.5 by five, three by six, five by six and 7.25 by 7.5, respectively, and the speed revolutions a minute are 800, 750, 600 and 560. The cylinders are of a special high grade, close grained, gray iron, carefully machined and ground to size, as are the pistons. The engine base is a substantial one-piece casting, suitably designed for the requirements of the various sizes, and liberal inspection plates permit of easy access to all working parts. The crankshaft is a high grade, specially treated steel forging, accurately ground to size and is supported in two, three or five babbitt bearings according to size of the motor. The camshaft is also of high grade material and the cams are drop forged and pinned. All connecting rods are dropped forged and fitted with removable babbitt filled bearings. All exhaust valves are located on the side, but the position of the intake members is varied, the three and five kilowatt sets being fitted with valves in the head while the larger motors are of the T head type.

Components of Motor.

The carburetor is of the General Electric constant level type to which the fuel is delivered by a pump integral with the engine. The motors are not restricted to the use of gasoline, however, as kerosene, natural or illuminating gas may be utilized, by the substitution of a mixing valve. The 25, 10 and five kilowatt sizes are provided with a General Electric low-tension magneto and induction coil while the three kilowatt is equipped with a high-tension magneto. The intermediate sizes are started directly on the magneto, although batteries may be employed if desired. Forced feed lubrication is employed on the 10 and 25 kilowatt sets, with splash on the smaller sizes, an



Showing Installation of Generating Set in Private Garage, Including Switchboard and Automatic Clock Cut-Out.



Installation of Cooling System Where Water Is Taken from a Lake or Pond.

exception being noted with the one kilowatt, which being of the two-cycle type, is lubricated by mixing the oil with the fuel.

The single-cylinder motor is a two-cycle, three-port type with throttle valve located in the transfer port between the crankcase and cylinder. The same high grade material and workmanship are incorporated in the design and the set has all of the efficient qualities of the larger units. The sets require but little floor space and the generator is mounted directly upon the engine shaft and enclosed in a compact frame.

Cooling Methods Outlined.

All motors are water-cooled and the method of supplying the fluid to the jackets varies according to the location of the unit and available supply of water. The one kilowatt engine is fitted with the thermo-syphon system, utilizing a cooling tank having a capacity of about .80 gallons. Where the amount of water available is limited, the fluid may be cooled by a motor driven blower set forcing air through a gilled tube radiator. This is the standard equipment furnished for the United States army.

Where a constant supply of cold water is to be had the amount essential to cool the motor properly is about seven gallons a minute, when operating the larger set under full load and proportionately less for the smaller outfits. Where the motor is not more than six feet above the level of the water, as in the case of a pond, lake, creek or ocean, the fluid may be lifted directly by the gear pump on the engine and discharged from the jackets into a waste pipe as outlined in an accompanying illustration.

Where the height is greater than six feet, an auxiliary motor driven pump may be utilized, or a submerged coil of pipe, the top of which is connected to the discharge pipe on the engine utilized. The lower end of the coil leads to a small expansion tank on a level with the motor, or a trifle above. Another pipe from this container is connected to the gear pump. In this method the height of the engine above the water does not affect the operation of the pump, as it is practically a closed and balanced circulating system. The method of cooling is regulated according to local conditions and the company points out that these cannot be complied with until known.

Construction of Generator.

The generator utilized in connection with the motors is a General Electric multi-polar continuous or direct current machine designed especially to meet the requirements of the set. The field winding is compound and compensates for the drop in engine speed between no load and full, thereby maintaining a constant voltage through the entire load range of the set.

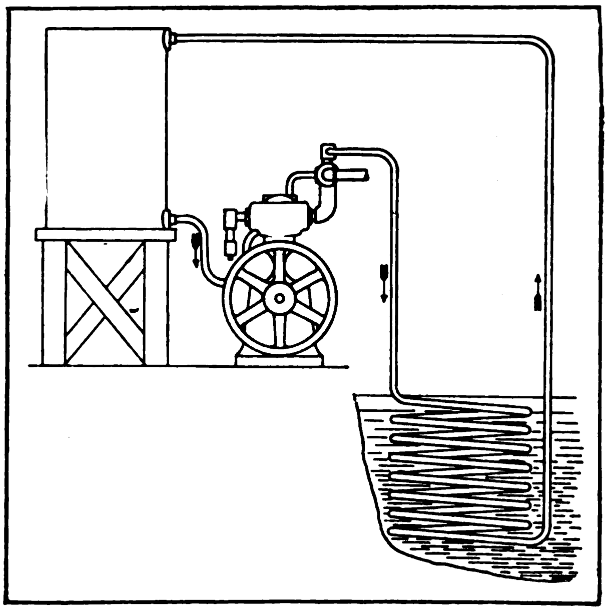
The armature of the generator is direct connected to the crankshaft of the gasoline engine and is supported in a ball bearing at the "outboard" end. Continuous current generators of all standard voltages can be furnished and alternating current members for special voltages are made upon special order. The 125-volt direct current generator, however, is considered standard equipment.

Lamp Loads.

The one kilowatt set is capable of supplying a total of 800 candlepower in General Electric Mazda lamps or 40 20 candlepower Mazda lights. The three, five, 10 and 25 kilowatt sizes furnish 2400, 4000, 8000 and 20,000 candlepower, respectively. The Mazda lamps supply approximately three times as much light as the carbon members with the same amount of current, and are important factors in the system, inasmuch as they reduce the power required to one-third.

A large number of these gasoline-electric generating sets have been installed by the company in private garages attached to country estates as well as at the sea shore and in the mountains where current cannot be secured from a central service station. In these days of refinement the city business man is loth to be deprived of the comforts of the city while sojourning at his summer residence and with a generating set the annoying inconveniences, such as poorly lighted houses, inadequate water supply, etc., are eliminated.

Electric motors operated from the generating sets can be utilized to drive domestic and farm appliances contributing to the comfort of the residents. By including a pump in the water circuit a plentiful supply of fluid may be pumped to the storage tank and the level of the latter may be maintained automatically. Motors may also be employed to operate vacuum cleaners, as well as laundry machinery. These sets are capable of supplying adequate current for cooking while a number of devices of surprising utility and variety may be operated throughout the house. These also include heating apparatus.



Depicting Method of Cooling Gasoline Motor Generator.

Charging the Electric Vehicle in the Private Garage with Current Supplied by Generating Set.

The installation of a gasoline-electric set makes possible the utilization of the pleasure or commercial electric vehicle, outside the usual so-called electric field, as with a controlling panel and rheostat the batteries may be provided with energy. The controlling panel is equipped with fused switches, ammeter, voltmeter, and polarity indicating lamps, for controlling one or more circuits as desired. It is also provided with brackets for wall mounting.

The charging rheostat may be placed under the controlling panel or on the wall adjacent, so as to take up minimum space and insure the utmost convenience in controlling the current. The device is enclosed by an easily removable sheet metal cover, which effectually prevents accidental contact with live parts of the circuits. The function of the rheostat is to prevent a heavy rush of current through the batteries when the latter are connected to the source of supply, as well as to regulate the flow of the electricity. The panel is equipped with circuit breaker, fused switch and reliable instruments and is also provided with pipe supports for mounting. With such an arrangement it is claimed that the electric vehicle may be charged easily, the operation involving no labor whatsoever.

Relative to the costs of installation and operation the General Electric Company points out that as with automobiles, so it is with generating sets, the one that can be purchased for the least money is not usually the least expensive in the end. If figured on the basis of dollars a cubic foot occupied or dollars a pound, or even dollars a kilowatt output, the sets are high priced, but on the basis of dollars a unit of reliability the prices are no higher than one would expect for an article of this nature. The cost includes all accessories to the generating apparatus but not auxiliary apparatus, such as switchboards, fuel and water tanks. batteries, etc.

In estimating the cost of operation of such a plant the company calls attention to the fact that all items of expense should be considered, such as repairs, cost of attendance, depreciation, cost of suitable building, etc., as well as that of fuel and lubricant. The higher the quality of the apparatus, the lower will be the items of repairs and depreciation; the more automatic the operation of the apparatus, the lower the cost of the attendance; and the more compact the design, the less the cost of installation and space occupied.

In figuring the cost of fuel, account should be taken of the fact that any gasoline engine driven set will supply more electrical output a gallon of fuel consumed when operating at its normal rated load, whereas in most cases apparatus of this nature is usually operated at only a fraction of its full capacity. Therefore, a piece of apparatus that will operate at but slight increase of fuel consumption a unit of output and fractional loads, is more economical than one that will consume practically as many gallons of fuel an hour on small as on full loads. The General Electric motors are so designed that a reduction of load results in a definite decrease of fuel consumed, the amount of fuel a kilowatt output increasing but little as the load is reduced.

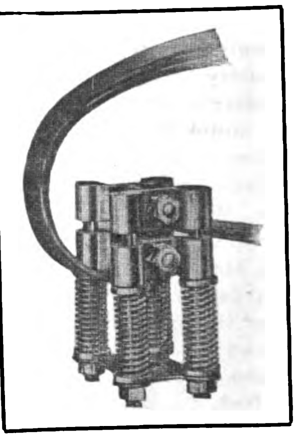
LENOX ANNUAL MEETING.

At the annual meeting of the board of directors of the Lenox Motor Car Company, Boston, June 3, a vote of thanks was tendered to Frank A. McClasky, the treasurer, for his work as general manager during the past year, and he was unanimously re-elected to that position. Among several important matters which were decided upon were the following: Declaring the regular semi-annual dividend to stockholders of record; the production of a six-cylinder Lenox car for 1913, and the erection of a larger plant. A committee was chosen for the purpose of selecting a site for this factory, and it is hoped that the company will be in its new home by Jan. 1.

VELVET AUXILIARY SPRINGS.

Motor car springs which provide comfortable riding qualities on smooth and level highways may jar and jolt the passengers when the machine is operated over rough roads at varying speeds. To eliminate all vibration and shock these stresses must be absorbed in such a manner that there is no recoil.

A device which has been tested and thoroughly tried out is the Velvet auxiliary spring for which George Sumner, Inc., New York City and Boston, is distributor. This differs from the usual form of shock absorber construction inasmuch as the rear of the car is practically suspended by eight elastic coils which are so designed that there is no side sway.



Velvet Auxiliary Spring.

As outlined in an accompanying illustration, it will be noted that two sets of block members are employed, one of these being bolted to each portion of the spring. One set of blocks slides freely up and down on studs over which are fitted the auxiliary springs and a plate is utilized to space the studs properly and to prevent binding.

The lower ends of the stud members are equipped with adjusting nuts, these permitting the regulation of the tension of the springs as desired. It is pointed out by the maker that no violent recoil is possible with the Velvet auxiliary springs as the downward and upward movements are equally compensated. They may be attached easily in a few minutes, as boring or special fittings are not required.

THE PROTECTION OF A GUARANTEE.

Standard productions, whether motor vehicles or their equipment or accessories, are usually placed in the market with a guarantee for quality and service. The producers do not give uniform protection and the conditions differ widely. But there appears to be no hesitancy to insure the purchasers against poor material and faulty workmanship. There is abundant reason why this insurance should be given, and a very cogent influence with purchasers when they have a choice at approximate parity of cost is the character of the guarantee.

As the producer makes the guarantee it must naturally be assumed that he has stated a protection he is justified in giving, and as he undoubtedly has the right to change the conditions of sale at will there appears to be no reason why the guaranty should not be lived up to. Under ordinary circumstances there are sufficient prescriptions in the warranty to protect the producer from imposition, which is all that could be expected. When the requirements have been met by the purchaser it is the duty of the guarantor to accept a situation, whatever that may be.

The guarantee as a whole generally relates to repair. The reasonable purchaser merely desires the character of service that he should have, and as restoration is usually a logical adjustment of a defect or failure, he is justified in believing that expense incurred by him in connection with adjusting a claim legitimately made should be minimized. Where a repair is necessary outside of the insurance of the maker the cost should be as low as it could consistently be made.

There are those, however, who establish extremely high prices for parts and labor in connection with repairing, and seemingly accept such occasions as may arise as opportunities for making large profits. No one will maintain that work should be undertaken at a loss, but it is equally logical to assume that no advantage should be taken of a customer. Business judgment should dictate that it is wise to satisfy and retain a patron, especially where there is decided competition and when he is an influence in the market, but this principle is often lost sight of and a good customer sacrificed.

There is no question that situations arise from misunderstandings that could be avoided by exercising common sense. In the event of a repair requiring more work than might be believed, or a larger number of parts, it is practical for the manufacturer to communicate with the customer, stating the facts and estimating the expense, leaving the matter to the judgment of the owner. Where there may be a choice it is best to have a decision and eliminate all possibility of controversy. But where an article is returned to the maker under a guarantee, and a large bill is rendered for what may be regarded as work the producer is obligated to perform, in the absence of exact knowledge suspicion of imposition is natural.

Unquestionably there are those who will deliberately conceal their own responsibilities and make claims for adjustment that are absolutely without foundation of fact or reason. It may be difficult to discriminate between the legitimate and the illegitimate demands, yet no justification can be made of methods that are insufficient to effectually protect all at interest. The proportion of those who have sufficient claims for adjustment is large compared with those who have not, and those who guarantee and shirk their obligations, or take advantage of an opportunity to create an expense that is not in every way warranted, must be the losers.

The market is increasing rapidly and the competition is relatively keen, and no person or firm has such control of a product as to be able to dictate to the buyers. Lack of business courtesy or dereliction of obligations are two of the greatest stimulants for a competitor to take advantage of, and while one can overlook a mistake or error there are few who will lost sight of imposition.

PUBLICITY IN SPECIALIZED MEDIUMS.

There are those who, seeking the greatest volume of publicity at the least expenditure, and guided by the application of a single principle, accept the general magazine as a vehicle that will be especially productive. Advertising is the greatest commercial problem of the day. To produce the finished notification to the public is an art. To make a successful campaign of promotion is a science and such undertaking depends entirely upon the knowledge of the needs of the people, the possibilities of the market and the choice of the mediums for informing the public.

The general magazines of today have extremely large distributions. They are neither sectionalized nor specialized, and assuredly ought to appeal equally to the people wherever sold. Examination, however, will establish the fact that these publications are created as a rule to deal with fiction and special subjects in which there may be some degree of concern, but there is nothing to impel interest other than continued stories, the value of which is relatively unimportant. With very rare exceptions do these prints present articles which in any way relate to the industries or the commercial enterprises bestowing advertising patronage. The editorial sections are limited and the publicity pages are variable with the demands upon them. Nothing is promotive of trade.

Such publications seldom index the advertisement sections. These are left for the reader's casual examination. Nothing impels attention save curiosity. The merit of some advertisements may command inspection, but at best this is incidental. Once the pages are scanned there is no reason for retention. With an article of general consumption or use the magazine of the character stated no doubt reaches a large number of possible purchasers with reference to the circulation, but where there are limitations to demand it is not to be assumed that this ratio is preserved, although the cost for the service is based on the advertising value as applied to the commodity in practically universal use.

In these publications the man who wishes to reach the limited number of the total distribution that might be interested in his or a similar production pays the same price as he who appeals to all readers. When those who are concerned in the proposal are eliminated from those who are not, and the real prospects are disclosed, the number will be found a surprisingly small percentage of the total. The cost is as large proportionately as the probable purchases are few. Considered from any viewpoint the proposition is the same, although there may be many different ratios and differing values with each instance analyzed.

It is not to be assumed that all publicity can be placed directly before those who will purchase, but it is entirely reasonable to make direct appeal to a class that constitutes a market for a product. To illustrate, the Automobile Journal is devoted to the owners of motor vehicles. More than 90 per cent. of its subscribers are actual possessors of cars. These men have large influence with their friends, who are enthusiastic of and are keenly interested in automobiles. This publication is given over to every phase of the use of motor vehicles. It is dependable in its information and it specializes subjects that are material and increase the value of the service of the machines, this in turn benefiting the people as a whole. As every subject relates to the automobile it will be understood that these, with discussions and reviews, with digests and descriptions, have a decided value. Naturally publicity in such a magazine must reach the class to which it is especially directed.

The Motor Truck is the most comprehensive print of the kind published in America. It is generally promotive of service wagon use. It takes up and deals with differing enterprises, the conditions to be met with each, the methods employed, the work accomplished by animal conveyances and the economies with motor transports, analyzing haulage problems and reaching conclusions that are invaluable to those employing highway transportation. It is read because of the distinct merit and worth of the contents. It is specialized for the benefit of those who have no other means of information, who realize that business requirements demand that they possess every fact that can be applied with profit, and that they guard against every error. Its distribution is not to casual readers, but to those who are constant in their attention and to whom it is valuable.

The Accessory and Garage Journal is a trade publication in every sense. It is a means for systematically distributing industrial intelligence that is to be found in no other form. Its subscribers are the active interests in the industry and trade, who value it because of the character and quality of information that it contains. It is equally serviceable as a reference. It is retained and consulted because of the reliability of its facts and data. It is a print that has a distinct place and has prestige with the business interests. It is read with deep interest because it is a business man's magazine. Its readers are those with whom business can be transacted, who know the merits of a proposition, and who are ever alive to opportunities offered to them. There could be no better class than this to reach—not those who make individual purchases, but those who buy in quantity and who, as direct representatives, promote and stimulate the market in which they are influences.

In these magazines, with distinct fields, there is no uncertainty with publicity. Each serves a definite purpose and unitedly reaches a very large proportion of those who would be concerned in any phase of the market and the industry. No more potent factors could be obtained, and when the expense is ascertained it will be found trifling when compared with the cost for similar service in publications characterized as general.

VALUE OF SPECIALIZED MAILING LISTS.

The statement relative to the circulation of the Accessory and Garage Journal and the value of the publication as a vehicle of publicity, has been productive of the criticism that, with certain enterprises, mailing lists were maintained that were larger in number of addresses than guaranteed distribution of the magazine. In statement that has been issued concerning the Accessory and Garage Journal it was maintained that it reached the executive of every concern of business actively engaged in buying and selling identified in any manner with the automobile vehicle and allied industries. This fact is reiterated and emphasized as being absolutely correct. There is no pretense made of reaching those interests that buy raw material and manufacture stock, as sheet brass, for instance, or bar metal, or lumber, or the like, offering this to the open market and selling it as standard production. Neither is there attention given to those who purchase such stock and manufacture standard tools, to illustrate, such as saws, hammers, vises, etc., that are not specialized. But no one is neglected who in any manner produces what can be utilized in the manufacture of motor vehicles or their equipment, and every one engaged in the distribution or sale of the machines, of accessories, supplies and parts, in the conduct of garages and public service stations and repair shops is reached by the magazine.

The individual mailing list, no matter how many addresses compose it, is not entirely a trade proposition. The largest business existing may have a collection of names of impressive proportions, but the mere matter of numbers does not indicate its value. As a matter of fact one of perhaps half the total might be more productive of results. The addition of names to a list is no indication that the publicity distributed will produce a larger return. Everything depends upon the persons named. They may have decided interest, or none whatever. Every business has its own direct representatives, and these supply, to a considerable extent, information on which the mailing list is based, but this is incidental and is not their principal duty. The person who receives publicity in which he is not interested does not notify the sender. The matter is thrown aside and its usefulness has never been realized. There is no manner of verification of the business prospects when a name is received. It is merely the matter of a single copy and no attention is given to it. The mailing may go on for years.

There is no better manner of judging the value of mailed publicity than from one's own experience, and the estimate one places upon it. Unless directly interested one's concern is casual. Costly catalogues and booklets are not so generously distributed. These go to those who are better known. Less expensive matter is given wider circulation, and so it is found that the systematically maintained mailing list is divided and there are selected series of names for differing purposes. Under any circumstances the list will contain "dead" names. Unless the postage is first class the mail is never returned, and usually it is too costly to pay for returning it.

The mailing list of the Accessory and Garage Journal is revised each day to the close of business. The magazine is not distributed with reference to a single business, but to all enterprises, and there is equal attention given to reaching all sections of the country and every market. Every copy is mailed with the request that it be returned if not delivered, and the postal regulations require that the publisher be notified of every change in address, two conditions that make it possible to follow each copy. This impels attention to "dead" distribution.

The magazine is created to interest its readers. It is a vehicle for publicity in that its contents impels its reading, and being devoted to the industries and the trade it directly concerns those who receive it. It has qualities that demand its preservation. It is retained as a reference. It is valuable not only to the buyer, but to every individual associated with him. It is not limited to a class or classes. It is published for the benefit of the entire industries and the trade and it reaches those who are the controlling influences direct.

No comparison can be made of the service of the Accessory and Garage Journal and a private mailing list that does not emphasize its superiority in no uncertain manner. But this is from the point of number of actual buyers reached. When expense is considered and the magazine is understood to be at parity with first class mail, it will be understood that the saving is from 75 to 90 per cent. of the cost of circularizing or any manner of distributing publicity. It should be clear to every person that this means a service of unquestioned superiority and a saving that is positive.

The publisher of the Accessory and Garage Journal realizes that the quality and character of its distribution must be the highest. Neglect means deterioration and loss. To maintain it is the greatest care. Not to do so is plainly sacrifice. Under any circumstances to maintain a private mailing is incidental. It can be and often is slighted. Were business absolutely dependent upon it there would be a different degree of attention.

PRICE CUTTING AND ITS CONSEQUENCES.

When an article or commodity is bought in the market the value is generally the price paid by the purchaser. If the cost be less than the standard charged it is assumed that the loss is sustained by the producer or by the dealer and that there is a gain by the buyer to the extent of the difference. There is, however, generally an excellent reason for a reduction in price. But whatever the cause it must be obvious that unless this is well known the original value is discounted and with some it is impossible to restore confidence in the merit and quality as it first obtained.

One of the first results of competition ought to be a better or improved production with no change in the cost. It is not wise to make sacrifice of what has been established at perhaps large expense and long endeavor, and it is not practical to reject the subject and begin all over again. The one would mean a loss simply incalculable, the other the destruction of a business because of the activity of competitors.

When a price has been cut the result is the temporary attraction of those who may have understood the worth of the product, and perhaps a temporary increase of the volume of transactions, but there cannot be otherwise than a feeling by the buyer that there is cheapening of quality or that the article is not what it is represented to be. The condition, it must be understood, is not governed by the public. It depends entirely upon the manufacturer or his selling agents. Of course it is possible for the former in his associations with his representative to obviate all possibility of price making, and if he does not do so primarily he is at fault. Should he make such restrictions then he has a legal remedy in the event that these are not observed.

Price reductions may be logical when there is a lessened demand for an article and there is a surplus stock that must be converted into money. But where there is one instance of this character there are hundreds where individuals without reflection, and without knowledge of the probable consequences, sacrifice their own business interests because of a belief that it is their own concern if they wish to sell their property at a less price. Assumedly it is a manifestation of business capacity, when as a matter of fact no man should so heavily stock that he will have an unsalable line in his store.

A reduction in any line not protected by the manufacturer is unwise from any point of view. In the event of there being no change in the selling price whatever profit is lost must be suffered by the dealer. Bargain hunters are not desirable patrons from the fact that they are influenced by motives which will attract them to any store and courtesies and attention are lost upon them. They are not influenced by the substantial reason of satisfaction. Their custom is casual at the best and naturally there is a lessened profit in it. It should be considered that it costs just as much to sell something at a loss as at a profit, and that the advertising value of such sales is worthless unless they are continued.

Price wars are ruinous from the standpoint of business success. They accomplish nothing and invariably result in loss to those engaging in them. There may be a temporary advantage for the purchasers, particularly if the basis of the competition is a stable supply, such as gasoline, and yet with a mistaken conception of business preservation men will cut prices simply because a competitor does so. It is strange so few realize that what is desirable because of a lessened price ought to be reasonably salable at the original figure. A reduced value cannot be constantly maintained with a standard article, and when a new price is fixed it becomes, under such circumstances, a mere matter of legitimate competition.

Few business men can afford to voluntarily reduce their profits. These are ordinarily limited by competition, and where they are required to specially advertise reductions there is additional loss. Where a limited quantity of stock may be offered exclusively, and can be profitably sold, is an entirely different proposition, but such a condition is not discussed. The statements are applied to those who are inclined to parallel their businesses with the average department store and believe that the methods of the latter can be successfully imitated.

CANADIAN BODY COMPANY.

The Fisher Body Company, Ltd., has been organized in Canada and will manufacture automobile bodies of aluminum, steel and wood. The new concern is capitalized at $150,000, and has purchased a plot of ground in Walkerville, Ont., on which will be built a plant which will have a capacity of upwards of 100 bodies a day. The incorporators are F. J. Fisher, L. Mendelssohn and A. Mendelssohn, who constitute the Fisher Body Company and the Fisher Closed Body Company, both of Detroit.

MICHIGAN CENSUS RETURNS.

The rapid growth of the automobile industry in the State of Michigan from 1904 to 1909 is shown in a recent report of E. Dana Durand, director of the 13th census. The increase in value was much greater relatively than that in number. Compared with 33 establishments in 1904 there were 113 in 1909, while the average value a machine in 1909 was $1086 as against $718 in 1904.

The entire value of automobiles produced in 1904 was $6,552,804, and in 1909, $70,359,749. The value of all other products reported, which, for the most part, represents the value of automobile bodies and parts turned out by establishments engaged primarily in that branch of manufacture, increased even more rapidly than that of the complete machines. This item was $1,443,730 in 1904 as compared with $26,291,702 in 1909.

The increase in number of cars produced during the five-year period, their value and other points of interest concerning the growth of the industry, is set forth in the following table:

	1904		1909	
	No.	Value	No.	Value
Buggies, runabouts and touring cars	9023	$6,481,164	62,319	$64,940,793
Limousines and cabs	*	....	1,560	3,825,066
Service vehicles	*	....	146	273,108
Delivery Wagons	51	35,250	401	319,071
Trucks and all others	51	36,390	374	1,001,711
Other products, including bodies, parts and repair work	...	1,443,730	....	26,291,702
Totals	9125	$7,996,534	64,800	$96,651,451
Gasoline cars	9114	6,537,404	64,262	69,130,223
Electric cars	11	15,400	538	1,229,526

GOODYEAR ADDS TO CAPITAL.

Within the past month several well known tire concerns have increased their capital stock and otherwise provided for additional production. Among the latest to make an announcement of this nature is the Goodyear Tire & Rubber Company, Akron, O., which has increased its capital from $6,000,000 to $15,000,000. Part of the money will be utilized in making improvements and extensions of the factory facilities.

NEW TIRE PLANT.

Following the announcement by the United States Rubber Company, New York City, of an increase in capital stock from $75,000,000 to $120,000,000, comes information from the United States Tire Company, that plans are under way for the erection of another plant, which is expected to have the largest output of any factory of its kind in the world. The two projects—that of increased capitalization and that of another factory—go hand in hand, the latter, in a way, being dependent upon the former.

The United States Tire Company is now operating four immense tire plants, these being located at Hartford, Conn., Detroit, Mich., Providence, R. I., and Indianapolis, Ind. The daily output runs into the thousands, yet such has been the demand that additional production facilities are deemed necessary.

J. M. Gilbert, general manager of the United States Tire Company, says the proposed new factory will increase the company's output about 5000 tires daily. At present, by working eight-hour shifts in all the plants and utilizing all available equipment, the company is barely able to care for its trade. The new factory, besides being the largest of its kind in the world, will be equipped with the most modern machinery known to the industry. Information concerning its location is to be made public soon.

SEEK LION FACTORY.

Soon after the disastrous fire, which destroyed the factory of the Lion Motor Car Company, maker of Lion cars, in Adrian, Mich., June 2, the officials of the company received a tempting offer from the Chamber of Commerce in Detroit. It would appear, however, that there is some doubt about the acceptance of the proposition, since several business men in Adrian have decided to raise $100,000 in additional capital in an effort to induce the concern to remain in that city.

ANOTHER NEW CAR.

It is understood that Dodge Bros., Detroit, formerly engaged in the manufacture of motors and gears utilized in Ford cars, is about ready to announce the production of pleasure and commercial vehicles, experimental machines having been tested out on the roads of that city and vicinity for a number of weeks. Frederick J. Haynes, until recently factory manager of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., is said to have been engaged in a similar capacity with the new enterprize. Detailed plans will be awaited with interest.

STUDEBAKER CANADA BRANCH.

The organization of the Studebaker Corporation of Canada, Ltd., the Canadian representative of the Studebaker Corporation, has been completed, and Frank E. Fisher appointed as manager. He is a Canadian, and well acquainted with the people and geography of the country, and has had considerable experience with the Studebaker companies, so that he is particularly well fitted for the position. He has been placed in entire charge of the Canadian business, which centres at the plant at Walkerville, Ont.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Hassett & Rogers, Inc., Amesbury, Mass.; to manufacture automobile bodies; $18,000; incorporators, J. H. Hassett, C. H. Hassett, George H. Collins.

Standard Auto Sales Company, Philadelphia; $10,000; incorporators, R. M. Snyder, C. H. Friars, E. H. Weaver, 717 N. Broad street, Philadelphia.

Acton Tire Repair Company, New York City; $3000; incorporators, Patrick Curry, William Koopman, Lawrence Kerrigan, 759 Seventh avenue, New York City.

Simplex Aluminum Solder Company, Inc., New York City; to manufacture aluminum solder; $25,000; incorporators, C. B. Erkens, 255 West 143rd street; Charles Decker, Henry Bender.

Eiseman Automobile Company, Cleveland, O.; $10,000; incorporators, S. N. Weitz, J. W. Campbell, Harry Pott, H. C. Cummings, Alvin Boehmer.

Automobile Resilient Tire Filler Company, Indianapolis, Ind; $10,000; incorporators, W. H. Disher, A. C. Balfour, Jessie Moffat.

Merchants Motor Service Corporation, Philadelphia; incorporators, G. B. Teaz, William Voss.

White Automobile Company, Indianapolis, Ind.; $2000; incorporators, R. D. Eaglefield and G. W. Fuller.

Pitt Motor Truck Company, Pittsburg, Penn.; $20,000; to manufacture motor trucks; incorporators, J. E. Douglass, W. S. Phillips, F. O. Brandt, J. E. McCalmont.

Eckberg & Place Garage Company, Fall River, Mass.; $7000; incorporators, V. J. Eckberg, Ernest Place, Robert Place.

Lansden Electric Vehicle Company, Boston; $5000; incorporators, A. B. Freeman, Gardner Freeman, William H. Britton.

Storage Battery Safety Lamp Company, Wilmington, Del.; $550,000; incorporators, George Washington May, Artemas Smith, M. E. Dorsey.

Todd Rubber Company of New London, Inc., New London, Conn.; $2000; incorporators, E. J. Todd, Alfred Wurts, A. P. Gunn.

Todd Rubber Company of Waterbury, Inc., Waterbury, Conn.; $2000; incorporators, E. J. Todd, F. H. Potter, A. P. Gunn.

Blue Ribbon Garage Company, Springfield, Mass.; $2000; incorporators, Harry Bland, Albert Karp, J. G. Gottesman.

Jiffy Auto Curtain Company, Chicago, Ill.; $100,000; incorporators, Frank H. Ilse, 1505 Michigan avenue, Chicago.

Smart Auto & Manufacturing Company, Indianapolis, Ind.; $50,000; to manufacture automobiles and parts; incorporators, O. S. Schrader, D. W. Reed, I. H. Shelton.

Suburban Equipment Company, New York City; $10,000; incorporators, Harrison Gray Otis, 2 Rector street; W. L. Otis, Charles A. Braker.

Ball Bearing Novelty Company, New York City; $6000; incorporators, A. B. Greenberg, 874 Longwood avenue, Bronx; Alfred Pioneer, Jacob Solomon.

Randolph Motor Truck Company of Delaware; $100,000; incorporator, I. B. Lipson, 105 West Monroe street, Chicago, Ill.

Eadie Vehicle & Gear Company, Buffalo, N. Y.; $200,000; incorporators, John M. Eadie, George P. Keating, Seward H. Millener, William J. Donovan, Howard G. E. Smith.

Mitchell-Edmondston Garage, Inc., New York City; $10,000; incorporators, Liland A. Mitchell, George W. Edmonston, Joseph P. Bickerton.

Kingsbury-Leahy Company, Albany, N. Y.; $40,000; to deal in automobiles and motorcycles; incorporators, J. S. Kingsbury, S. M. Kingsbury, E. W. Leahy.

Pennsylvania Automobile Company, St. Louis, Mo.; $10,000; incorporators, William A. Fortner, Claude G. Fordran, George P. Burleigh.

Charter Automobile Company, Baltimore, Md.; $75,000; incorporators, C. R. Fouts, W. E. Byrd, G. H. Reinhardt.

Pembroke Manufacturing Company, Rochester, N. Y.; $50,000; to deal in and manaufacture automobile parts and accessories; incorporators, Charles J. Pembroke, Winfield P. Pembroke, Walker J. Fellows.

Etchell Auto Company, Biddeford, Me.; $10,000; incorporators, Arthur L. Roberts, Joseph Etchells, Charles V. Tanner.

Wetherbee Bros. Company, Arlington, Mass.; $20,000; incorporators, Ivers L. Wetherbee, Clarence A. Wetherbee, A. Ingham Bicknell.

Punctureless Tire Company of Massachusetts, Boston, Mass.; $15,000; incorporators, William E. Riddell, J. Hiram Smith, Frank H. Jenkins.

Guide Motor Lamp Manufacturing Company, Cleveland, O.; $100,000; incorporators, H. J. Monson, W. F. Persons, W. H. Bunce, J. D. Kauffman, W. L. Rose.

Hampton Manufacturing Company, Indianapolis, Ind.; $5000; to manufacture accessories; incorporators, S. B. Nussbaum, Sol Allman, William Hampton.

Diamond Motor Car Company, Pelham Manor, N. Y.; $10,000; incorporators, C. W. Rundell, C. W. Jaycox, Frank Davis.

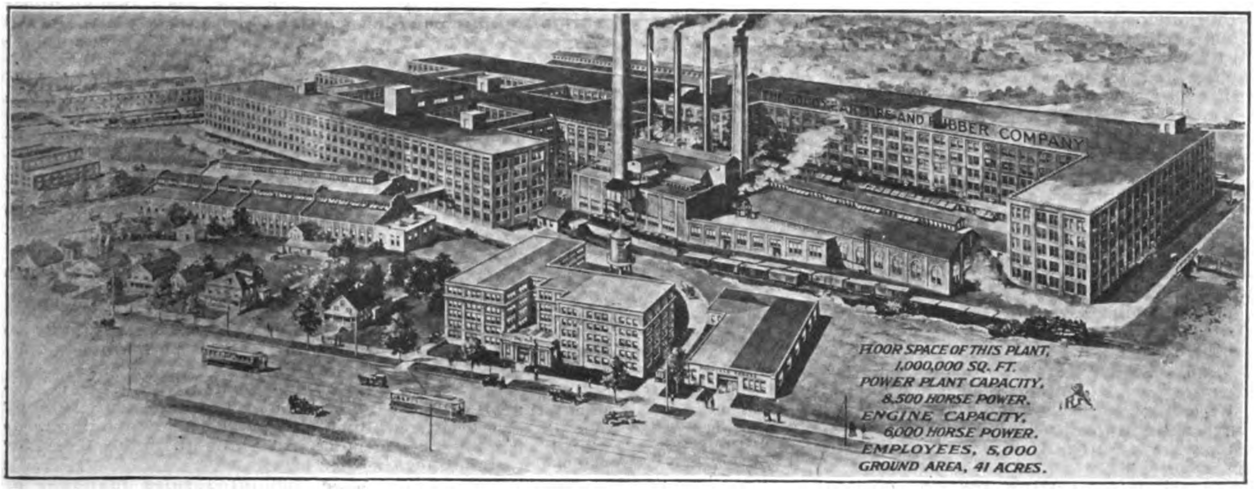
Automobile Fault Finder & Anti-Forgery Electric Pen Company, New York City; to manufacture automobile accessories; $50,000; incorporators, P. H. Couty, D. D. P. Ghadiali, Henry Weinberger.

Ceylon Filler Company of New Jersey, Camden, N. J.; $3000; incorporators, H. L. Merrick, J. A. Kinney, William Williams, T. W. Shore.

Mandel-Frisch Auto Repair Company, Sioux City, Ia.; $5000; incorporators, A. J. Mandel, August Frisch.

L. A. W.-Carburetor Company, New York City; $100,000; incorporators, N. Leinau. S. Heineman, H. A. Watkins.

Smith Bros. Garage, Inc.; Melrose, Mass.; $1000; directors, Rufus W. Smith, Rufus W. Smith, Jr. L. A. Smith.



AND RUBBER COMPANY
FLOOR SPACE OF THIS PLANT, 1,000,000 SQ. FT.

ENGINE CAPACITY, 6,000 HORSE POWER.
EMPLOYEES, 5,000
GROUND AREA, 41 ACRES.

Latest Photograph of the Goodyear Tire & Rubber Company's Plant at Akron, O., Showing New Administration Building and Garage.

Blaisdell Automobile Company, Dexter, Me.; $25,000; to deal in automobiles and supplies and conduct repair shop; incorporators, Charles R. Blaisdell, Ernest D. Blaisdell.

Vanderheyden Garage Company, Troy, N. Y.; $5000; incorporators, Fred E. File, 18 Hoosic street, Troy; William G. Pike, Eleanor M. Pike.

Brooklyn Delivery Company, New York City; $2000; to conduct automobile delivery; incorporators, M. A. Lynch, 109 W. 82nd street; Charles E. McMahon, E. S. Lucas.

Yonkers Auto Repair Company, Inc., Yonkers, N. Y.; $1000; incorporators, Herman Flader, Albert Kipfer, Elizabeth Kipfer.

Bayside Taxicab Company, Bayside, N. J.; $5000; incorporators, William Wagner, Charles B. Story, Charles Bonner.

Consumers' Rubber Company, Providence, R. I.; to manufacture and deal in rubber goods; $600,000; incorporators, P. W. Gardner, A. L. Churchill, E. Butler Moulton.

California Co-Operative Motor Company, Long Beach, Cal.; $150,000; incorporators, Joseph J. Mottell, W. H. Benette, S. H. Underwood, George A. Spicer.

The Bergdoll Car Company of Missouri, Camden, N. J.; to manufacture and deal in motor cars; $10,000; incorporators, Frank R Hansell, John A. MacPeak, C. U. Martin.

P. & A. Non-Metallic Oilless Bearing Company, Wilmington, Del.; $50,000; incorporators, E. E. McWhiney, William J. Maloney.

Never Puncture Tire & Tube Company, Wilmington, Del.; $1,500,000; incorporators, E. E. McWhiney, William J. Maloney, Norman P. Coffin.

Standard Engineering Company, Belfast, Me.; $10,000; to manufacture and sell automobiles and supplies; incorporators, A. W. Keating, Maurice W. Lord.

National Auto Specialty Manufacturing Company, Tama, Ia.; $10,000; incorporators, E. E. Harlan, John Pitka, L. L. Hufford.

A. S. Lee Company, Providence, R. I.; $5000; incorporators, Daniel J. Healy, H. Ladd Walford and G. Otis Washburn.

Republic Motors Company, Brooklyn, N. Y.; $2000; to deal in automobiles and motors; incorporators, Stephen C. Frere, Ernest J. Ellenwood, W. J. Maloney.

Presto Inter Rim Company, Portland, Me.; $200,000; incorporators, M. A. Thurston, H. P. Sweetser.

Como Automobile Supply Company, Charlotte, N. C.; $50,000; incorporators, Morehead Jones, C. C. Coddington, Mrs. M. M. Jones, Mrs. M. L. Coddington.

V. C. Motor Truck Company, Kittery, Me.; $100,000; incorporators, Horace Mitchell, C. E. Smothers, William E. Sisk.

Ford Auto & Truck Company, Inc., Clarendon, Va.; $25,000; incorporators, E. H. Bauer, W. W. Barnes, R. Gordon Finney.

North Jersey Auto Supply Company, Inc., Newark, N. J.; $80,000; incorporators, Max Permission, 525 18th street, Newark; A. C. Mohrof, C. G. Butler, F. W. Mead.

Broadway Penn Garage, Inc., Brooklyn, N. Y.; $2000; incorporators, Herman Goldstein, 181 Penn street, Brooklyn; Meyer Kaplan, Hyman Maisel.

Gressler Aviation Company, New York City; $25,000; incorporators, W. Romain Gressler, 139 W. 37th street, New York City; W. R. Kip, Gerardus P. Herrick.

Briggs Oil Company, Long Beach, Nassau country, N. Y.; $1500; to deal in oils and greases; incorporators, William S. Driggs, Long Beach; Abraham Lodholz, Henry J. Frink.

Gotham Sporting Goods Company, New York City; $10,000; to deal in motorcycles, automobile supplies, etc.; incorporators, Benjamin Goodman, Henry Ephriam, Ben Stacy.

The Veitch Motor Manufacturing Company, New York City; $200,000; to manufacture motors, automobiles, motor trucks, etc.; incorporators, James S. Harris, Percival J. McIntosh, Charles H. Toy.

Northern Motor Car Company, Albany, N. Y.; $25,000; incorporators, R. Dudley Cannon, Arthur P. James, J. Somers McClellan.

Robert Stock Auto Spring Wheel Company, New York City; $300,000; incorporators, Robert Stock, Augusta M. Stock, Joseph F. Bokelman.

American Carburetion Company, New York City; $5000; to manufacture carburetors and parts thereof; incorporators, William H. Woolley, Albert G. Hubbell, James F. Bisselle.

The Walden Aeroplane Company, New York City; $10,000; incorporators, Joseph M. Gottesman, Henry W. Walden, Louis Green.

Audubon Auto Service Company New York City; $500; incorporators, Michael P. Caffe, Edmond Huerstel, Julius M. Ferguson.

Kirchner Motor Company, Poughkeepsie, N. Y.; $2500; incorporators, Otto Kirchner, Charles Kirchner, John E. Townsend.

Eastern Motor Racing Associotion, East Orange, N. J.; to manufacture automobiles and motorcycles; $50,000; incorporators, H. H. Picking, C. O. Geyer, F. E. Ruggles.

WITH THE MANUFACTURER

J. Murray Page, one of the popular men along San Francisco's automobile row, has been appointed manager of the factory branch which the Locomobile Company of America, Bridgeport, Conn., is to establish in Los Angeles, Cal.

C. B. Thomas, formerly with the Studebaker Corporation, has become identified with the Metzger Motor Car Company, Detroit, as special travelling representative. Frederick Wade, who was also with the Studebakers, has become purchasing agent of the Metzger company.

R. A. Weinhardt, formerly mechanical engineer of the Hener Manufacturing Company, has joined the Continental Motor Company, Detroit.

The Jeffery-De Witt Company, Detroit, recently received an order for 1000 spark plugs from England.

The Cartercar Company, Pontiac, Mich., maker of Cartercars, is now running night and day in order to keep up with orders.

The Juno Motor Truck Company, Juneau, Wis., has been reorganized and new officers elected as follows: President, L. C. Pautsch; vice president, Theodore P. Hemmy; secretary, Henry A. Henning; sales manager, William McDougall.

The Olds Motor Works, Lansing, Mich., has leased a lot in Boston, at the corner of Commonwealth avenue and Cummington street, upon which will be erected a three-story building of reinforced concrete with a floor area of 26,000 square feet. It will be occupied by the Oldsmobile Company of Massachusetts, the New England representative of the Olds Motor Works, and will be operated as a sales and distributing house, with a complete service department in connection.

The Bower Roller Bearing Company, Detroit, is enlarging its plant considerably in order to take care of increased business. Contracts have been placed for new machinery and equipment to cost $50,000.

The Standard Roller Bearing Company, Philadelphia, recently installed new machines at a cost of over $100,000. This move was made necessary to take care of the rapidly increasing business of the company.

The Reslilo Tire Filling Company, Elmira, N. Y., has secured a plant at First and State streets, where it will manufacture a tire filling compound. George B. Wilcox has been secured as superintendent.

The Matheson Automobile Company has opened a temporary establishment in Philadelphia, at 203 North Broad street, in charge of B. M. Westerman. A permanent factory branch is to be established in that city.

The Eagle Company, Newark, N. J., has discontinued the manufacture of Standard Friction and X-L windshields, and sold its entire stock of those shields to Charles Weidman, New York City. This move was made because the factory space was needed for other manufacturing The company is to confine itself to the Eagle Rain-Vision shield

Hall's Garage, 131 Clinton street, Wausau, Wis., has taken the agency for Truffault-Hartford shock absorbers and other products made by the Hartford Suspension Company, Jersey City, N. J., and in keeping with the policy of the latter concern has established an attaching station in connection with the regular garage business. The building, which is devoted to the needs of automobile and motorcycle owners, is shown in an accompanying illustration.

The Goodyear Tire & Rubber Company, Akron, O., has completed the additions to its factory, which now presents the appearance depicted in an accompanying illustration. Two of the new structures were the administration building and garage. The entire plant has a floor space of 1,000,000 square feet and affords employment for 5000 persons. The business of the concern is handled by 66 direct factory branches in the United States and Canada, in each of which the service system is an important feature. In addition there are a large number of agencies, each of whom is given liberal support by the home office.

The Abbott Motor Company, Detroit, has purchased a plot of land along Beaufait avenue, to the north of the present factory, and is to erect new buildings which will enable a 25 per cent. increase in the output of the company during the coming year.

The Motz Tire & Rubber Company, Akron, O., has opened a branch in Cleveland, O., at 2352 Euclid avenue, in charge of C. R. Serfoss. This move was made necessary by the increasing business of the company in that locality, the Motz cushion tire proving quite popular with Cleveland motorists.

The Goodyear Tire & Rubber Company, Akron, O., reports that its 1911 sales exceeded the sales for 1910 by 500 per cent., tire equipment for 102,250 cars being produced. This year the company plans to make tires for 250,000 automobiles.

E. C. Howard has been appointed sales manager of the Cadillac Motor Car Company, Detroit, succeeding E. R. Benson, who resigned to join the Studebaker forces.

The Federal Rubber Manufacturing Company of Milwaukee, Wis., is planning a six-story addition to its plant at Cudahy. The building will be 400 by 100 feet, and will give the company double its present capacity. The total floor space now occupied is 170,000 square feet. From a payroll of 38 men last July, when the Cudahy plant was taken over, the Federal company has increased its business, so that now it has a factory force alone of 428 men, which, with the sales force and engineering corps, brings the number nearly to 600.

W. W. Farnsworth, formerly with the Motor Wagon Company of Detroit, and before that with the Federal Motor Truck Company in the same city, has joined the Flanders Manufacturing Company, being connected with the advertising department.

The Cadillac Motor Car Company, Detroit, has secured John Calder, formerly with the Remington typewriter, who will assist in the organization and production work.

Frank Smith, first assistant to Paul Smith in the sales department of the Studebaker Corporation, has resigned and it is rumored that he will shortly join the Metzger Motor Car Company.

Pratt, Carter, Sigsbee & Co., Detroit, has been experimenting recently with a single-cylinder truck of 800 pounds capacity. The car has been put through many long runs, and is to be shortly manufactured in a large factory which has been leased.

J. G. Phipps and C. W. Whitson, Detroit, have brought out a new electric with a 107-inch wheelbase. It is stated that manufacturing operations are to be commenced shortly.

The Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., announces the addition of a new department for the manufacture of dies, tools, special machinery, etc., for the purpose of making the numerous specialties produced by this company.

The Continental Engine Company of Chicago is to move its plant to Dallas City, Ill., across the river from Burlington Ia. The company is also to be reorganized, Charles Barry, formerly with the Deering Harvester Company, and T. C. Mars, formerly with the Model Gas Engine Works, joining the organization.

The Belvidere Screw & Machine Company, Belvidere, Ill., has increased its capital stock from $100,000 to $200,000, in order to provide for expansion. Contracts have been awarded which will more than double the present factory, which is now running day and night on spark plug and other automobile work. The output for this year will reach the million mark in plugs.

The Brooks Manufacturing Company, Saginaw, Mich., has succeeded to the delivery wagon business of the Duryea Auto Company and is now engaged in the manufacture of light delivery wagons under the Duryea patents. The passenger vehicle business has been taken over by the Duryea Motor Company of Saginaw, which is headed by Charles E. Duryea.

The Long Manufacturing Company, Detroit, Mich., has sold its plant to the Cadillac Motor Car Company and will build a new factory, 270 by 120 feet, on a site which it has bought. Double the floor space of the old factory will be afforded, and the output of the company's radiators will be increased materially.

Wallace H. Robertson, brother of George H. Robertson, the well known racing driver, has joined the sales department of the Simplex Automobile Company, New-York City, maker of the Simplex.

The Stevens-Duryea Company, Chicopee Falls, Mass., is erecting a four-story brick and steel building 508 feet long, with frontage of 80 feet on Page boulevard, East Springfield. The quarters are to be used for the body building and painting departments.

H. N. Hovey and T. C. Starret of Detroit have secured the entire stock of the Simplex Motor Car Company, manufacturer of the Amplex car, with headquarters at Mishawaka, Ind., the 30 or more stockholders turning in their stock, rather than stand a pro rata assessment. Mishawaka people are hopeful that the action will save the concern for their town and that it will not be moved to Detroit as it was planned to do at one time. Operations will be continued on a small scale until reorganization. Present plans are to capitalize for $1,000,000.

John A. Graham, at one time superintendent of assembling and testing at the Brightwood Motor & Manufacturing Company of Springfield, Mass., was recently appointed engineer and superintendent of the Westfield Motor Truck Company, Westfield, Mass.

The England Manufacturing Company, maker of metal stampings and automobile accessories, formerly located in Amesbury, Mass., recently removed to Detroit, taking the old factory of the King Motor Car Company at 1559 Jefferson avenue.

The General Aluminum & Brass Castings Company is the name of a new concern which will erect a huge plant at Grand boulevard and St. Aubin avenue, Detroit, to manufacture castings and other parts for the automobile trade. Frank C. Root, who was identified with the Aluminum Castings Company, and capitalists from Detroit and Cleveland, will be identified with the venture.

The Bruns Automobile Company, Brooklyn, N. Y., has opened a new garage at New York and Atlantic avenues. This is one of the most modern buildings in the city, being completely equipped for the work of a service department.

Matthew B. Morgan, an automobile engineer, who has been with the Chalmers Motor Company of Detroit, Mich., for the past three years, has joined the Marion Motor Car Company force at Indianapolis, Ind. Morgan's experience, covering a number of years, took him through employment with the Peerless Motor Car Company of Cleveland O., Packard Motor Car Company of Detroit, Mich., and the Olds Motor Works, Lansing, Mich.

J. J. Cole, president of the Cole Motor Car Company of Indianapolis, Ind., for which the G. E. & H. J. Habich Company of Boston is the Massachusetts distributor, and William Colt of the Colt-Stratton Company, New York City, eastern distributor for the Cole, were recent guests of automobile men in Boston. Dinner was served at one of the leading hotels, following which there were interesting addresses by the guests and a number of Boston business men.

The Dayton Engineering Laboratories Company, Dayton, O., operates two factories, one of which is located in Chicago and the other in Dayton, O. The latter is presented in an illustration herewith. It is in this plant that the Delco self-starting and lighting systems are manufactured, while the ignition equipment is produced in the Chicago plant. The entire building shown is well fitted for the work, being equipped with all of the most modern machinery. A particular feature of the construction lies in the fact that the workmen are supplied with an abundance of light and special attention is paid to the matter of ventilation.

John F. Singleton, for the past six years advertising manager for the Firestone Tire & Rubber Company at Akron O., has organized the John F. Singleton Company and has opened offices in Cleveland, O. The new concern plans to conduct a general advertising agency business.

Hall's Garage, Hartford Suspension Service Station at Wausau, Wis.

The Blair Manufacturing Company, Newark, O., maker of the worm driven Blair truck, is now installed in its new factory, a general view of which is shown in an accompanying illustration. The plant is admirably arranged for this work, and is thoroughly equipped in the most up-to-date manner. Every modern manufacturing facility is incorporated for the rapid production of 1.5, 2.5 and 3.5-ton models.

The Union Motor Truck Company was recently formed in Sunnyvale, Cal., for the purpose of manufacturing and placing on the market commercial vehicles. The officers are: President, C. Y. Williams; vice president, Ernest Horstman; secretary, W. P. Buckingham; treasurer, Edgar Pomeroy. A large amount of new machinery will be purchased.

The Penn Motor Car Company has just completed the removal of its plant from Pittsburg, to Newcastle, Penn. All the machinery from Pittsburg, together with a large amount of new machinery, has been installed, and the company has resumed operations.

The Motor Manufacturing Company of Geneva, N. Y., is removing its plant to Dunkirk, and will occupy a part of the Lux Light plant in the latter city. The firm will employ about 100 men in its new plant.

E. D. Bangs of Milwaukee, Wis., is organizing a stock company for the purpose of manufacturing an elastic rim, perfected by Mr. Bangs, for holding solid tires on automobile wheels. Mr. Bangs announces that it will be at least a month before all the details of the new concern are completed. According to a statement by him the resiliency of the new device can be adjusted to suit any conditions.

GARAGE & DEALER

W. C. Durant recently arranged for the opening of branches of the Chevrolet Motor Company of Detroit, and the Little Motor Car Company of Flint, Mich., at Buffalo, N. Y. A large store has been leased and Joseph F. Rath has been appointed representative for the two companies in the district including Buffalo and surrounding territory.

The Urbana Automobile Company of Urbana, Ill., will erect an addition 100 by 50 feet to its garage. It will be of brick and concrete construction, and will give the company a floor space of 12,000 square feet. The garage is one of the best equipped and most finely appointed in the vicinity

The Seely Auto Sales & Training School of South Bend, Ind., will have new quarters at 232 North Michigan street, which will be among the finest of its kind in Indiana when completed. The basement will be used exclusively for training purposes, while the main floor will be utilized for garage and general salesrooms. Complete storage and recharging apparatus for electric machines will be installed.

Capt. F. W. Cole of the Pan-American Motors Company of San Francisco, Cal., has taken the agency for the Durable Dayton truck, built by the Dayton Auto Truck Company of Dayton, O. His territory will include California, Oregon and Nevada.

S. R. Smith has opened a new garage at 198 Church street, Poughkeepsie, N. Y. The building is a fine brick structure, and is up-to-date in every way.

F. L. Niell, well known to the automobile trade throughout the State of Pennsylvania, recently purchased the Auto Supply Company's business, conducted by Ross Leonard in Washington, Penn. He will continue the business at its present location, Main street and Highland avenue.

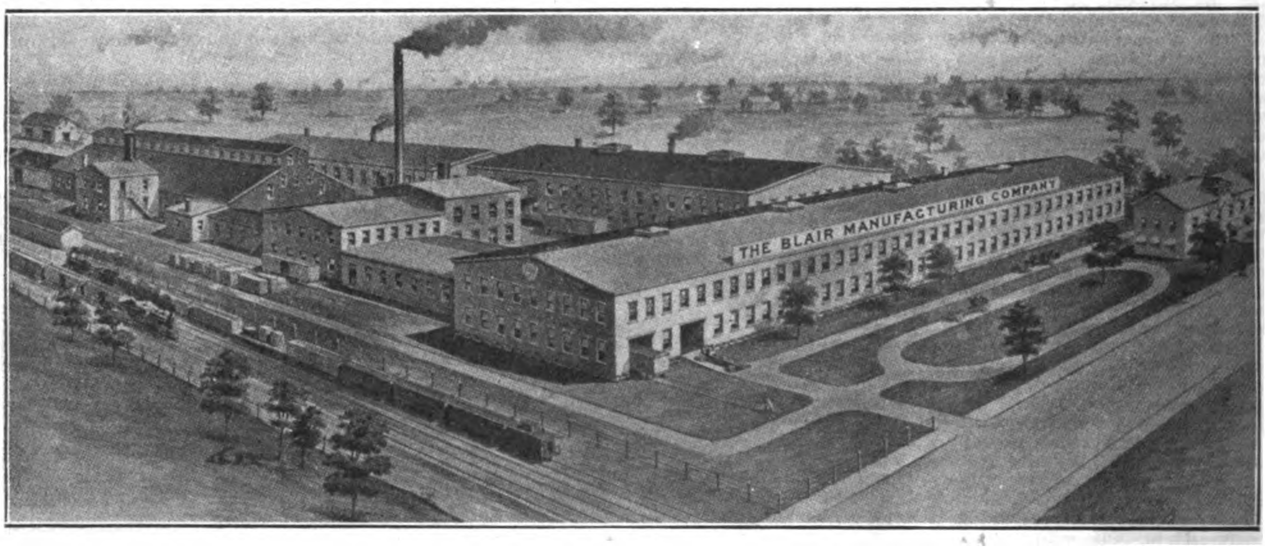
J. S. Fowler of Anderson, S. C., in addition to being one of the largest cotton growers in the United States, and also a big corn raiser, has established the reputation very recently of being the most successful automobile salesman in his state. During the last year he has sold $200,000 worth of machines.

Carl G. Fisher, president of the Indianapolis motor speedway, has taken the agency for the Packard car, made by the Packard Motor Car Company of Detroit, and has started the erection of a sales service building at Vermont street and Capitol avenue, Indianapolis. The structure will be one of the most complete of its kind in the Middle West.

W. K. Chetwood, who went to Portland, Ore., about a year ago from San Francisco, Cal., to represent the Kelly-Springfield Tire Company of New York City, has opened headquarters in a building at 328 Pine street. Mr. Chetwood is one of the best known men on the Pacific Coast, being familiar with the trade in all the larger cities.

The Sturdy Manufacturing Company of Chicago, maker of the Sturdy spark plug, has granted the Cedar Rapids Sales Company, Cedar Rapids, Ia., the exclusive sales right of its product in the State of Iowa. An office has been opened at Avenue A and Fourth street in the latter city.

The Enterprise Motor Truck Company was recently incorporated in Baltimore, Md. G. H. Nachman of the Enterprise Fuel Company, Hanover and Fayette streets, is one of the principal owners of the new concern. A contract for the erection of a garage at Oak and 20th streets has been awarded and the work will be commenced at once.



Plant of the Blair Manufacturing Company, Newark, O., in Which the Blair Worm Drive Trucks Are Produced in Three Models.

C. D. Warner has disposed of his automobile business, conducted for a number of years on Arsenal street, Watertown, N. Y, to Ralph Wise, Louis Mitchell and Fred Folger. Mr. Warner has had the agency for the Ford car, built by the Ford Motor Company, Detroit, Mich.

T. E. Smith, who has taken the agency for several makes of cars, is having a garage built at Ridgefarm, Ill. The new structure will be modern in every detail and will be strictly fireproof.

The Menard Company has opened a new garage on Division street, Holyoke, Mass. It has a capacity of 30 automobiles, and among the improvements to the building are a concrete floor and the installation of an electric lighting system.

Barney Gilinsky, one of the best known business men in Council Bluffs, Ia., is having erected a pressed brick structure, 65 by 115 feet, one story in height, at the corner of Broadway and Eighth streets, which will be used as a garage and automobile supply and service station. It will be managed by his son, Joseph Gilinsky.

Marion Brown has installed new machinery in his garage at Graniteville, N. Y.

The J. H. Hansen Company is to open a new service station at 225 South St. Joseph street, South Bend, Ind. The building has been entirely remodelled and will be used as a show room for the Abbott-Detroit, made by the Abbott Motor Company, 612 Waterloo street, Detroit, and the R-C-H, manufactured by the R-C-H Corporation, Detroit.

Frank E. Block is having an automobile salesroom, 100 by 100 feet, two stories high, erected in Atlanta, Ga. The building will be of mill construction, will have two steam plants for heating and will be lighted by electricity. The cost, it is said, will be $25,000.

John S. Bridges has plans under consideration for the erection of a garage at Charles and 35th streets, Baltimore, Md. The building is to be of two stories and will cost $2500. The contract has been awarded to Gladfelter & Chambers.

The Capitol City Auto Company of Hartford, Conn., found it necessary recently to secure larger quarters, and salesrooms have been opened at Allyn and High streets, affording increased floor space for the storing and demonstration of machines.

The Harvard Garage Company has been formed in Boston with a capital stock of $5000. One hundred shares at $50 each have been issued. The directors are: E. F. Blake, John B. Lynch and W. E. Collins.

Charles Doughman, Ottawa, Kan., has taken the local agency for Lion cars, made by the Lion Motor Car Company, Adrian, Mich., and will conduct a garage and salesrooms in addition to his hardware store.

The Shelton Garage, Ansonia, Conn., is now in the hands of J. N. Sinsabaugh, he having purchased the interest of Frank Alling, who has gone to New Haven to open a garage.

Commercial Motors Company, with headquarters at 432 E. Broadway, Louisville, Ky., was recently organized with the following officers: President and treasurer, Harry B. Fitch; vice president and manager, R. C. Hurt; secretary, R. E. Scharf. The company will conduct an automobile service station, and is incorporated for $10,000.

Winegarten & Holmes has opened a new garage in the Carter block, Jottingham, Ill.

The Big Rapids Automobile Company, Big Rapids, Mich., is installing new machinery, including a drill press and a lathe. This will enable the concern to handle almost every class of automobile repair work.

The Texas Motor Car & Supply Company, Cuero, Tex., has bought the automobile business of Richter & Cook and is to move into the Knights of Pythias building, which is being fitted up especially for use by the company.

The Morgan Garage at I and Tuolumne streets, Fresno, Cal., was recently sold to A. J. Arnaudon of Mendota, for $45,000. It is a two-story brick building a little over a year old, and will be continued under the same management.

The Pan-American Motors Company, recently organized in San Francisco, Cal., to handle Michigan and Moon cars for the northern Pacific Coast, is to build a new structure at a cost of $300,000 at Golden Gate avenue and Hyde street. It is planned to make it one of the most modern and attractive in the city, the plans calling for what is remarkable in a city establishment—namely, a 20-foot lawn in front. The building will be of steel and concrete, thoroughly fireproof.

The Tire & Auto Service Company is the title of a new concern which is located at 1580 Woodward avenue, Detroit, just beyond the Grand boulevard. The company carries tires principally, but also handles a large line of accessories and supplies.

The Donaldsonville Garage Company, Donaldsonville, La., is erecting an addition to its garage to be utilized as the Pioneer Auto Brokers. Second hand cars will be handled, and a repair shop conducted.

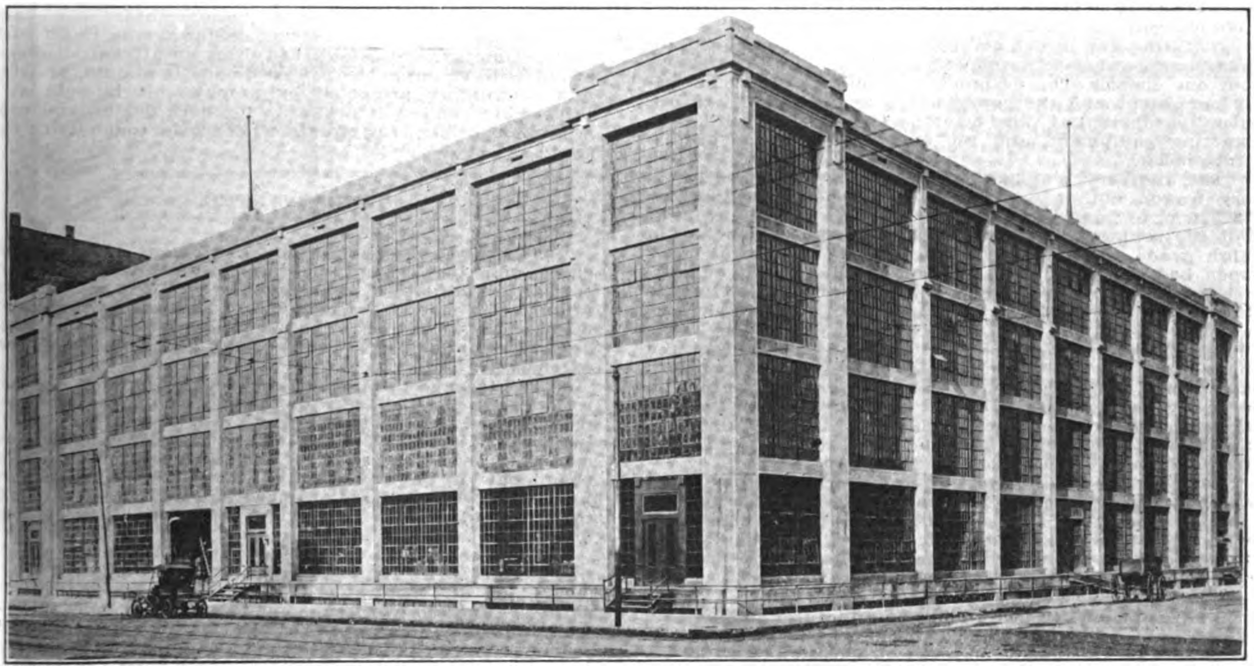
The Florida Apperson Sales Company, Jacksonville, Fla., has moved to 325 West Adams street, taking the quarters formerly occupied by the Miller Automobile Company and securing room for a larger display of cars.

The Hailey Auto Company, Hailey, Id., has been bought by Furcht & Thorp, who will conduct a repair shop and livery business.

The W. P. Barnhart Company, Washington, D. C., has leased the store at 1707 Fourteenth street, N. W., where the Everitt car will be handled after extensive alterations have been made.

Julian Howard, Jacksonville, Fla., has moved from his former location to 532 West Forsyth street.

The W. H. McIntyre Company, Auburn, Ind., has appointed a number of new agents who will handle the McIntyre line of motor trucks in their respective localities. The new agents follow: McIntyre Commercial Car Company, Hartford, Conn.; Mechaley Auto Company, Stamford, Conn; Shinkle, Richardson & Co., Huntington, Ind.; Fox Brothers, La Crosse, Wis.; McIntyre Auto Sales Company, Webster, N. Y.; Imperial Motor Car Company, Nashville, Tenn.; C. E. Swanson, Chicago, Ill.; Syracuse-McIntyre Company, Syracuse, N. Y.; Werick Brothers Motor Car Company, Buffalo, N. Y.; George R. Beeson, Connersville, Ind.; Kingman Plow Company, St. Louis, Mo.; Bradley, Merriam & Smith, Council Bluffs, Ia.; E. Wiley Hill, Butte, Mont,; McKee & Scott, Fresno and Bakersfield, Cal.; McIntyre Auto Sales Company, Albany, N. Y.; Standard Motor Truck Company, Boston, Mass.; D. F. Head, Ithaca, N. Y.; H. H. Maurer, New Berlin, Penn; Lovegrove & Co., Philadelphia, Penn; F. B. Austin, Little Falls, N. Y.; Banta Brothers, Peoria, Ill.; J. J. Aker, Schenectadv, N. Y.; Owen M. Smith, South Whitley, Ind.; F. A. Burmeister, Memphis, Tenn.; Hartford City Auto Company, Hartford City, Ind; J. August Schmidt, Gloversville, N. Y.



Factory of the Dayton Engineering Laboratories Company in Dayton, O., Where the Delco Starting and Lighting Systems Are Made.

The Donaldsonville Garage Company's addition will also include a paint shop, 26 by 38 feet. It will be divided into two rooms, one an air tight and dust proof drying room.

The Dove Machine Company is a new concern in South Lawrence, Mass., occupying a $30,000 brick structure at the corner of Broadway and Groton street. The building is thoroughly equipped with all kinds of machine tools for automobile repair work, including a large power hammer.

The Richardson Tire Company, Hartford, Conn., recently moved into new quarters at 20 Ford street, in order to secure more room to accommodate its rapidly growing business. The firm makes a specialty of tire repairing and carries a full line of supplies.

The Mandel-Frisbee Auto Repair Company, Sioux City, Ia., has just opened a new garage at 312 Pearl street. An automobile livery is being conducted, and the establishment includes a repair shop and painting rooms.

The Maine Motor Car Company, Portland, Me., was recently organized to succeed the Maine Motor Carriage Company. Offices have been taken at 43 South street, where car sales will be handled until Nov. 1, when the garage and accessory department will be turned over to the new company, which has $50,000 capital.

The Five Points Auto Company, Fort Smith, Ark., recently opened for business at 913-15 North A street, with J. R. Braidwood and A. W. Chisholm in charge.

Lusted & King, San Diego, Cal., has leased the establishment at 1140 Second street known as the Modern Automobile Shop, and will continue it under the name of

The Wevco Supply Company, St. Louis, Mo., with branch houses in Birmingham, Ala., and Ft. Worth, Tex., has taken the agency for Hagstrom spark plugs and other products of Hagstrom Bros., Lindsborg, Kan.

The R-C-H Corporation, Detroit, has signed agency contracts with the following: J. H. Reichhardt Company, Cornell, Ill.; Rudolph Dittmar, Masbach, Ill.; the Capitol Motor Car Company, Raleigh, N. C.; Crescent Garage, Riverside, Cal.; Clark's Garage, Pomona, Cal.; Alfred S. Donau, Tuscon, Ariz.; G. F. Wisegarver, Decatur, Ill.; Weir-Moore Motor Company, Monmouth, Ill.; Fred Fiene, Freeborn, Minn.

The King Motor Car Company, Detroit, has appointed new agents as follows: Coleman Cutchins, Richmond, Va.; Barton Ford Motor Company, Cedar Rapids, Ia., and S. J. Wise & Co., Boston, the last named, for New England. The King car is now being manufactured in a new factory which is being run night and day to fill orders.

The Murray O'Neill Company, New Bedford, Mass., is now fully settled in its new garage at 497-501 County street. The building is well protected against fire, the boiler room being separated from the rest of the departments, while the gasoline room is divided from the brazing department by a concrete wall.

TRADE INFORMATION EXCHANGE
BUSINESS PROPOSITIONS.

Two Classes of Opportunities Are Offered Below—for Agents to Secure New Lines, and for Manufacturers to Secure Agents. These Propositions Offer State and Community Representation to Makers of Pleasure Cars, Motor Trucks, Accessories and Supplies, While Dealers May Get in Touch with Manufacturers Desiring to Extend Their Agency Connections. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without the Names of the Firms, Which Desire Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding to the Concerns.

AGENTS WANTED.

772, Trucks—A desirable connection may be made by a number of agents for a line that includes both electric and gasoline delivery wagons and trucks. The machines are built by a concern of undoubted reliability, with large resources, and the guarantee given to purchasers is very broad. The factory attention given by this company is such as to justify careful inquiry. The range of prices is extremely wide, vehicles being produced for every requirement.

798, One-Ton Truck—Agencies can be established for a high grade service wagon of one ton capacity, made with but one chassis. The design is in every way mechanically consistent and the construction and material are unusually substantial The machine is furnished with self-starting equipment, and the opportunity is one of distinct merit.

806, Delivery Wagon—The maker of a standard delivery wagon with a capacity of 1500 pounds, selling for $875 f. o. b. factory, wishes to establish agents throughout the country. The machines are well constructed, of high grade material, have all desirable equipment, with open body standard, and are sold with a broad guarantee. The line is one which will interest all desiring to secure the agency for a popular priced and reliable machine.

779, Delivery Wagon—Agents generally are required by a well established firm making a delivery wagon with a capacity of 3000 pounds. The vehicle is high grade in every respect, and possesses an unusual number of exclusive features which insure economy of time and attention and make for reliability. The price for the chassis ranges from $2200 to $2500 f. o. b. at the factory.

918, Delivery Wagons—Manufacturer of two types of delivery wagon, one of 1000 pounds and the other of 1500 pounds capacity, the first with enclosed and the latter with open body, will make attractive arrangements with live wire representatives. Some excellent New England territory is available. The machines sell for $1000 and $1050 f. o. b. at the factory.

814, Oil and Grease—The manufacturer of a well known and widely advertised line of automobile oils and greases has an agency contract proposition that is exceedingly liberal to offer to those who wish to connect themselves with a reliable and dependable firm. The oils and greases are of grades to meet every requirement and are produced from the highest class crudes by scientific refining.

816, Spark Plugs—A spark plug manufacturer, producing plugs that have exclusive and desirable qualities, wishes to establish a number of first class agencies. A liberal contract is offered and territorial rights will be given to those who can demonstrate their ability to secure business.

801, Plant Opportunity—A company manufacturing high grade pleasure car and motor truck wagon wheels in New York State, having excess factory space and facilities, will consider proposition to combine with a concern manufacturing automobile parts or completed vehicles. The plant is new, equipped with the latest machinery and ample power, has abundant water from artesian wells and good fire protection. The site covers four acres, with an 856-foot frontage on the railroad. The city is a rapidly growing one and possesses the best of freight and express shipping facilities. The company desires to increase its capital and business, and to the proper parties will lay the proposition open to the closest inspection.

891, Pleasure Cars and Trucks—Agencies are open for a line of high grade pleasure cars, trucks, municipal service wagons and fire department apparatus, widely known and well advertised, made by one of the best established manufacturers in the industry. Every class of vehicle required for business or pleasure is produced and the maker is prepared to afford factory service of a character calculated to secure results. The proposition is open only to those who can purchase a demonstrating machine and contract for a number of cars commensurate with the territory taken.

892, Delivery Wagon—An excellent opportunity is offered dealers who desire to handle a small delivery wagon possessing unusual merit. The car has a maximum capacity of 1600 pounds and sells for $750. Manufactured in Newark, N. J., it possesses unusual strength and reliability, coupled with the simplicity which was the keynote in designing the car. An excellent proposition will be made to dealers throughout the country.

893, Gasoline Gauge—The manufacturer of a new gasoline gauge wishes to secure dealer agents in all parts of the country. To established firms an attractive proposition will be submitted. The device is simple, reliable. and thoroughly protected by patents. It is sold at a price which makes it desirable for both dealer and user. A great specialty for agents who are in touch with the trade.

LINES WANTED.

811, Accessories and Garage Equipment—A large machine shop in Vermont, making automobile and garage specialties, desires to secure agency relations with manufacturers of standard accessories, supplies, garage equipment and similar lines. The concern is an old established one, and contemplates entering the automobile business extensively.

929, Pleasure Cars and Trucks—The agency for two well known lines of cars in Omaha, Neb., wishes to expand and secure the representation of pleasure cars selling from $750 to $1250, and trucks from $800. The concern has been successful in handling two of the most prominent of the moderately priced lines of cars, and knows its field well. Consideration will be given only to nationally known cars which offer possibilities commensurate with the field.

833, Pleasure Cars and Accessories—The agency for a line of pleasure cars selling for not more than $2000 is desired by the proprietor of a Vermont garage. The locality offers an excellent opportunity and the man is well known and progressive. He also wishes to handle standard lines of accessories and supplies. The garage is to be improved, and catalogues are desired from manufacturers of garage and repair shop equipment and supplies.

877, Express Data Wanted—A resident of New York. City, desires to obtain from manufacturers of electric wagons and trucks the results obtained with these vehicles in an express business, including information concerning small installations and the approximate cost of operation and maintenance. This prospect is worthy of the attention of every maker of electric vehicles of the type desired.

1004, Wanted, Agency for Gas and Electric Trucks—A resident of Boston, Mass., desires to make an agency connection with a manufacturer of gasoline and electric delivery wagons and trucks. Has unusual opportunities for the sale of electric machines. Has an acquaintanceship with many of the managers and superintendents of electric lighting and power companies throughout New England, who may be in the market for electric conveyances, preferably from 750 to 1500 pounds capacity, that can climb hilly streets at reasonable speed and make from 15 to 20 miles an hour on good roads. With a satisfactory selling arrangement could establish selling agencies with many electric companies.

927, Accessory Lines Wanted—An active and energetic selling agent, with wide acquaintance in the motor vehicle and equipment trade, is about to establish an office in New York City, to represent several well-known and well-advertised lines. He is desirous of learning of specialties produced by manufacturers who want to create and continue strong introductory campaigns and who have the products that will justify this form of endeavor.

912, Wanted, Agency for Pleasure Cars—Man now erecting a high-class garage in a hustling Illinois city is desirous of becoming agent for a line or lines of automobile pleasure cars selling from $1000 to $2000; also a line of automobile equipment, a line of automobile accessories, a line of automobile supplies, garage equipment and supplies, machine tools, and repair shop equipment and supplies. This proposition should interest practically every manufacturer of automobile vehicles and accessories, supplies and garage equipment.

968, Accessories—A new concern, located in Rock Island, Ill., and carrying a line of accessories, desires to increase its business by the addition of new lines. Well advertised articles of merit are wanted, and the company desires to build up a high class trade. Supplies are also desired, such as tires and oils. The company is a new one, but gives every evidence of success, and connection with it will no doubt prove of mutual profit.

946, Accessories, Supplies, Tools—The manufacturer of a line of pleasure and commercial cars, located in Wisconsin, desires to hear from manufacturers of automobile equipment, accessories, supplies and tools of all kinds. The company has been developing its agency for some time, and now plans to expand. Factory equipment and machine tools are also to be purchased.

762, Pleasure Cars, Trucks and Supplies—Boston men desire to hear from manufacturers of pleasure cars, trucks and supplies, catalogues and full details of the agency propositions being wanted. It is contemplated to enter the business extensively, with several lines of cars and the more prominent accessories and supplies.

764, Cars and Accessories—A subscriber to the Exchange, located in Boston, desires to enter the automobile business extensively, and wishes to hear from manufacturers of pleasure and commercial cars and camp wagons, accessories and supplies. Well advertised lines of quality are desired.

987, Wanted, Time Clocks, Stamps and System Details—This proposition covers the inquiries of two subscribers who are desirous of obtaining full information relative to time clocks and systems, suited for, or which may be adapted to the use of garages of moderate size. Both concerns are anxious to purchase and want the best available. With replies please enclose two sets of literature.

1001, Wanted, Agency for Trucks—An established service station in a progressive commercial centre of New England, wishes to make an agency connection with a manufacturer of motor driven trucks selling from $1000 to $1500. This concern handles several lines of pleasure cars and has a well-organized sales department.

961, Wanted, Equipment—The management of a garage doing a business of considerable proportions is to make a number of changes and wishes to obtain full information and prices concerning air compressors and other modern service station equipment.

760, Wanted, Information Covering Fire Apparatus—Two members of the purchasing board of the fire department of a large New England municipality desire to learn from all manufacturers of all classes of motor driven fire apparatus, prices and full information concerning each type, where such equipment is now in service, the work it is doing, the cost of maintenace, and comparison with other forms of service.

THE ACCESSORY —AND— GARAGE JOURNAL

Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. PAWTUCKET, R. I., JULY, 1912. No. 3

FIRST ANNOUNCEMENT OF WIRE WHEELS.

Knight-Engined Stoddard-Dayton Will Be Thus Equipped---Schacht to Have Block Motor---Michigan Plans Surprise---White Abandons Yearly Models---Atlas Engine Works Sold---New Factory Buildings---Other Items of Interest.

Decided interest in the matter of wire wheels has been created in America during the past few months, and it is not at all surprising to learn that at least one manufacturer has adopted this equipment for the 1913 season. Reference is had to the Dayton Motor Car Company, Dayton, O., a subsidiary of the United States Motor Company, and maker of the Stoddard-Dayton. It will be remembered that this concern was one of the first in America to utilize the Knight motor, and the wire wheels are to be fitted to the six cylinder Knight model.

The 1913 line consists of the six-cylinder, built as a touring car, limousine and compartment roadster; the 48 horsepower with valve-in-the-head motor, and touring, limousine and compartment roadster bodies; the 38, with block motor and as touring car, compartment roadster, coupe, limousine and landaulet, and the 30 with block motor and as touring car and compartment roadster.

All limousine bodies are designed to seat seven passengers and embrace every feature and appointment that make for comfort and convenience. The roadsters, all of the compartment type, have a large enclosed space for luggage back of the driving seat. The new landaulet and coupe are typical of the Stoddard-Dayton's standard of coachwork, the former being designed as a seven-passenger car and the latter for three.

For the most part, no radical changes have been made. Minor mechanical refinements that have been dictated by service, have been incorporated, and there are numerous details which tend to simplify driving and promote comfort.

TWO SCHACHT MODELS.

New Motor of Monobloc Design and Other Features of Particular Interest.

Two new models, distinctly different in body design but employing the same chassis, comprise the 1913 line of the Schacht Motor Car Company, Cincinnati, O., according to the recent announcement of the company. These will be known as model NS, a five-passenger touring car, and model KL, a roadster. Both will be equipped with fore doors, and will present all the latest refinements, including self-starter, electric lights, demountable rims and one extra rim, etc. Left hand drive with centre control is employed.

The chassis is practically of the same construction throughout as in the 1912 offering. However, the motor is a new design, being of the monobloc type, with three bearing crankshaft. The bore is 4.25 inches and the stroke, 5.5, making it practically a long stoke unit, and the rating is 45-50 horsepower. Other features include the use of the cellular radiator, full floating rear axle and larger brakes.

THE NEW MICHIGAN.

Two Models on One Chassis to Possess Surprising Innovations of Decided Value.

Formal adoption of the specifications for the 1913 Michigan, the product of the Michigan Buggy Company, Kalamazoo, Mich., has been made but the details are carefully guarded, as it is not the intention of the company to make announcement concerning the new car for a few weeks. The specifications are the work of Chief Engineer W. H. Cameron, who recently joined the Michigan forces, having formerly been with the Willys-Overland Company, Toledo, O.

The company authorizes the statement that the car will remain in the medium price class, although several high priced features are to be incorporated in its design. Two models will be produced, utilizing one chassis—a touring car to be known as model R and a roadster designated as model S. President F. B. Law of the company makes the following statement:

"At present we can only say that we have included a long list of features that automobile men have said could never be figured into a medium priced car. Some of these features are now used only on the famous high priced cars of America and Europe. As manufacturers on a large scale for 30 years, the problem of costs is one of long experience with us. We have solved the cost problem so many times when other manufacturers said it could not be done that we are loath to concede impossibilities in the automobile.

"It has been our ambition from the very first to bring more and more of high priced practise into the medium priced car, as represented by the Mighty Michigan. We have added something every year. But our 1913 car eclipses even our own expectations. We have a surprise—really a staggering surprise—in store."

NEW OLDSMOBILE HEAD.

Oliver C. Hutchinson Leaves Marquette Company to Succeed W. J. Mead.

With the announcement that W. J. Mead, vice president and general manager of the Olds Motor Works, Lansing, Mich., had resigned to become president of the reorganized Amplex Motor Car Company, Mishawaka, Ind., came the information that Oliver C. Hutchinson, formerly head of the Marquette Company, Saginaw, Mich., had been promoted to succeed him.

Few men in the industry are better known to the trade throughout the country, but his most signal success has been in connection with the Marquette company, the product of which may be considered as one of the newest of the General Motors Company, having been placed in the market last year. The plans put under way by Mr. Hutchinson have caused this car to become as thoroughly entrenched as many of the older machines. In connection with the promotion of Mr. Hutchinson, comes the statement that interesting announcements concerning the Oldsmobile line for 1913 may be expected in the near future when Mr. Hutchinson becomes thoroughly acquainted with his new duties.

O. C. Hutchinson, General Manager, Olds Motor Works.

FUTURE WHITE POLICY.

The White Company, Cleveland, O., maker of White pleasure and commercial cars, announces that it has given up entirely the idea of bringing out new models at a certain specified time each year. In accordance with this policy, in the future White cars will be known by their model letters, without reference to date, and a model will continue, irrespective of the year, until it is found advisable to change it. At that time the current model designation will be dropped, and a new one will be substituted. Any change in design or construction that is found desirable will be made as soon as it is apparent that such will be a real improvement, instead of waiting to announce it at the end of the season. For these reasons there will be no 1913 announcement of White cars.

ATLAS ENGINE SALE.

Announcement is made that the Atlas Engine Works property in Indianapolis, Ind., will be sold under a superior court order, July 29. It is stated that a corporation in Detroit, which is desirous of establishing a plant in Indianapolis, will be among the bidders. In the event that this company shall be the successful bidder, the tentative terms of purchase are said to have been arranged as follows: The purchaser to assume the mortgage against the property which secures bonds aggregating $1,050,000; to pay $105,000 indebtedness secured by the bond issue of $150,000 and cancel the bonds, and to turn over to the receiver sufficient money to pay all mercantile accounts contracted since the creditors' committee took charge of the plant, as well as the salary rolls and receivership expenses, amounting to about $80,000. The upset price has been fixed at $80,000. The Detroit concern, it is claimed, would manufacture the Diesel and silent Knight engines as heretofore, and also a line of four-cylinder cars, employing from 5000 to 7000 men. There is no intention of removing the present plant now in operation to Detroit.

GRANT COMPANY MOVES.

The Grant Motor Car Company, Cleveland, O., moved into new factory buildings at 152nd street and St. Clair avenue, Collinwood, recently. The main building is 100 by 400 feet and the auxiliary structure is 60 by 160 feet. Both are of reinforced concrete. The new models made by the company will not bear the date of the year manufactured, but will be listed in series. Series No. 2 will be placed on the market Jan. 1, and each succeeding year another series will be added. The output of the company at present is 15 cars a day, but one model being manufactured. A six-cylinder roadster will be placed on the market the first of next year.

EAST JOINS AMPLEX FORCES.

Another announcement of a change in the personnel of the Olds Motor Works organization at Lansing, Mich., is made in that George L. East has resigned as director of advertising to take a similar position under President W. J. Mead of the Amplex Motor Car Company, Mishawaka, Ind., maker of Amplex cars. Mr. East has been with the Oldsmobile people some five years, during which time he has had general supervision of the advertising and publicity. He will be located at the Chicago offices of the Amplex concern.

BRISCOE DENIES REPORT.

President Benjamin Briscoe of the United States Motor Company, New York City, denies the published report respecting the possible removal of the Columbia Motor Car Company from Hartford, Conn., to Dayton, O. Vice President J. W. Wellington, in charge of manufacturing for the parent concern, joins Mr. Briscoe in this denial.

REACHING THE REAL BUYERS.

Value and Cost of Specialized Publicity Contrasted With That of Private Mailing List.

Engaged in manufacturing and distributing products that are directly or indirectly used in the motor vehicle and allied industries, are approximately 3000 concerns or individuals, including manufacturers, selling agents, dealers and the general trade, who sell direct or through their representatives to the American motorists. This total is increased to between 17,000 and 18,000 when one includes the retail dealers in accessories and supplies, attachments and conveniences, and in this classification may be placed the owners and managers of garages and public service stations, repairers and those who deal in or influence the trade of the 600,000 or so motorists.

Whatever the product, it is necessary to establish it in the market, and it cannot become known unless it is given publicity through legitimate promotion or the individual influence of the purchasers. Obviously the former means brings immediate returns, and the latter a continuance and increase of patronage. If an article is worth producing it is worthy of exploitation, and in proportion to the exploiting is the demand, even though well established and widely known, because of competition that is stimulated in every way by the practical man of business.

The manufacturer or distributor may believe that he can by one line of publicity reach both the trade and the consumers. If this policy is followed it is usually the experience that the results are insufficient, and recourse is made to the mail to reach either the selling interests or the purchasers, or perhaps both. It is always found that a campaign of this character, employing high grade printing, first class postage, and the maintenance of an adequate and dependable mailing list, brings the cost of promotion much in excess of the estimated expense or the publicity appropriation.

Conditions compel the specialization of motoring prints. Advertising solicitors depend upon the circulation of their papers to owners to secure patronage. But it is apparent that if any magazine is devoted to the interests of owners it cannot at the same time appeal to the manufacturers, distributors and the trade. No publication aside from the ACCESSORY and GARAGE JOURNAL is issued wholly for manufacturing and trade distribution. As a business man's print it is conducted for his benefit alone, and it is the only medium that can be depended upon to reach him. It cannot be maintained that there is no field for the trade magazine. Every experience proves that these are the best and strongest publications with those to whom they are devoted. They are not only the logical mediums through which to direct publicity to the industrial interests, but they are read with extreme care. It is evident that the advertising that promotes industry and distribution cannot be expected to stimulate general purchasing and consumption. There must be separate and direct appeals to different classes of buyers.

To secure the same attention from the trade and owners alike then all publications must be used, which would mean duplication of circulation, and unless the advertising was intended for the two interests it would not be of a character to satisfactorily attract either. Besides this there is the element of expense, that would be in itself practically prohibitive.

The ACCESSORY and GARAGE JOURNAL has a circulation of more than 12,000 copies each issue. It is placed in the hands of and is read by practically all the men who direct the purchasing of the concerns identified with the motor vehicle and allied industries. The distribution is guaranteed and it reaches the live buyers—the men who create and influence the market. For advertising service in this magazine the cost is exceedingly moderate. No other publication can equal its productiveness, and no other can give so great value for the money.

To emphasize the economy of publicity in this medium, issued regularly each month and reaching the trade and industry, its service may be compared with circularizing with a private mailing list, which is never systematic, never well maintained, and never dependable, unless an extremely high price is incurred. It is never guaranteed.

The cost of one, two, three and four-page circulars, printed in one color, with a fair grade of envelope, with cost of addressing and maintenance of mailing list, and using a penny stamp, for 12,000 copies, would be at a reasonable estimate $204.50, $217, $224.50 and $232 respectively, and were first class postage used the price would be increased $120 in each instance. This does not include the original expense for a mailing list nor the actual increase through the loss of undelivered packages.

The cost of a page monthly in the ACCESSORY and GARAGE JOURNAL is $50 an issue under a yearly contract, and this space may be increased at the same ratio as desired at yearly rates. A single page costs but $60 an issue. Several pages can be used each issue and yet be well within the cost of a mailing list, without the care of supervision. Practically all lists used by the manufacturers are of the trade.

The cost of maintaining a mailing list is heavy provided it is kept to its maximum efficiency. With the average business man it is an incidental detail. The ACCESSORY and GARAGE JOURNAL subscription list is revised from day to day, because it is absolutely the most important factor in creating the value of the publication. To neglect it means a sacrifice. The distribution of the ACCESSORY and GARAGE JOURNAL is guaranteed, and its use for publicity is as advantageous to the small concern as it is to the mammoth establishment. It is the only magazine in which the same service is given and in which all can be certain of reaching the buyers.

NEW $65,000,000 CONCERN.

W. C. Durant, active head of the Little Motor Car Company of Flint, Mich., and of the Chevrolet Motor Car Company, Detroit, is said to be the principal moving spirit in the Republic Motor Company, recently formed in New York City with a capital stock of $65,000,000. It is claimed that the new concern is to build large factories in 10 of the leading cities of the country, which will serve as assembling plants for the Little and Chevrolet companies.

Quarters for the first plant in the long string were recently secured in New York, when the factory formerly occupied by Rothschild & Co., automobile body builder, which occupies the entire block front on 11th avenue, between 56th and 57th streets, was secured. R. L. Losey, who recently resigned his position as manager of the Indianapolis branch of the Buick Motor Company, is now in New York where he has a position as sales manager for the new Republic company.

NEW CONTEST RULES.

There is much reason to believe that the contest board of the American Automobile Association, as well as the sub-committee of the Manufacturers' Contest Association, has given much time and study to the matter of motor car races, as evidenced by the new rules recently made public. It is decidedly apparent that every effort has been made to guard against the possibility of accident, either to the contestants or the spectators.

It should not be forgotten, however, that the public has some responsibility in this matter. The rules appear to be all that could be asked, and it is to be expected that the referees will see that they are rigidly enforced. Much depends upon the co-operation received from those who attend the events.

THE SPECIALIZED PUBLICATION.

All will agree that the publication devoted to a special class ought to have decided interest for that class, and perhaps incidentally attract some attention from others generally, but just in the ratio that it will possess especial attractions for those whom it concerns it will lack in attraction for other classes. It may be the purpose of the publishers to specialize for that class which appears to be most productive from a publishing standpoint, but it is not practical to divert endeavors to more than one channel and sacrifice the value of the print to the advertisers who are giving, or might be expected to give, it support. It is safe to judge any publication by the consistency of its policy. If there be indifferent or casual attention to the demands of its readers it may be assumed that their interest can be measured by the character and quality of the contents. The best of articles and the finest illustrations will fail in their purpose unless they serve a distinct purpose in the minds of those who are constant readers, because casual interest is absolutely worthless to the publisher.

The AUTOMOBILE JOURNAL was established as a magazine having contents that would interest the owners of pleasure automobile vehicles. It was created with the purpose of publishing articles that were of constant or timely value and of subjects that would be regarded and recognized as promotive of the use of motor cars. In this work of promotion it was realized that it would have the encouragement and support of the industry, at least that element of it that understood that following enthusiasm in pleasure would come the practical views of those who measured expense for motor service, just as they applied a measure to any other need, for every one could forecast the time when the motor vehicle would become a general utility.

It was realized that the owners of cars constitute the market. They are not only the logical buyers of vehicles, but their influence is exceedingly potent with their associates. These enthusiasts are logically the prospective users of cars and it is intensely practical to seek to interest them in what the market affords and to educate them in the relative merits of differing productions. To reach them, however, it is necessary to interest those to whom they naturally turn for advice.

Since its publication the AUTOMOBILE JOURNAL has been an owners' magazine. More than 90 per cent. of its readers are of that class. Its editorial policy has always been to afford its subscribers what was distinctly for their benefit as motorists, and to advocate and encourage whatever would promote their welfare. It has dealt with subjects that were of unusual value and have received recognition because of their decided merit. It has always maintained the editorial standard and it has never restricted the volume of its contents. The best criterion is the constantly growing distribution and advertising patronage, which are an extremely certain gauge of approval.

The specialized motoring magazine has its distinct place, and that place is in the hands of appreciative readers, who know what they want and when the choice is to be made unhesitatingly determine what will best serve their purpose.

ESTABLISHING A TRUCK SERVICE STATION.

Outlining Methods by Which the Average Garageman May Build Up a Successful Business in Caring for Commercial Vehicles.

WHILE it is admitted that in most cities, at least outside the larger centres, the use of the commercial automobile hardly has become sufficiently general to warrant the establishment of garages devoted exclusively to the care and maintenance of motor trucks, the time is not far distant when service stations of this character will be an absolute necessity. The far seeing business man, who desires to keep abreast of the situation, will recognize the truth of this assertion and begin to make provision for taking part in the development of a paying proposition.

—CONTRACT WITH OWNER—

The Eastern Garage & Service Company, in consideration of .... dollars, hereby agrees to provide a weekly inspection, and to keep in perfect running order for one year from date, exclusive of the expense of new parts, the .... ton .... truck, kept at the garage of said service company, and owned by and operated under the direction of ....

Date ....

Signed,

..........................For the Owner

..........................Garage Representative

Suggested Contract Covering Full Service, Six Inches Long by Three Wide.

Those who have given the matter even casual study will agree that the manufacture and sale of industrial transports must be along altogether different lines than those which have marked the growth of the pleasure vehicle side. Indeed, it is now generally acknowledged that the conditions to be met in the satisfactory placing of commercial vehicles are being more or less reflected in the handling of automobiles devoted more largely to pleasure purposes. It is only within a few years that the service station, as it is now known, has come into vogue.

—CONTRACT WITH OWNER—

The Eastern Garage & Service Company, in consideration of .... dollars, hereby agrees to provide a weekly inspection, and to keep in perfect running order for one year from date, exclusive of the expense for new parts, the .... ton .... truck, owned and operated by ...., and kept at the latter's garage, said truck to be delivered at garage of Eastern Garage & Service Company for the inspection and necessary repairs.

Date ....

Signed.

..........................For the Owner

..........................Garage Representative

Suggested Contract Covering Weekly Inspection, Six Inches Long by Three Wide.

Many manufacturers are establishing factory branches in the principal centres, forcing their representatives in the intervening districts to adopt measures more in keeping with the service granted by these branches. In many instances this has meant the investment of larger sums on the part of dealers, but the return in added business has been such as to amply repay for the effort and attention.

If it is possible to increase materially the business done in the sale of pleasure cars through the establishment of service stations which guarantee to the owner that his machine shall be kept in satisfactory condition at a minimum of cost, it follows that the garageman who recognizes the full value of such an investment will be in a position to meet the demands for commercial motor vehicle service when the situation in his immediate locality reaches the point where someone must supply those needs.

The question of investment must be left to individual judgment, but it may be pointed out that it is possible to anticipate the need along this line. The garage proprietor who is firmly established in his community can easily work up a business of this character without feeling the added expense. The returns ought to be sufficient to more than offset the outlay, from the very beginning.

DRIVER Frank Jones | INSPECTOR E. S. Wood

Inspector's Report Blank, Eight by 10 Inches.

To cite a concrete instance, it may be stated that about two years ago a garage proprietor in southeastern Massachusetts adopted the policy of caring for his pleasure car owners so long as they were possessed of one of the machines represented by him. Not only does he maintain a system of periodical inspections, thus keeping the car in good order all of the time, but he undertakes to give it a complete overhaul at the end of each year, the charge for this service being $100. His sales have increased materially since this plan was put into operation.

With a business thus established it will prove sur-

prisingly easy to so extend the service that it may include commercial motor wagons. It will be admitted that some sort of system is necessary, and as is true of every other feature of the garage business, this system should be as simple as practical results will permit.

For the purpose of further explaining the proposition contained herein it will be assumed that the Eastern Garage & Service Company has been established for some time, with a growing business in the sale of pleasure cars and an agency for some well known motor truck. It follows that it has a thoroughly equipped repair department, a well lighted shop and abundant facilities for undertaking all manner of automobile work.

The location is in a city of moderate size, in which the business men are beginning to appreciate the worth of the motor truck. The Eastern Garage & Service Company believes that the future presents excellent possibilities and that the local business men need the right kind of encouragement at this critical period. Incidentally, it may be remarked that this concern does not feel that the particular make of industrial transport represented by it occupies a position so unique that the product of no other manufacturer shall be considered.

As has been outlined, the concern has the necessary equipment and the opening is one which it is able to meet in a satisfactory manner. Naturally, it offers its customers garage service in its building, where the trucks sold by it may be cared for by men thoroughly acquainted with these vehicles. Perhaps it ought to be suggested that these quarters are too limited to admit of taking all the cars which might be brought to it, and as the business has not yet been developed it will be unwise to add further to the investment at this time. Moreover, there are certain business men who prefer to garage their own trucks, and for these the Eastern Garage & Service Company offers a specified service which should prove attractive.

The two contracts accompanying this discussion set forth in simple language the two types of service. In either case, the truck, no matter what the make, receives periodical and expert inspection. The character of this must be such as to keep the car in perfect working condition. A suggested inspection report is presented, and it may be added that the original is filed in the office of the service station, while a copy is forwarded to the owner of the vehicle.

The contract specifies what repairs shall be assumed by the company. It is bound to make such adjustments at once, but if the report indicates that work not covered by the contract is required, the owner is apprised of this, and can use his own judgment in the matter. It hardly will be expected that such repairs will be delayed longer than absolutely necessary.

Of course, efficiency plays an important part in the practicability of the commercial vehicle, and the owner desires to know just how long his machine is to be kept out of service. This is a point upon which the motor truck service station must be even more particular than is true where pleasure vehicles alone are considered. If possible, a time should be set at which the owner may expect to receive his car, and every effort should be to make delivery as promised.

Having assumed that the inspector has discovered necessary work and that the owner has ordered this done, the office force makes out the accompanying

Stock Requisition, Four Inches Long by Two Wide.

Of course, it might be possible that certain repairs would escape detection even by the expert inspector, and such will develop only after the car is dismantled in the shop. Whenever such work is found the owner should be notified at once. This holds true of all repair work, but more particularly with the business man who is depending upon his motor truck. It is not to be assumed that the owner will desire to avoid making necessary repairs, but he must be considered, especially when his business is at stake. He is best able to judge whether it is practical to have the work done at this or some other time.

The obverse side of the repair ticket shows what work is to be done. The reverse has space for noting the amount of time expended upon the vehicle. This is a feature which deserves careful attention. Every garageman knows from experience how difficult it is to convince an owner that the amount of time for which he has been charged actually has been expended on his car. To overcome this difficulty, some scheme must be devised whereby the garage proprietor can show absolutely just how the time of all of his workmen has been employed. It will be admitted that the time clock solves this problem.

The repair ticket should be so constructed, of moderately heavy material, that when the repairman begins work on a given truck he can slip the ticket into the time clock, thereby recording the hour and minute at which he began operations. Whenever he is called away, no matter for what purpose, he should first visit the time clock with his repair ticket, as a result of which when the work is finished he will have a complete record of the job, to which the owner may have access whenever he wishes. Not only will this method tend to eliminate all possibility of dispute, but it will afford the office ample opportunity to check up the daily time of the workmen, thereby simplifying the work of the bookkeeping department.

This is a part of the system, which should be applied to the entire work of the garage or service station. It is quite as essential to convince the owner of a pleasure car that he has not been overcharged in this respect. And it may be added that the last set of blanks presented herewith also is adaptable to any line of repair work.

As the business of the concern grows it will become more and more evident that some system of checking up the supplies must be adopted. Under ordinary circumstances it will be found quite sufficient to make the foreman responsible for the stock room. All goods should be kept under lock and key, and when a workman requires any spare part, for instance, a simple form of requisition should be filled out. Provision also must be made for returning goods which are later found not to have been needed. A credit voucher, like that shown, solves this problem.

It may be said in passing that the system outlined for the Eastern Garage & Service Company is adapted from one which has been employed by a factory branch in one of the larger cities for the past two or three years. It has the advantage of being exceedingly simple, yet entirely sufficient for all needs. By its use the garage proprietor is able at any time to gain information concerning every detail of the business.

The weekly inspection reports keep him in close touch with the owners; the repair tickets show just what work was done, how long it took and how his workmen's time was employed; the requisitions, properly checked up at stated intervals, indicate the condition of the stock room at all times. Not only is this a satisfactory method of keeping watch of the business, but the work of the office force is greatly simplified.

While an attempt has been made to indicate how an established service station may take the initial steps to secure added business, which later will supply a substantial portion of its income, practically all of the system will be found applicable to the average garage and repair shop. The need for some such suitable check on the various departments is being realized more and more, and the suggestions offered herein will be found of distinct value in working out a plan to meet individual needs.

CURRENT PAIGE-DETROITER.

The current issue of the Paige-Detroiter, published by the Paige-Detroit Motor Car Company, Detroit, is replete with information which is timely and of interest to owners and contemplated owners of Paige-Detroit cars, made by this concern. The cover design is quite in keeping with the season, and the text matter is equally pertinent. Three articles are worthy of special mention, these being: "Glad Hand," a story by Clarence E. Goodard and Lewis A. Deffner, both of Springfield, Mass., concerning the first leg of their transcontinental trip from Boston to San Francisco; "The Advantages of Co-Operative Advertising," by James M. Dunlap, and "Coming with Culley," by O. R. Hardwell, advertising manager of the company.

NEW FORD PLANT.

The Ford Motor Company, of Detroit, is still further extending its system of branch assembling plants, and has made plans to establish a station in Milwaukee, Wis. The Courteen block in that city has been leased and shortly will be occupied by the Ford people. Parts will be shipped to Milwaukee by water.

UP-TO-DATE Machine & Tool Equipment

OLMSTEAD POWER HACKSAW.

Any tool or device which will save time and labor in the repair shop is money well invested. In well appointed shops the hand hacksaw is employed only for fine work such as the cutting off of pins of small diameter, etc. Where heavy material is to be cut, considerable time is required with the hand tool and often some of the metal is wasted, to say nothing of numerous broken blades in the operation.

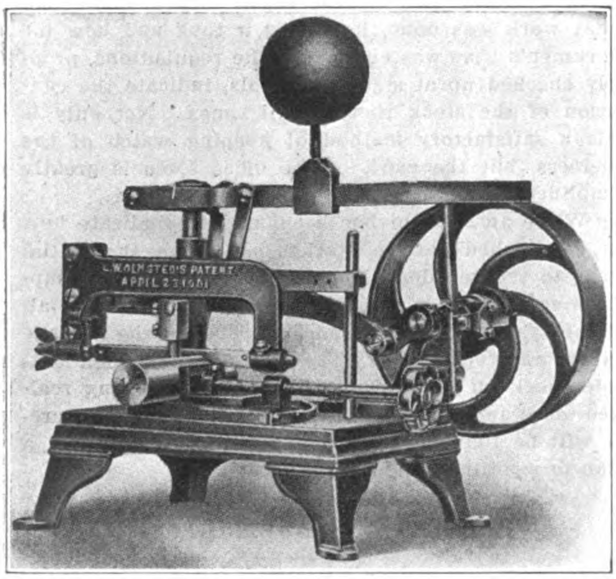

Fig. 1—Olmstead Power Hacksaw Designed for Work up to Two Inches, Either Round or Square.

Power hacksaws are inexpensive and once the work is secured and energy applied, the device requires no further attention until the saw completes its work. During this time the workman can perform other tasks, and an advantage of the power device is that it cuts evenly and accurately.

L. H. Olmstead, Hasbrouck Heights, N. J., manufactures a variety of power hacksaws, these being adapted for light and heavy work. That depicted at Fig. 1 will take work up to 1.25 inches, either round or square, and it may be secured to the bench or table and driven from the main shaft of the power equipment. It is provided with a clutch for starting and stopping and is fitted with a swivel device to permit sawing at any angle. The driving pulley is six inches in diameter and should be driven at 175 revolutions a minute. The net weight of the machine is 16 pounds.

AUTO ENGINE CLEANER.

In the overhaul of the motor car considerable time, as well as gasoline is utilized in removing the accumulations of grease and dirt that collect upon the various components. It is troublesome to remove all grease as many places are difficult of access with the ordinary brush.

The up-to-date repair shop employs air mixed with gasoline which is compressed to a high pressure, and when employed in this form removes dirt easily and quickly. The Cleveland Faucet Company, Cleveland, O., is marketing the Auto Engine Cleaner, shown at Fig. 4, which is designed for the repair shop, garage and private owner.

The complete outfit consists of a three-gallon, seamless, galvanized steel tank, to which a special hand pump is attached, also a gauge and a safety valve. Provision is made for the introduction of gasoline, kerosene or any other cleansing fluid. An air inlet cock is provided, also 10 feet of flexible tubing.

In practise, the tank is filled two-thirds full with gasoline and the outlet cock closed, after which the pressure is pumped up to 80 or 100 pounds. The air inlet cock is next closed, after which the other two members are opened and the apparatus is ready for service. The spraying nozzle is of sufficient length to reach easily any part of the motor or other components of the automobile.

HISEY ELECTRIC BREAST DRILL.

Portable electric hand or breast drills are a valuable addition to the shop equipment as by them work may be drilled either in the vise or on the car. At Fig. 2 is presented one of several types manufactured by the Hisey-Wolf Machine Company, Cincinnati, O. It is made in three types and the motor is operated by a direct current of 110 or 220 volts. It is equipped with two side handles, one detachable and one combination end, and a breast handle. Their speed under load varies according to the design, being from 400 to 900 revolutions a minute. The chuck is offset, allowing drilling in close corners.

The motor is completely enclosed, air-cooled, the openings being in the housing and protected by a brass screening, thereby preventing any cuttings from getting into the motor, no matter in which position the drill is operated. The gears are cut from solid steel, hardened, run in grease, and are separately encased. The brush holders and wire connections are also enclosed, preventing short circuiting. The drill and armature spindles are provided with ball thrust bearings, insuring easy running.

The operation of the drill is controlled by a patented, enclosed automatic switch which controls current by means of a brass trigger operated through the permanent handle. It is claimed that this construction prevents the operator burning his fingers or short circuiting the motor, and that the drill is under control at all times. The handles are made of hollow steel tubing, screwed into the housing. Each attachment

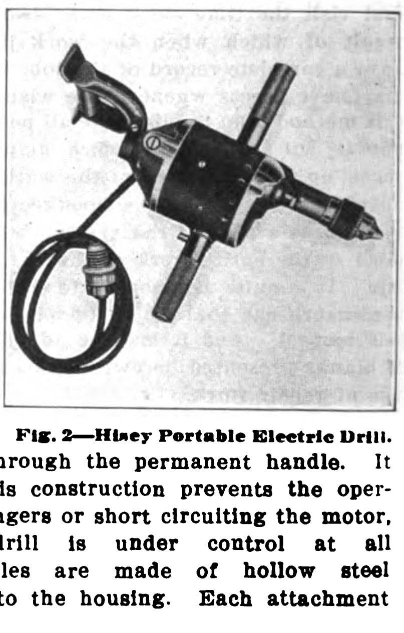

Fig. 2—Hisey Portable Electric Drill.

plug has a fusible cap, protecting the motor from an overload. The drop cord is connected on the outside of the motor housing with an insulated cover, preventing any possible damage by lead wires and inside connections should it be accidentally torn loose.

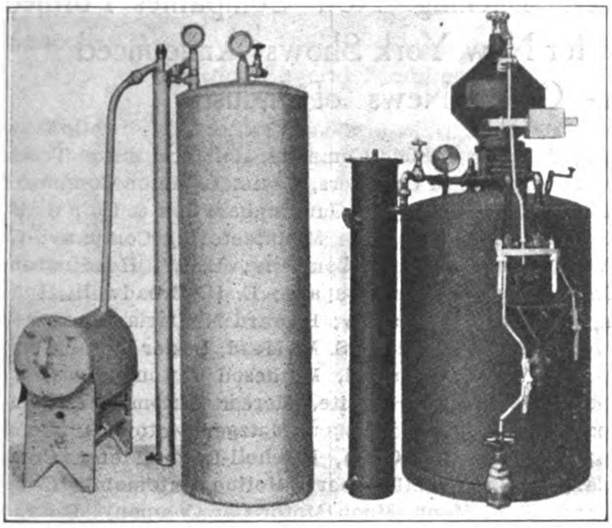

Fig. 3—Oxy-Acetylene Welding and Cutting Outfit Produced by the Oxy-Carbi Company.

OXI-CARBI WELDING OUTFIT.

Oxy-acetylene welding outfits are important factors in the repair of automobiles, as the process permits the welding of broken and cracked parts which were formerly discarded. Although there are concerns which make a special business of welding, some repair shops are installing the apparatus, saving much time as well as deriving profit.

The Oxi-Carbi Company, New Haven, Conn., manufactures both portable and stationary welding outfits and these are designed for any number of blowpipes. The equipment outlined at Fig. 3 is known as the No. 2 and this with the No. 4 is more generally installed by the company.

The acetylene generators are of the carbide feed type and are said to be so designed as to make it impossible for those not familiar with their use to tamper with them and bring about accidents. In charging, the elevating screw shown on the bracket on the front of the hopper is raised to its highest point. This movement raises the feed lever and closes the valve that feeds the carbide. The upper section of the tank forms the expansion chamber and the lower the generating compartment.

Raising the two right hand cock levers shuts off the expansion chamber. Raising the right hand lever gives vent to the generating chamber, and the water filling cock can then be opened, as well as the sludge valve. Turning the agitator handle at the right of the tank loosens the sludge or lime that has settled in the tank. The top of the tank is provided with a removable plug for replenishing the supply of carbide.

When the tank is filled with water to the overflow in the filling funnel, the cock is closed first, then the vent cock and last the gas cocks. The interference rods prevent operating differently, and as the vent pipe connects with the safety pipe which is run to the open air no gas will enter the room with this generator. The object of the expansion chamber is to reduce the air space when recharging, as with this shut off the only air admitted to the generator is in the generating chamber as the sludge is emptied. This air is exhausted as it is recharged, leaving but a small amount, and it is claimed by the maker that this arrangement prevents dangerous mixtures.

With all cocks closed, the elevator screw may be lowered, which allows the valve to open and the carbide to feed through. As soon as pressure of gas is sufficient the lever will raise and close the valve. Utilization of the gas causes the valve to operate and no further attention is needed until the supply of carbide becomes exhausted.

The outfit illustrated has 25 pounds capacity. The oxygen generators are of the pressure type and are operated by filling a tray with potassium chlorate mixed with manganese dioxide, and placing in the retort. The cover is then bolted on and the gas burners beneath are lighted. The heat causes the chemicals to give off a gas in the form of oxygen, this passing through purifiers into a storage tank at pressures suitable for welding and cutting. The tank requires from two to 20 pounds according to the size of tip employed, while for cutting, 30 to 75 pounds is utilized. It is stated that one tray full will produce approximately 28 cubic feet. The retorts may be recharged immediately if required.

The blowpipes utilized with the outfit are of the improved type and capable of performing a wide range of work, the No. 1 equipment having five tips, these being for sheet metal up to .25 inch thick and cast iron up to two inches. The welding tip may be removed easily and the cutting member substituted. The latter increases the pressure on the oxygen at the reducing valve and it is claimed that it will cut a two-inch round bar of steel in 90 seconds. In welding, all of the usual metals may be united, such as steel, aluminum and bronze of the different alloys; cast iron, malleable iron, wrought iron, etc.

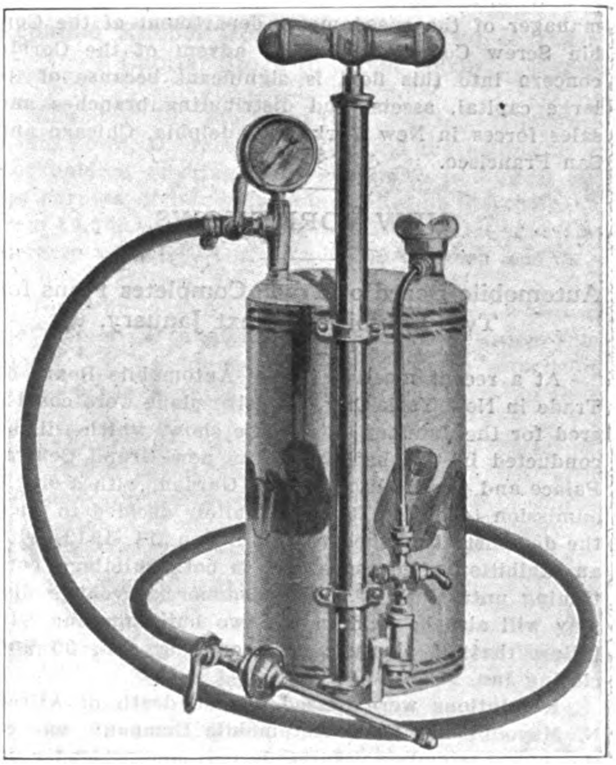

Fig. 4—Auto Engine Cleaner Which Utilizes Gasoline or Kerosene Mixed by Compression.

MANY CONCERNS INCREASE CAPITAL.

Maker of Austin to Secure Additional Financial Backing---New Companies Formed to Produce Cars and Accessories---Plans for New York Shows Announced ---Some Recent Patent Litigation---Other News of Industry.

Plans are under way for a reorganization of the Austin Automobile Company, Grand Rapids, Mich. For the past 10 years, James E. and Walter S. Austin, father and son, have conducted the business and have manufactured in limited quantities one of the most imposing cars that have come out of the West.

George H. Davidson and William R. Shelby of Grand Rapids have become interested with the Austins, and a $500,000 corporation will be organized. Of the capital, $300,000 will be represented by common stock and $200,000 by six per cent. preferred. It is planned to make the Austin product a greater factor in the automobile field than heretofore.

CORBIN IN NEW FIELD.

New Britain Concern Announces Its Entrance into Manufacture of Speedometers.

Announcement has been made by the Corbin Screw Corporation, a division of the American Hardware Company, New Britain, Conn., that it will manufacture and place on the market the Corbin-Brown speedometèr. The device has been known as the Brown speedometer, but under the new name will embody a number of invaluable features.

The Corbin-Brown instrument is the invention of Col. W. C. Brown of New York City, who will be sales manager of the speedometer department of the Corbin Screw Corporation. The advent of the Corbin concern into this field is significant because of its large capital, assets, and distributing branches and sales forces in New York, Philadelphia, Chicago and San Francisco.

NEW YORK SHOWS.

Automobile Board of Trade Completes Plans for Two Exhibitions Next January.

At a recent meeting of the Automobile Board of Trade in New York City extensive plans were considered for the January automobile show, which will be conducted in two buildings—the new Grand Central Palace and the Madison Square Garden, with a single admission to both. It was definitely decided to open the demonstration the evening of Jan. 11, 1913, with an exhibition of pleasure cars in both buildings, continuing until Jan. 18. The commercial vehicle display will also be held in the two buildings and will follow that of pleasure cars, opening Jan. 20 and closing Jan. 25.

Resolutions were passed on the death of Alfred N. Mayo of the Knox Automobile Company, one of the oldest members of the board, and a leader in the automobile industry since its inception.

Those present were: M. L. Downs, Autocar Company; W. C. Leland, Buick Motor Company, Cadillac Motor Car Company, Cartercar Company, Elmore Manufacturing Company, Marquette Company, Oakland Motor Car Company, Olds Motor Works, Rapid Motor Vehicle Company, Reliance Motor Truck Company; Hugh Chalmers, Chalmers Motor Company; James C. Dryer, James Cunningham Son & Co.; G. H. Stilwell, H. H. Franklin Manufacturing Company; G. W. Bennett, Garford Company; E. W. Headington, Haynes Automobile Company; E. H. Broadwell, Hudson Motor Car Company; Howard M. Davis, Knox Automobile Company; W. S. M. Mead, Lozier Motor Company; W. C. Shepherd, Matheson Automobile Company; William T. White, Mercer Automobile Company; William E. Metzger, Metzger Motor Car Company; James M. Cram, Mitchell-Lewis Motor Company; W. H. VanDervoort, Moline Automobile Company; E. J. Moon, Moon Motor Car Company; George M. Dickson, National Motor Vehicle Company; C. C. Hanch, Nordyke & Marmon Company and Premier Motor Manufacturing Company; M. J. Budlong, Packard Motor Car Company; L. H. Kittredge, Peerless Motor Car Company; Charles Clifton, Pierce-Arrow Motor Car Company; George Pope, Pope Manufacturing Company; Oscar Stevenson, Pullman Motor Car Company; F. B. Stearns, F. B. Stearns Company; J. E. Quimby, E. R. Thomas Motor Car Company; Windsor T. White, the White Company; Alfred Reeves, United States Motor Company; John N. Willys, Willys-Overland Company; C. W. Churchill, Winton Motor Carriage Company; H. A. Bonnell, general manager.

PREST-O-LITE PATENT.

Illinois Judge Makes Important Ruling Affecting Product of This Concern.

Justice Kohlsaat of the United States district court for the northern district of Illinois, has decided that the patent of the Prest-O-Lite Company of Indianapolis, Ind., is dead, despite the fact that seven United States district courts and one United States circuit court of appeals have decided that it is still entitled to a lease of existence for some five years. His decision was rendered in the action brought by the Prest-O-Lite people against the Searchlight Gas Company of Chicago, sustains his denial of a preliminary injunction, and until the case is fought out in the court of appeals, gives the Searchlight company the right to continue its business as heretofore, within that judicial district.

The line of suits hinges about a point of patent law. Prior to 1897 the statute held that a foreign patent taken out in the United States expired at the same time as the foreign patent, but the law was amended in that year. The application for the Claude & Hess patent, under which the Prest-O-Lite Company has manufactured its product, was made before 1897, but was not granted until Dec. 25, 1900. The English right officially expired June 30, 1910. The English and American patents are somewhat similar. The defense has contended that the Prest-O-Lite patent is the same as the English grant, and since application was made prior to 1897 it has expired. The Prest-O-Lite contention, which has thus far been upheld, is that the English grant covers a "process," while the American covers an "apparatus."

COLE SALES DEPARTMENT.

Absorbs Henderson Selling Organization and Promotes Several Members.

Following the announcement a short time ago that the Cole Motor Car Company, Indianapolis, Ind., had absorbed the Henderson Motor Sales Company of the same city, came the news that Charles P. Henderson, who was at the head of the sales company, had been made general sales manager of the Cole company. H. C. Lathrop, who was secretary and treasurer of the sales company, is to have charge of the Indianapolis branch of the Cole company, with a large allotment of territory.

The large organization that surrounded Mr. Henderson and assisted him in the general success of the sales company, goes bodily to the Cole company, some advancements being made. Edward Harris, who was in charge of the promotion department, moves to the position of assistant sales manager; Jay D. Riker, who comes from the Parry Buggy Company, takes the promotion department; John A. Murphy, cashier of the sales company, becomes assistant secretary of the Cole Motor Car Company; E. E. Rogers remains in his same post; Homer McKee is advertising director; H. C. Bradfield takes the road as travelling newspaper consultant, while Harlow Hyde, a new man, has been taken on in charge of the detail work in the advertising department.

NEW GRAMM COMPANY.

Close Corporation Formed with Capital of $500,000 to Manufacture Trucks.

B. A. Gramm, who a short time ago retired from the Gramm Motor Truck Company, when John N. Willys, president of the Willys-Overland Company, Toledo, O., took over the former company, has become associated with M. Bernstein, a very wealthy and successful manufacturer in Lima, O., in a new corporation to be known as the Gramm-Bernstein Company. The capital stock of the new concern is $500,000, of which $300,000 is common and $200,000 preferred.

Fred Biszantz, designer and general superintendent, formerly with the Gramm company, and one of the best known men in his line in the country, is to be with the new organization. Mr. Bernstein, formerly a director in the Gramm company, is president; H. O. Bentley is secretary, and Mr. Gramm is vice president and general manager.

An excellent plant has been purchased in Lima. Additions are now under construction, which, when finished, will give a total of 125,000 square feet of floor space. The building is all of one story, steel constructed, with the most modern lighting system. Everything is light, airy and sanitary. The structures are located on the main line of the Pennsylvania and D., T. & I. tracks, providing the best facilities for shipping. Concerning the new company, Mr. Gramm states:

"We have been working up the business, and, no doubt, the country will expect the best trucks on the market from us, owing to our great experience in this business, having specialized in it for years. We are placed in a position where we have nothing to hold us back from producing the best. Already half of our next year's output is spoken for. Our aim is to build every truck a masterpiece, and produce the trucks in such a way that they will themselves become our best salesmen."

PRESIDENT JAMEISON DEAD.

Head of Abbott Motor Company Succumbs in Pennsylvania Home After Long Illness.

Charles W. Jamieson, president of the Abbott Motor Company, Detroit, died at his home in Warren, Penn., early in the month, after an illness lasting over a year. He had been kept to his bed since last December. A short time ago strong hopes of recovery existed, and the announcement of his death came as a distinct shock to the industry. The management and future plans of the company will in no wise be affected, it is announced.

Mr. Jameison became a heavy stockholder in the Abbott company on its reorganization two years ago. He was made president and had been one of the chief instruments in its development. His financial resources were large and he employed them freely in the Detroit enterprise. He was one of the largest independent oil refiners in the country; was president of the First National bank of Warren, and was heavily interested in mining and manufacturing.

For the past seven months the affairs of the Abbott company have been directed by F. M. Knapp of Warren, one of the directors. He will remain in charge.

PLANS FOR EXPANSION.

Republic Rubber Company Intends to Increase Capital Stock to $10,000,000.

Directors of the Republic Rubber Company, Youngstown, O., recently authorized the calling of a stockholders' meeting to be held early in August for the purpose of increasing the capital of the company from $4,000,000 to $10,000,000. The capital after the increase will consist of $6,000,000 common and $4,000,000 preferred.

No definite announcement has been made as to the amount of additional capital to be issued this year. It is understood, however, that the growth of the business will require new funds before another season.

The directors have also authorized the construction of a large modern reclaiming plant, which, with the completion of the five-story building now in course of erection, will give considerably greater capacity.

DUQUESNE CAR COMING.

Pittsburg Capitalists Organize Concern Which Will Locate in That City.

The Duquesne Motor Car Company, a close corporation, financed by a small number of leading business men in Pittsburg, Penn., has been formed, and will begin the manufacture of pleasure cars in the Pennsylvania city. About 250 men will be employed at the beginning, and it is planned to manufacture 500 pleasure cars as the first year's output.

Early in the campaign for the formation of the new company, the Industrial Development Commission of Pittsburg called attention to the fact that 45 per cent. of all the raw material used by automobile manufacturers was made in that city, and but few automobiles were manufactured there. The commission also called attention to the fact that the topography of Pittsburg would insure satisfactory results from any car that could withstand the tests made there. As a result of the commission's efforts the new concern was organized.

W. L. Rodgers, president of the Pittsburg Gage & Supply Company, is president. Oscar J. Howick, formerly designer for the Lozier Motor Company, Detroit, and Frank H. Morse, the engineer who developed the KisselKar, are associated with the new company, the former as designer and the latter as engineer. The company has established its plant at 30th and Liberty streets, where it occupies a floor area of 60,000 square feet.

The first model will be a four-cylinder, five-passenger car with 50 horsepower Wisconsin motor of the T head type. It will be equipped with an electric self-starter and electric lights. Designs are also being made for a six-cylinder, seven-passenger model. The company proposes to enter the field in the fall. The product will be known as the "Duquesne," and the trade mark will be the seal of the city of Pittsburg, enamelled in the colors of the city, black and orange.

The Duquesne Motor Car Company has a present nominal capitalization of $25,000, which will be shortly increased to $250,000. R. F. Rampsey of Pittsburg is the treasurer.

JOIN FLANDERS FORCES.

Two Former General Motors Company Officials Make Important Change of Interests.

C. A. McGee, general controller of the General Motors Company, and one of the most important factors in the recent successful reorganization of that concern, has resigned to enter the employ of the Flanders Manufacturing Company, Pontiac, Mich. Ford Hawes, another former General Motors Company official, and for 10 years chief engineer of the Cadillac Motor Car Company, has also joined the Flanders.

Mr. Hawes has, for a long time, been recognized as one of the big men in the engineering field as well as one of the "safest" designers of whom the industry can boast. His particular hobby has been attention to details, and he has been engaged for his new position as "detail engineer."

COLUMBIA TO REMOVE?

Chamber of Commerce in Dayton, O., Announces Acquisition of Plant from Hartford, Conn.

Through an announcement made by the Chamber of Commerce of Dayton, O., it became known recently that the Columbia Motor Car Company, Hartford, Conn., maker of Columbia cars, a subsidiary of the United States Motor Company, is contemplating the removal of its big plant to North Dayton, where already one branch of the United States Motor Company is located.

Eugene R. Mertens, for sometime general superintendent of the Columbia concern, recently left Hartford for Dayton to assume the post of general superintendent of the Dayton Motor Car Company. He is one of the best posted men in the country on the subject of gasoline engines, and was born in Belgium. As a boy he entered the employ of the Columbia company, taking a position in the machine room. He learned the trade of tool maker in the old Electric Vehicle Company and developed considerable skill. He became a tester and was soon promoted to the superintendency of the testing department. In turn he was made assistant superintendent of the Columbia concern, left to become superintendent of the Whitlock Coil Pipe Company, and later returned to his former employer as superintendent.

WILLYS-GARFORD COMBINE.

President of Overland Concern Adds Garford Company to His Present Holdings.

The agreement between the Willys-Overland Company, Toledo, O., and the Garford Company, Elyria, O., whereby the former has marketed the products of the latter, was dissolved recently, and John N. Willys, president of the Willys-Overland Company, took over the controlling interest in the Garford company. Following the disposal of his interests, Mr. Garford sailed for Europe in company with M. D. Johnson of Cleveland, O., his attorney and business adviser.

Mr. Willys has been elected president of the Garford company, and George W. Bennett vice president, these being the positions they hold in the parent Willys-Overland holding company. Vice President Bennett plans to spend one day a week at the Garford plant, as well as a day a week at the Gramm Motor Truck Company's factory, Lima, O., which recently also was secured by the Willys interests. The latest deal not only places Mr. Willys in direct charge of the sales of Garford passenger and commercial vehicles, but will also give him supervision over their manufacture.

STEWART TRUCK COMING.

Recently Organized Buffalo Concern Makes Announcement Relative to Its Product.

The new Stewart Motor Corporation, Buffalo, N. Y., recently formed by T. R. Lippard and R. G. Stewart, who withdrew from the Lippard-Stewart Motor Car Company, has secured the big plant recently vacated by the Niagara Machine & Tool Works at the corner of Randall and Superior streets, Buffalo. It will be put into condition for occupancy at once, orders for machinery, equipment, etc., now being placed from the temporary offices of the concern at 1056 Ellicott square. Every effort will be made to start manufacture at the earliest possible moment, so as to fill orders already received for early fall delivery.

The new company will manufacture light trucks. Mr. Lippard is president and general manager; Mr. Stewart, vice president and chief engineer; R. P. Lentz for several years connected with the London & Lancashire Fire Insurance Company of Hartford, Conn., secretary and treasurer, and Robert W. Ingersoll, recent manager of the Firestone Tire & Rubber Company of Buffalo, sales manager.

The new product will be known as the Stewart truck, being named after Mr. Stewart, who also was the designer of the Lippard-Stewart truck. Automobile men who are acquainted with the designs of the new product, proclaim it ahead of anything that has ever been placed upon the market, and say it is bound to meet a ready sale.

MECHANICAL POINTERS for GARAGEMEN AND OWNERS

SPLICING COUPLINGS.

A coupling of the Oldham type wears considerably when subjected to severe stresses and it is not always convenient to replace with a new one, especially if it be of large size. A car recently came into a repair shop with orders for a thorough overhaul, and in dismantling, it was found that a four-inch coupling was worn badly. To make one would require a large piece of stock and consume much time. The old part was rebuilt as shown at Fig. 1. The illustration, being self explanatory, presents the manner in which the metal was smoothed up, and wedged shaped pieces fitted and riveted.

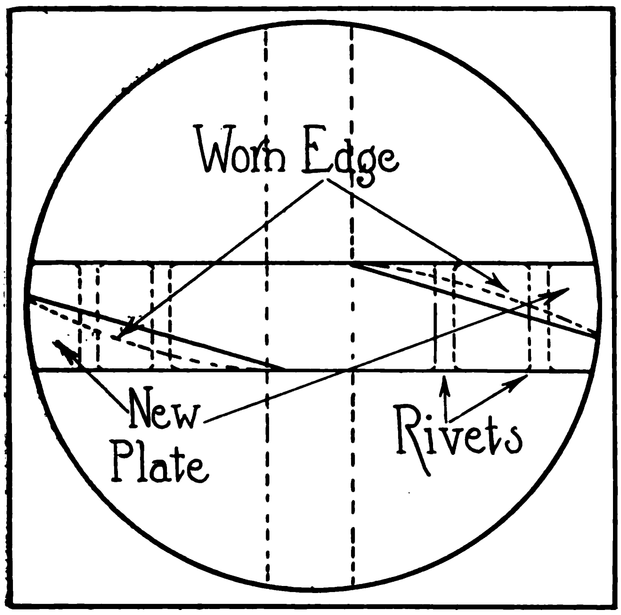

Fig. 1—Method of Repairing Worn Oldham Coupling.

FITTING WITH SPARK PLUGS.

The average motorist who purchases new spark plugs to replace old or faulty members does not take into consideration the fact that to obtain the greatest efficiency from the motor the plugs should fit properly. Usually if the plug be gas tight and ignites the mixture the automobilist is satisfied. The construction and location of these members are of vital importance and engineers and designers have given a considerable amount of study to the subject.

It is well known that spark plugs are subjected to great changes in temperature and consequently those of expansion and contraction. The distance of the so-called spark gap must be maintained in accordance with the engine requirements and with the current with which it is used.

With the introduction of the high-tension magneto it was found necessary to design a plug to meet the peculiar requirements of this current. Ordinary spark plugs when utilized with a high-tension magneto gave trouble, owing to the intensity of the current burning the points and increasing the gap, and heat resisting materials are employed in the construction of the electrodes.

With the magneto plug two or more electrodes are fitted, each having approximately the same sized gap. The current will invariably pass across the gap presenting the least resistance and should its electrode burn away slightly it would offer greater resistance so that the current would seek one of the other gaps.

Location Is Important.

The best and most scientifically designed plug will not give satisfactory results if its location in the cylinder be incorrect. In order to obtain the greatest efficiency from the motor the time required for the spread of the flame through the charge of mixture should be as brief as possible, and to secure this end the spark plug gap should be located in the combustion space, and not in a pocket or recess. If the latter conditions exist, such as shown at Fig. 2 A, dead gas will accumulate about the electrodes, causing slow combustion and missing.

The action of the motor may be improved considerably by boring out the valve cap, allowing the plug to set down so that the points of the member will project into the combustion chamber as depicted at B. The spark will then come in direct contact with the clean and fresh mixture and the flame will spread with maximum rapidity. The plug should preferably

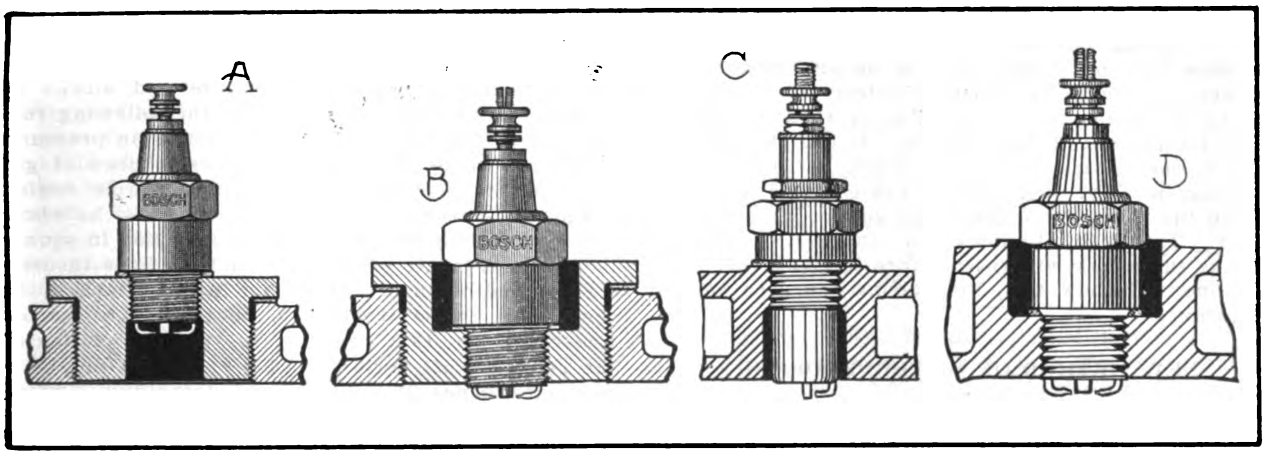

Fig. 2—Outlining Positions of Spark Plug in Cylinder: A, Poor Location, Creating Pocket for Dead Gas; B, Proper Position, with Points Extending into Combustion Chamber; C, Faulty Design, Exposed to Heat; D, Showing How Same Valve Cap May Be Bored to Obtain Correct Location of Plug.

be located in the immediate neighborhood of the intake valve and in such manner that it will be surrounded by the fresh gas that enters on the inlet stroke. If the plug be located on the exhaust side there is a liability that dead gas will collect around its points causing faulty action.

Obtaining Best Results.

In order to obtain the best results the plugs should be so set in the cylinder that cooled metal is in proximity to the sparking points, as in this manner possible overheating of the points will be eliminated. A plug that is not cooled properly will overheat and the points will become incandescent, creating trouble. The plug should not extend too far into the combustion chamber as in this position it would be subject to undue heating.

If, on the contrary, the desired length of the plug is made up by extending the barrel, or that portion above the thread, the metal of the electrodes will be adjacent to the cooled metal of the engine and the heat will be transferred readily. On some motors the plug is set in the cylinder wall in such manner that it must project through the water jacket, and extension plugs are required in order to prevent the pocketing of gas.

At C is depicted a plug so located that a pocket is provided. Considerably better results will be obtained on engines of this type if the spark plug hole be made large enough to permit the thread to be cut at its very bottom, as shown at D, for in this manner the plug will be cooled properly.

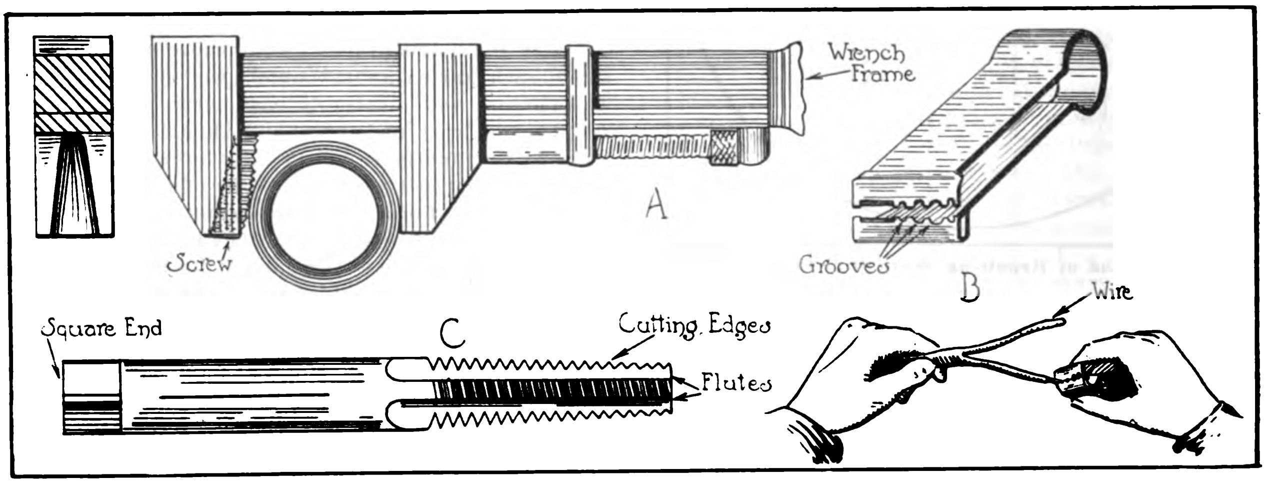

Fig. 3—Handy Devices in the Shop: A, Utilizing the Monkey Wrench as a Pipe Wrench; B, Wire Stripper; C, Marking Small Taps to Prevent Breaking.

A TAP SAVING KINK.

In tapping out small holes it is very annoying to have the tool break, as this usually means the broken part must be annealed before it can be removed from the work. At Fig. 3 C is shown a kink for preventing this trouble. It consists of cutting a line parallel with the shank, as outlined in the sketch. The tool is then heated, half way between the threads and the shank end, to a light blue color. This will eliminate the chances of breakage as the shank will twist before it gives way, and the line will show this, thus giving the user ample warning.

NEW METHOD OF WATERPROOFING.

After quite an extensive series of experiments, experts connected with the French army have fixed upon a new method of waterproofing fabrics which is claimed to be superior to the usual processes. This includes the use of acetate of aluminum, which, when applied to the material can be made to form alumina, or aluminum oxide, in a gelatinous state, and volatile acetic acid. When the fabric thus treated dries it is waterproof but does not become air proof, one objectionable feature of rubber and other materials. It is also quite supple, a necessary quality for goods from which clothing is to be made. The bath is composed of one part of the acetate to 40 of water, in which articles are soaked for 24 hours and then dried in the air, after which they will be found ready for use.

Hitherto English manufacturers have been in the lead in bringing out waterproof fabrics. Besides rubber, there have been used insoluble gelatine, boiled linseed oil, metallic soaps and some others with more or less success, but this new process is considered the best by competent authorities. The acetate of aluminum solution can now be found in the general market and does not need to be specially prepared, as was formerly the case.

THE USEFUL MONKEY WRENCH.

The monkey wrench with several attachments can be made to fill many wants, and at Fig. 3 A is shown a simple method of converting it into a pipe wrench. This will provide a handy tool to carry in the kit when called out on an emergency job, as it will serve a double purpose. To make the device, a small groove is milled on a taper as outlined in the sketch. In this is placed an old piece of a bolt or stud the treads of which have been hardened. This will prevent the wrench from slipping around the pipe.

TWO-STROKE VS. FOUR-CYCLE.

It is a general belief, in theory at least, that a two-stroke motor should develop twice the power of a four-cycle engine of the same bore and stroke of cylinder, but this is not correct for the following reason: If two motors have equal compression pressure, then that which receives the greatest charge of gas develops the most power. In the four-cycle engine the maximum theoretical amount received is the whole volume swept by the piston. Area of piston in square inches times length of stroke in inches equals theoretical volume of charge drawn in, in cubic inches. In the simple two-stroke motor the theoretical charge received is not that swept by the piston, because of the open exhaust ports. In this case, area of piston in square inches times (length of stroke minus width of exhaust port in inches) equals theoretical volume of charge, in cubic inches. It is clear therefore, that, for equal bore and stroke, the simpler two-cycle engine cannot develop twice the power of a four-stroke motor, of the ordinary type of construction.

The latter has its defects, however. For instance, in Fig. 4 is shown a theoretical indicator diagram taken from a kerosene engine, in which horizontal distances represent the stroke of the piston (and therefore the volume swept out by it), and the vertical heights indicate pressures acting upon this member. The line A A represents atmospheric pressure; the line B B, a perfect vacuum or zero pressure. Imagine a cylinder with its piston at the top of the exhaust stroke. At the end of this movement the pressure has not reached that of the atmosphere because there is of necessity a certain amount of back energy in the muffler. But the gasoline vapor which the engine must draw in from the carburetor has an atmospheric value and cannot enter the cylinder until the pressure therein has fallen below that.

If the motor be fitted with automatic intake valves, the atmospheric pressure from the outside cannot open these and send in vapor until the piston has moved sufficiently far down to allow the dead gas in the cylinder to expand. Even then, there is a further delay owing to the inertia of the valves and their gradual opening. With the mechanically operated form there is a slight advantage, in that they are raised and quickly lifted off their seating by the action of the cams, but even in this case the fresh charge cannot enter through the open valve until the piston has moved downward and allowed the dead gas to expand less than 14.7 pounds.

On the return stroke the charge is compressed, and the length C D indicates the volume of gas drawn in, measured at atmospheric pressure and it will be noted how very much smaller this is than the ideal volume; that is, the whole amount swept out by the piston.

Returning to the simple two-stroke engine and its open exhaust port: It generally will be found that the height of this is about 35 per cent. of the whole stroke of the piston. Hence, for cylinders of equal bore and stroke, and assuming the same efficiency at the inlet, the volume of charge would be:

$$\frac{\text{Two-stroke motor}}{\text{Four-stroke motor}} = \frac{65\%\text{ of the length of stroke}}{\text{Length of stroke of piston}}$$

Hence also, theoretical power developed by:

$$\frac{\text{Two-stroke motor}}{\text{Four-stroke motor}} = \frac{2 \times .65}{1} = 1.3$$

Assuming that the compression pressures in the two engines are equal, so that in theory their thermal efficiencies should be the same: It is obvious that the two-cycle, even under the most favorable conditions, cannot develop more than 1.3 times as much power as the four-cycle. Also that the crank chamber into which the charge is drawn from the induction pipe is in direct communication with the working cylinder through the inlet port when the piston is at the bottom of its stroke, and hence induction cannot begin until the piston has moved up sufficiently to cover this port.

Then the gas already in the crank chamber has to expand slightly below atmospheric pressure (it being now at the exhaust pressure corresponding to that in the working cylinder) before the automatic inlet valve will open. It would be quite correct to assume that the height of the inlet port is 15 per cent. of the working stroke of the piston, so that the greatest volume of charge which the two-stroke motor can draw in is only 85 per cent. of that drawn in by the corresponding four-cycle engine.

The crank chamber of the motor may be regarded as a pump cylinder, but there must be space enough within to allow the crank arms and large end of the connecting rod to rotate freely, and even when this is reduced to a minimum it is difficult to see how the volume of the crank chamber and connecting pipe can be made less than that swept out by the underside of the piston in its travel (reckoned between the top end of the stroke and the top of the inlet port in the cylinder wall). At the commencement of the down-stroke, then, we have in the crank chamber the working volume (reckoned down to the top of the inlet port) plus the clearance (in which the crank rotates) and assuming these two equal, this gives us twice the former. The pressure now will be at least three pounds a square inch below atmosphere if crank chamber has an automatic valve. Assume it is 12 pounds, absolute. The minimum pressure in the working cylinder into which the charge eventually must be forced cannot be less than three pounds a square inch above atmosphere with any ordinary muffler. Assume it is 18 pounds.

The ratio of pressure is $12 \div 18$, and therefore that of volume is nearly two-thirds. This means that when the pressure in the crank chamber has risen to 18 pounds a square inch absolute, the space occupied by the gas is approximately 1.3 times the working volume. Deducting now the clearance, which always remains the same in the crank chamber, only one-third is left with which to fill the cylinder. Eighty-five per cent. of .33 is only .28, so that, instead of the simple two-stroke motor receiving 65 per cent. of the charge as with the four-cycle engine, it only gets

$$\frac{.28}{.65} = 43$$

per cent. of this. As the result, therefore, instead of developing 1.3 times the power of the equivalent four-stroke engine, the two-cycle can develop only 43 per cent., or a trifle over one-half as much.

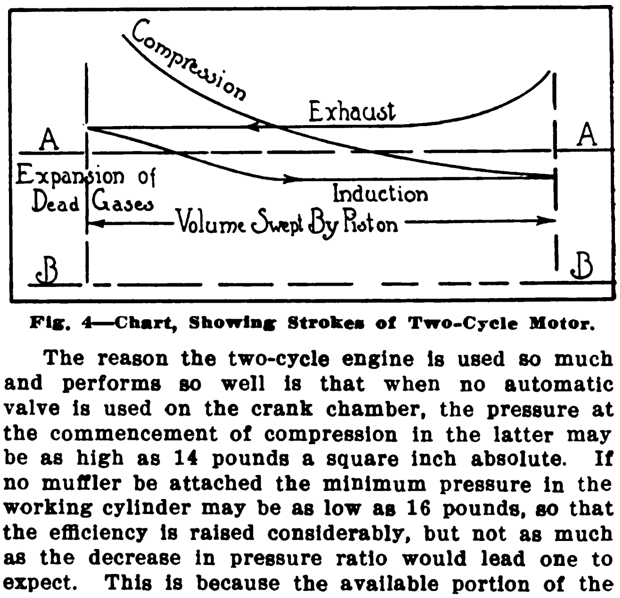

Fig. 4—Chart, Showing Strokes of Two-Cycle Motor.

The reason the two-cycle engine is used so much and performs so well is that when no automatic valve is used on the crank chamber, the pressure at the commencement of compression in the latter may be as high as 14 pounds a square inch absolute. If no muffler be attached the minimum pressure in the working cylinder may be as low as 16 pounds, so that the efficiency is raised considerably, but not as much as the decrease in pressure ratio would lead one to expect. This is because the available portion of the stroke for drawing in the charge is still further cut down by the second or transfer port.

TECTORIUM, A SUBSTITUTE FOR GLASS.

A material that is said to be exceedingly flexible, strong, impermeable, and very well adapted as a substitute for glass is prepared by applying a varnish to a finely meshed iron-wire fabric. The material consists principally of good linseed oil in which the netting is dipped as many as 12 times. After each immersion the thin layer of oil is dried in warm air.

Reducing Tire Friction—When fitting an inner tube in a tire at any time, a little ground talcum, the talcum powder of daily use, placed on both, or shook freely into the shoe will reduce materially the friction between the two. In this way, the members will wear longer, while the internal heating will be reduced to a minimum. Powdered graphite also is recommended.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Rutenber Engine Lubrication.

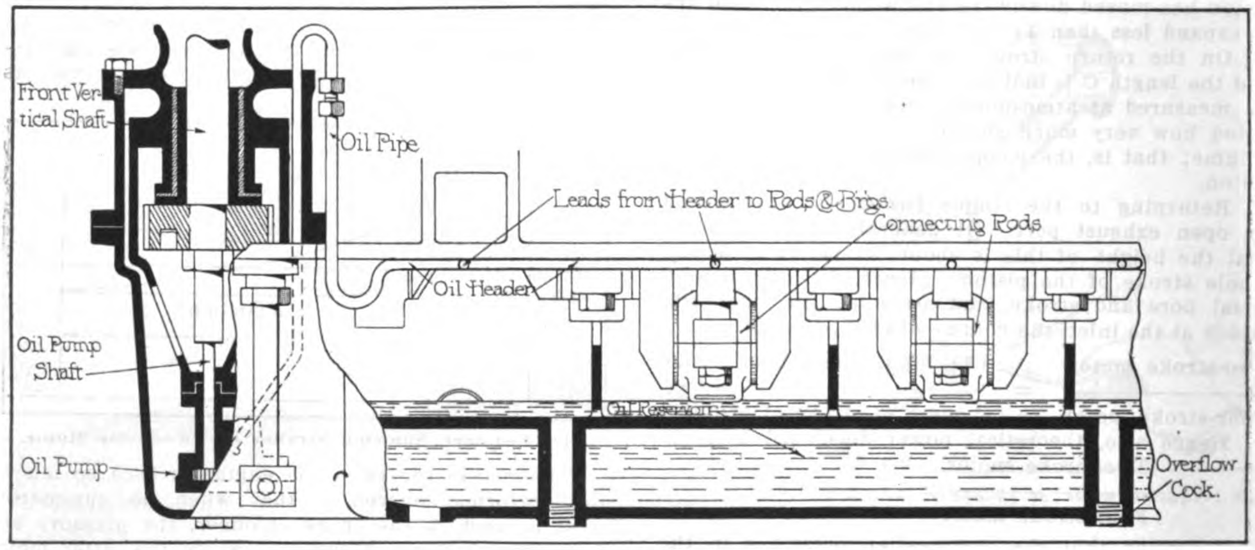
(84)—I noticed your article, in a recent issue of one of your publication on "Lubrication," but failed to find anything in it, either descriptive or in the way of illustrations, concerning the Rutenber engine. Now, my car has a Rutenber motor in it, and although I understand the lubricating scheme, I would like to see it illustrated and described in the columns of your valued paper.

THOMAS F. JAY.

Willimantic, Conn., June 25.

The space possibilities crowded out the description of the lubrication scheme noted, although our correspondent is mistaken as to its not being mentioned. It was stated in the article that this make of engine worked on the constant-level-using-a-pump method, forcing the oil to a header along the side of the engine.

As the illustration below shows, this is a good, though brief description of it. The oil pump is located at the front of the motor, being placed at the bottom of a vertical shaft, the upper end of which drives the timer or similar accessory. This pump is shown within the forward compartment of the engine, but may be located outside if desired, this latter position making it more accessible.



Sectional View of Crankcase on Rutenber Engine, Showing Method of Lubrication Utilized.

This pump drives the lubricants, received from the reservoir in the bottom of the crankcase, up through a vertical pipe to a header. The vertical pipe may be broken at the union shown for the purpose of inserting a sight feed if desired. The header is simply a good sized pipe along the side of the engine with the oil flowing in at the end, and out through drilled holes to the bearings and onto the connecting rods.

Excess oil flows off into the crankcase, where overflow holes allow it to pass into the reservoir below. These overflows are set so high as to maintain an oil level, into which the rods will always dip, splashing the lubricant around the case and to all parts not otherwise reached by the oil leads from the header.

Semi and Full Floating Axles.

(85)—Will you please explain the difference between a semi-floating and a full floating rear axle? Also between a reversible and an irreversible steering gear?

JAKE W. LIEBEN.

New Bedford, Mass., June 23.

A semi-floating rear axle is one in which part of the weight of the vehicle is supported upon the axle shaft, while in the full floating axle, none of the weight is borne by the axle itself. In the latter case, it is possible to remove both halves of the axle and leave the car standing on the wheels, the load being carried on the axle housings.

A reversible steering gear is one in which the road shocks are transmitted through the steering gear back to the driver's arms and hands, while an irreversible type is one in which the character of the gearing used is such as not to transmit any road shock to the driver. The latter is the best one to use for this reason, but the former must sometimes be utilized because of its low cost.

With the former type, should one front wheel hit the curbstone, the shock of this turning action might throw the driver—if he should continue to hold onto the steering wheel—out on his head. This type is dangerous because it is almost impossible to avoid striking obstacles at times.

Fuel Injection Queries.

(86)—Will you explain to me the present status of fuel injection? About a year and a half or two years ago, there was considerable talk about this, and I believe a number of cars were turned out, the engine in which had the gasoline supplied in this way. What was supposed to be the special economy of this method, less fuel or less complication?

VOLNEY R. DAVIS.

Freeport, Me., June 21.

Except for a few marine and stationary engines of the Diesel type, and one or two which have been tried in flying, the situation is as it was two years ago in the matter of direct fuel injection, unless it be that designers have discovered this method brings more complication rather than simplification. About that time, two cars were brought out which had motors supplied with fuel by pump instead of carburetor. One of these was a Wisconsin product, while the other hailed from New England.

If a simple pump of few parts, reliable in action, and possessing other qualifications can be developed, it will be of considerable use in rotating engines of the Gnome and Adams-Farwell type. At present the former takes its fuel through a hollow crankshaft, while the American make is fitted with a form of distributing chamber from which radial pipes run to the cylinder heads.

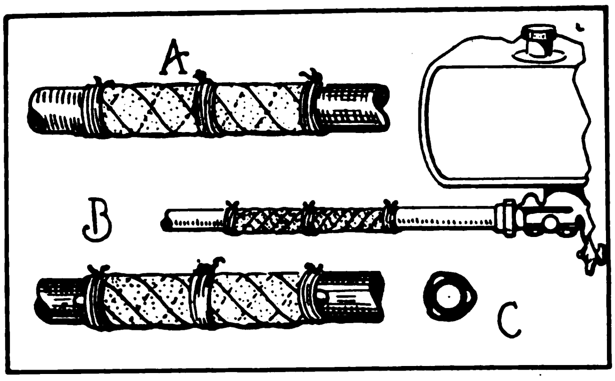
Why Wheels Are Dished.

(87)—Why is the distance between the front wheels of an automobile greater at the top than at the bottom?

WILLIAM BAMFORD.

North Andover, Mass., June 12.

The greater distance is due to the dish or concavo-convex of the wheels. It has been found that this construction better withstands side stresses than when the spokes are all in one plane. The reason for the slight incline is that the wheels have a tendency to fly out when running at high speed under load, and the slight dipping is designed to overcome this tendency, so that they are at all times in a plane perpendicular to the ground, in which position they are able to withstand the greatest loads. Dishing may be brought about by bending the axle down slightly, which movement increases the distance at the top and diminishes that at the bottom of the members.



Method of Repairing a Broken Fuel Pipe.

Repairing Gasoline Pipe.

(88)—Will you please inform me how a temporary repair can be made to a broken gasoline pipe? I had one break while on the road and experienced difficulty in getting home as in spite of my efforts to stop the leak, I lost considerable fuel. CHARLES C. JAMES.

Indianapolis, Ind., June 15.

One of the simplest methods is to utilize a section of rubber tubing which is slipped over the metal pipe, but if the break be in the centre of the line the vibration would tend to chafe the rubber. The latter should be braced by splints and the manner of attachment is shown at C. Where this is not obtainable a repair may be made with ordinary friction tape. Strips of wood are laid lengthwise and in the same direction as the line and the tape wound as depicted at A, being tied with twine. The wrapping should be snug where the break occurs to prevent leakage of the fuel. At B is shown the work completed. A small crack may be treated in a similar manner or by using soap and tape as the former is not affected by gasoline; in fact, a piece of this material is invaluable in the tool kit.

Vulcanizing Rubber with Flat Irons.

(89)—I noted in a motoring journal a method of vulcanizing rubber with flat irons. I have tried it with ordinary rubber and sulphur, but cannot make it work. I should like to know what kind of rubber to use and how it is done? RALPH SAFFELL.

Farmington, N. M., June 23.

Your failure to vulcanize successfully was due probably to the fact that you employed a cured rubber. When the vulcanizers are employed utilizing flame and heat vapor, such as the portable outfit included in the motor car equipment, the materials used consist of uncured Para rubber stock, and a special vulcanizing cement that contains a certain percentage of sulphur. The most important point is that the temperature be regulated properly. Excess heat will burn the material, and too little will not effect a proper cure. The temperature at which vulcanizing occurs varies from 250 to 275 degrees Fahrenheit. The first step in the process is to clean all parts thoroughly, then trim the rough edges carefully. The surface is next roughed with emery cloth and the vulcanizing cement applied, two coats being enough, the first being allowed to dry before the second is put on. The pure rubber is placed over this and a strip of cloth laid between it and the vulcanizer. After the proper temperature is reached the instrument is allowed to remain in contact for 15 or 20 minutes, according to the size of the repair. Considering the application of flat irons the difficulty would be in securing and maintaining the proper temperature.

Making Simple Rod Ends.

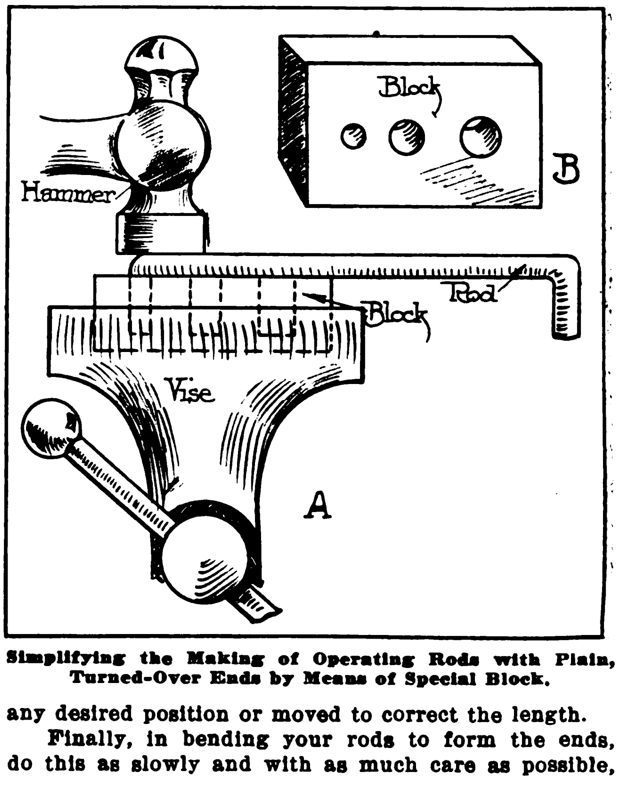
(90)—Please give me some advice in taking care of my car and making repairs for it. It is a ———, which I have had about a year and all of the operating rods have perfectly plain ends, made by bending the stock through a right angle. This bend is then pushed through the operating lever, a hole drilled on the opposite side, and after putting a washer over it, a cotter pin retains it in position. The principal trouble I have had has been with these ends bending and breaking off. I usually go to a blacksmith and have a new one welded on and bent to shape, but this always makes trouble in two ways. The length is not quite correct, requiring extra work to make it fit in place, since there is no adjustment, and many times the diameter of the new piece is such that it is a very snug fit, requiring much filing and fitting, as well as hard driving to get it through the hole. D. W. G. RUSCOE.

Freehold, N. J., June 22.

This form of rod end seldom fails to give trouble, but in your case it will be well to arrange matters so as not to have it occur again. Have a block made at the blacksmith's, and take this to a machine shop, where three holes can be bored in it. These should vary in size slightly, from .0625 inch below the actual diameter of rod used to the same amount above. Possessing this, when it is desired to make a new member, you can do the work yourself as shown in the accompanying cut at A.

The block is held in the vise, and the rod after bending, is stuck into one hole, then the hammer is employed to finish the work. In purchasing stock, buy soft iron, or as the smith would doubtless call it, Norway iron. It also is advisable to use a size slightly larger than that utilized previously, boring out the holes in the various levers to take this. If that be done, a less amount of trouble will be encountered because of the larger wearing surface and greater strength afforded.

As for adjustment, the best plan is to buy a turnbuckle at the nearest hardware store, cut your rod at the middle or other convenient point, thread each end, and screw on the connection. By means of lock nuts placed on either side of it, this can be located in any desired position or moved to correct the length.



Simplifying the Making of Operating Rods with Plain, Turned-Over Ends by Means of Special Block.

Finally, in bending your rods to form the ends, do this as slowly and with as much care as possible, drawing out considerable excess of metal to help from the corner. In this way, the strength of the fibres may be preserved, and the section kept large so as to have full strength where the strain comes.

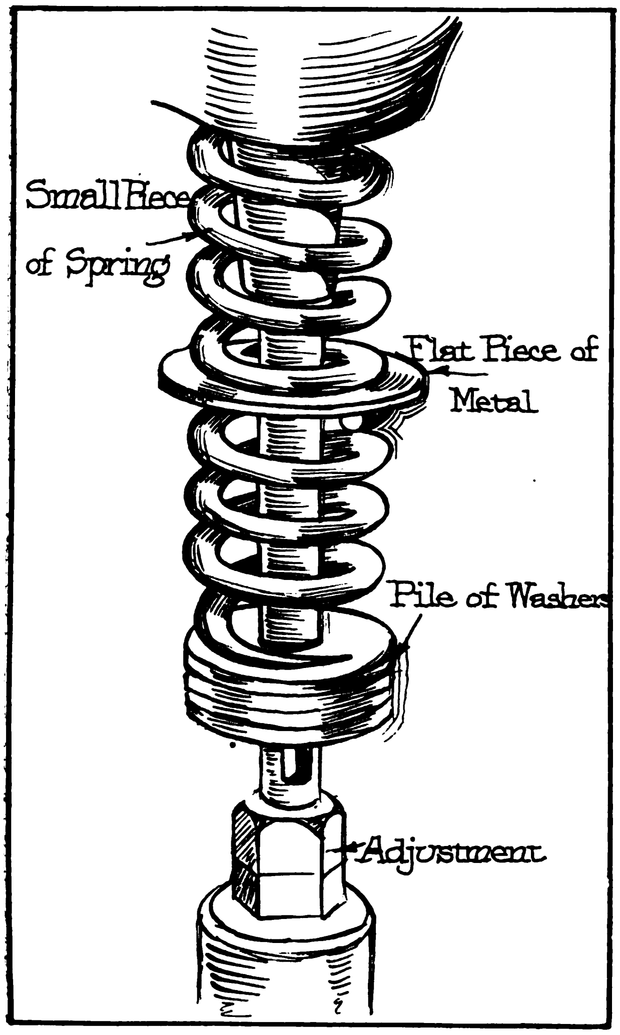
Ratio of Power to Speeds.

(90)—Kindly explain a matter which is puzzling me greatly. It is relative to the speed and power of racing cars. If an automobile of 50 horsepower will go at the rate of 90 miles an hour, why will not one of twice as much power or 100 horse, travel just twice as fast?

S. V.

Huntington, L. I., June 19.

The resistance to speed is based on a number of quantities, and the variation in these causes the difference in the rate of travel with the amount of power available. Thus the speed is lowered by the necessity for overcoming the air resistance, this increasing approximately as the square of the rate of motion. If it took a certain amount of power to overcome this at say 90 miles an hour, this being represented by 10 at twice that or 180 miles, the resistance would be indicated not by 20 but 100.



Two Methods of Strengthening Weak Valve Springs: Above, Added Member; Below, Extra Washers.

Another source of speed loss lies in the traction which the wheels can secure. At slow rates of travel this may be comparatively high, as the wheels are always in contact with the ground and the distribution of weight is doubtless such as to make for considerable adhesion. When moving rapidly, however, it has been proven that the wheels are off the ground a very large portion of the time, during which period much traction is lost, and the forward progress of the vehicle delayed accordingly.

As a third item in speed work, mention might be made of the losses due to the ventilation of the wheels; that is, the additional resistance to the air set up by the rapidly rotating spokes and other parts.

Some recent tests made in France with a 30 horsepower car shed considerable light on this problem. This machine was driven at varying rates and the loss due to many different causes determined. At 43 miles an hour on the level, the power delivered to the crankshaft was divisible into four parts; the transmission took up 13.7 per cent., the wheels and rims absorbed 22.9 more, ventilation consumed no less than 2.3, while air resistance required just 61.1 per cent. of the total.

On the basis of the previous assumption that the resistance offered by the air varies as the square of the speed, and considering the figure just given, 61.1 per cent. absorbed at 43 miles an hour, it readily can be seen that speeds of double this or more require enormous power plants.

Since it is a simple matter to increase an existing engine, one can reason backwards from the records which now exist that something more than just horsepower determines the rate finally attained. Were this not the case, the maker of any car could put a second motor back of the first and double his speed with little or no expense or trouble. As a matter of fact, the huge expense, special designing, use of particular materials, and many other similar items in connection with the production of a "speed monster" to reduce existing records is well known.

A secondary matter of a practical nature in this connection is that of tires. Some of the blows struck these by the impact of the car on the ground after it has been shot off into space by striking a small bump when going at a terrific rate of travel have a value in foot pounds of energy which could only be produced by a very large trip hammer, and one which rubber filled air was never designed to withstand. Coupled with this pounding action is the matter of heating. During a speed dash, as an attempt at a 50-mile record, the outer portion of the shoes becomes so heated that the hand cannot be held upon it.

Strengthening Valve Springs.

(91)—Will you please advise me if there is any manner in which I can stiffen or strengthen the springs operating my valves? They have become very weak and allow the valves to open with the suction of the piston when they should not, as on the power stroke, and also hang open long after they should have been closed by the spring. I have taken up the adjustment until there is no more to go, while the people who made my engine have gone out of business, so I have no one to apply to for new springs. Would stretching them do any good, or, rather, would it make a permanent job?

J. WILSON VANDENGORDER.

Jersey City, N. J., June 17.

There are two good methods by which springs in the condition described above can be remedied so as to give good results as new ones, both at small or no cost and very little work. These are shown in the accompanying figure, at the top and bottom.

In effect, the spring must be lengthened, although stretching will do absolutely no good, the time saving being less than if the member were renewed and repaired properly. It may be made longer by cutting and setting a thick piece of metal or washer between the two pieces, in which manner about .25 to .5 inch may be gained, or a similar but shorter spring may be obtained and placed above the present one with a washer between the two.

While this scheme will work well, if a small amount be needed, washers may be added either above or below the cup, in such manner as to reduce the distance between the two points of support.

PROF HORSFORD IS MANAGER.

Prof. Winthrop C. Hosford, M. E.

The many friends of Prof. Winthrop C. Hosford, M. E., chief instructor of the Boston Y. M. C. A. automobile school, will be glad to learn of his promotion to become manager of this institution. The school itself enjoys the distinction of being the first of its kind in America, and its reputation has been such as to place it in the very front rank of progressive and effective institutions of this character.

Prof. Hosford has served for several years as chief instructor, and the constant and growing success of the school is attributed largely to the system and methods employed by him. Over 5000 men,—chauffeurs, operators and others connected with the industry in various capacities—can testify to his skill as a teacher and to his genial personality.

Born in New Britain, Conn., Prof. Hosford entered a machine shop at the age of 16. During the next four years he studied machine drawing and designing evenings. He entered the automobile field in 1898, when he became identified with the New England Motor Carriage Company. For the past 14 years he has been connected with the industry continuously in some capacity.

The promotion comes as a fitting tribute to his energy and painstaking efforts on behalf of the school. He is not only a hard worker, but studies constantly, keeping abreast of the improvements and developments of the modern automobile. In his work he is assisted by 16 instructors, all of whom are trained and experienced in their respective branches. In this manner the highest possible standard is maintained at all times.

HILLS IS SUPERINTENDENT.

Clarence A. Hills, son of Mr. and Mrs. F. O. Hills of Prescott street, Torrington, Conn., has been made superintendent of the Abbott Motor Company's works at Detroit, Mich. For the past two years he has been connected with the Hupp Motor Car Company of Detroit, maker of the Hupmobile, in the same capacity. At the close of his engagement a short time ago the employees of the firm gave him a gold watch and the officers of the company presented him with a diamond stick pin.

As a boy, Mr. Hills took his first lessons in mechanical drawing in the Y. M. C. A. classes at Torrington. Later he went to a technical school in Kingston, R. I., and then took a position with a manufacturing concern in Bantam, Conn. As soon as he had earned sufficient money he went to Ann Arbor, Mich., where he completed a course in mechanical engineering and at once accepted a position with the Olds Motor Works in Detroit as draftsman. When this plant was removed from Detroit to Lansing, he secured a position with the Chalmers Motor Company, leaving the latter concern to go with the maker of the Hupmobile.

FOREIGN STUDEBAKER AGENT.

W. H. Lalley has been appointed foreign sales manager of the Studebaker Corporation, Detroit, after having been in charge of the European sales of the company for the past two years. He has established branches in London and Berlin, and is one of the directors of the Studebaker Corporation of England, Ltd. Besides having had considerable experience with the foreign sales of the Studebaker, he is a technical man, being a graduate of the Massachusetts Institute of Technology. His many friends throughout the industry will be glad to learn of his appointment.

WINS DESERVED PROMOTION.

Ernest L. Smith, Manager Rhode Island Oldsmobile Branch.

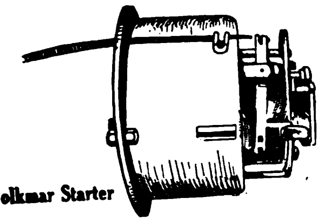
The Rhode Island branch of the Olds Motor Works, which was established the first of the year, is in charge of Ernest L. Smith, who was transferred from Boston to Providence at the time the branch was opened. Mr. Smith was for years a commercial salesman and when he decided to become identified with the automobile industry he made a connection with the sales department of the Olds Motor Works and was stationed at Boston. Mr. Smith's home has been at Pawtucket, R. I., for years and he is widely and favorably known.

When the company decided that a branch was necessary in Rhode Island in order to give its patrons the consistent attention and service they were justified in expecting, Mr. Smith was named as the manager. This was followed by the opening of admirably located salesrooms at 77 Exchange street and the establishment of a service station in Broad street. The policy of the company is to give to Oldsmobile owners factory attention and to deal with them direct instead of through an agent. The Rhode Island branch has the equipment and the facilities to deal with any condition that may arise, and Mr. Smith says that the satisfaction this insures will be realized.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

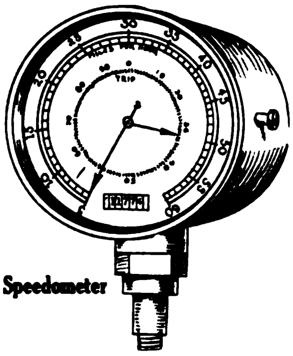
The Volkmar Starter is made by the Volkmar Auto Starter Company, 203 Broadway, New York City, and is of the spring type, the motor being turned over by means of two steel springs. It is simple in construction there being but 28 parts, all exposed to view by removing the brass cover, as shown in the illustration. The starter is attached in place of the starting crank and needs no alteration of the car before it can be installed. It is eight inches in diameter and seven inches long, and is operated by a pedal connected to which is a flexible cable. Depressing the pedal releases the springs, which turn over the motor. When the motor starts, it rewinds the springs to the original tension, when they are disconnected from the crankshaft and held tightly until the next time it is desired to start the car. Two types of the starter are made, A for cars with motors of up to 30 horsepower, and B for cars of up to 60 horsepower, weighing 35 and 45 pounds, respectively.



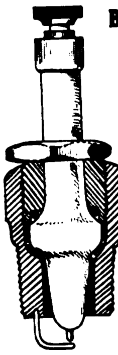
Volkmar Starter

★

The Reliance Speedometer is made by the Reliance Speedometer Company, Boston, in a number of styles. It is of the centrifugal type, with an evenly balanced ball governor which makes the indication of speed steady. It is provided with speed and trip hands and a season odometer. The trip hand may be set to any desired reading by means of a screw. The construction of the instrument is substantial, with ball bearings at every point. Noise is prevented by the use of hard composition ring gears having cut teeth and running with a fibre pinion. Accuracy is secured by the fact that each instrument and dial is calibrated individually. The trip hand moves continuously. The finish may be had in brass, nickel, black, brass and black, or nickel and black. A feature of the Reliance installation is the swivel drive and ball bearing shaft. The drive is ball bearing, swivels, and is provided with spiral gears, insuring quietness and smoothness, and eliminating chances of breakage. The flexible shaft, provided with ball bearings, serves to give a steady drive, eliminating sudden jumps in the indication and also guarding against shaft breakage. A swivel is provided at each end of the shaft.



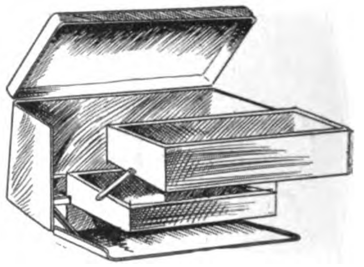
Reliance Speedometer



Buscoba Spark Plug

★

The Buscoba Spark Plug is made by the Bush-Scott Company, Detroit, and may be had in conical and petticoat types in .5-inch standard, S. A. E. standard, or metric sizes. The shells are full length and handsomely finished. When the plug is taken apart for cleaning the copper asbestos gasket is retained by means of a recess in the bushings, which are hardened to prevent bruising, adding to the life and service of the plug. The porcelains are accurately formed of a special heat resisting material and are interchangeable, with the caps well crimped in place and filled with cement to exclude oil and water. The sparking points are made of a special alloy which approaches platinum in its resistance to heat and the electric spark. The binding post and nut are so formed as take a great variety of cable terminals. The packing of the plug consists of asbestos filled copper gaskets of standard type.



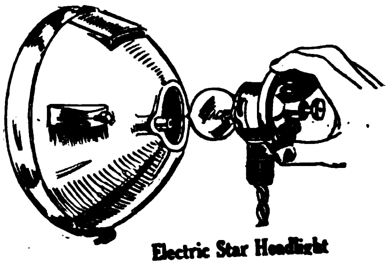
Gray Tool Box

★

The Gray Tool Box is constructed with the trays on movable arms so that they may be pulled out and held in such position that all the contents are in view at once, an obvious convenience in searching for tools. The front is hinged and may be used as a shelf with the box bolted on the running board. The device is provided with a brass trunk lock and is made by the Gray Specialty Company, 148 Avon avenue, Newark, N. J.

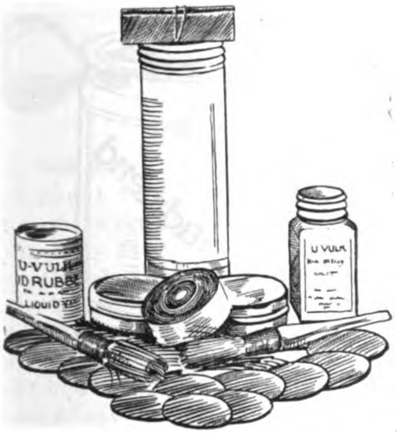
★

Electric Star Headlights are made by the Milwaukee Bronze Casting Company, 119 Clinton street, Milwaukee, Wis., and are designed to throw a powerful white light straight ahead and at the same time diffuse a less brilliant illumination to the side, lighting up the curves and passing vehicles so as to reduce the risk of collisions. This double ray effect is secured by the design of the reflectors, which are of modified parabolic form. The lamp is cast of non-corrosive silver aluminum about .1875 inch



Electric Star Headlight

thick, without any rivets to jar loose or solder to crack because of the vibration to which automobile lamps are subjected. The interior is brought to a high polish which is unaffected by the weather or gases, due to the composition of the metal. The lamp is equipped with Ediswan bayonet lock base, which will not allow the bulb to become loose. A feature of the member is a focussing device which enables the bulb to be focussed in a position which will give the illumination desired. This is controlled by means of a screw and lock nut on the outside of the hub which carries the bulb.



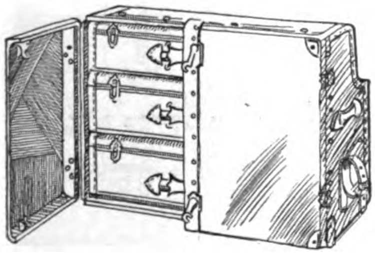
U-Vulk Repair Kit

* * *

U-Vulk is a vulcanizing outfit which is complete in itself, containing patches, brushes, rubber in strips and in solution, and a liquid vulcanizing agent which chemically vulcanizes the raw rubber to the tire or tube. It renders tire repairs possible without heat, and comes in a compact form, fitting in a pasteboard screw top carton. It is made by the Gem City Liquid Vulcanizer Company, Dayton, O.

* * *

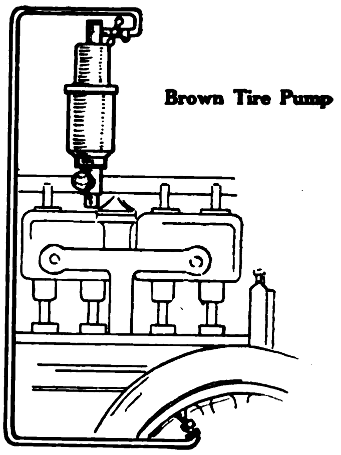
Ajax Trunks are made by the Ajax Trunk & Sample Case Company, 91 Mercer street, New York City, and are well known. The No. 406 suit case trunk, made especially for automobile use, is illustrated. This carries three suit cases, and is so shaped that it will fit on the trunk rack in the rear of a car, the top portion being cut in for about 10 inches to allow the lower part to go under the overhang of the car body. The doors swing outward like wardrobe doors, and each case is placed on an independent shelf which it fits exactly, so that one may be removed without disturbing the others. It is made throughout of the best materials, and is lined with green felt. It may be had in three lengths, 28, 30 and 32 inches, the width and height being 16 and 24.5 inches.



Ajax Trunk

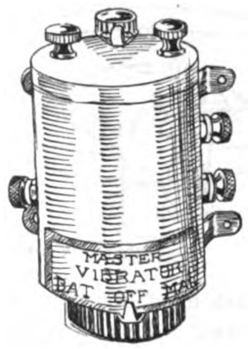
* * *

The Brown Impulse Tire Pump is made by the Brown Company, Syracuse, N. Y., and is a power tire pump operated by the compression of the motor. It may be used either as a permanent fixture on the motor or attached only when it is desired to use it. When fitted permanently, a hole is tapped into the cylinder head in which the pump is screwed, operating horizontally instead of vertically as seen in the illustration, which depicts the temporary installation, with the pump screwed in the spark plug hole. In use, the cylinder to which the pump is attached is cut out from the ignition circuit, the compression of the cylinder being used to operate the piston which forces the air to the tire. Only fresh air is pumped. The outfit consists of the pump, 12 feet of hose and pressure gauge. The pump is made like a motor, with two cast iron piston rings and a connecting rod of high grade steel between the larger piston on which the compression acts and the smaller one which forces the air to the tire. The cylinders are made of gray iron, bored and reamed to exact size.



Brown Tire Pump

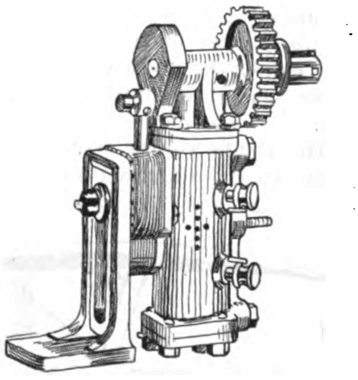
The B. & S. Master Vibrator is made by the Briggs & Stratton Company, Milwaukee, Wis., and was designed with the idea of correcting the timing of a multiple-cylinder motor and increasing its power by substituting one vibrator for three or four. It takes the place of the usual box coil with its several vibrators, each responding to the current at different speeds, held to result in uneven firing. The B. & S. device is small and compact, being 5.25 inches high and 2.5 inches in diameter, and is water and dust proof with an adjustment which is proof against accident or carelessness and yet is sensitive.



B. & S. Master Vibrator

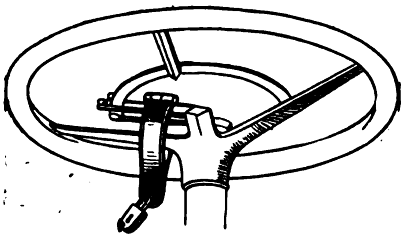
* * *

The Hartford Tire Pump is a double acting single-cylinder pump of great power and capacity. It will pump 1.5 cubic feet of air a minute at a speed of 500 revolutions. That illustrated is designed to be driven from the magneto or pump shaft through a split gear meshing with the gear on pump crankshaft, but one also may be had with a friction wheel, to be driven by contact with the engine flywheel. The gear driven pump is attached to the frame of a car in such position that its gear may be slid in and out of engagement with the gear on the pump shaft. The pump is strongly constructed, the cylinder, pis-



Hartford Tire Pump

ton and piston rings being of cast iron. The piston is of the double type, hollow, and with two valves, one in each head. The pump may be attached where convenient, and is 9.5 inches in height, 3.5 inches in width and 8.5 inches long. It weighs 13 pounds and is tested to 150 pounds pressure. The cylinder bore and stroke are 1.5 inch. The outfit consists of the pump, gears, hose and pressure gauge. To use the gear pump, the motor is stopped, pump gear slid into engagement with gear on magneto shaft and engine started. It is made by the Hartford Pump & Manufacturing Company, 7 Arch street, Boston.



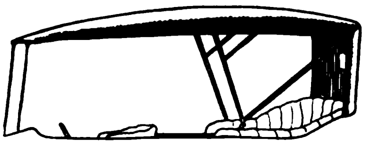
Watch Dog Lock

* * *

The Watch Dog Lock is one of the newer automobile locking devices on the market, and will no doubt be quite popular. It is simple in construction, consisting of a pair of hinged arms adapted to go around the steering wheel spider and the throttle and spark levers. It is made by S. Breakstone, 1712 Michigan avenue, Chicago, and may be had with or without the padlock, that which is sold with the device being of Corbin make. The advantage of locking the spark and throttle levers lies in the fact that while the car can be moved about the garage, it cannot be run under its own power, so that while protection from thieves is made, the car is not immovable. This is a decided advantage in public garages, where the car must be moved by the employees to make way for other machines, or for washing.

* * *

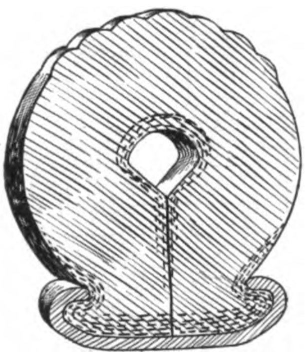
The Golde Top is made by the Golde Patent Manufacturing Company, Inc., 509 West 56th street, New York City, and contains several new features. As may be seen in the illustration, it has no bow irons for the front seat, there being but a single bow socket on each side. In front of this the top is supported by hinged rods. This construction is such that it may be adjusted nearly as quickly as the old horse buggy top, there being no bows to fit in sockets, etc. No springs are used, and the whole is quite durable. Two styles are offered, one with tapering oval steel rods finished in black enamel, and the other with wooden bows and steel and wrought iron trimmings, the metal being finished in black and the wood in the natural color. The cloth material may be water proof canvas, mohair, or Pantasote.



Golde Top

* * *

The Cleveland Air Cushion Tire is made by the Cleveland Puncture Proof Tire Company, Columbus, O., and has been designed to derive some resiliency from air, at the same time combining with it the non-puncturing qualities of the solid tire. The construction is seen in the illustration. The tire is solid save for a central air chamber, which communicates with the outer air through a slit in the base, which is lined with friction cloth. The result of this construction is claimed to be that when the tire strikes an obstruction the pressure on the rubber closes the slit and compresses the air, which then lends its resiliency to that of the rubber. This effect is obtained without the use of inner tubes, valves or inflation, so that there is no danger of blowouts, punctures or leaks. The tire is made in standard sizes to fit the standard clincher rims, and is provided at the base with a rubber covered layer of friction cloth to provide against cracking. The tread is beaded to prevent skidding and afford a wearing surface.



Cleveland Tire

* * *

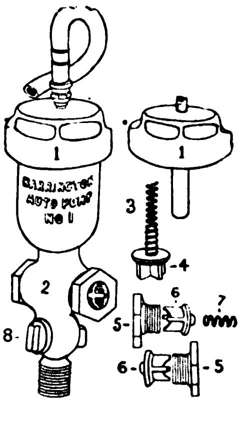
Treadmend is being placed upon the market by the Liberty Rubber Company, Orange, N. J., and consists of a preparation especially made to fill up holes in the tread of a tire and sealing up cuts.

Treadmend

In the care of a casing one of the essentials upon which the tire manufacturers insist most strenuously is the quick attention to small holes and cuts. Through a small hole which might be thought harmless an astonishing quantity of sand will pass, resulting in the familiar sand blister which may remove a considerable section of the tread and need the services of a professional vulcanizer. To prevent such blisters, all holes should be filled up as soon as seen with a preparation like Treadmend.

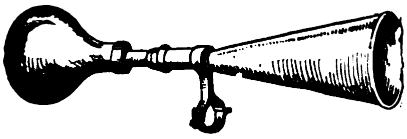
* * *

The Barrington Automatic Pump is made by the Barrington Automatic Automobile Pump Company, Short and South street, Harrisburg, Penn., and is of the compression power variety. The pump is designed to be attached permanently to the engine, being screwed into a hole tapped in the cylinder head. It is only 6.5 inches high, allowing the hood to be closed when not in use. It is simple in construction, with few wearing parts, as may be seen in the illustration. While it may be used as a detachable pump and screwed into a spark plug hole, only when



Barrington Tire Pump

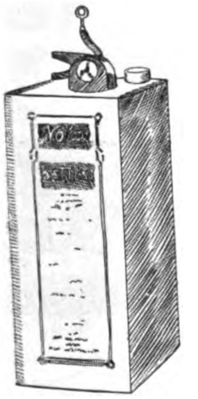
it is desired to use it, trouble may be saved by having the pump attached permanently. In the illustration 1 is the cap forming the top of the compression chamber; 2, the body of the pump; 3 and 4, check valve and spring located in the bottom of the chamber; 5, 6, 7, intake check valves and spring; 8, stop cock to throw the pump out of action when not in use. The pump operates with the engine throttled low as follows: The motor piston on its downward stroke draws air through the two intake valves 5 and 6; the next upstroke of the motor piston forces this air up through the neck of the pump, past the check valve 4 and into the pump compression chamber, from which it goes to the tire.



Vixen Horn

* * *

The Vixen Horn is in external appearance similar to an ordinary bulb horn, but the sound it makes is that of a siren. It is manufactured by the Motor Car Equipment Company, 55 Warren street, New York City. The device is quite unique in combining in a bulb horn the siren quality. Instead of the customary reed there is a small mechanical siren of considerable power which emits the characteristic note which attracts attention even in the traffic roar of a large city. It is stated that the sound is not too loud for city use, and possesses sufficient penetrative ability for use in the country.

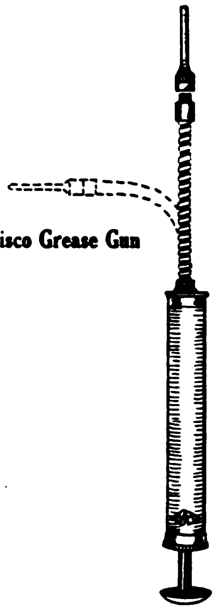


Noloss Battery

The Noloss Battery is an innovation in ignition batteries, being a wet battery in dry battery form, thus possessing the advantages of both. It is made by the Burn-Boston Battery & Manufacturing Works, 9 Doane street, Boston, and consists of a wet battery in a can so sealed that it cannot leak, spill, or appreciably evaporate. It thus combines the long life of the wet battery with the portability of the dry cell. The cell is the same size as the regular dry member, and gives the same voltage and amperage.

* * *

The Wisco Grease Gun is made by the Wilson Instrument & Specialty Company, Passaic, N. J., the No. 5 gun of this company being illustrated. It may be used for either oil or grease and is fitted with a flexible spout which enables the contents to be shot into the most inaccessible places.

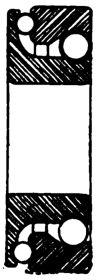


Wisco Grease Gun

The spout may be turned through any angle from zero to 90 degrees, and is provided with a thread to screw into a grease cup, facilitating loading a bearing. The gun will be appreciated by motorists who have tried to load grease or oil into a bearing on a car while on the road, only to have most of the lubricant escape to the ground on account of the awkward position of the gun. The flexible spout enables the contents to be delivered where desired when held in any position.

* * *

The Globe Ball Bearing is a new type of combined ball radial and thrust bearing, being placed upon the American market by the Globe Ball Bearing Company, 50 Church street, New York City. It is made by the Societe de Mecanique de Precision of Clichy, France. The construction is easily seen in the drawing. There are two ball races, one of which bears the radial load, while the other takes care of the thrust. The bearings will be found of especial advantage in axles, where there is considerable thrust as well as radial load to be taken care of.



Globe Bearing

* * *

The Buscoba Dry Fire Extinguisher is, as its name indicates, a fire extinguisher of the dry powder variety. It is made by the Bush-Scott Company, 31 Woodward avenue, Detroit, and consists of a tin tube filled with a dry chemical which when thrown at the base of a fire generates a gas. This gas does not support combustion, as it does not contain oxygen, and thus puts the fire out. The extinguisher will be appreciated by the motorist, as it is not bulky to carry, being 22 by two inches, and gives effective protection against gasoline and oil fires. As its compactness renders it possible to place it in such a position in the car that it will be instantly available, any blaze can be quenched in its incipiency. One or more may also be kept in the garage convenient for service there should an emergency arise.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from June Issue.)

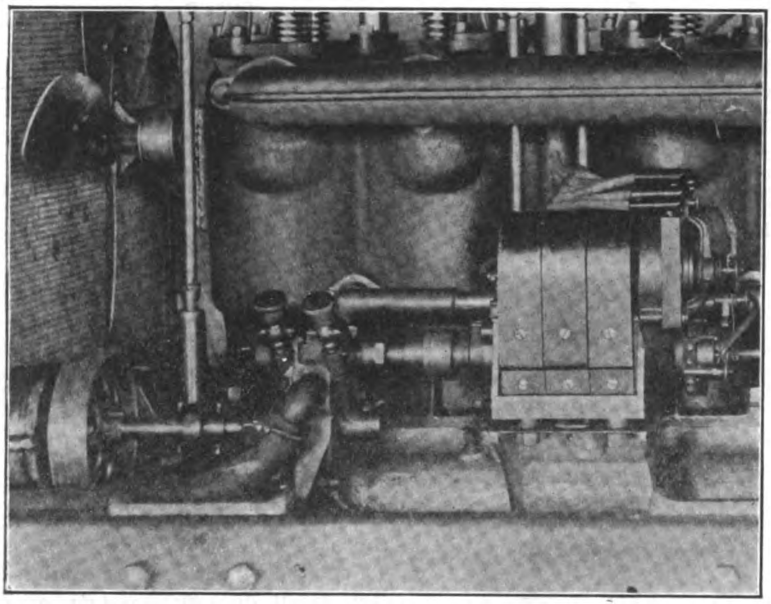

Fig. 44—Magneto Mounting and Peculiar Drive on Pennsylvania Motor.

A very peculiar method of driving the magneto is shown at Fig. 44, which represents the installation on some Pennsylvania models. The magneto is bolted to a cast aluminum bracket formed as a part of the engine base. A gear pump is employed for circulating the water through the cooling system, and as is customary, the gears therein are the same size. The lower gear of the pump is driven at crankshaft speed by a gear meshing with the exhaust camshaft driving member, the magneto armature is turned by a shaft extending from the top pump gear. An Oldham coupling is interposed between the pump gearshaft and armature, this type of joint permitting some slight movement if shafts it joins are not perfectly aligned.

The magneto installation on the Premier six-cylinder engine is shown at Fig. 45. The device is anchored to an extension of the motor base by a cast bronze strap and two bolts as indicated, and is driven by an extension of the centrifugal water pump impeller shaft. The armature and the pump shaft are joined by a flanged coupling which is arranged with a series of holes so spaced that the magneto can be timed with great accuracy. The two flanges are held together by a through bolt.

The Pope-Hartford cars have the magneto installed in a distinctive manner. Instead of the armature being parallel with the crankshaft it is placed at right angles to it, as shown at Fig. 46. This location enables one to reach the distributor and contact breaker very easily, as the magneto is installed just back of the fan. It is held in place against the aluminum platform by a strap having a bolt that is adapted to fit in the slot in the base. Loosening the nut enables one to slip the retaining bolt out of the slot and lift the magneto from its base. The magneto is driven by worm gearing from the same gear that drives the pump and mechanical oiler. An Oldham coupling is interposed between the magneto and the end of the driving shaft. As the gearing is well protected and thoroughly lubricated, there is but little possibility of wear at this important though minor point.

A typical system of magneto driving gears is outlined at Fig. 47, this being the system employed on Knox motors. As will be evident, the camshaft driving gear is at one side of the crankcase and plays no part in turning the magneto armature. The small gear on the engine shaft meshes with a large idler gear, which in turn engages the pinion employed to revolve the armature. The magneto driving pinion and the engine shaft gear are the same size, each having 36 teeth, this tending to turn the magneto at engine speed. The method of holding the magneto in place is similar to that employed on the Premier engine, involving a cast yoke held in place by a pair of bolts provided with winged nuts permitting easy removal if it should become necessary to do this.

The train of gears employed to operate the magneto in the N. S. U. motorcycle power plant is clearly shown at Fig. 48. A small 16-tooth gear is attached to the engine shaft, this meshing with a 32-tooth gear employed to operate the valves. The camshaft gear meshes with an idler gear that serves to drive another gear attached to the armature that is the same size as the camshaft gear. Thus, the magneto and the camshaft turn at the same speed, or half the engine speed. In this view, the case is partly cut away to show the method of installing the gears and the number employed. The magneto is bolted to a small cast bracket or platform attached to the engine case as indicated.

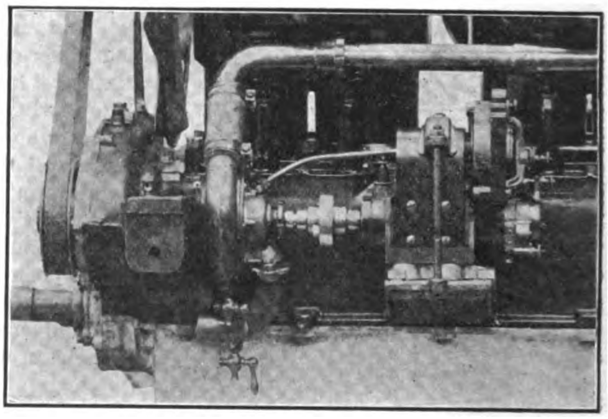

Fig. 45—Attachment of Magneto to Premier Six-Cylinder Power Plant.

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company.

Magneto Distributor Arrangement.

In fitting magnetos care should be taken to observe the essential precautions necessary to insure correct operation, and the type of engine and number of cylinders will make material difference with the form and manner of application of this device. For instance, when used on three, four, six or eight-cylinder engines it is imperative that they be so coupled that they will be driven in the right direction and at the correct speed, have a properly shaped cam and the proper number of contacts in the distributor.

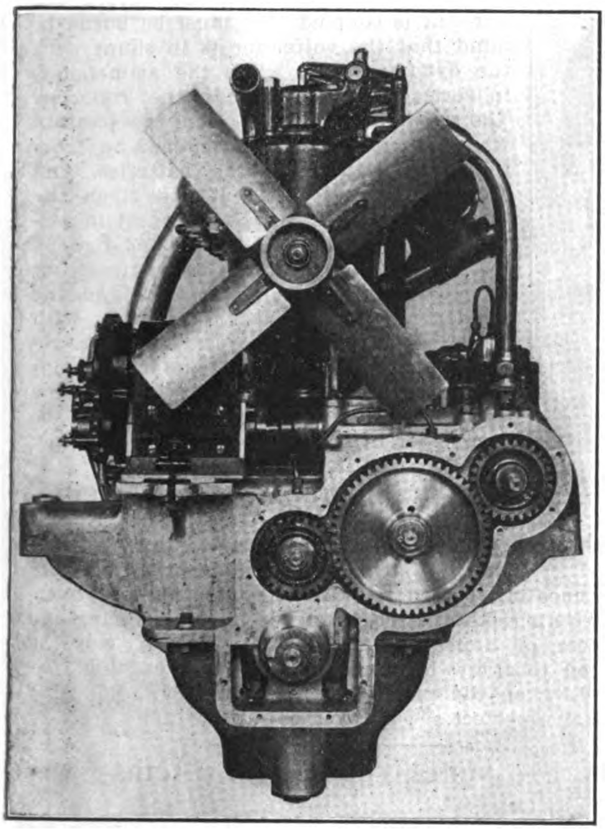

Fig. 46—Unconventional Disposition of Magneto on Pope-Hartford Engine.

At Fig. 49 it will be seen that the important parts of the Simms magneto, which has been previously described, are shown, special attention being called to the distributor design, which is for a four-cylinder motor. The contact breaker is attached directly to the armature and revolves with it at engine speed, the contact points being separated twice each revolution or every time the grounded contact lever toe comes in contact with the fibre rollers attached to the interrupter casing.

Single-Cylinder Type.

A magneto designed for use with a single-cylinder motor does not differ materially from those to be used on other forms, except that the distributor is dispensed with and the secondary winding is coupled directly to the spark plug. The illustration shows the arrangements of the distributors and contact makers of engines designed for fire engines from one to eight cylinders, as well as the speed of rotation compared to the crankshaft, and should prove valuable for reference. When applied to a single-cylinder engine, a single point cam is used, and the appliance is driven at one-half the crankshaft speed if the engine is four-cycle type, and if of the two-cycle type, at crankshaft speed. Obviously, a two point cam would enable one to run the device at the same speed as advised for the four-cycle form. As will be evident, there is but one interruption of the contact for two revolutions of the engine when of the four-cycle type, and an interruption every revolution when the single-cylinder motor is of the two-cycle construction. The direction of rotation is immaterial with this type of machine.

Forms for Two Cylinders.

Various forms of two-cylinder engines are used, the most common being the horizontal opposed type. This form offers no difficulty in installation, and the distributor is fitted with contacts spaced 180 degrees apart, the armature being driven at engine speed, a single point cam being used. The primary circuit is therefore interrupted once each revolution. In event of being used with a two-cycle vertical engine, it should be driven at twice the crankshaft speed, which will result in two sparks each revolution. The form shown at B may be used to advantage when two vertical four-cycle cylinders operate on crankpins which are on the same plane.

When used on two-cylinder vertical four-cycle engines with opposed cranks or with motors of the V type, a special distributor is required and the armature is driven at crankshaft speed. The type of distributor used is shown at C, and it will be noticed that the segments on the distributor are so placed that the order of firing is conversed. When used with a two-cylinder vertical engine, the explosions occur at irregular intervals, there being a spark in one cylinder during the last half of one revolution and in the other the first part of the next, 90 degrees crank travel apart. For this reason the segments are spaced 90 degrees apart, as shown. With a V engine the position is determined by the degree of angle between the cylinders. Two-cycle motors are never built in the V form because there are no advantages to be obtained by this method of placing the two cylinders relative to one another.

Other Forms of Motors.

The use of the magneto on three, four, six or eight-cylinder motors involves no difficulties if they are of conventional forms, the sole precaution being that they are driven at the right speed and in the right direction. A three-cylinder magneto should be driven at three-quarter crankshaft speed, four-cylinder forms at crankshaft speed. When used for six-cylinder ignition, the armature revolves one and one-half times as fast as the shaft, while on an eight-cylinder motor twice the crankshaft speed is necessary. When applied to two-cycle engines, twice the speed advised for four-cycle forms is needed, because there are twice as many explosions a revolution.

The segments on the distributor of a three-cylinder magneto are spaced 120 degrees apart, on a four-cylinder 90 degrees, on a six-cylinder 60 degrees, while the segments of an eight-cylinder distributor are separated by spaces equivalent to 45 degrees. The figures D, E, F and G illustrate this clearly, and show that the contact breaker employs a double cam.

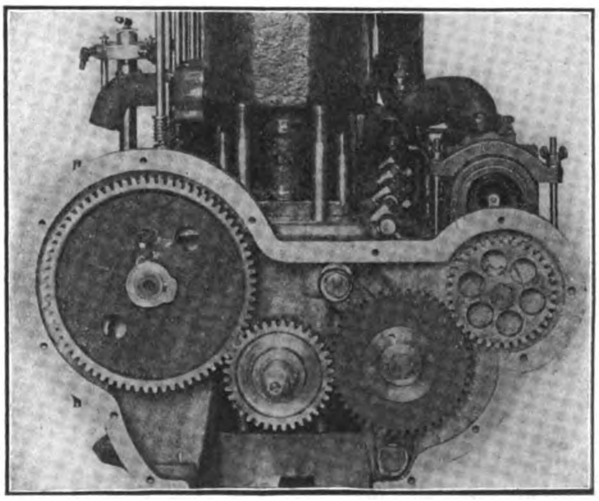

Fig. 47—Typical Method of Driving Magneto.

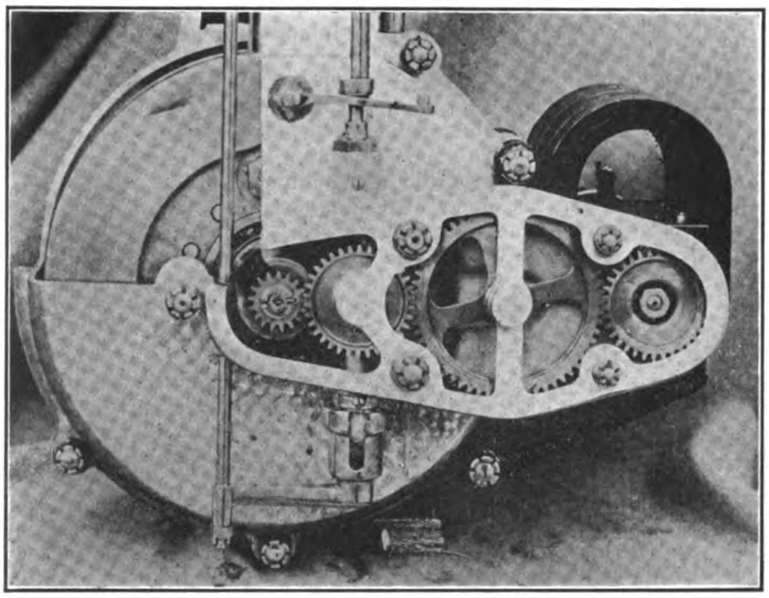

Fig. 48—Train of Gears Used to Drive Magneto on N. S. U. Motorcycle Power Plant.

As these magnetos are to be run in only one direction, it is well to state whether the armature is to run "clockwise" or "counter clockwise" when ordering from the maker. The direction the armature runs is determined by the method of placing, the way the motor turns and the number of gears employed in driving, and will vary in almost every instance.

(To Be Continued.)

CHARGING WITH DYNAMO.

In charging batteries with a compound-wound dynamo, the series coil, or thick wire must not be in use, but only the "shunt" coils; thus the dynamo will be working as a "shunt" machine. It is necessary to find the positive terminal of the generator, and to connect it to the positive of the battery. When four batteries are to be charged they are connected together in series, the positive of one cell to the negative of the next. As every four-volt ignition cell requires a dynamo pressure of five volts, it will be seen that four cells require a like energy of 20 volts, so that the machine must be run at such speed as to give at least 20 volts across the terminals before the last cell is coupled. It must be borne in mind that the voltmeter is in shunt with the dynamo leads, while the ammeter is in series with one lead to the batteries. The ammeter should be noted to ascertain what amount of current is passing from the dynamo through the batteries, and more or less speed should be given the former to get the charging current in amperes required. It is possible to light a few 20-volt lamps at the same time that the batteries are being charged, and the former must be connected in shunt with the dynamo terminals. It should be remembered, however, that by placing lamps in circuit reduces current flowing into the batteries; therefore the dynamo must be run faster in order to supply the demand.

ANNEALING TOOL AND DIE STEEL.

It is an advantage to use annealed tool and die steel, as it obviates the necessity of annealing before roughing, economizes and overcomes all risks of overheating or burning during the process of annealing. After roughing it may be heated to a low heat and left to cool and then finished, when the results in hardening and tempering will give perfect satisfaction.

TO NEUTRALIZE BATTERY ACID.

A certain percentage of sulphuric acid is utilized for the electrolyte of the storage battery, and in handling the device the solution may be spilled upon the clothes or the fittings of the car. To neutralize the effect of the acid there is nothing better than ammonia. When mixed with vaseline it forms a good preventative of corrision when rubbed on terminals.

Oil for Tops—Every car owner should have on hand a can of neatsfoot oil, applying this to his top every two weeks. It keeps the leather soft and pliable.

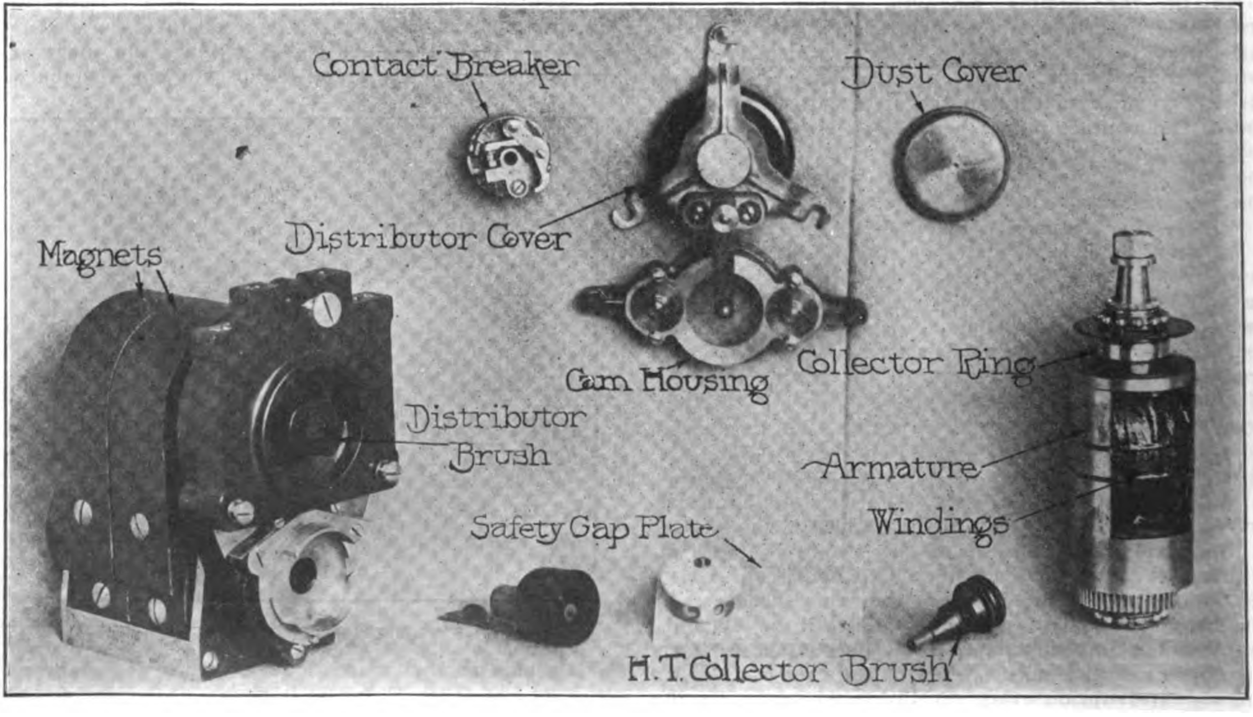

Fig. 49—Important Components of Simms High-Tension Magneto.

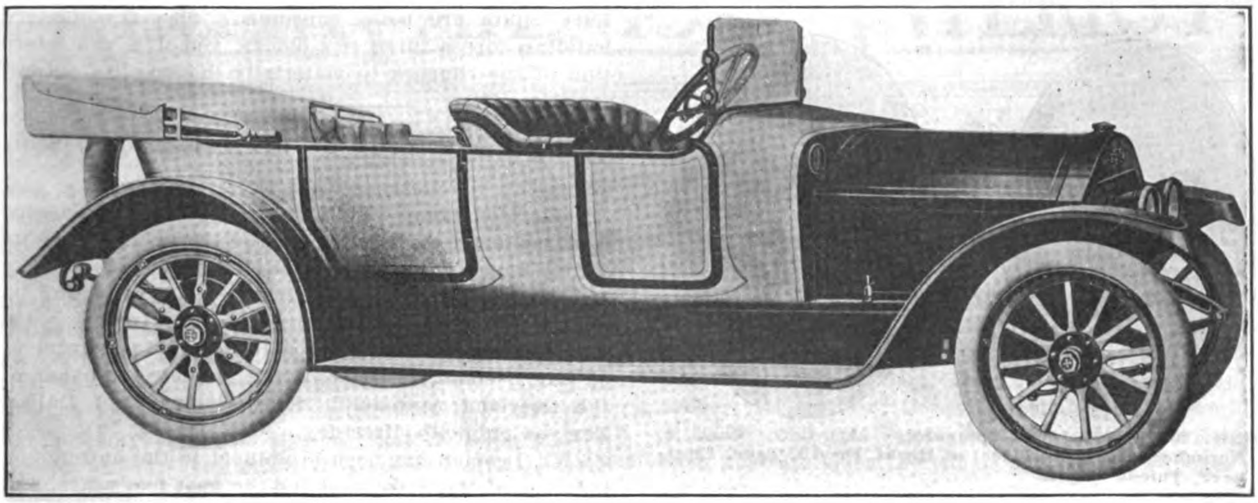
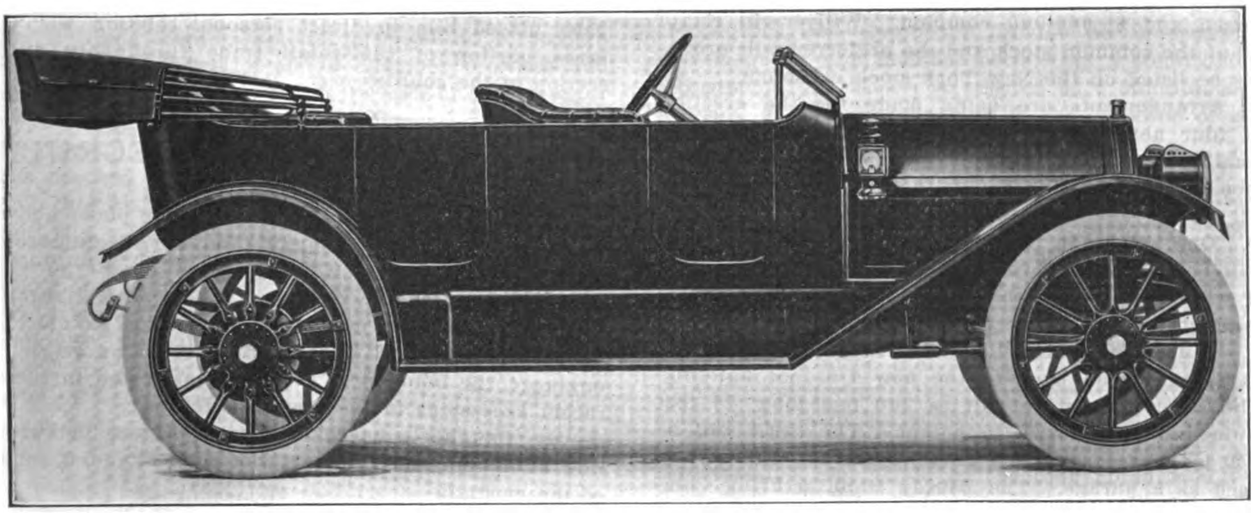
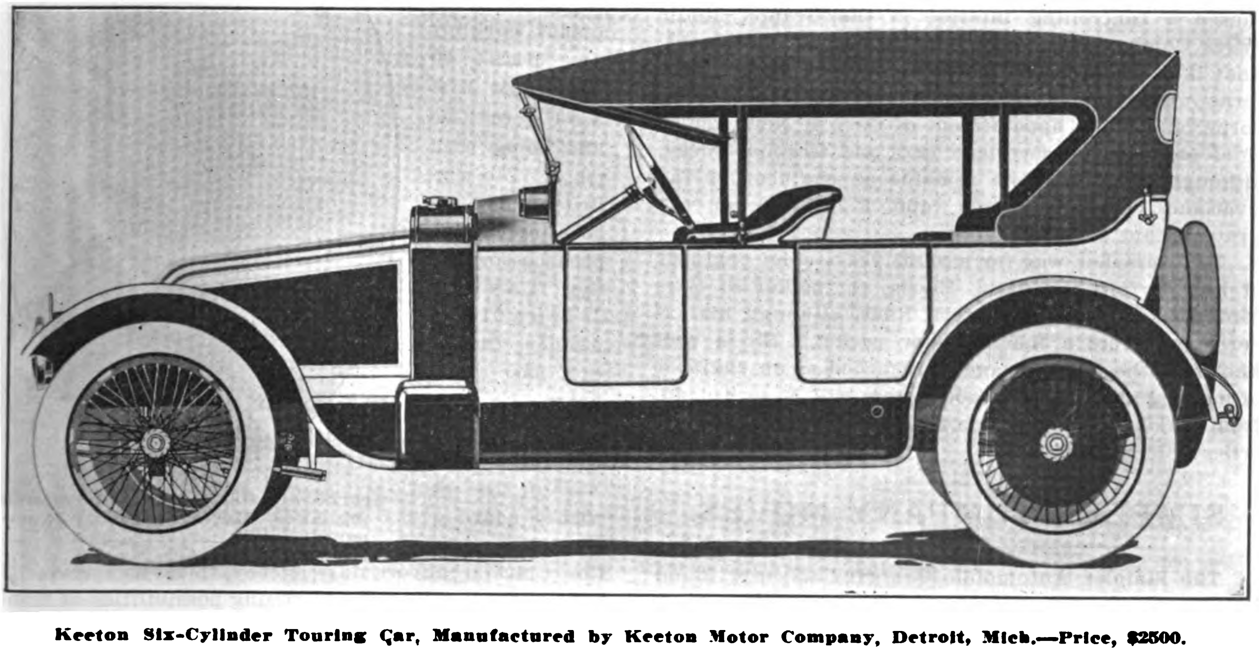
ATTRACTIVE LINES FOR LIVE AGENTS.



Henderson Five-Passenger Touring Car, Model 46, Manufactured by Henderson Motor Car Company, Detroit, Mich.—Price, $1385.



Imperial Model 44 Five-Passenger Touring Car, Manufactured by Imperial Automobile Company, Jackson, Mich.—Price, $1750.



Keeton Six-Cylinder Touring Car, Manufactured by Keeton Motor Company, Detroit, Mich.—Price, $2500.

OVERLAND PLANS EXPANSION.

President John N. Willys of the Willys-Overland Company recently announced plans for increasing the capital stock of his company from $6,000,000 to $15,000,000, and the taking in of his various properties without change of status. When the increase is made, the capital stock will be divided into $10,000,000 preferred and $5,000,000 common. Willys will retain all of the common stock and the preferred will probably be listed on the New York stock exchange.

With Willys-Overland Company: At Left, Carl A. Neracher, Chief Engineer; at Right, Fred I. Tone, Engineer, Toledo Plant.

Arrangements are being made for the erection of four new factory buildings, the improvement of smaller ones and the employment of 3000 additional men. It is planned to double the capacity of the plant. All of the new buildings will be erected in Toledo, O. One will be in the rear of the present plant, and will be 700 by 100 feet and three stories in height. It will extend from the Lake Shore Railway nearly to Derby street. A second will be erected just west of the drop forge department fronting on Derby street, and will extend back to the new 700-foot building. The second structure will be 200 feet long, 70 feet wide and two stories in height. The third will be 130 by 60 feet, fronting on Derby street, and will be used as a garage. The Kinsey Manufacturing Company, one of the Willys concerns, will construct a new five-story building, 300 by 100 feet, on the corner of Derby street and West Central avenue.

It will be remembered that Willys recently purchased a controlling interest in the Gramm Motor Truck Company of Lima, O., maker of Gramm trucks. That it is the intention to operate these various concerns under one general management seems to be borne out by the appointment of Carl A. Neracher as chief engineer for Overland cars and Gramm trucks, although Fred A. Tone remains as engineer of the Overland plant in Toledo, and F. Bisantz of the Gramm plant in Lima.

Mr. Neracher was for several years chief engineer of the Garford Company, Elyria, O., maker of Garford pleasure and commercial lines, although his experience covers a much longer period. He is well known in the industry and is regarded as an engineer of marked ability. His headquarters will be at Toledo, from which point the sales policy of the Willys properties will be conducted.

SIMPLEX COMPANY MOVES.

The Simplex Automobile Company recently found it necessary to remove its entire plant from New York City to New Brunswick, N. J., in order to keep pace with its rapidly growing business. The former factory building on the East river front has been entirely abandoned, but the service station in Long Island City and the retail branch at 59th street and Central Park South are being continued. The new factory building covers three city blocks, and it is the intention of the concern to materially increase its output.

TEXAN WITH HENDERSON.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the new Henderson car, which made its initial appearance during the 500-mile race on the Indianapolis speedway, Memorial Day, is collecting its department heads from widely scattered points. Announcement has just been made of the appointment of Ray Leeman, advertising and publicity manager of the Overland Automobile Sales Company of Dallas, Tex., as publicity director.

Mr. Leeman has been prominent in the automobile industry of the Southwest for the past five years, and is considered an expert on runs, tours, etc. He was for some time manager of the Goodyear Tire & Rubber Company's branches in Houston and San Antonio, Tex., and his association with the Overland Sales Company placed him in direct personal relation with a large portion of the retail trade throughout that section of the country.

ANOTHER MICHIGAN RECRUIT.

As a further evidence of the extensive plans under way by the Michigan Buggy Company, Kalamazoo, Mich., maker of the Michigan car, comes the announcement of the appointment of George H. Daugherty as advertising manager. Following so closely upon the news of W. H. Cameron's selection as chief engineer, the industry is decidedly interested in these recent accessions to the Michigan forces.

Mr. Daugherty has had wide experience in handling automobile accounts, having superintended some of the most signal successes in this field. He has been connected with agency work for the past 10 years, his first work in this line being with the Long-Critchfield Corporation, the predecessor of the Taylor-Critchfield Agency. During the past few years he has been an investigating member of the advisory board of Lord & Thomas, the Chicago advertising agency, and has travelled widely, developing the advertising possibilities of many of the most important accounts handled by that house.

George H. Daugherty, Advertising Manager, Michigan Buggy Company.

RECENT PATENTS of INTEREST

Automatic Fuel Vending Machine.

An automatic gasoline vending machine of the coin-in-the-slot type is the invention of Randolph Shaffer, Albany, Ga., to whom a patent has been issued. The exterior of the fuel container is similar in appearance to that of the usual oil tank and is mounted upon wheels so that it may be moved readily, although means are provided for fastening the device securely. A slot for the insertion of a coin is placed near the top of the vessel and the passage leads to an arm or lever which is connected with another member suitably equipped with a pawl in mesh with a ratchet wheel. The latter is connected with a larger wheel provided with teeth and these are in mesh with a vertical rod which extends downwards to a piston operating in a cylinder in the fuel chamber proper. When a coin is inserted in the slot, the pawl is released and the piston in the chamber descends, forcing a predetermined amount of gasoline through a pipe connected to the piston chamber, upward and out through a suitable nozzle located on the exterior of the vessel. An ingenious arrangement is provided for closing the coin slot when the fuel is exhausted or has reached a certain point. A vertical rod is fitted and this extends upward and into a passage to the coin slot. In conjunction with the rod is a pivotally mounted arm carrying a ball which acts as a float. When the gasoline falls to a predetermined level, the float lever actuates the device in mesh with the toothed rod, and the latter rises, closing the opening into which the coin is inserted, thus preventing loss of the coin as well as signalling that the fuel has become exhausted.

McKee Pneumatic Tire Patch.

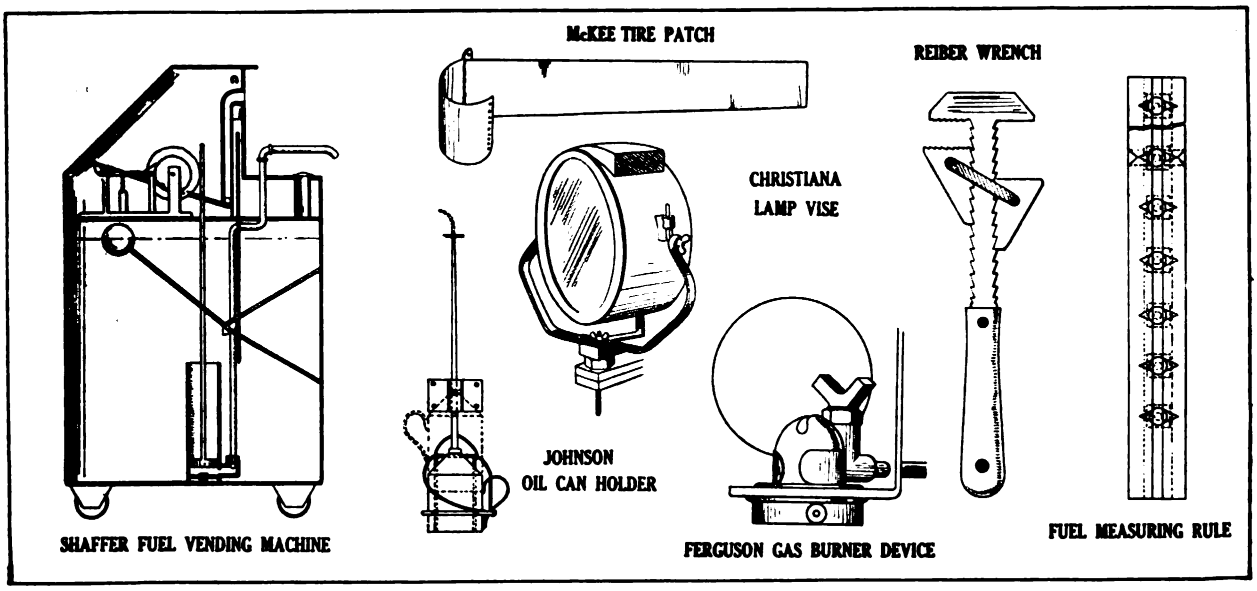
Clarke W. McKee of San Diego, Cal., has been granted a patent for a blow-out patch with which it is claimed that creeping is eliminated. It is constructed of a band of non-elastic material tapered toward one end and of sufficient length to wrap the tire one or more times. The smaller end is tapered while the larger extremity is made of heavier material and provided with a short flap with eye holes for lacing when the device is attached to the shoe. It is claimed that the patch will remain as attached if properly fitted.

Reiber Wrench.

A wrench having adjustable features, also providing means for two different sized openings of the jaws at the same time, has been patented by John Reiber, Huntington, Ore. The shank of the tool is fitted with double stationary jaws, these projecting from opposite sides thereof at one end. The sides of the shank are fitted with a series of teeth, these extending to the handle. A movable jaw on either side of the shank is fitted with teeth corresponding to those on the stationary member and these mesh. The movable jaws are connected by links having pivotal connections and the latter provide an independent movement of each member permitting a step-by-step adjustment. A release is effected by a simultaneous pressure on the movable jaws in the direction of the stationary members.

Gasoline Measuring Rule.

A fuel measuring rule which presents practical features has been patented by Frank M. Edmonds and Russell J. Goodnow, Boston, Edmonds being assignor to Goodnow. It consists of a rod having a number of pointers mounted thereon and these indicators are movable the entire length of the device. Another member is so fitted that it may be slid up or down without interfering with the other indicators. If a fuel tank is to be measured, a gallon or any part of this measure, is poured into the container and the rule inserted, the height of the fluid noted, and the lower indicator set. This operation is continued until the tank is full and the measurements desired obtained. The rule may be calibrated to secure any measurement and the loose sliding member employed to ascertain quantities between the markings.



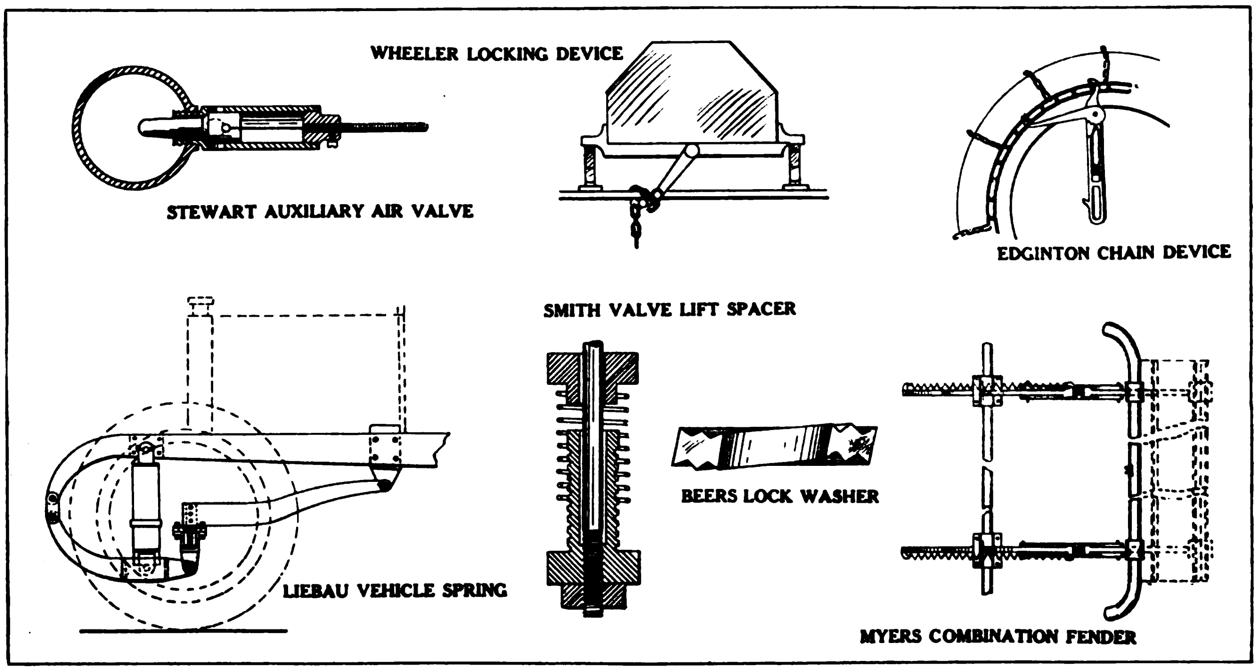
Some Recent Ideas of Inventors Working on Automobile Parts, Accessories and Appliances, Including an Automatic Fuel Vending Machine of the Nickel-in-the-Slot Type.

Christiana Lamp Vise.

A device for holding automobile headlights is the subject of a patent granted to Elmer V. Christiana, Kingston, N. Y. It comprises a base for attachment, and a pair of laterally adjustable oppositely arranged arms mounted upon the base. The lower ends of these members are flat and slotted to fit a bolt or stud having a wing nut for locking the parts securely. An L shaped bracket is also incorporated and held by similar means. The ends of the brackets are provided with means for holding the lamps also wing nuts for clamping the attachment securely.

Ferguson Gas Burner Attachment.

A device for converting oil lamps into acetylene or gas burners has been patented by John Ferguson, New York City. It comprises a spring clip consisting of separable spring jaws to embrace the flame guard of an oil burner. An elbow pipe is fitted securely to the clip, one end of the former being upright and containing means for attaching an acetylene burner. Leading from the elbow is a gas conduit or pipe, this extending through the side of the lamp for means of attaching the tube connecting with the gas container.



Outlining Some of the Ideas of Inventors Working Along Lines Applicable to the Automobile.

Johnson Oil Can Holder.

A patent has been granted Isaac R. Johnson, Milwaukee, Wis., for an oil can holder. It comprises a back brace, part of which is securely fastened to the place of location. To the ends of the rectangular brace is attached a hoop member and a guide rail is incorporated between these parts. A backbone extends from the back brace and the former is fitted with a can nozzle retaining loop, also a bracket for securing the oil can.

Stewart Auxiliary Valve.

A patent has been granted to Alfred C. Stewart, Los Angeles, Cal., for an auxiliary air valve applicable to the intake manifold or pipe of an internal combustion motor. It comprises a cylindrical casing, one end of which is reduced and threaded to fit the manifold. The reduced part has a shoulder forming a seat for a movable valve which seats in a manner similar to a poppet valve. Attached to the valve member is an operating wire enclosed in a flexible housing which leads to any convenient point for service. Near the valve are apertures through which air is drawn when the valve is moved from its seat, and the amount of atmosphere may be regulated.

Wheeler Locking Device.

To prevent the use of the automobile by others than the owner or those intended, Charles A. Wheeler, Bridgeport, Conn., assignor of one-half to the Smith & Egge Manufacturing Company of the same city, has patented a locking device for motor car cranks. It comprises a substantial chain having an elongated socket formed of a series of wire convolutions, one end of the wire being pivotally connected to the chain. The other end is equipped with a padlock. In attaching, the socket is utilized for the handle of the starting crank, the chain wrapped tightly around the cross bar or other suitable place and the padlock secured.

Liebau Vehicle Spring.

A patent for a vehicle spring which presents unusual features, inasmuch as it is designed to combine the function of a spring and shock absorber, has been granted to Richard Liebau, Watervliet, N. Y. Instead of the lower section of the spring being mounted upon the axle it is divided into two sections, that from the body or frame being fastened securely above the axle while the other extremity is pivotally mounted to an extension of the frame. Attached to the goose neck is another spring member, this being secured by a link, while the other end is pivotally mounted and held under the axle. Interposed between the spring and frame is a pneumatic cylinder, also pivotally mounted.

Edgington Chain Tool.

In attaching tire chains, especially worn members, it is sometimes difficult to tighten the chain properly and at the same time snap the retaining hooks into place. William F. Edgington, Springfield, O., assignor of one-half to Alexander Murray of the same city, has invented a chain tightener which consists of two levers, one of which is pivotally mounted and carries a pawl which engages with the smaller member. Both arms are equipped with hooks, these being so constructed as to fit and engage between the links of the outside chain. When the main lever is moved the action brings the hook members together and by means of the ratchet and pawl mechanism the tool is locked, allowing the securing of the locking members of the chain.

Smith Valve Lift Spacer.

Charles W. Smith, Annapolis, Ill., has been granted a patent for a valve lift spacer for internal combustion motors. It comprises a valve mechanism, combining an inlet controlling valve having a stem, and a sleeve mounted upon the latter, and having a screw threaded exterior. Longitudinal grooves intersect the threads, and a valve closing spring and spring lock device are mounted upon the sleeve. The spring is bent into circular form and has a loop at one end and an eye at the other extremity laterally deflected and adapted to interlock with the terminal loop to secure the ends of the wire when brought together. It also has loops or crimps to form a support for the valve closing member and means for contracting the locking device about the sleeve.

Beers Lock Washer.

A patent has been issued to Charles F. Beers of Newark, N. J., for a lock washer which comprises a spirally shaped body having a number of concentric ridges which are triangular in cross section. It is claimed by the inventor that such an arrangement will retain nuts, etc., more securely than those of the spring form.

Myers Bumper and Fender.

Harry T. Myers, Chicago, has been granted a patent for a combined bumper and fender which comprises a two-part bumper and an apron. The upper and lower edges of the latter are attached to the bumper and in a normal position are compactly arranged. Means are provided for opening the apron automatically as well as for separating the parts of the bumper to stretch and hold the apron.

OTHER PATENTS GONE TO ISSUE.

Terminal, William C. Brunt, Boston. A fork shaped spark plug terminal provided with an insulated handle and a set screw to hold secondary wire in said handle.

Steering-Driving Mechanism, Felix A. Eisner, Rochester, N. Y. A driving and steering system in which all four wheels are driven by means of a fluid motor, provision being made in the fluid connections to steering wheel to give differential power effect in turning.

Tire Inflator, Royal L. Foster, Fort Riley, Kan. A rotary pump attached to the axle and wheel spokes, pumping air direct to the tire and to a pressure chamber.

Faucet, Frank M. Ulmer, Philadelphia. A lock faucet for gasoline or other fluids, in which a lock is embodied, the insertion of key in handle being necessary before same can be turned.

Lighter for Gas Burners, Stewart Brown, Chicago, Ill. A spark gap for acetylene burners, in which the sparking wires are held in a base which is movable by means of a thumb screw, enabling it to be adjusted.

Bearing, H. E. Coffin, assignor to the Chalmers Motor Company, Detroit. A bearing for a motor crankshaft, consisting of a disc attached to the shaft between the cranks and bearing on an annular soft metal seat in the crankcase, giving a bearing for each end of each crank and also separating each into a separate gas tight compartment.

Running Gear, David M. Dearing, Jackson, Mich. Automobile running gear in which two members are hinged at the middle, the upper being attached to the frame by the usual elliptic springs, and the lower to the axle. Between the ends of the members are coil springs, so that while the axle may be moved from the horizontal without affecting the elliptic springs, the resistance of the coil springs is met.

Motor, Simon Lake, Milford, Conn. A two-cycle motor in which a chamber is formed in the head, into which gasoline and air is injected to be transformed into a gas by the heat of the chamber and then forced into the combustion chamber by means of air from a pump. The base of the cylinder is also scavenged by a jet of air.

Carburetor, F. H. Walker, Lincoln, Neb. A carburetor for starting motors, in which an inner chamber may be filled with gasoline from which an especially rich mixture can be drawn.

Pneumatic Cushion, F. L. Baker, Orange, Mass. A pneumatic spring, in which the compression chamber is separate from the plunger guides, being between them.

Radiator, J. B. Beam, Punxsutawney, Penn. An automobile cooler in which the radiating sections are removable from the frame.

Lamp, Percy Avery, Milwaukee, Wis. An electric automobile headlight in which the electric bulb may be inserted and removed from the back, without disturbing the glass front. The inner surface of the portion which holds the bulb forms part of the reflecting surface of the lamp.

Rotary Motor, Olof F. Edqvist, Denver, Col. Cylinders are mounted on fixed shaft so that their produced axes do not intersect the axis of rotation. Provision is made to lock pistons against travel and for varying their speed in relation to the cylinders.

Hub Odometer, H. P. C. Browne, New York City. An odometer in combination with the hub cap of a wheel, the cyclometer being operated by means of a plug inserted in a hole in the stationary axle.

Starter, Cornelius Van Tubbergan and Paul Westrate, Grand Rapids, Mich. A starter of the spring type, the spring being attached to a sleeve which may be fitted to the engine shaft by means of a clutch.

Lamp, John H. George, Bridgeport, Conn., assignor to the Hawthorne Manufacturing Company, Inc. An automobile lamp with the reflector held in a holder of sheet metal provided with a threaded projection extending beyond the casing, enabling adjustment of the reflector.

Wrench, George Jurkovitch, Homer City, Penn. The parallel jaws of this both slide upon a frame, to the opposite ends of which handles are attached, so that the jaws are midway between the two handles.

Carburetor, Francis P. Johnson, Oakland, Cal. Is provided with a chamber containing a number of horizontal plates, over which air is forced through the gasoline from the bottom to the top.

MUFFLER NEEDS ATTENTION.

The muffler and exhaust pipe should receive attention if best results from the motor are desired. Cleaning the exhaust pipe is generally easily attended to, but if there should be any trouble owing to bends, the carbon and dirt can be removed by filling the member with small pieces of grit and then shaking well. The muffler itself is best cleaned by placing it in the fire and heating to a fairly bright red. When cool the dirt can be removed easily by tapping or brushing. This does not apply to brass or copper mufflers which should be cleaned by scraping. Sometimes back pressure is caused by too small openings which can be increased. Often these apertures are roughly drilled or punched, with the result that a burr is left on the edges, which considerably impedes the passage of gas by causing eddies at this point.

STARTING ON THE MAGNETO.

Some drivers complain that they cannot start their engine on the magneto although it will respond readily when the battery and coil is utilized. Usually the magneto is blamed, whereas this may not always be the case, but may be due to the carburetor. When some types of motor are being turned over slowly as good a spark is not provided as with the battery and coil, and if the vaporizer be so adjusted as to provide a weak mixture at starting, the flame given out by the magneto is not sufficient to ignite the charge drawn into the cylinder.

This difficulty may be overcome by a readjustment of the mixing device on the low speed, or if no means be provided for this, it is a simple matter to arrange a slide or valve at the end of the main air intake. This may be coupled directly in most cases to a length of .1875-inch steel rod, which can be carried forward in such manner that it may be manipulated from the front of the car. By closing this slide wholly or partially, the mixture will be enriched.

Celluloid Cement—To repair celluloid articles, use three parts alcohol and four parts ether mixed together and applied to the fracture with a brush until the edges become warm. The edges are then stuck together, and left to dry for at least 24 hours.

MEAD NEW AMPLEX HEAD.

An announcement which means much to the industry is that of the retirement of W. J. Mead as vice president and general manager of the Olds Motor Works, Lansing, Mich., maker of the Oldsmobile, to become president and general manager of the reorganized Amplex Motor Car Company, Mishawaka, Ind., maker of Amplex cars. Mr. Mead was also a vice president of the General Motors Company. His place as head of the Oldsmobile establishment has been taken by Oliver C. Hutchinson, the former head of the Marquette Motor Company, Saginaw, Mich., makof Marquette cars.

In the departure of Mr. Mead the General Motors Company loses one of its best known and most capable men. Before his advent in the automobile field, he had made a decided success in the bicycle and sewing machine business. His first motor car experience was with the Jackson Automobile Company, Jackson, Mich., maker of Jackson cars. In 1905 he joined the forces of the Buick Motor Company, Flint, Mich., maker of Buick cars, and for a time was manager of the Chicago salesrooms of that concern. Three years ago he became associated with the Olds Motor Works, and rapidly arose to distinction in the councils of the General Motors Company, acting as its head for a time.

W. J. Mead, President, Amplex Motor Car Company.

Mr. Hutchinson is well known in automobile circles. Under his management the Marquette, the newest production of the General Motors Company, first placed on the market for the 1912 season, has achieved a remarkable success. In this connection, it may be stated that plans are under way which involve the production of an entirely new model for 1913, and the work of Mr. Hutchinson will be carried on by a new manager, whose name the concern does not feel at liberty to divulge at present.

Respecting the Amplex plans, it is stated that under Mr. Mead's direction the factory will be enlarged and brought up-to-date in every particular. It is understood that the sales end will be entirely separate, and that offices will be located in Chicago, probably on Michigan avenue. Special attention will be paid to the matter of the service department, through which owners of Amplex cars will be accorded most efficient co-operation.

MORGAN WITH MARION.

Matthew B. Morgan, one of the best known automobile engineers in the country, has joined the James I. Handley forces as chief engineer of the Marion Motor Car Company. The selection of Mr. Morgan by President Handley provided one of the big surprises of recent date in automobile circles.

Mr. Morgan was chief engineer of the Chalmers Motor Company, Detroit, the past three years, producing the 1910, 1911 and 1912 models. Three years previous to associating himself with the Chalmers interests, Mr. Morgan was with the Olds Motor Works, Lansing, Mich., maker of the Oldsmobile. He first acted as assistant engineer, but was made engineer to take the place of Chief Engineer Dunham when the latter went to the Hudson Motor Car Company. The Oldsmobile six-cylinder is well known as one of his creations.

Before going to the Oldsmobile concern he was with the Packard Motor Car Company, Detroit, and with the Peerless Motor Car Company, Cleveland, O. In the Peerless factory he had work as special assistant to Chief Engineer L. P. Moore. Mr. Morgan says that he can base his fame on having designed the first racing car for Barney Oldfield, the famous "Green Dragon."

TO ESTABLISH BRANCHES.

Howard E. Wagner, until recently sales manager of Wyckoff, Church & Partridge, Inc., New York City, has assumed his duties in the same capacity with the Buffalo Electric Company, Buffalo, N. Y. He will make his headquarters in Buffalo, and will take charge of the work of establishing branch houses in a number of cities throughout the country.

Mr. Wagner's association with the automobile industry dates from 1904, when he had charge of the selling of Pope Waverley electrics at Indianapolis, Ind. From 1906 to 1908 he managed the selling department for Babcock electric carriages for Wyckoff, Church & Partridge in New York, and in the latter year became branch manager for the Babcock Electric Carriage Company in that city.

The Buffalo Electric Company was organized recently with capital of $1,000,000, being a consolidation of various electrical concerns in Buffalo, including the maker of the Babcock electric vehicles. The reorganized firm also will enter the field with electrically driven baggage trucks and commercial vehicles. Branch houses already have been established in Rochester, Buffalo, Chicago and Cleveland, and others undoubtedly will follow in all principal cities.

Howard E. Wagner, Sales Manager, Buffalo Electric Company.

NATIONAL SHOW CIRCUIT.

The National Association of Automobile Manufacturers at a recent meeting in New York City arranged a 12-city circuit for shows during the coming year, the determination for such a plan being announced immediately after a session of the executive committee, and show managers in 12 of the largest cities of the country will assist in promulgating the new idea. Chester I. Campbell, manager of the Boston show, was chairman of the committee appointed to arrange the national dates, as follows:

Cleveland, Jan. 4-11; New York, Jan. 11-18; Philadelphia, Jan. 20-25; Detroit, Jan. 27-Feb. 1; Chicago, Feb. 1-8; Minneapolis, Feb. 10-15; Kansas City, Feb. 17-22; St. Louis, Feb. 24-March 1; Pittsburg, March 3-8; Boston, March 8-15; Buffalo, March 17-22; Indianapolis, March 24-29.

The plan was not adopted until after a lengthy discussion, those present at the meeting finally deciding unanimously that it would result advantageously to both manufacturer and show promoter.

The subject of special trains for the conveyance of exhibits and employees, co-operative advertising and uniform rules also was considered, and a committee was appointed to confer with the Motor and Accessory Manufacturers in an endeavor to procure its co-operation and sanction of the circuit.

It is possible that the summer of 1913 will see a commercial vehicle exhibition and demonstration conducted by the N. A. A. M., which may or may not take the place of the winter shows as now held, this being a subject for which the opinion of the trade will be canvassed. The matter has been referred to the show and commercial vehicle committees.

Other business transacted included the admission to membership of the Auburn Automobile Company, Auburn, Ind., represented by J. I. Farley and the Ideal Motor Car Company, Indianapolis, Ind., represented by E. G. Sourbier. H. R. Bradford was elected to succeed R. A. Palmer as representative of the Cartercar Company, Pontiac, Mich., and H. W. Taylor to succeed B. A. Becker of the Elmore Manufacturing Company, Clyde, O. The membership formerly held by W. J. Groves, representing the Mack Bros. Motor Car Company, was transferred to C. P. Coleman, representing the International Motor Company, New York City, of which the Mack concern is now a constituent.

Show managers present were: Louis Block, Philadelphia Automobile Trade Association; T. I. Cochran, Pittsburg Automobile Show Association; A. E. Doherty, Automobile Show Association of Pittsburg; F. W. Paynes, St. Louis Automobile Dealers' Association; H. E. Pence, Minneapolis Automobile Show Associa- Association; F. H. Calet, F. C. Wood, Cleveland tion; W. F. V. Neumann, Detroit Automobile Dealers' Automobile Show Company; Chester I. Campbell, Boston Automobile Dealers' Association; H. L. Archey, Indianapolis Automobile Trade Association; A. L. Pope and S. A. Miles of the N. A. A. M. show committee.

TO SELL O. N. L. Y. CAR.

A meeting of the stockholders and directors of the Southern Only Motor Car Company of Delaware, was recently held at the offices, 209-11 Bisbee building, Jacksonville, Fla. This company is the distributor for the O. N. L. Y. car, which was to make its appearance this month. The new car is equipped with a 90 horsepower motor, which, the manufacturer claims, will run 30 miles on a gallon of gasoline. The company is also distributor for the Dayton airless tires and other new accessories.

BENSON WITH STUDEBAKER

Ernest R. Benson recently was appointed sales manager of the Studebaker Corporation, Detroit, after having been connected with the Cadillac Motor Car Company in the same capacity for five years, and the move has attracted considerable attention in automobile circles. He is numbered by those who are qualified to know, as one of the pioneers in placing automobile selling on a firm basis, where the prices and service of high grade cars are as well established as in other lines of successful business endeavor.

E. R. Benson, Sales Manager, Studebaker Corporation.

Mr. Benson has earned the name of business builder, having a reputation for creating a solid and permanent volume of sales, and of securing the confidence of the manufacturer, dealer and customer. During his experience he has been a sales organizer, engaged with dealers in managing selling arrangements. His first connection was with the Pope Manufacturing Company, Hartford, Conn., with which concern he was associated for 12 years, as a member of the sales organization. He then joined the sporting goods house of A. G. Spaulding & Bro., working in the sales department for four years. Returning to Hartford, he became secretary of the Hartford Rubber Works Company in charge of the New England sales.

It was from this office that he went to the Cadillac as manager of sales. In this he succeeded in building up the business along well founded principles, creating a permanent and loyal body of dealers. This quality of developing a loyal force of dealers coupled with his ability to sense the future of the markets and lay plans accordingly makes Mr. Benson a valuable acquisition to the Studebaker organization.

REPUBLIC TIRES IN CLEVELAND.

To care for its rapidly growing trade in the district, the Republic Rubber Company of Youngstown, O., maker of Republic tires, recently opened a factory branch at 5919 Euclid avenue, Cleveland. The new branch is to be in charge of B. C. Swinehart, who has been situated at the factory for the past 2.5 years, where he has charge of the solid tire department, and who will continue this work in addition to his new duties. He has been closely associated with the rubber business for the past 12 years.

Members of the Society of Automobile Engineers, Their Wives and Children, in Attendance upon the Annual

THE HAYNES HOUSE PARTY.

The first annual house party of the Haynes Automobile Company, maker of Haynes cars, was held at the new factory of this concern in Kokomo, Ind., late last month. More than 300 invitations had been issued to Haynes agents and dealers, and others connected with the industry, and over 200 were registered when the proceedings were called to order by General Manager Warren. The first business of the convention, if such it may be termed, was the presentation of 50 certificates, good as gold in any store in town, to each of the visitors. The object was to make it unnecessary for the guests to spend a cent during their stay in Kokomo.

Among those present were the following:

Edward Anderson, Diamond Rubber Company, Chicago; Miss Armstrong, New Albany, Ind.; J. L. Ashbaugh, Indianapolis.

H. G. Bosler, Indianapolis; Edward A. and Omar L. Banschbach, Haynes Automobile Company, Chicago; J. H. Bridger, Colorado Springs, Col.; J. T. Bishop, Cleveland, O.; Walter A. Bermingham, Chicago; T. J. Butler, Harrison, N. J.; Orville Barnett, Maroa, Ill.; Peter Beyrent, Scranton, Penn.; B. W. Baxter, Haynes Automobile Company, Indianapolis; George Brown, Indianapolis; C. C. Blodget, New York City; R. N. Brady, National Acme Manufacturing Company, Cleveland, O.; C. G. Beck, Portland, Ind.; C. S. Beck, Marion, Ind.; V. Bendix, Kokomo, Ind.; T. W. Brotherton, Jr., Haynes Auto Sales Company, Los Angeles, Cal.; E. L. and E. M. Brown, Marshall Auto and Machine Company, Marshall, Mo.; H. R. Baurmann, Chicago; F. M. Blessing, Mueller Implement & Auto Company, Delphos, Ind.

Mrs. H. D. Chapin, Muncie, Ind.; W. J. Caughy, Farmer Auto Company, St. Joseph, Mo.; B. Cooley, Galena Auto Company, Galena, Kan.; F. R. and C. R. Carson, F. R. Carson & Son, South Bend, Ind.; L. S. Conarroe, Goodnight & Conarroe, Kempton, Ind.; G. and D. Cordell, Hagerstown, Ind.; R. N. Crawford, Chicago; Mr. and Mrs. W. B. Cochran, Haynes Auto Sales Company, San Francisco, Cal.; St. Clair Couzens, Chicago; Charles A. Chevraux, Cleveland-Canton Spring Company, Canton, O.; H. D. Chapel, Haynes-Automobile Company, Chicago; C. C. Cartwright, Portland, Ind.; Mr. Courd, Hagerstown, Ind.

James M. Dunlap, Dunlap-Ward Advertising Company, Chicago; Mr. Deb, Hagerstown, Ind.; O. M. Dale, O. M. Dale Company, Franklin, Penn.; D. L. Dider, Haynes Automobile Company, Kansas City, Kan.; Thomas Diager and E. H. Diohy, Haynes Automobile Company, Chicago; Mr. and Mrs. Charles E. Davis, Warner Gear Company, Muncie, Ind.; Charles C. Dodge, Wyman & Gordon Company, Worcester, Mass.; Paul Doran, Santa Fe, N. M.; E. J. Disher, Buffalo, N. Y.; Edward A. Dauer, Providence, R. I.

C. O. Eal and Mr. Ensley, Hagerstown, Ind.; R. H. Eckenroth, Eckenroth Sales Company, Cleveland, O.

J. H. Ferryman, South Bend, Ind.; R. V. Faulkner, Haynes Automobile Company, Indianapolis; H. W. Faurer, Diamond Rubber Company, Indianapolis; A. B. Fairchild, Chicago; A. R. Fernald, Mathews, Kaye, Mann & Co., Detroit; R. R. Ferguson, Haynes Automobile Company, Philadelphia.

C. G. Gray, Reimers Motor Car Company, Louisville, Ky.; Mr. Green and Mr. Grove, Hagerstown, Ind.; C. E. Gordon, Timken products, Detroit; E. E. Grady, Chicago; F. C. Gilbert, Timken-Detroit Axle Company, Detroit; F. W. Graessle, Stilz & Graessle, Nashville, Tenn.; L. Mac Goodwin, Raleigh Motor Car Company, Raleigh, N. C.; F. A. Gibson, Northwestern Garage, Kansas City, Kan.; C. H. Gurnett, Chicago; A. H. Gunder, Fairmount, Ill.; B. E. Griffey, B. E. Griffey Company, Indianapolis; T. E. Goodnight, Goodnight & Conarroe, Kempton, Ind.

G. Hoyt, Tri-State Supply Company, White Plains, N. Y.; C. H. Haynes, Dallas, Tex.; M. C. Hann, Haynes Automobile Company, Chicago; W. M. Haynes, Portland, Ind.; Mr. Hawkins, Hagerstown, Ind; Robert E. Hosea, McCullough Motor Supply Company, Indianapolis; D. L. Hogen, Konkakee, Ill.; Frank Horn, Haynes Automobile Company, Santa Fe, N. M.; Frank G. Hood, Haynes Auto Sales Company, San Francisco; R. L. and G. M. Haughey, Sheridan, Ind.; E. G. Hunter, McCord Manufacturing Company, Detroit; E. W. Headington, Haynes Automobile Company, New York City; F. C. Headington, Haynes Automobile Company, Indianapolis.

A. J. Interreiden, Warner Instrument Company, New York City.

HAYNES
HOUSE PARTY

Guests of the Haynes Automobile Company Assembled at Kokomo, Ind., for the First House Party of

Midsummer Convention, Soon After the Arrival of the Good Ship City of Detroit II at Mackinac Island.

A. H. Jones, Hastings, Neb.; H. L. Jones, Chicago; Mr. and Mrs. M. W. Jennings, Hellman Motor Car Company, Cincinnati, O.; C. T. Jay, C. T. J. Motor Company, New Orleans, La.; James H. Johnson, Johnson Motor Car Company, Philadelphia; C. E. Jordan, Springfield, O.; Miss Jennings, Chicago; W. T. Jay, New Orleans, La.

R. Kelley, Jr., Kelley Auto Company, Youngstown, O.; S. L. Krebs, Swarthmore, Penn.; W. C. Knight, Warner Instrument Company, Indianapolis; J. L. Keeling, Campbell & Keeling, Joliet, Ill.; A. A. King, Chicago.

Mr. Lamb, Hagerstown, Ind.; Percy Leach, South Bend, Ind.; N. C. Lipsitz, Muncie Foundry & Machine Company, Muncie, Ind.; Fred Lehman, Canton, O.; B. M. Leece, Leece-Neville Company, Cleveland, O.; J. A. Long, Portland Body Works, Portland, Ind.

L. L. Magruder, Augusta Machine Company, Augusta, Ga.; C. L. Magruder, Haynes Automobile Company, Danville, Ill.; James S. Marlow, Holcomb Steel Company, Indianapolis; Mr. and Mrs. Lester McCullough, McCullough Motor Supply Company, Indianapolis; Lee W. Maxwell, Chicago; Mr. Murray and Mr. Morris, Hagerstown, Ind.; W. J. Morgan, American Automobile Association, New York City; W. S. McHaffey, Haynes Automobile Company, Chicago.

Fritz Neef, Eisemann Magneto Company, New York City; S. M. Neville, Leece-Neville Company, Cleveland, O.; S. R. Nowlin, Maroa, Ill.; R. J. Nightingale, Willard Storage Battery Company, Cleveland, O.

Frank A. Osburn, Timken products, Detroit; Edgar Oliver, Muncie, Ind.; L. F. O'Donnell, Haynes Automobile Company, Jacksonville, Ill.

John P. and James G. Parker, Maroa, Ill.; H. M. Paine, Paine Automobile Company, St. Louis, Mo.; H. A. Paxton, Paxton's Garage, Bucyrus, O.; H. W. Paton, Detroit Carriage Company, Detroit; E. P. Poyer, Chicago; Edward Politz and G. E. Porter, Haynes Automobile Company, Chicago; Mr. Paul, Hagerstown, Ind.

J. F. Ross, Louisville, Ky.; H. Harvey Roemer, Catalogue Service Corporation, Indianapolis; Joseph D. Rourk, Brooklyn, N. Y.; Carl G. Reimers, Reimers Motor Car Company, Louisville, Ky.; Mr. Rowe, Hagerstown, Ind.; W. L. Russell, W. L. Russell Company, Boston; W. H. Reed, Portland, Ind.; F. A. Ross, Warner Instrument Company, Beloit, Wis.; Paul Morse Richards, New York City.

O. P. Stehn, Hydraulic Pressed Steel Company, Cleveland, O.; George H. Smith, Portland, Ind.; B. S. Snell, Stilz & Graessle, Nashville, Tenn.; C. R. Schuyler, Haynes Automobile Company, Newark, N. J.; Lewis C. Smith, Portland Body Works, Portland, Ind.; J. O. Stone, Stone's Alarm Device, Tipton, Ind.; Charles W. Stone, Tipton, Ind.; L. A. Safford, Chicago; Mr. Starr, Hagerstown, Ind.; T. H. Shiff, Paine Automobile Company, St. Louis, Mo.; Zi See and Chi Tin Sun, Lafayette, Ind.

T. L. Tincher, Haynes Automobile Company, Santa Fe, N. M.; R. C. Thomas, Calgary, Alta., Canada; C. N. Teeter, Light Inspection Car Company, Hagerstown, Ind.; Neil Thomas, Kokomo, Ind.; Lother, M. I. and B. Teeter, Hagertown, Ind.; H. A. Townsley, Haynes Automobile Company, Akron, O.

D. P. Vanmeter, Marshall Auto & Machine Company, Marshall, Mo.

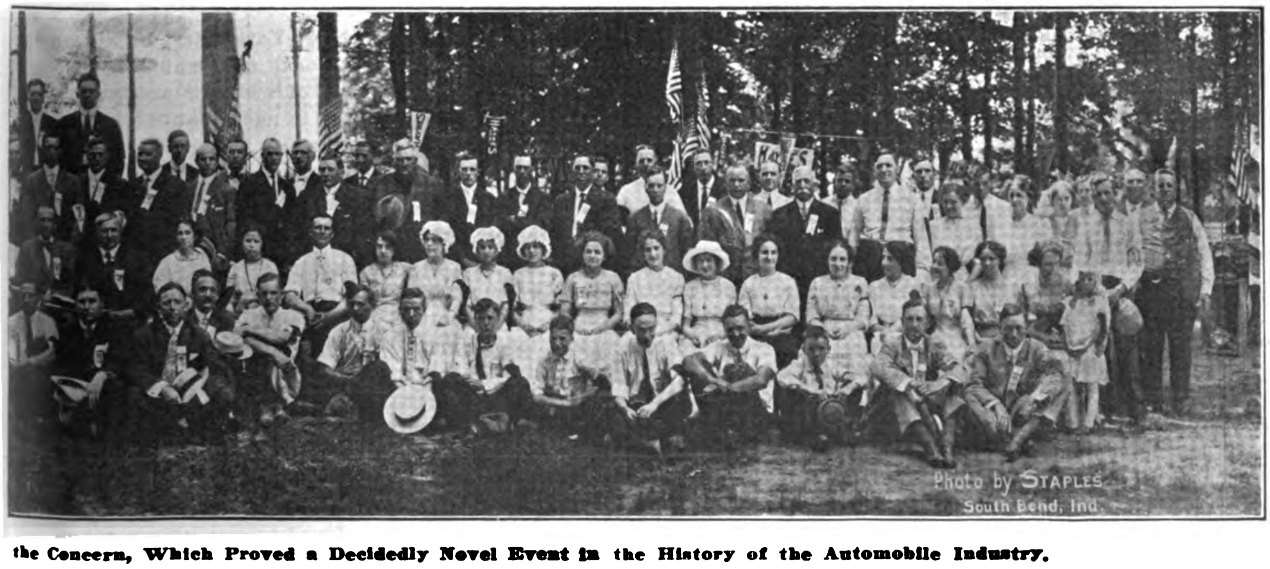
E. G. Westlake, Chicago; E. W. Werick, Werick Bros. Motor Car Company, Buffalo, N. Y.; C. D. Wright, New York City; Evander Williams, Evander Williams & Co., Memphis, Tenn.; J. E. Williams, Chicago.

Lloyd Yount, Yount & Ewry, Portland, Ind.

A. M. Zimbrich, Rochester, N. Y.; E. C. Zaring, Haynes Automobile Company, Indianapolis.

ENGINEERS' MIDSUMMER MEETING.

The annual midsummer meeting of the Society of Automobile Engineers was held in Detroit, June 27-29. That is to say, Detroit was the rendezvous of something over 250 members, their wives and children, aside from those who reside in that city and vicinity, while the meetings to listen to reports of officers and committees and to discuss the interesting papers presented, were held on board the steamer City of Detroit II en route to Mackinac and return. Incidentally, the selection of Mackinac island proved wise, inasmuch as automobiles are rigorously excluded from the domains and the engineers had ample opportunity to forget their usual vocations entirely.



the Concern, Which Proved a Decidedly Novel Event in the History of the Automobile Industry.

TRUFFAULT-HARTFORDS IN RACING.

Special attention is being paid to the matter of accessories fitted to cars taking part in the important racing events this year, and it is of particular interest to note that Truffault-Hartford shock absorbers, made by the Hartford Suspension Company, Jersey City, N. J., were employed on all of the first nine prize winners in the recent 500-mile race on the Indianapolis motor speedway. Dawson's National, which won the first prize, utilized a double set of these shock absorbers, and it is stated that they aided materially in making it possible to maintain an average speed of 78.72 miles an hour. In accordance with its announcement the Hartford Suspension Company has paid the following special prizes as the result of the work done by Truffault-Hartford equipped cars in this event: First, Dawson, National, $250; second, Tetzlaff, Fiat, $150; third, Hughes, Mercer, $100.

MARMON COMPANY EXPANDS.

In order that it may be able to increase its output to meet the demand created for Marmon cars, the Nordyke & Marmon Company, Indianapolis, Ind., has made arrangements for substantial additions to its plant. A new office building is to be erected, this being a two-story brick structure, 43 by 155 feet. The general and executive offices will be located on the first floor, and the enlarged drafting rooms on the second. Two stories, 52 by 243 feet, also will be added to one of the factory buildings.

CATARACT TIRE GUARANTEE.

The Cataract Rubber Company, Buffalo, N. Y., which was organized about a year ago, is placing in the market a guaranteed tire, in the production of which a liberal use of the finest Para rubber and selected Sea Island cotton plays a prominent part. The maker has given the Cataract tire every test, and it has been abundantly indicated that the consumer is certain of securing a service of 6000 to 8000 miles. Branch offices have been established in a number of cities, included among which are Boston, Mass., and Providence, R. I. The officers are: President, William J. Bullock; first vice president, Samuel J. Greene; second vice president, George N. Steere; treasurer, Francis M. Adams; secretary, Edwin P. Dodge. The concern is capitalized for $500,000. The manager of the Boston branch, which is located at 1002 Boylston street, is I. C. Emery.

R-C-H IN DEMAND ABROAD.

Since the first R-C-H car was shipped from the factory of the R-C-H Corporation, Detroit, a little over six months ago, it has achieved considerable popularity abroad. At present dealers are handling it in 28 different countries, with hundreds of cars in operation. This representation is not confined to any one section of the globe, for the cars are to be seen on every continent and in all the principal countries. All the cars are shipped complete, with the regular bodies, in contrast to much of the export trade in automobiles, which is in the chassis alone, the bodies being built abroad according to foreign ideas.

NEW BARRETT JACK FACTORY.

Five acres of ground on Preble avenue, Northside, Pittsburg, Penn., on the lines of the Pennsylvania and Baltimore & Ohio railroads, have been purchased by the Duff Manufacturing Company of Pittsburg, exclusive maker of Barrett lifting jacks. Work is to be started at once on the erection of a new factory building, which, when completed, will be the largest in the world devoted exclusively to the manufacture of lifting jacks. The new site, and that of the Pittsburg Screw & Bolt Company occupy the Riter Conley Company's property and that adjacent thereto, totalling about 12 acres. The Duff Manufacturing Company's products comprise the largest line of lifting jacks in the world, ranging in capacity from 1000 pounds to those capable of lifting 500 tons and over.

VULCAN PLANT IN CANADA.

When the first spade of dirt was turned, preparatory to building a new factory in Wetaskiwin, Alberta, Can., for the Vulcan Automobile Company, work was started that will make automobile history, not only in Canada, but possibly in this country. It is the plan of the officers of the new company to manufacture an all-Canadian automobile as soon as operations can be commenced after the completion of the plant. Work is being pushed forward as rapidly as possible on the new structure, and it is understood that the firm plans to begin manufacturing this fall. Announcement concerning the style of cars to be made and other information is expected to be forthcoming at an early date.

DEATH OF A. W. HARRIS.

The industry will be deeply grieved to learn of the death of A. Walter Harris, head of the A. W. Harris Oil Company, Providence, R. I., in that city, June 30. Mr. Harris may be regarded as one of the pioneer oil men of the industry; in fact, the A. W. Harris Oil Company was organized some 28 years ago and was engaged in the production of cylinder oils for steam engines and other purposes long before the practicability of the automobile was considered as established. It may be added that the business of the concern will be continued as in the past, Mr. Harris' associates assuming the burdens laid down by him.

NEW TIRE MADE IN SECTIONS.

Jacques Bustanoby of New York City has been granted a patent for a motor car tire which is constructed in four sections, each of which is a complete air chamber and bolted to rim in such manner that it may be removed without disturbing the others, in the event of a puncture or a blowout.

DIAMONDS IN MOTOR CAR INDUSTRY.

It is not generally known that diamonds are utilized in the manufacture of automobiles, but the gems are so employed for the purpose of truing emery and other abrasive wheels used in grinding, a process that plays an important part in motor car construction. Parts that were formerly filed or machined in different ways, are now finished by being ground with emery wheels revolving at a high rate of speed. These must be kept true, and like any other cutting tool are so hard that diamonds are employed to smooth up rough and uneven places.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

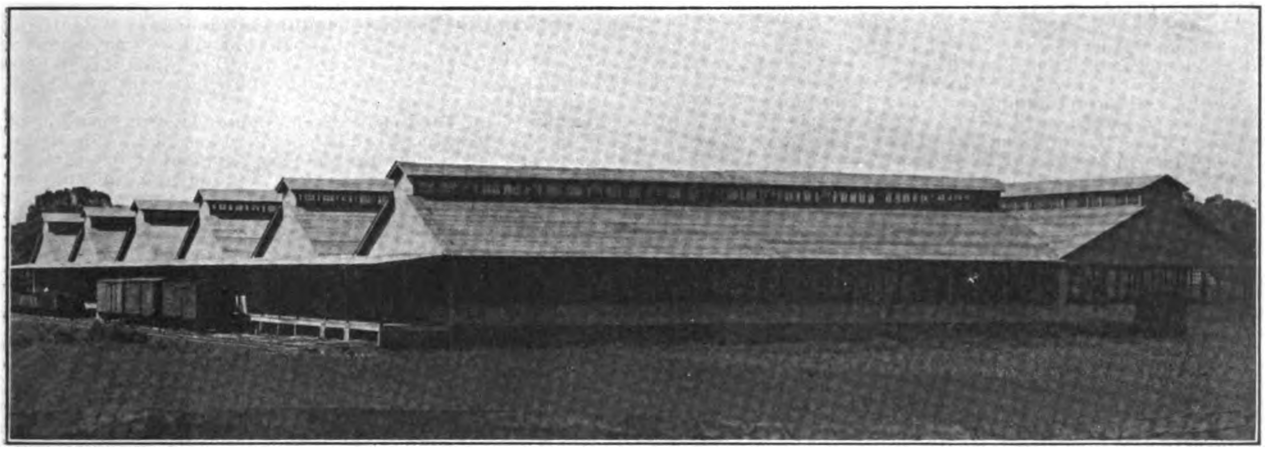
Hexolene Lubricating Company, Inc., New York City; $6250; to manufacture lubricants for automobiles and other machinery; incorporators, Fred Lesser, Norman Ehrenthal, Herman Block.

The Henry Engineering Company, New York City; $20,000; to design and manufacture parts for motors, automobiles, etc.; incorporators, George L. Henry, Henry W. Badenhausen, Myron F. Hill.

White Automobile Company, Indianapolis, Ind.; $2000; to deal in automobiles; incorporators, R. D. Eagelfield, J. H. Darling, G. W. Fuller.

Paris Auto Transfer Company, Nashville, Tenn.; $2500; incorporators, F. L. Hensler, M. H. Gholston, F. P. Johnson, J. H. Cooper and J. M. Shackleford.

Auburn Wheel and Manufacturing Company, Auburn, R. I.; $60,000; to manufacture automobile wheels and other parts; incorporators, George Wilkinson, Fred Edgeworth, Bernard T. Egan.



Factory of the Penn Motor Car Company at New Castle, Penn., with Main Building, 510 by 60 Feet, and Six Wings, Each 150 by 60 Feet.

Sacramento Co-Operative Company, Sacramento, Cal.; $200,000; incorporators, T. J. O'Kelly, T. J. Benson, J. W. Shanks, T. R. Simpson and Bert Leek.

Drake Railway Auto Truck Company, New York City; $250,000; incorporators, F. E. Drake, A. Bauer, H. B. Tibbetts.

Mohawk Tire Company, Syracuse, N. Y.; $6000; to manufacture automobile tires; incorporators, Henry J. Moses, Winifred G. Rice, Clarence B. Rice.

W. F. Kerr Auto Supply Company, Inc., Philadelphia, Penn.; $5000; incorporators, L. C. Lee, William Embery, E. J. Laughlin.

General Auto Company, Camden, N. J.; $50,000; incorporators, Frank A. Kuntz, F. Stanley Saurman, Frank S. Muzzey.

Universal Car Company, Wilmington, Del.; $3,000,000; incorporators, E. E. McWhiney, William J. Mahoney, Herbert E. Latter.

The Amplex Motor Car Company, Wilmington, Del.; $1,000,000; incorporators, E. E. McWhiney, William L. Mahoney, Norman P. Coffin.

Baxter Side Car Company, Boston, Mass.; $20,000; to deal in motorcycles, motor vehicles, etc.; president, William P. Everts; treasurer, John R. Lazonby, and Edward T. Roche.

Plymouth Auto Company, Plymouth, Mass.; $2000; incorporators, Howard F. Eaton, Harriet M. Eaton, Carrie W. Finney.

Stewart Motor Corporation, Buffalo, N. Y.; $250,000; incorporators, Charles J. Bork, Bernard L. Fisher, William F. Strasmer.

Central Garage, Jacksonville, Fla.; $5000; to operate a garage; incorporators, J. S. Arnold, Jr., P. E. Harry, H. V. Arnold.

The Central Garage Company, Indianapolis, Ind.; $5000; incorporators, Walter Howe, Kirke Howe, H. R. Sterling.

The Aristos Company, Boston, Mass.; $1000; to sell automobiles on commission; directors, Treasurer C. D. Knapp, A. Leslie Harwood, Jr. and Thomas D. Luce, Jr.

Esco Sales Company, Niagara Falls, N. Y.; $10,000; incorporators, Joseph Dovesmith, Spencer B. Parker, Charles Gombert.

The Apple Electric Company, Dayton, O.; $300,000; to manufacture and deal in electrical ignition and starting systems for motor cars and all kinds of gasoline engines; incorporators, V. G. Apple, Oscar Apple, J. C. Slager, Clarence Keifer, Carl Bauman.

Forest City Automobile Company, Forest City, Me.; $10,000; incorporators, C. V. Robbins, W. B. Clark, J. A. Clark, J. L. Clark.

West Twenty-Fifth Supply & Garage Company, Cleveland, O.; $10,000; to deal in motor cars; incorporators, R. H. Robinson, O. W. Lillard, R. Schama.

Motor Transportation Company, Kenosha, Wis.; $25,000; to operate a motor delivery; incorporators, P. E. Haworth, P. W. Herman, I. Spencer Cox.

Knickerbocker Commercial Vehicle Company, New York City; $300,000; to manufacture commercial vehicles; incorporators, E. A. Dillenbeck, J. B. Williams, E. A. Smith.

Canadian Overman Company, Inc., New York City; $20,000; incorporators, A. Z. Gray, W. A. Pease, Jr., L. Wilmerding, D. Sage.

Roberts & Sherburne, Inc., Boston, Mass.; $30,000; incorporators, Edward R. Sherburne, W. Medford, Frank L. Roberts, William H. Whalen.

V-C Motor Company, Augusta, Me.; $100,000; to deal in motor cars; incorporators, Horace Mitchell, C. E. Smothers, William E. Sisk.

The Automobile Vehicle Corporation, Buffalo, N. Y.; $20,000; incorporators, L. A. Kenyon, Frank H. O'Neill, Otto A. Hagelm, James C. Fox.

Egypt Garage & Machine Company, Scituate, Mass.; $6500; incorporators, William E. Chaffin, Charles M. Litchfield, Charles W. Peare.

Shafer, Decker Company, Rochester, N. Y.; $50,000; president, Charles H. Shafer; treasurer, C. P. Hugo Schoellkopf; general manager, Frederick J. Decker; secretary, James B. Shanly.

Merchants Motor Service Corporation, Philadelphia, Penn.; $100,000; incorporators, William Vees, George B. Tets, George L. Oddy, Nathan W. Bushby.

The Worcester Spring Company, Worcester, Mass.; $25,000; to manufacture springs, etc.; incorporators, Charles B. S. Jackson, G. A. McKenzie, C. E. Sampson.

Seaton Wheel Company, Nashville, Tenn.; $130,000; to manufacture automobile wheels; incorporators, G. Jackson, Samuel S. Lord, B. C. Seaton, John T. Landis, J. Ray Boone.

Goldfinger Auto Renting Company, New York City; $2000; incorporators, Benedict Goldfinger, Walter E. Fisher, Isaac Wolf.

The Walker Tire Chain Company, Toledo, O.; $150,000;

incorporators, Henry F. Rohrman, Charles A. Newman Charles P. Eger, A. M. Edwards, George C. Bryce.

Saratoga Auto Company, Brooklyn, N. Y.; $5000; to deal in motor cars; incorporators, George D. Smith, 2123 Metropolitan avenue; Harry A. Bogard and Emily J. Bogard, both of 18 Furman avenue.

D. K. & D. Company, New York City, $5000; to manufacture motors; incorporators, Eckford D. DeKay, Sidney G. DeKay, Andrew C. Dam.

C. & T. Auto Specialty Company, New York City; $10,000; to deal in motor accessories; incorporators, George F. Connelley, John J. Treacy, John R. Hunt.

Service Recorder Company, New York City; $10,000; to manufacture automobile devices; incorporators, Harold F. Seymour, Frederick Seymour, Benjamin N. Levy.

Todd & Courtney Company, Barberton, O.; $10,000; incorporators, J. H. Todd, O. I. Courtney, L. E. Courtney, C. C. Courtney.

Federal Auto Accessories Company, Columbus, O.; $2000; incorporators, J. R. Loofburrow, H. M. McDonald, W. C. Wetherhold, E. J. Mace, M. L. Mace.

Schacht Motor Car Company, Los Angeles, Cal.; $100,000; incorporators, O. A. Walling, William Dietz, W. T. Kreitz.

Harvard Garage Company, Boston, Mass.; $5000; incorporators, E. F. Blake, John B. Lynch, W. E. Collins.

The Buroff-Fuller Motor Company, Watertown, Wis.; $30,000; incorporators, John M. Sorlie, Edward R. Buchholz, Martin O. Larson, Ragnvald Strum.

Brooks Motor Car Company, Buffalo, N. Y.; $100,000; incorporators, Herman G. Rechsteainer, George B. North, B. O. Kerr.

Electric City Specialty Company, Buffalo, N. Y.; $25,000; automobile specialties; incorporators, Joseph E. Stark, John H. Beer, Ida E. Stark.

Peninsular Automobile Company, San Francisco, Cal.; $15,000; to deal in motor cars; incorporators, H. E. Holmes, John D. Gish, W. T. Chubbuck.

Hippe Motor Car Company, Chilton, Wis.; $15,000; to deal in motor cars; incorporators, Robert H. Hippe, Herman Gierow, F. J. Egerer, George J. Berger.

A. B. Manufacturing Company, Poughkeepsie, N. Y.; $200,000; incorporators, Max A. Kotzen, Jacob Lichtenstein, Ralph H. Raphael.

Whiteboro Motor Car & Garage Company, Utica, N. Y.; $1000; incorporators, J. Webster Rogers, Mabelle G. Malsan, Adrian S. Malsan.

Stanley Automobile Company, Louisville, Ky.; $2000; incorporators, E. C. Walker, George H. Laib, W. B. Young.

Auto Repair Company, Savannah, Ga., $10,000; incorporators, Shelby Myrick and others.

C. D. Franke & Co., Charleston, S. C.; $250,000; incorporators, Emil H. Johnz and Julius H. Johnz.

Robinson Automobile Company, Charleston, S. C.; $20,000; incorporators, C. B. Huiet, Walter B. Wilbur, J. T. and V. F. Robinson.

Fiat Motor Car Company, Memphis, Tenn.; $20,000; incorporators, O. C. Fleumer, Nelson E. Taylor, H. O. Bell, J. W. Kirkpatrick and J. E. McCadden.

Newark Auto Truck Manufacturing Company, Newark, N. J.; $500,000; incorporators, L. W. Babbage, H. H. Poole, J. T. Walsh.

Brooks Motor Car Company, Buffalo, N. Y.; $100,000; incorporators, H. G. Rechtsteiner, G. B. North, E. O. Kerr.

Ohio Motor Car Distributing Company, Chicago, Ill.; $5000; to manufacture and deal in automobiles, motor vehicles, bicycles, etc.; incorporators, Joseph Slotow, Samuel C. Wood, Fred C. Churchill.

Dunn Flyer Company, Boston, Mass.; $50,000; aerial craft, etc.; directors, Stephen C. Burgoyne, C. D. Woodbury, R. Cushman.

Hubmark Rubber Company, Boston, Mass.; $25,000; to manufacture rubber goods, tires, etc.; incorporators, George H. Mayo, O. W. Smith, W. H. Mayo.

Perfection Aero-Navigation Company, Pittsburg, Penn.; $200,000; incorporators, Dyke Smith, Joseph Sinkovitz, W. L. Mooks.

Everitt Motor Car Company, Wilmington, Del.; $3,000,000; incorporators, Byron F. Everitt, Paul Smith, Harry W. Davis.

Field Electric 'Bus Company, New York City; to manufacture electric cabs, etc.; $10,000; incorporators, William Eastman, C. J. Field, Burgess Osterhout.

Garden Taxicab Company, New York City; $15,000; incorporators, Richard Gruen, G. R. Schulze, J. J. Harvey.

Knickerbocker Motor Car Sales Company, New York City; $10,000; incorporators, Benjamin Harris, R. L. Noah, William L. Robertson.

Trojan Rubber Company, Stamford, Conn.; $50,000; incorporators, E. G. Hoffman, C. F. Waterbury, E. H. Johnson, Robert A. Fosdick, W. H. Taylor.

Westwood Auto Garage Company, Westwood, N. J.; $10,000; incorporators, Walter Peveraly, A. H. Steele, Walter Halliday.

The Stark Rubber & Novelty Company, Canton, O.; $100,000; incorporators, J. J. Lisbae, Walter A. Stafford, D. L. Holwick, Lester King, W. E. Scherer.

The Lansden Company, Allentown, Penn.; to manufacture and sell motors; $1,000,000; incorporators, William D. Schantz, W. L. Case, W. J. Maloney.

WITH THE MANUFACTURER

The Eberly & Orris Company, Mechanicsburg, Penn., maker of wheels and spokes, has completed an addition to its plant, which is being used for the manufacture of automobile wheels entirely. The latest machinery for this work has been installed and the plant is in full operation.

The Clark Motor Company, one of the largest industries in Jackson, Mich., denies the report that it is contemplating the removal of its plant from the Michigan city.

The Automatic Starter Company was recently incorporated in St. Louis, Mo., with a capital stock of $50,000. The concern will manufacture an automobile starter, which is the invention of John J. Cochran of St. Louis. It can be built into an automoile engine or can be attached to it. It uses gasoline from the carburetor and operates by the pushing of a button. It is planned to build a factory in St. Louis.

Henry W. Ford, president of the Ford Motor Company, Detroit, has gone to Europe for the summer. He is taking the trip mainly for recreation, although he will visit many of the plants abroad.

The Warner Instrument Company, Beloit, Wis., maker of automobile speed indicators, is having a large addition built to its plant in South Beloit. The new structure it is claimed, will give the firm three times its present manufacturing capacity.

The C. R. Wilson Body Company, Detroit, has closed bids for a $75,000 factory building. The new plant will be five stories in height, 171 by 101 feet, and will be of brick and steel construction.

The Detroit Electric Appliance Company, Detroit, has closed a contract with the Oakland Motor Car Company, whereby the Deaco combined lighting and high-tension ignition system will be part of the equipment of the 1913 Oaklands.

The Argo Electric Vehicle Company, Saginaw, Mich., is making extensive additions to its plant. A new concrete and steel building, 140 by 160 feet, two stories in height, is being erected with foundations of sufficient strength so that several more stories may be added. With this building completed the company will be enabled to increase its output 100 per cent.

The England Manufacturing Company, producers of metal stampings and automobile accessories, formerly in Amesbury, Mass., has taken factory buildings in Detroit, at one time occupied by the King Motor Car Company. The concern is planning an enlargement of its business.

The Havers Motor Car Company, with factory headquarters located at Port Huron, Mich., is planning some extensive improvements and a considerable addition to its factory this fall. The plant at the present time is devoted exclusively to the manufacture of the Havers six-cylinder motors, and utilizes about 150,000 square feet of floor space.

The Panama Manufacturing Company has been formed in Malvern, Ark., for the purpose of making motor-driven trucks. S. F. Sherman of Chattanooga, Tenn., is president of the new concern, and it is said considerable Tennessee capital is interested in the project.

The Park Motor Car Company of Cleveland, O., recently increased its capital stock from $10,000 to $15,000, and changed its name to the Park Motor & Manufacturing Company.

The R-C-H Corporation, Detroit, recently signed contracts with J. A. Vilmure, Assumption, Ill., and G. C. Walker, Granville, N. Y., giving them the exclusive agency for the different models of the R-C-H cars in their respective territories.

The Triumph Manufacturing Company, maker of motorcycles, located at Detroit, Mich., is erecting a new factory, which will be fitted with entirely new equipment. The company plans to increase its output almost twofold.

The Miami Cycle Manufacturing Company, Middletown, O., has under construction a new five-story building, which, when finished, will cost approximately $250,000. The concern plans to increase its output considerably.

John A. Graham, at one time superintendent of assembling and testing at the Brightwood Motor and Manufacturing Company of Springfield, Mass., has been recently appointed engineer and superintendent of the Westfield Motor Truck Company at Westfield, Mass.

The Remy Electric Company of Anderson, Ind., is making plans for enlarging its factory. The company recently took a contract to furnish all the magnetos for one year for the Buick Motor Company and the Willys-Overland Company, necessitating an output from the Remy plant of 130,000 magnetos. The concern now employs about 700 people. The enlargement of the plant will make places for at least 300 more.

The Ideal Motor Ca[illegible]pany, maker of the Stutz car, was recently incorpor[illegible] under the laws of Indiana for

$100,000. The incorporators are Henry F. Campbell, Harry C. Stutz, William D. Myers, William F. Glickert and Everett L. Deupree. The West Virginia charter of the company was surrendered, the reincorporation being for the purpose of making the company a state institution and not a foreign corporation doing business in another state. The headquarters of the concern are at Indianapolis.

W. L. Rodgers, F. W. Newton and R. F. Ramsey have applied to the governor of Pennsylvania for a charter of incorporation under the name of Duquesne Motor Car Company. The company is to be formed for the purpose of manufacturing pleasure and commercial motor vehicles, accessories and supplies.

The Ross Gear & Tool Company is having a large addition built to its plant in Lafayette, Ind., which will give the company 50,000 feet of floor space when finished.

C. Lawrence Wisehart, Elmira, N. Y., has assumed the management of the Resilio Company, 511 South Clinton street, Syracuse, N. Y., maker of a new tire filling product.

The Firestone Tire & Rubber Company, Akron, O., has opened a branch in Montreal, Can.

Charles D. Schmidt, with headquarters at 416 Broadway, has been appointed sales agent for New York City by the Baldwin Chain & Manufacturing Company.

R. J. Mackensie, has joined the Kelley Motor Truck Company, Springfield, O., as purchasing agent.

The Webb Motor Fire Apparatus Company, St. Louis, Mo., it is reported, is to move to Allentown, Penn., in the fall. Mack truck interests are said to have stock in the company. During 1911 the firm made an even 100 pieces of fire apparatus. This year its business is reported as even larger. Milton A. Strauss, formerly with the Moon Motor Car Company, has been appointed sales manager for the Webb concern.

The R-C-H Corporation, Detroit, Mich, recently opened a branch and service station in San Francisco, Cal. A. E. Morrison, western sales manager, made the arrangements for the opening, the step being necessary in order to care for the increasing trade on the Pacific Coast. The building secured is a three-story structure, in the heart of San Francisco's automobile district, and provides 18,000 feet of floor space. The corporation now has stations and factory branches in Detroit, Chicago, New York, Boston, Philadelphia, Atlanta, Buffalo, Cleveland, Kansas City, Minneapolis, Denver, Los Angeles and Walkerville, Can.

The Penn Motor Car Company, formerly located in Pittsburg, Penn., now occupies its new factory buildings in New Castle, Penn., covering more than five acres. The main structure is 510 by 60 feet, and is used for the chassis assembling and chassis painting. Running back from this building are six wings, each 60 by 150 feet, which are to be used for the machine shop, upholstering and top departments, testing and repairs, stock rooms and final assembling. The entire building is of steel, concrete and glass. There is excellent light and ventilation, and one admirable feature is that there is not a post in the entire structure. Situated so that it can easily ship by four different trunk lines, the railroad facilities are excellent. The company makes pleasure cars and a light delivery motor car.

Harry E. Freeman, for 12 years connected with the advertising department of a prominent Cleveland newspaper, was recently appointed sales and advertising manager of the Sewell Cushion Wheel Company, Detroit.

D. E. Keith, manager of the Indianapolis branch of the Ford Motor Company, is makng a six weeks' tour over Indiana in a Ford car. He is visiting all of the 65 agents in the state, and making a thorough investigation of the automobile prospects in Indiana for 1913.

The G. & T. Tire Company has purchased a tract of ground, 170 by 220 feet, in Indianapolis, Ind., on which it will erect a five-story building of reinforced concrete to cost approximately $100,000.

The Dorris Motor Car Company's new factory, St. Louis, Mo., is rapidly nearing completion. The new building will mean practically a doubled capacity for the Dorris company. The structure is fireproof and three stories in height.

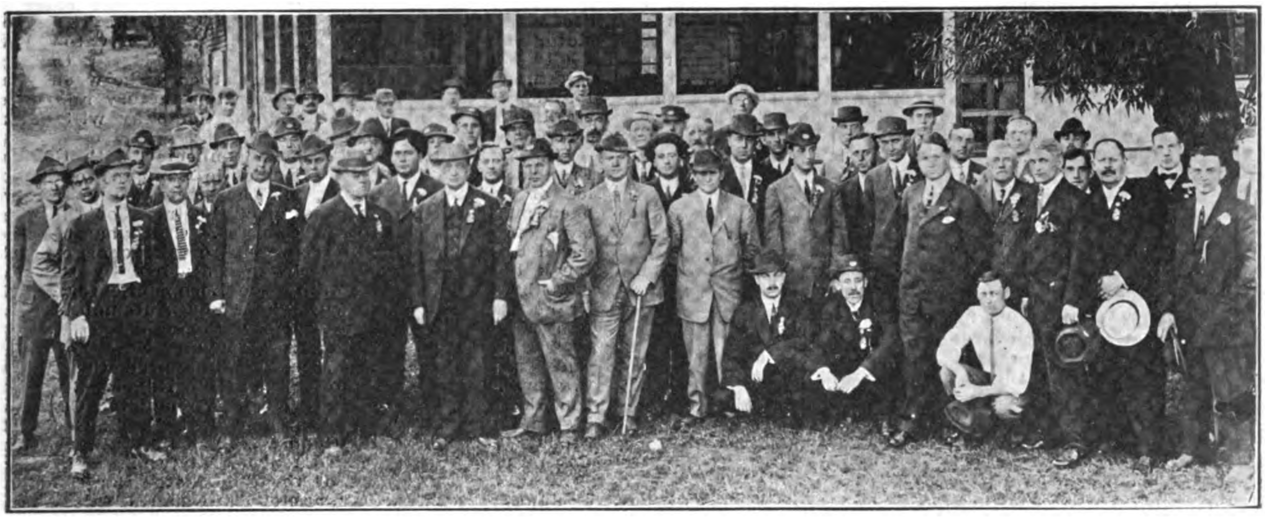
The Timken-Detroit Axle Company is having two large additions built to its plant in Detroit. The firm denies the report that it has purchased land in Toledo, O., and that a plant is to be erected there.

The Cartercar Company, Pontiac, Mich., has just closed a contract giving the MacEwen-Webster Auto Company of Swift Current, Sask., the agency for Saskatchewan, Alberta and Manitoba.

The Todd Manufacturing Company is to open a factory at 820 Mary place, Minneapolis, Minn., for the purpose of making radiators, hoods, fenders, drip pans, tanks and other sheet metal specialties for automobiles. The parties representing the firm are Frank Todd, formerly superintendent of the Long Manufacturing Company of Chicago and Detroit; B. A. Wolfe and Morgan C. Wood.

Arthur I. Philp has become associated with the Studebaker Corporation, Detroit, as assistant sales manager of the automobile division. He was until recently district manager for the United States Tire Company, and prior to that was with Morgan & Wright. In the old bicycle days he sold Imperial wheels for Ames & Frost.

The Willys-Overland Company recently held its annual district managers' convention at Toledo. The session was of three days' duration, the time devoted to business and to pleasure being almost equally divided. While the men assembled were busy enjoying the various entertainments and banquets they were also laying vigorous plans for 1913. Business meetings were held at the plant of the company each morning and afternoon, while the evenings were spent at the theatre or about the table. A power boat ride and banquet at the Toledo Yacht Club headquarters brought the convention to a close.



District Managers of the Willys-Overland Company at Their Recent Annual Convention in Toledo, O.

GARAGE & DEALER

W. W. Watson, agent for the Chessman estate, Denver, Col., has secured authority to erect a two-story automobile salesroom and garage at Colfax and Lincoln streets, the estate to be the owner. The structure will be 138 by 127 feet and will cost approximately $35,000. The building has already been leased for a term of years to the MacFarlane-East Auto Company, agent for the Packard and Buick cars and to the Cole Auto Company, agent for Cole cars. The salesrooms will be the largest and most finely appointed in the city of Denver.

The Abbott-Detroit Sales Company, Syracuse, N. Y., has opened a new garage on South Clinton street, near Tallman, where the Abbott-Detroit cars are handled and a general garage and repair business carried on.

D. W. Kaatze, 113 Keap street, Brooklyn, N. Y., is erecting a four-story brick garage at Ten Eyck and Lorimer streets, at a cost of $5000.

The Aston Motor Car Company, Bridgeport, Conn., is building an addition which will make its garage the largest between New York City and Boston. The addition has been specially planned for large motor trucks, and will be 60 by 100 feet. It will be fireproof, and is expected to be open in a short time.

The Fisk Garage, located on Washington street, Middletown, Conn., recently built an addition to the establishment, to enable it to take care of the rapidly growing automobile trade in the vicinity.

Thomas B. Dewhurst, owner of the Dewhurst Garage, Lexington, Ky., is planning to erect an addition to the establishment in the shape of a corrugated iron storeroom. It will cost in the neighborhood of $600.

Edward Wells has resigned as assistant sales manager of the E. R. Thomas Motor Car Company, to engage in the automobile business direct. He will assume control of the State garage, 119 East Third street, Jamestown, N. Y., and will handle Thomas cars and those of another well-known make; also a full line of tires and accessories. Mr. Wells has been connected with the Thomas company for 3.5 years. George Waite, late sales manager for the Simplex Motor Car Company, will take Mr. Wells' place at the Thomas factory.

The Los Angeles Branch of the Locomobile Company of America, with headquarters at Bridgeport, Conn., which was temporarily located at 942 South Grand avenue, Los Angeles, Cal., is now occupying new permanent quarters at Pico and Grand avenues.

F. H. L. James, who has operated the Central garage in Pawtucket, R. I., for a number of years, has opened the Central garage annex at 109 Exchange street. The new plant is in a round building with an inside diameter of 90 feet, which provides excellent facilities for the use to which it has been put.

The Lawrence Auto Company, New Castle, Penn., was recently purchased outright by the John Electric Company of the same city. Leo Collier, who was with the Lawrence Auto Company, has gone to Youngstown, O., where he plans to conduct an automobile garage.

Harold Boone is to spend $16,000 in the erection of a garage at Macon, Ga. This structure will be 52.5 by 150 feet, of mill construction, and electric lighted throughout. When finished the building will be one of the most up-to-date of its kind in the state.

George Baer, McKeesport, Penn., has a $20,000 garage, 60 by 134 feet, under process of construction in Ninth avenue, that city.

E. P. Moriarty & Co., of Kansas City, Mo., will represent the Lozier car, made by the Lozier Motor Company, Detroit, Mich., for 1913. In addition it will handle the Abbott-Detroit line, which has been handled by the Kaw Valley Automobile Company, of which J. F. Moriarty is the manager. The Kaw Valley company will be merged with E. P. Moriarty & Co., and the new firm name is to be the Moriarty Bros. Motor Car Company.

Byron & Brown, proprietor of the Lemoore garage at Lemoore, Cal., distributor of the Ford car made by the Ford Motor Company, Detroit, Mich., is having a large addition to its building. The remodelled structure will provide 1250 additional feet of floor space and will contain a magneto room and vulcanizing department.

Earl Howard, for several years engaged in the plumbing business in Bakersfield, Cal., is now doing business under the name of the Central Auto Supply Company, and will handle a complete line of tires, oils and automobile accessories. Mr. Howard has also taken the agency for Haynes and K-R-I-T automobiles.

The Eastern Motor & Conveyance Company is contemplating the erection of a public garage at Fayette street and Philadelphia avenue, East Baltimore, Md. Plans call for a one-story building of brick and reinforced concrete, 50 by 122 feet.

Aaron C. Cohen, who is associated in the automobile business with Frank M. Zimmerman in New Britain, Conn., recently bought the Ford agency in that city from H. B. Freeman of Hartford. The purchase included a number of new cars.

The Citizens' Motor Car Company, Cincinnati, O., recently leased three rooms in the new Steely building in that city. The company is agent for the Packard car, made by the Packard Motor Car Company of Detroit, Mich.

Collins & Dassonville, formerly of Brewster's in New York City, one of the largest coach factories in the United States, has decided to locate in Bakersfield, Cal., and will open a first class automobile painting and finishing shop. This will include a dust-proof finishing room, and equipment will be installed for enamelling, brass burnishing and polishing. Both men have had many years' experience at their trade.

C. B. Long has a garage 34 by 90 feet under construction at Fithian, Ill. The building will be of brick, two stories in height.

Cheatham Bros., Atlanta, Ga., is to erect a two-story building at 453 Peach street, for the use of the Velie Motor Vehicle Company as a garage. The building is to be of brick, and will cost approximately $5000.

The Pacific Coast Branch of the New York Lubricating Oil Company, sole proprietor and refiner of the Monogram oils and greases, has moved into its new general quarters at 516 Second street, San Francisco, Cal. The new location is a four-story building, fitted with the most modern appliances for the storage and handling of lubricating oils.

The East End Auto Company has extensively improved its property near 13th and Walnut streets, Harrisburg, Penn. The building has been enlarged and a modern repair shop and elevator installed. The company recently took the agency for the Atterbury truck.

The Cole Motor Car Company, Indianapolis, Ind., recently appointed the following agents: R. H. Smith, Deland, Fla.; Potter-Burgess Motor Company, 1013 State street, Erie, Penn.; H. B. Mahon, Follansbee, W. Va.; William E. Morse, Gorham, N. H.; Sanders & Dutton, Leesburg, Fla.; Cole Macon agency, 250 Second street, Macon, Ga.; Nashville Saddlery Company, Nashville, Tenn.; Harvey Case, Nakomis, Ill.; J. A. Rudy & Sons, Paducah, Ky.; St. Augustine Machine Works, St. Augustine, Fla.; C. C. Starbird, Strong, Me.; Arkansas Motor Company, Texarkana, Ark. J. G. Maxwell, who handled the Cole car successfully at Calgary, Alberta, Can., some time ago, has moved to Swift Current, Saskatchewan, and has made application to handle the Cole product there.

William E. Brown, Yonkers, N. Y., has bought the Riverdale Avenue Garage, 217 Riverdale avenue, that city.

The Morgan Construction Company is to build a garage, steel and pattern storage building, at 15 Carbon street, Worcester, Mass. The new building will be of brick, steel and concrete construction and will cost $10,000.

R. E. Donaldson is having a garage, 50 by 120 feet, erected in Milford, Ia. He will conduct a salesroom and service station.

The Northside Garage in Belleville, Kan., was recently purchased by A. J. Budworth.

The Taylor Garage in Walla Walla, Wash., has been bought by J. H. Abbott, who plans to continue the business.

W. H. Abbey, owner of the Wasso, Cal., garage, has sold the business to I. H. Litten.

The Standard Motor Car Company, which covers the Pacific Coast and operates distributing agencies in San Francisco, Oakland and Los Angeles, for the sales of Stoddard-Dayton cars, made by the Dayton Motor Car Company, Dayton, O., is to give a two weeks' vacation in the East to the salesman who makes the best record between May 1 and July 31. The Stoddard-Dayton factory and other plants of the United States Motor Company will be included in the itinerary.

H. W. Evans, who has been connected with the San Francisco branch of the Locomobile Company of America of Bridgeport, Conn., for the past two years, has been put in charge of the truck business of the company on the Pacific Coast. George A. Crane has been secured by the Locomobile company to take charge of the truck business in the territory controlled by the Chicago branch. Before joining the Locomobile forces, Mr. Crane was connected with the Knox Automobile Company and the United States Motor Company.

The American Locomotive Company, New York City and Providence, R. I., recently announced the following new dealers added to its list: H. T. Rogers, Binghamton, N. Y.; Six Thirty-eight Tire & Vulcanizing Company, Memphis, Tenn.; W. H. Ash, Peekskill, N. Y.; George E. Stocking, Rochelle, Ill.; Geddes & Sheffield, Calgary, Atla., Can.; Taylor & Musson, Edmonton, Alta, Can.

J. J. Cole, president of the Cole Motor Car Company, Indianapolis, Ind., accompanied by General Sales Manager Charles P. Henderson and William L. Colt, the latter of the Colt-Stratton Company, New York City, eastern distributor for Cole cars, have been making a tour of the agencies in the East. The first stop was in Pittsburg, from which city they went to Washington, Baltimore, Philadelphia and Newark, to New York, where a banquet was held, at which representatives of the metropolitan press were the guests of honor. A similar gathering was held in Boston.

G. A. Besosa of San Juan has taken the agency for the Marmon cars, made by the Nordyke & Marmon Company, Indianapolis, Ind. G. L. Omohundro of Little Rock, Ark., is also a new Marmon dealer.

The Henderson Motor Car Company recently awarded contracts to the following agencies: W. A. McKnight, Alexis, Ill. Johnson Motor Car Company, Philadelphia, Penn.; Service Motor Sales Company, Newark, N. J.; James A. Binney, Boston, Mass.; Atlanta Auto Sales Company, Inc., Atlanta, Ga.; Mattoon Refrigerating Company, Mattoon, Ill.; Bonnheim-Moore Motor Car Company, San Francisco, Cal.; the Blackhawk Auto Company, Waterloo, Ia.; A. C. Schafer, Grundy Centre, Ia.; Model Auto Sales Company, St. Louis, Mo.; Matheson Motor Company, Washington, D. C.; J. W. Wilcox, Los Angeles, Cal.; Whittlesey Garage & Machine Company, San Bonito, Tex.; J. J. Deskin, Missouri, Ia.

H. W. Yeager, president of the Yeager Piano Company, Hartford, Conn., has taken the agency for the complete line of Velie pleasure and commercial cars, made by the Velie Motor Vehicle Company, Moline, Ill. His territory will include Hartford and vicinity.

H. F. Sundin has become the distributor for the National car, made by the National Motor Vehicle Company, Indianapolis, for Kansas City and vicinity. He was formerly a travelling representative of the National company.

TRADE INFORMATION EXCHANGE
BUSINESS PROPOSITIONS.

Two Classes of Opportunities Are Offered Below—for Agents to Secure New Lines, and for Manufacturers to Secure Agents. These Propositions Offer State and Community Representation to Makers of Pleasure Cars, Motor Trucks, Accessories and Supplies, While Dealers May Get in Touch with Manufacturers Desiring to Extend Their Agency Connections. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without the Names of the Firms, Which Desire Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding to the Concerns.

CAR AGENCIES DESIRED.

948—Rhode Island Dealer, in excellent location, wants agency for cars selling at less than $1000, and trucks selling at $500 to $2000.

966—Michigan Concern, well established, would like to represent manufacturer of pleasure cars selling at $500 to $1500.

969—Ohio Company, recently organized, desires agency for pleasure automobiles selling at $900 to $1500.

973—Nebraska Concern, already carrying two well known lines, would add pleasure cars selling at $750 to $1250, and trucks from $800.

950—South Carolina House, located in rapidly growing territory, wants agency for pleasure cars selling at $500 to $2000, and commercial lines at $500 to $1000.

971—Kentucky Garage would add lines selling at $600 to $2000 to its present agency for pleasure cars.

988—Iowa Concern, already representing an established line, would add pleasure cars selling at $700 to $2000.

999—Illinois Agent, well established in growing community, desires agency for pleasure cars selling at $1000 to $2000.

1005—Central New York Company would represent manufacturers of pleasure cars selling at $1000 to $2500 and trucks selling at $500 to $9000.

1010—Connecticut Concern, with one established line, would add pleasure cars selling at $800 to $2100.

1011—Minnesota Truck Sales Company wants agency for power wagons selling at $750 to $2600.

1019—Ohio Sales Agency, with well established business, would add pleasure cars selling at $1000 to $3000.

1023—California Pleasure Car Agency, in splendid location, desires agency for trucks selling at $1500 to $3500.

1028—Mississippi Garage, recently organized, wants agency for pleasure cars selling at $500 to $5000 and trucks selling around $3000.

1035—Connecticut Garage, with well established business in large city, wants agency for pleasure cars selling at $550 to $6000 and trucks at $1000 to $5500.

1034—Massachusetts Dealer, with exceptional opportunity to sell electric vehicles, would secure agency for cars, preferably with capacity of from 750 to 1500 pounds.

EQUIPMENT NEEDED.

630—Rhode Island Garage, recently established, desires equipment for repair shop and vulcanizing plant.

641—South Carolina House, with well equipped repair shop, needs air compressors, gasoline storage tank and pump, and vulcanizing plant for retreading.

653—Iowa Concern, recently incorporated, wants all kinds of equipment for garage and repair shop.

660—Illinois Garage, with new building in course of construction, desires information relative to garage and repair shop equipment, machine tools, etc.

671—New York State Company, establishing garage in growing town, wants complete garage and repair shop equipment, machine tools, etc.

673—Connecticut Agency, contemplating the addition of a repair department, is in the market for repair shop equipment and machine tools.

675—Minnesota Truck Concern, establishing a service station, desires repair shop equipment.

683—Mississippi Agency, recently incorporated, wants garage and repair shop equipment, machine tools, etc.

684—Connecticut Concern, well established, but rebuilding after fire, wants garage, repair shop, machine tool and other equipment.

678-681—Two Inquirers desire full information relative to time clocks and systems adapted to the use of garages of moderate size. Two sets of literature should accompany all replies.

ACCESSORY AGENCIES.

923—Minnesota Sales Company, located in large city, seeks agency for chains, tops, power wagon equipment, supplies and accessories.

933—Ohio Concern, in well established location, would add to its line of accessories and supplies.

938—Mississippi Garage, recently incorporated, wants agency for all lines of pleasure and commercial car accessories and supplies.

943—Connecticut Garage, well established, wants line of supplies for small power wagons, and pleasure car accessories and supplies.

946—Rhode Island Concern, doing a good repair business, would add accessories and supplies for both pleasure and commercial cars.

958—Michigan House, recently organized, wants agency for automobile and repair shop accessories and supplies.

951—Ohio Agency, recently incorporated in growing city, wants agency for pleasure car accessories and supplies.

949—South Carolina Company, on direct southern travel, wants agency for tire covers, tire holders, medium price lamps, etc.

942—Kentucky Agency, recently incorporated, desires agency for full line of pleasure car accessories and supplies.

935—Iowa Concern, with well established agency for three lines of cars, is ready to take agency for all kinds of pleasure car supplies and accessories.

927—Illinois Dealer, building new garage, seeks agency for pleasure car accessories and supplies.

936—Central New York Dealer, with large field from which to draw business, desires agency for all kinds of accessories and supplies for pleasure and commercial cars.

MANUFACTURERS' OPPORTUNITIES.

827—New York State Concern, located in a rapidly growing city, has excess factory space and facilities and will consider proposition to combine with company manufacturing parts or complete vehicles.

869—Delivery Wagon Maker, producing vehicles with capacity of 1500 pounds and selling for $875, f. o. b., factory, wishes to establish agencies throughout the country.

821—Maker of Gasoline Gauge, with several new and exclusive features, desires to place agencies with established concerns in all parts of the country.

833—Truck Manufacturer, producing a wide line of gasoline and electric vehicles, with factory attention such as to justify careful inquiry, desires agents in open territory.

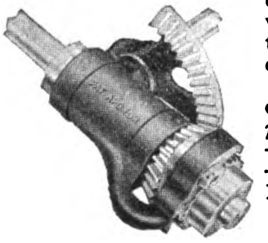
841—Spark Plug Concern, placing in the market a new and exclusive design, has a liberal contract proposition for those able to demonstrate their reliability and dependability.

A Perfect Starter At Last!

Energetic Dealers Wanted

A rare business opportunity. Live dealers throughout the entire world wanted to represent us and to install the National Starter

The First Perfect Mechanical Starter



It has always been said that if a *perfect* starter could be built—a *dependable* starter—one that would start the engine from the seat and forever do away with dangerous cranking—that such a starter would revolutionize motoring—that it would add the final touch of perfection to the automobile.

—and now, after years of experimenting, comes the first *perfect* mechanical engine starter—the NATIONAL STARTER—the *only* starter that is actually 100% efficient.

Works *every* time.

No batteries—no tanks—no wiring—no piping—no springs. Nothing but simple ball-bearing gearing.

Dealers in automobiles and accessories, and garage owners will instantly recognize the tremendous business possibilities of this new starter.

The Principle of the National

The National is built on a patented principle.

It is purely mechanical.

A simple pressure of the foot and the engine turns over—just like cranking.

The powerful leverage which is obtained through gear reduction turns the engine over easily—*so easily that you can start on the magneto just as readily as on the batteries.*

The National works equally well in hot or cold weather. It is *not* dependent upon acetylene gas, compressed air, gasoline, electricity or springs. It develops its entire energy through the slight pressure of your foot on the dash pedal—like a clutch. In case of back-fire the National automatically disengages.

We have subjected the National to the severest tests. We have tried it out in all sorts of weather and on all sorts of cars. We made it *prove* its merits.

And now we back every National with an ironclad guarantee for one year.

Easy to Install—Easy to Operate

The National can be installed on any car in about two hours' time. It is fastened to the front of the car in place of the crank. Total weight is about 15 pounds.

THE NATIONAL GAS ENGINE STARTER COMPANY

Dept. 563 B, 30-32 N. Dearborn St., CHICAGO, U. S. A.

Car Owners: *Write us for literature and name of nearest "National" dealer.*

Manufacturers: *Write us for literature and our offer to install the National as standard equipment.*

A ten year old child can operate the National easily. One pressure of the foot—the crank shaft turns—the engine starts. Just a simple mechanical operation.

A Big Business Proposition

The tremendous demand for a *perfect* starter makes the selling end of the National only a matter of proving its merits. *Thousands and Thousands* of car owners will install the National as soon as they see it.

They'll want the advantages of the National for themselves as well as to enable the women-folks to drive.

You see the field is practically boundless.

Big business men consider this a big enough proposition to *open up special demonstrating salesrooms for the exclusive sale of the National.*

They realize the wonderful possibilities of the National.

The retail price of the National is $50.00 *completely installed.* Figure out approximately the number of cars in your territory and you will have an idea as to how broad a proposition this is.

Applications for Agencies Now Being Received

Already we have received thousands of applications for National agencies. We are literally *swamped* with requests. South America, England, Germany, France—energetic dealers in all these countries have applied for National agencies as well as thousands of American business men. But we are prepared to meet the tremendous demand.

THE NATIONAL STARTER
TRADE MARK

We have practically unlimited manufacturing and financial resources.

Agencies for the National Starter are now being allotted. Applications will be handled in the order in which they are received.

Wire us, and come to Chicago if you can—let us show you just how the National is built—let us tell you in a personal interview the tremendous business possibilities of this proposition.

If you cannot come, write us. Full information and large descriptive circular can be had by signing and mailing the coupon.

CAREFUL DRIVERS USING SO-CALLED GUARANTEED MILEAGE TIRES HELP TO PAY FOR TIRES ABUSED BY RECKLESS DRIVING

Why Pay For Tires Abused By Others?

Did you ever stop to think, Mr. User of Mileage Guaranteed Tires, that while you are following out the letter and spirit of your agreement by careful driving, proper inflation, and no overloading, there are scores of drivers paying no attention to these details. Factory perfect

FRONTIER TIRES

are guaranteed absolutely against mechanical imperfections and to afford reasonable service under ordinary conditions. Immediate and amicable adjustment will be made where Frontier Tires fail to give satisfaction.

Frontier Tires are lower than their competitors. Ask for a price list and be convinced. Also be up-to-date on tire matters by constantly asking your dealer for the latest Frontier tire-treating tips.

"Buy a Frontier Tire and Get a Long Run For Your Money"

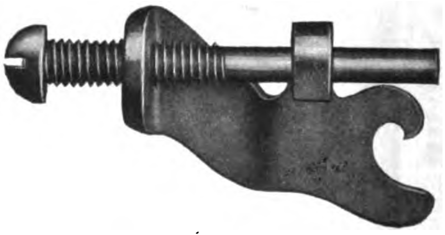
Q. D. RIM REMOVER

Saves Time, Labor, Trouble



Hook the tool over the outer edge of tire rim, between the two ends of locking ring. Push valve tube into rim so that locking lug clears inside of Shoe. Screw the bead ring off locking ring. It holds the rings apart, leaving both hands free to remove the locking ring. Nickelled and case hardened, it weighs 2 1-2 oz. If not carried by your dealer, mailed prepaid in the U. S. on receipt of 65c P. O. or EXPRESS MONEY ORDER, or 75c on check requiring collection charge.

Frontier Specialty Co., 734 Main St., Buffalo. (All-in-One.)

Hardy Co., R. E., 1134 Austin Ave., Chicago. (Sta-Rite.)

Janney, Steinmetz & Co., Philadelphia.

Kimball Manufacturing Co., Motor Mart. Boston. (Lodge Double-Pole.)

Randall-Faichney Co., Boston. (Mac-Kae.)

Progressive Manufacturing Co., The, Torrington, Conn. (Black Eagle.)

Splitdorf Electrical Co., Walton Ave. and 188th St., New York.
Branches: See Magnetos and Magneto Supplies.

SPARK PLUG TERMINALS.

Randall-Faichney Co., Boston. (Mac-Kae Universal.)

SPEEDOMETERS.

Jones Speedometer, New Rochelle, N. Y.
Branches: Broadway and 76th St., New York; 109 Massachusetts Ave., Boston; 1416 Vine St., Philadelphia; 1430 Michigan Ave., Chicago; 852 Main St., Buffalo; 253-255 Jefferson Ave., Detroit; 530 Golden Gate Ave., San Francisco; 1229 So. Olive St., Los Angeles, Cal.; 329 Ankeny St., Portland, Ore.; 917 E. Pike St., Seattle, Wash.

Warner Instrument Co., 1221 Wheeler Ave., Beloit, Wis. (Auto-Meter.)
Branches: 116 Edgewood Ave., Atlanta, Ga.; 925 Boylston St., Boston; 720 Main St., Buffalo; 2420 Michigan Ave., Chicago; 807 Main St., Cincinnati; 2062 Euclid Ave., Cleveland; 1518 Broadway, Denver; 870 Woodward Ave., Detroit; 330½ North Illinois St., Indianapolis; 1613 Grand Ave., Kansas City; 748 S. Olive St., Los Angeles, Cal.; 1902 Broadway, New York; 302 N. Broad St., Philadelphia; 5940 Kirkwood Ave., Pittsburg; 14 N. Seventh St., Portland, Ore.; 36-38 Van Ness Ave., San Francisco; 611 E. Pike St., Seattle, Wash.; 3923 Olive St., St. Louis; 559 Yonge St., Toronto, Can.

SPRINGS FOR AUTOMOBILE SUSPENSION.

Perfection Spring Co., 1542 Superior Ave., N. W., Cleveland.

SPROCKETS.

Boyd F. Shirley, 893 Boylston St., Boston. (Baldwin.)

STORAGE SYSTEMS—GASOLINE AND OIL.

Janney, Steinmetz & Co., Philadelphia.

SWITCHES, LOCK.

Blackburn Specialty Co., 1120 Prospect Ave., S. E., Cleveland. (Autolock.)

TANKS, ACETYLENE GAS.

Carbo-Light Co., 51st and Butler Sts., Pittsburg, Penn. (Carbo-Light.)

Prest-O-Lite Company, 271 East South St., Indianapolis. (Prest-O-Lite.)
Branches: See Cylinder Cleaning Compound.

TANKS FOR FUEL AND WATER.

Janney, Steinmetz & Co., Philadelphia.

TANKS, TIRE INFLATING.

Prest-O-Lite Co., 271 East South St., Indianapolis. (Baby Tire Filler, The Emancipator.)
Branches: See Cylinder Cleaning Compound.

THERMOS CASES.

Dover Stamping & Manufacturing Co., Cambridge, Mass.

TIRE CASES.

Hopewell Brothers, Newton, Mass. (Hopewell.)
Branch: 1974 Broadway, New York.

TIRE CHAIN GRIPS. (See Chains.)

TIRE PRESERVATIVES AND PROTECTORS.

Gray Specialty Co., 148 Avon Ave., Newark, N. J.

Page-Lester Co., 129 W. Van Buren St., Chicago. (Tite-Wud Rubber Putty.)

Perfection Filler Co., 421 Old South Bldg., Boston. (Perfection.)
Factory: Somerville, Mass.

TIRES—CASINGS AND INNER TUBES.

Ajax-Grieb Rubber Co., Trenton, N. J. (Ajax.)
Branches: 15 Park Sq., Boston; 1731 Michigan Ave., Chicago; 905 First Ave., South, Minneapolis; 1529 Cleveland Place, Denver; 1038 South Main St., Los Angeles, Cal.; 544 Van Ness Ave., San Francisco; 917 E. Pike St., Seattle; 316 North Broad St., Philadelphia; 1197 Broadway, New York; 48 Auburn Ave., Atlanta, Ga.; 743 Woodward Ave., Detroit; 1616 Grand Ave., Kansas City.

Dayton Inner Tire & Manufacturing Co., 17 Madison St., Dayton, O. (Dayton.)

Diamond Rubber Co., Akron O. (Diamond.)

Firestone Tire & Rubber Co., Akron, O.
Branches: See Rims—Removable and Detachable.

Fisk Rubber Co., Chicopee Falls, Mass. (Fisk.)
Branches: 811-813 Boylston St., Boston; 17½ Dorrance St., Providence.

Frontier Tire & Rubber Co., 1054 Main St., Buffalo, N. Y. (Frontier.)

Goodyear Tire & Rubber Co., Madison St., Akron, O. (No-Rim-Cut.)
Branches: In all principal cities.

Hood Rubber Co., Watertown, Mass. (Shawmut.)

United States Tire Co., Broadway and 58th St., New York. (Continental, G & J. Hartford, Morgan & Wright.)
Branches: See Rims—Removable and Detachable.

TIRES—CUSHION.

Motz Tire & Rubber Co., The, Akron, O. (Electric Special, Motz Cushion.)
Branches: New York, Philadelphia, Chicago, Kansas City, Cleveland.

TIRES—MOTORCYCLE.

United States Tire Co., Broadway and 58th St., New York. (Morgan & Wright, G & J.)
Branches: See Rims—Removable and Detachable.

TIRES—SOLID AND COMMERCIAL.

Ajax-Grieb Rubber Co., Trenton, N. J. (Ajax.)
Branches: See Tires—Casings and Inner Tubes.

Diamond Rubber Co., Akron, O. (Diamond.)

Firestone Tire & Rubber Co., Akron. O.
Branches: See Rims—Removable and Detachable.

Fisk Rubber Co., Chicopee Falls, Mass.
Branches: See Tires—Casings and Inner Tubes.

Motz Tire & Rubber Co., The, Akron, O. (Motz.)
Branches: See Tires—Cushion.

Republic Rubber Co., Youngstown, O. (Republic.)

United States Tire Co., Broadway and 58th St., New York.
Branches: See Rims—Removable and Detachable.

TOPS AND ATTACHMENTS.

Springfield Metal Body Co., 20 Medford Ave., Springfield, Mass.

TROUBLE FINDERS.

Hopewell Brothers, Newton, Mass. (Vibrator.)
Branch: 1974 Broadway, New York.

TRUCKS. (See Cars, Commercial.)

TRUNK RACKS.

Connecticut Steel & Wire Co., Hartford, Conn.

TUBING, GAS.

Caldwell Manufacturing Co., 1756 Cranston St., Providence.

TURNTABLES.

Canton Foundry & Machine Co., Canton, O. (Universal.)

Portland Garage, Portland, Me., (Portland.)

UNIVERSAL JOINTS.

Bretz Co., J. S., 250 W. 54th St., New York. (Hartford.)

Kinsler-Bennett Co., The, P. O. Box 124, Hartford, Conn. (Kant-Break.)

VULCANIZERS.

McVey Manufacturing Co., Third and Canal Sts., Dayton, O. (McVey.)

National Motor Supply Co., 1911 Euclid Ave., Cleveland. (Garage and Individual.)
Branches: In all principal cities.

Williams Foundry & Machine Co., Akron, O.

WASHING DEVICES.

Perfect Manufacturing Co., Albany, N. Y.

WELDING OUTFITS.

Prest-O-Lite Co., 309 W. South St., Indianapolis. (Prest-O-Welder.)
Branches: See Cylinder Cleaning Compound.

WIRE MECHANISM.

Bretz Co., J. S., 250 W. 54th St., New York. (Bowden.)

WIRES AND CABLES.

Diamond Rubber Co. of N. Y., Akron, O. (Diamond.)

WRENCHES AND COMBINATION OUTFITS.

Coes Wrench Co., Worcester, Mass.

Cutter, George A., Taunton, Mass.

THE ACCESSORY -AND- GARAGE JOURNAL

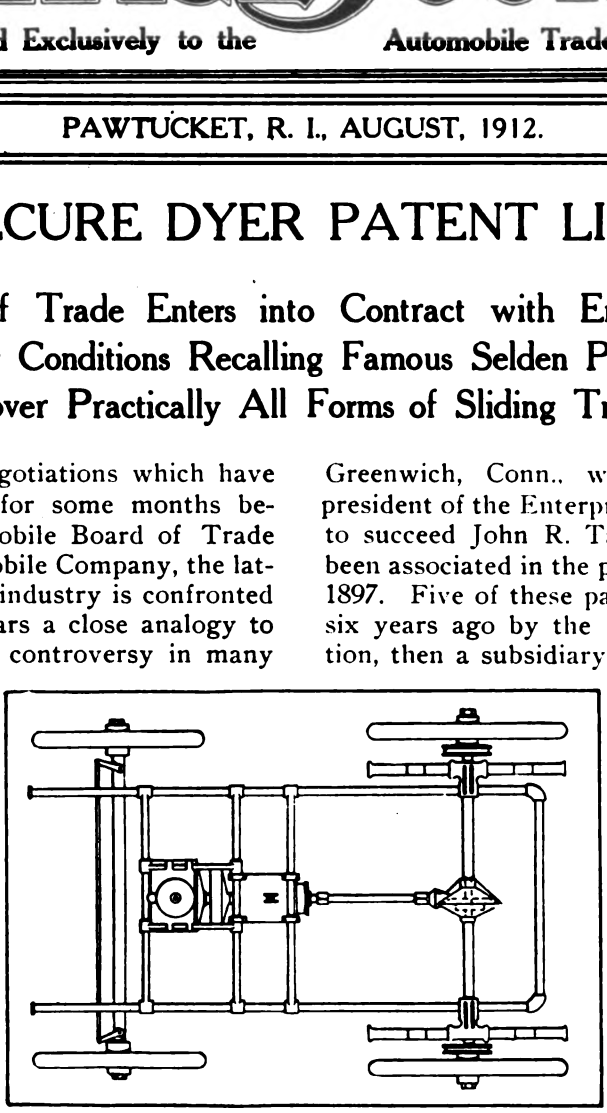
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. PAWTUCKET, R. I., AUGUST, 1912. No. 4

WILL SECURE DYER PATENT LICENSES.

Automobile Board of Trade Enters into Contract with Enterprize Automobile Company Under Conditions Recalling Famous Selden Patent Situation--Held to Cover Practically All Forms of Sliding Transmission.

As THE result of negotiations which have been carried on for some months between the Automobile Board of Trade and the Enterprize Automobile Company, the latter of Hoboken, N. J., the industry is confronted with a situation which bears a close analogy to the famous Selden patent controversy in many respects. The importance of the transaction, which involves the right to manufacture under the so-called Dyer transmission patents, is indicated in the official announcement of the Automobile Board of Trade under date of Aug. 13, as follows:



Showing Location of Dyer Patent Device, Looking Down upon a Motor Vehicle Chassis.

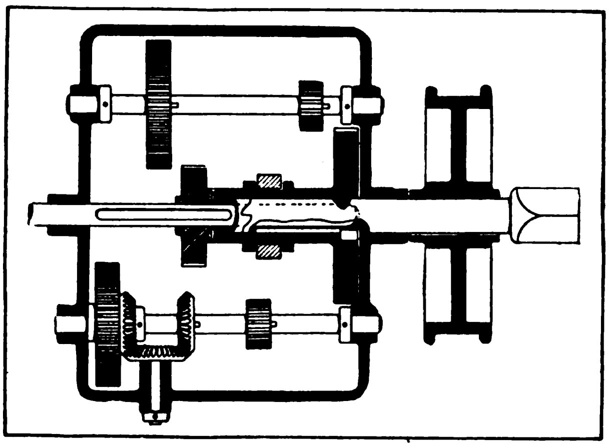
"After negotiations, extending over a period of more than six months, the Automobile Board of Trade has perfected an arrangement with the Enterprize Automobile Company, owner of the Dyer transmission patents, granting its members licenses to operate under them. The patent numbers are as follows: 643,595, 657,650, 662,400, 662,401, 676,223, 886,986 and 921,963. These patents cover practically all forms of sliding gear transmission in use on motor cars at the present time. The patents committee of the Automobile Board of Trade which successfully conducted the negotiations, is composed of the following: C. C. Hanch, W. H. VanDervoort, L. H. Kittredge, Alvan Macauley and L.E. Latta."

It should be stated that the patents mentioned above were issued to Leonard H. Dyer, now of Greenwich, Conn., who recently was elected president of the Enterprize Automobile Company, to succeed John R. Taylor, with whom he has been associated in the practise of patent law since 1897. Five of these patents were acquired some six years ago by the Patents Holding Association, then a subsidiary of the old Association of Licensed Automobile Manufacturers, which was succeeded by the Automobile Board of Trade soon after the adverse decision in the so-called Selden patent cases in January, 1911. These were the five first named, and they have been turned over to the Enterprize Automobile Company as a part of the consideration in the present contract.

Patent 643,595 was granted Feb. 13, 1900, and is held to cover two gears and an intermediate epicyclic gearing interposed between one of the gears and the driven axle. Antedating this a trifle in the matter of application is patent 657,650, which was granted Sept. 11, 1900, and is held to cover a fixed guide plate with recesses and notches to hold the gear shifting lever. Patent 662,400, granted Nov. 27, 1900, relates to the subject of two shafts with spur gearing and means for intermeshing the gear wheels so as to transmit power from the driving to the driven shaft. Patent 662,401 is for a multiple speed transmission gearing, and is similar to the main patent, described below except that the gears cannot be shifted as an entirety and the principle of direct drive with all gearing quiescent is not covered. Patent 676,223 is held to cover a removable rigid bridge to carry the motor and operating parts.

What is termed the main patent is that numbered 885,986, for which application was made Jan. 22, 1900, and which was issued April 28, 1908. This is claimed to extend backward in its effect to Feb. 3, 1900, inasmuch as it is declared to be a division of an application for a patent filed that date, which was later granted as patent 921,963 under date of May 19, 1909. This last patent is claimed to underlie the so-called main patent as a sort of foundation for it, and is held to cover improvements in the frame, driving gear, and changing and reversing mechanism of a motor vehicle.

While the main patent embodies 57 separate claims, and that upon which it is based, three more, it is assumed that the public will be interested in learning just what these claims may be. The sketches herewith are taken from the original patent drawings and set forth, in connection with the claims, the entire situation with respect to patents 885,986 and 921,963. The latter reads as follows:



Dyer Patent as Applied to Low Speed and Reversing Gears.

Claims of Patent 921,963.

1—The combination in a vehicle of a spring-supported frame, driving and steering wheels, a motor mounted upon the front of the frame, a shaft driven by such motor and in line with the shaft of the motor, the said shaft being longitudinally arranged substantially at an equal distance between the wheels and substantially parallel with the ground, a friction clutch connecting the shaft to the motor, a second shaft in line with the first shaft, means for directly connecting the two shafts for driving the second shaft without reduction in speed, means for breaking the connection between the two shafts and for connecting them together through power transmitting mechanism, affording a reduced speed, a differential gear between the second shaft and the wheels of the vehicle, and a reversing gear for reversing the direction of travel of the vehicle.

2—The combination in a vehicle of a spring-supported frame, driving and steering wheels, a motor mounted upon the front of the frame, a shaft driven by such motor and in line with the shaft of such motor, the said shaft being longitudinally arranged between the wheels, a friction clutch connecting the shaft to the motor, a second shaft in line with the first shaft, means for directly connecting the two shafts for driving the second shaft without reduction in speed, and means for breaking the connecting between the two shafts and for connecting them together through power-transmitting mechanism, affording a reduced speed.

3—The combination in a vehicle, of a spring-supported frame, driving and steering wheels, a motor mounted upon the front of the frame, a shaft driven by such motor and in line with the shaft of the motor, the said shaft being longitudinally arranged between the wheels, a friction clutch connecting the shaft with the motor, a second shaft in line with the first shaft, means for directly connecting the two shafts for driving the second shaft without reduction of speed, means for breaking the connection between the two shafts and for connecting them together through power-transmitting mechanism, affording a reduced speed, and a reversing gear for reversing the direction of travel of the vehicle.

Claims of Patent 885,986.

1—In a transmission for motor vehicles, the combination of a driving member, a driven member, a driving gear for the former, a plurality of intermediate gears, including a reversing gear and means, including mechanism shiftable as an entirety, for driving said driven member through any one of said intermediate gears.

2—In a transmission gear for motor cars, the combination of a driving member, a driven member, a driving gear for the former, a plurality of intermediate gears including a reversing gear and means, including mechanism shiftable as an entirety, for coupling said driving member to said driven member and for also driving said driven member through any one of the said intermediate gears.

3—Transmission mechanism for motor vehicles, the same comprising a driving member, a driven member, means to couple said driven member to said driving member to be driven by the latter and means comprising mechanism shiftable as an entirety to drive said driven member at a different speed for said driving member and to drive said driven member in reverse direction from said driving member.

4—Transmission mechanism for motor vehicles, the same comprising a driving member, a driven shaft axially aligned therewith, means to couple said member and shaft, one to the other for direct drive of the latter by the former, a plurality of gears arranged out of line with the axis of said shaft and driven by said member, and a shiftable transmission device on said shaft and adapted to engage the said plurality of gears to drive said shaft in the same, and also in a reverse direction.

5—In a transmission gear for a motor vehicle, the combination of driving member, a driven member, and means comprising mechanism shiftable as an entirety coupling said driving member to said driven member to drive the latter from the former and for varying the speed and direction of movement transmitted from said driving member to said driven member.

6—Transmission mcehanism for motor vehicles, the same comprising a driving shaft, a plurality of fixed intermediate gears, including a reversing gear, means for supporting said gears, a driven shaft and means comprising a longitudinal, shiftable transmission device to rotate the latter from the driving shaft to any one of said intermediate gears.

7—Transmission mechanism for motor cars, same comprising a driving shaft, gear supporting means driven therefrom at a reduced speed, a plurality of fixed intermediate gears, including a reversing gear, a driven shaft and means comprising a longitudinal, shiftable transmission device to rotate the latter from the driving shaft through any one of said intermediate gears.

8—Transmission mechanism for motor vehicles, comprising a driving member, a driven member, a shiftable transmission member, means co-ordinate therewith to couple said driven member to said driving member, one or more stationary intermediate gears driven by said driving member and means to bring said transmission member into separate engagement and disengagement with said one or more intermediate gears.

9—Transmission mechanism comprising a driving member and a driven member adapted to be driven one by the other at the same speed, at different speeds, or in a reverse direction and mechanism longitudinally shiftable as an entirety for obtaining such changes in speed and direction.

10—Transmission mechanism for motor vehicle comprising a driving member, a driven intermediate gear, a jack-shaft arranged at transmission device on said shaft, means for coupling said driving member and said driven shaft one to the other for the direct drive of the latter by the former, one or more stationary gears arranged at one side of the axis of said shaft and driven by said driving member and means to shift such transmission device into engagement with the said one or more gears.

11—In a motor vehicle, a motor, clutch, driving gear and driven shaft, all axially aligned, intermediate gears between said driven shaft and driving gear, mechansim shiftable as an entirety to couple said driven shaft to said driving gear and to drive said shaft from said driving gear through any one of said intermediate gears, a jack-shaft arranged at an angle with said driven shaft and driven therefrom and vehicle driving wheels connected with and driven from said jack-shaft.

12—In a motor vehicle, a motor, clutch, driving shaft and driven shaft, all axially aligned, means comprising mechanism shiftable as an entirety for varying the speed and direction of movement transmitted from said driving shaft to said driven shaft, a jack-shaft arranged at an angle with said driven shaft and driven therefrom and vehicle driving wheels connected with and driven from said jack-shaft.

13—In a transmission gear for motor vehicles the combination of a driving member, a driven member, axially aligned therewith and means comprising mechanism shiftable as an entirely to couple said driving and driven members together and to vary the speed and direction of movements transmitted from said driving member to said driven member.

14—In a speed changing gear for motor vehicles, the combination with a motor shaft, a driven shaft, means for connecting the two together to secure high speed, a low speed gearing consisting of a plurality of gear wheels caused to engage by longitudinal shifting movements and means for producing reverse rotation of the driven shaft.

15—In a motor vehicle the combination with the motor and driving wheels, of a gearing connecting the driving wheels and motors, the said gearing comprising a longitudinal shaft and a clutch connecting the shaft to the motor, and by means of which it will be driven, of means for rotating the wheels and a portion of the shaft at a different speed ratio, the said means including a jaw-clutch and longitudinally sliding gears, a single lever for sliding the gears and engaging and disengaging the jaw-clutch and a reverse gearing, and means operated by the said lever for engaging the reverse gearing.

16—In a motor vehicle the combination with a driving motor and driving wheels, of a gearing connecting the two, the said gearing comprising longitudinally aligned driving and driven shafts and a clutch connecting the driving shaft to the motor, and by means of which it will be driven, connections between the driven shaft and the driving wheels, gearing connecting the longitudinal shaft to positively drive the driven shaft at low or high speed, and comprising longitudinally sliding gears and a second clutch, and a single manually operated sliding device for sliding the gears, and for engaging the second clutch.

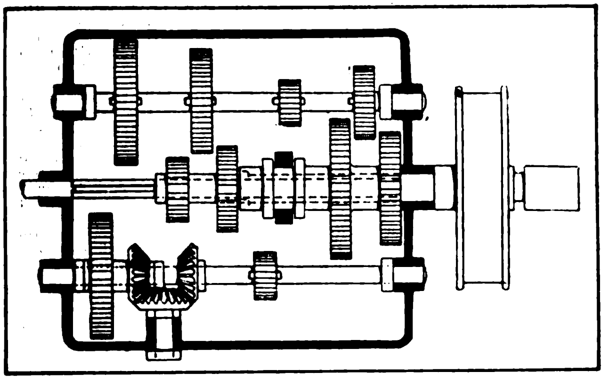
17—In a motor vehicle, the combination with a driving motor and driving wheels, of a gearing connecting the two, said gearing comprising longitudinally aligned driving and driven shafts and a clutch connecting the driving shaft to the motor and by means of which it will be driven, connections between the driven shaft and the driving wheels, gearing connecting the longitudinal shafts to positively drive the driven shaft at low or high speeds, and comprising longitudinally sliding gears and a second clutch, and a single actuating lever for sliding the gears and for engaging and disengaging the second clutch.

18—In a motor vehicle, the combination with the motor and driving wheels, of a gearing connecting the two, the said gearing comprising longitudinally aligned driving and driven shafts and a clutch for connecting the two, for driving the driven shaft at high speed, and reduced speed gearing for positively driving the driven shaft at a reduced speed and means for engaging the said reduced speed gearing, the said reduced speed gearing being entirely disconnected when not in use, and being introduced and disengaged by a longitudinally sliding movement.

19—In a motor vehicle the combination with the motor and driving wheels of a gearing connecting the two, the said gearing comprising longitudinally aligned driving and driven shafts and a clutch for connecting the two for driving the driven shaft at high speed, and reduced speed gearing and reverse gearing for positively driving the shaft at a reduced speed, or in the reverse direction, and means for engaging the said reduced gearing and reverse gearing, the said reduced speed gearing and reverse gearing being entirely disconnected when not in use, and being introduced and disengaged by a longitudinally sliding movement.

20—In a motor vehicle the combination with the motor and driving wheels, of a gearing connecting the two, the said gearing comprising a longitudinal shaft, a clutch connecting the shaft to the motor and by means of which it is driven, connections between the shaft and the driving wheels, and a change speed device for rotating a portion of the shaft at a less speed than the motor, the said change speed device comprising an auxiliary shaft and gears on the longitudinal shaft, and means for intermeshing the gears by a sliding movement.

21—In a motor vehicle, the combination with the motor and driving wheels of a gearing connecting the two, the said gearing comprising a longitudinal shaft, a clutch connecting the shaft to the motor, and by means of which it is driven, connections between the shaft and the driving wheels and a change speed device for rotating a portion of the shaft at a less speed than the motor, the said change speed device comprising an auxiliary shaft, and gears on the longitudinal shaft and means for intermeshing the gears by a sliding movement, the said means comprising a single manually operated lever.



Additional Forward Speeds Obtained by Addition of Extra Secondary Gears on One of the Auxiliary Shafts, Together with Others on Main Driving Shaft.

22—In a motor vehicle the combination with the motor and driving wheels, of a gearing connecting the two, the said gearing comprising a longitudinal shaft, a clutch connecting the shaft to the motor, and by means of which it is driven, connections between the shaft and the driving wheels and a change speed device for rotating a portion of the shaft at a less speed than the motor, the said change speed device comprising an auxiliary shaft, mounted in rigid bearings, gears rigidly mounted on the auxiliary shaft and gears on the longitudinal shaft, and means for intermeshing the gears by a sliding movement.

23—In a motor vehicle the combination with a driving shaft made in two parts, of a clutch made in two parts and connecting the shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, an auxiliary shaft, gears thereon and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft, to cause the two shaft parts to rotate at a different speed relation.

24—In a motor vehicle the combination with a driving shaft in two parts, of a clutch made in two parts and connecting the shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft gear thereon, the said shaft being mounted on rigid bearings and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft, to cause the two shaft parts to rotate in a different relation.

25—In a motor vehicle, the combination with a driving shaft made in two parts, of a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, and auxiliary shaft, gears thereon, the gears being rigidly mounted on the shaft and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

26—In a motor vehicle the combination with a driving shaft made in two parts, of a gear case, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft, mounted in rigid bearings, carried by the gear case, gears movable in a fixed plane with respect to said shaft, on the auxiliary shaft and means for longitudinally sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear, on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

27—In a motor vehicle, the combination with a driving shaft made in two parts, of a gear case, bearing on the gear case for the shaft parts, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft, mounted in rigid bearings, carried by the gear case, gears on the auxiliary shaft, the said gears being rigidly mounted on the shaft and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

28—In a motor vehicle, the combination with a shaft made in two parts of a gear case, bearings on the gear case for the shaft parts, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear upon the other shaft part and rotating with it, and auxiliary shaft, mounted in rigid bearings carried by the gear case, gears on the auxiliary shaft, and means carried within the gear case for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

29—In a motor vehicle the combination with a driving shaft made in two parts, of a gear case, bearings on the gear case for the shaft parts, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft mounted in rigid bearings carried by the gear case, gears on the auxiliary shaft, the said gears being rigidly mounted on the shaft, and means carried within the gear case for sliding the moving clutch part and its companion to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

30—A motor vehicle, having driving wheels, a motor, a shaft in line with the motor shaft, a clutch connecting the two to cause the shaft to rotate at the same speed as the motor, the shaft being longitudinally arranged between the driving wheels and divided into two sections, a device for connecting and disconnecting the two sections for causing them to rotate as an entirety or to permit independent rotation, means for rotating the rear section of the shaft at a lesser speed than the motor or in a reverse direction, said means including sliding gears, longitudinally movable in a fixed plane with respect to said shaft and mechanism for so moving said gears.

31—In a motor vehicle, the combination with a shaft formed of two parts, a connecting clutch and a gear on each shaft part, of a second shaft and gears thereon, and a single lever for shifting the gears on the first shaft and actuating the clutch.

32—Transmission for a motor vehicle, having a shaft formed of two parts, one telescoping within the other, connecting a clutch, a gear carried by one clutch member, a second gear connected to the first gear but freely rotatable with respect thereto, a second shaft, and gears thereon and a single lever for shifting said first gears, and actuating the clutch.

33—In a motor vehicle, the combination with a shaft formed of two parts, of a clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch, and engaging with one part, a second gear formed integral with the sleeve and engaging with the other part, an auxiliary shaft, gears thereon disengaged at the high speed, intermediate gears interposed between the gears on the second shaft, and means for moving the sleeve, clutch and gears to disengage the two shaft parts and intermesh the gears whereby the two parts of the shaft may be caused to rotate in different speed relation.

34—Transmission gearing for a motor vehicle, having a shaft formed of two parts, one telescoping within the other, a connecting clutch, a gear integrally formed upon one clutch member, a second gear, a sleeve thereon, connecting with, but freely rotatable with respect to the first gear, a second shaft with gears thereon and a single shifting lever for sliding first gears and disengaging the clutch.

35—In a motor vehicle, a gear case therefor, having a cover and supporting brackets, with a set of common securing bolts.

36—In a motor vehicle, a combination of a shaft therefor, formed in two parts, a fixed clutch member on one part, a movable clutch member on the other, gears connected to said movable member, a plurality of auxiliary shafts, gears thereon, and means for sliding said movable clutch member and connected gears along the shaft to disengage the clutch and intermesh the gears seriatim.

37—In a motor vehicle, the combination with the shaft, formed in two parts of a clutch for connecting parts together to cause the shaft to rotate as an entirety, slidable gears on the shaft's parts, connecting to and working with one clutch member, auxiliary shafts with gears thereon, and means, which being moved, will first disengage the clutch and move the gears to a position to engage with the gears on one auxiliary shaft to cause the shaft's parts to partake of the different speed relations, and the continuation of the movement will cause the gears to engage with the gears on the other auxiliary shaft and cause the shaft's parts to rotate in opposite directions.

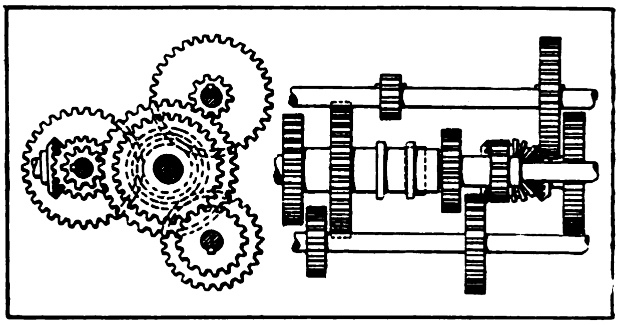
38—In a motor vehicle, the combination with an operating motor, of connections between the motor and the driving wheels, comprising a two-piece shaft connected thereto, connections to said shaft and driving wheels, a clutch connecting the two parts of the shaft, a gear carried by one part of the shaft, a second gear carried by the other part, connections between the gears and the clutch for moving altogether, an auxiliary shaft, two gears secured thereto, out of mesh with the other two gears at the high speed, a second auxiliary shaft, two gears secured thereto, normally out of mesh with the first two gears, intermediate gearing interposed between the two gears on the second auxiliary shaft, and means for disengaging the clutch and intermeshing the different gears, whereby the two parts of the shaft may be caused to rotate in different speed relations.

39—In a motor vehicle, the combination with the driving shaft made in two parts, of the clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch, a second gear formed integral with the sleeve and engaging with the other part, and an auxiliary shaft, gears thereon, disengaged at the high speed, and means for moving the sleeve, clutch and gears to disengage the two shaft parts and intermesh the gears, whereby the two parts of the shaft may be caused to rotate in different speed relations.

40—In a motor vehicle, the combination with the driving shaft made in two parts, of a clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch, a second gear formed integral with the sleeve and engaging with the other part, an auxiliary shaft, gears thereon, disengaged at the high speed, a second auxiliary shaft gears thereon disengage at the high speed and means for moving the sleeve, gears and clutch to disengage the two shaft parts and intermesh the gears, whereby the two parts of the shaft may be caused to rotate at different speeds.

41—In a motor vehicle, the combination with the driving shaft made in two parts, of a clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch and engaging with one part, a second gear formed integral with the sleeve and engaging with the other part, and an auxiliary shaft, gears thereon, disengaged at the high speed, intermediate gearing interposed between the gears, means for moving the sleeve, clutch and gears to disengage the two shaft parts and intermesh the gears.

42—In a motor vehicle, the combination with a motor and driving wheels, of connections between said motor and the driving wheels, including a two-piece shaft, a clutch connecting the two shaft pieces, gears upon the shaft pieces and auxiliary shaft with gears thereon, said gears being so arranged as to be out of mesh when the clutch is engaged, an element longitudinally shiftable as an entirety for actuating said clutch and intermeshing said gears, substantially as set forth.



Views of the Device as Seen from Above and from One End.

43—In a motor vehicle, the combination with the shaft formed in two parts, one telescoping within the other, of a connecting clutch, a gear integrally formed upon one clutch member, a second gear connected to the first gear but freely rotatable with respect thereto, a second shaft, and gears thereon, and a single lever for shifting said first gears and actuating the clutch, substantially as described.

44—In a motor vehicle, the combination with the driving shaft formed in two parts, of a fixed clutch member on one part, a sliding clutch member on the other part, a gear rigidly connected to said slidable member, a gear rotatably connected to said slidable member, and auxiliary shaft, gears thereon and means for moving said slidable clutch member and connected gears along the shaft to disengage the clutch and intermesh the gears.

45—In a motor vehicle, the combination with an operating motor, of connections between the motor and the driving wheels, comprising a two-piece shaft connected thereto, the connections between said shaft and driving wheels, a clutch connecting the two parts of the shaft, a gear carried by one part of the shaft, a second gear carried by the other part, connections between the gears and clutch for moving all together, an auxiliary shaft, two gears secured together, out of mesh with the other two gears at high speed, a second auxiliary shaft, two gears secured thereto out of mesh with the first two gears at the high speed, and means for disengaging the clutch and intermeshing the gears, whereby the two parts of the shaft may be caused to rotate in different speed relations.

46—In a motor vehicle, the combination of the driving wheels, the motor, the driving shaft between the motor and driving wheels, made of two longitudinally aligned sections, a clutch arranged to couple the sections so that the driving shaft may turn as an entirety and longitudinally sliding speed reducing gearing arranged to connect the shaft sections, and so co-ordinated with said clutch that the engagement of said gearing will effect the prior disengagement of said clutch and vice versa.

47—In combination in a change-speed mechanism, a driving shaft, a driven shaft, gears mounted upon said driving shaft and driven shaft, intermediate gears on an axis in fixed relation with the axis of said driving and driven shafts, means for transmitting power from said driving shaft to said driven shaft through said intermediate gears, and means movable on the driven shaft for directly connecting the driving and driven shafts with all intermediate gears at rest.

48—In combination in a change-speed mechanism, a driving and a driven shaft arranged in the same axial line and adapted to have independent movement, change gears carried upon the driving and driven shafts, means for varying the position of said gears, power transmitting means adopted to connect a gear on said driving shaft and on said driven shaft and a clutch mechanism for directly connecting said driving and driven shafts.

49—In combination in a change-speed mechanism, a driving shaft, a gear borne upon said shaft, a countershaft, a gear borne upon the counter shaft and meshing with the gear upon the driving shaft, a driven shaft operatively arranged with relation to the driving shaft and provided with a clutch mechanism adapted to clutch it directly to said shaft, and intermediate gears borne upon the driven shaft and counter shaft, whereby the speed of the former may be varied with relation to the speed of the latter.

50—In combination in a change-speed mechanism, a driving shaft and driven shaft, a driving gear for the former, a plurality of intermediate gears including a reversing gear and means for driving said driven shaft through any one of said intermediate gears.

51—In combination in a change-speed mechanism, a driving shaft, a driven shaft, a plurality of transmission gears mounted to slide thereon, a plurality of intermediate gears arranged to engage and drive respectively, but singly, the said transmission gears, and means to couple said driven shaft directly to said driving shaft.

52—In a motor vehicle, the motor, clutch, driving gear and driven shaft, all axially aligned, means to drive said driven shaft from said driving gear at the same and also at different speeds, a jack-shaft arranged at an angle with said driven shaft and driven therefrom, and vehicle driving wheels connected with and driven from said jack-shaft.

53—In combination in a change-speed mechanism, a driving shaft, a driven shaft, a counter shaft in fixed relation to said driving and driven shafts, and operative gearing on said shafts, and inclosing casing, a bearing in said casing for one end of the driven shaft, the other bearing for said driven shaft being in the driving shaft.

54—In combination in a change-speed mechanism, a driving shaft and a driven shaft, operatively arranged, an inclosing casing, a bearing in said casing for one end of one of said shafts, the other end of said shaft having a bearing in the other shaft, a counter shaft in fixed relation to said driving and driven shafts and a plurality of gears connecting said counter, driving and driven shafts.

55—In combination in a change-speed mechanism, a driving shaft and a driven shaft, the driven shaft having a bearing in the driving shaft, and means movable on the driven shaft to engage the surrounding end of the driving shaft to rotate the two shafts at the same speed, a counter shaft in operative fixed relation to said driving and driven shafts and a plurality of gears connecting said counter, driving and driven shafts.

56—In combination in a change-speed mechanism, a driving shaft and a driven shaft axially aligned, a counter shaft in fixed relation to said driving and driven shafts, a plurality of gears connecting said counter, driving and driven shafts, and inclosing casing, a bearing in said casing for one end of the driven shaft.

57—In a transmission mechanism for motor vehicles, a casing, a driving shaft or shaft section projecting into said casing at one side, a bearing therefor in the wall of said casing, a gear and clutch part fixedly secured on or integral with said shaft section, and entirely on one side of said bearing within said casing, a driven shaft in said casing having a movable complementary clutch part, a counter shaft in fixed relation to said driving and driven shaft, and a plurality of gears on said shaft whereby varying speeds are transmitted to a shaft projecting from said casing.

ANOTHER OAKLAND BRANCH.

Following its policy of establishing branch houses in leading distributing centres, so as to improve the service end of the business and to facilitate the selling end, the Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, will take over the business of the Oakland Company of Pennsylvania, in Philadelphia, Sept. 1. The new branch will be in charge of Edward K. Leach, for some time past general manager of the Commercial Car Journal in that city.

SIMPLEX ALUMINUM SOLDER.

One of the difficulties with which repairmen must contend is that of soldering aluminum. This metal differs from ordinary materials, but it may be successfully handled if the right solder is employed. The Simplex Aluminum Solder Company, 108 Broadway, Astoria, Long Island, N. Y., is marketing Simplex aluminum solder which is designed for soldering aluminum parts as well as for joining brass or copper to aluminum.

According to the maker it requires no other tools than an ordinary copper soldering iron, and no acid, rosin or other similar substance is necessary in its application. All that is needed is that the work shall be free from dirt, grease, etc., and bright and clean. The parts to be repaired may be cleansed with gasoline and if very dirty or greasy, the foreign elements may be removed with nitric acid.

The simplicity of the operation will appeal to workmen who have struggled to secure good results. All parts are first tinned in the usual manner, taking care to have the iron clean, after which the solder is applied. When large castings or pieces are to be joined, which is held to be practical with Simplex solder, the parts should be heated to nearly the same degree as the solder. Brass or copper can be tinned with ordinary solder then joined to aluminum with the Simplex material, providing the work is free from acids. Simplex aluminum solder is inexpensive and is guaranteed by the maker.

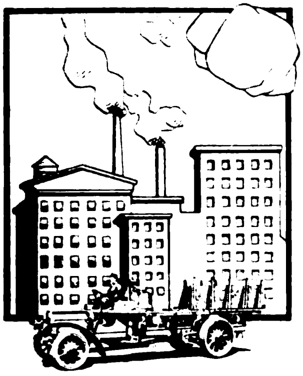
SECURES CONTROL OF THOMAS.

The entire control of the E. R. Thomas Motor Car Company, Buffalo, N. Y., was recently secured by interests closely allied with the United States Motor Company, New York City. President F. R. Humpage of the Thomas concern, it is stated, has secured an option of purchase of all the stock, and is now seeking the necessary capital to consummate the deal.

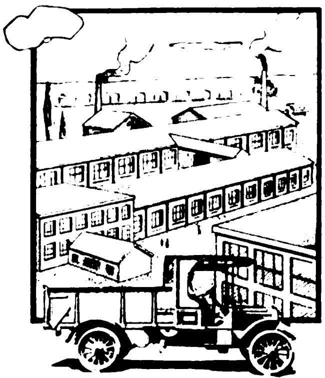
Although it has been known for a considerable length of time that the largest stockholders in the one company were the largest in the other, there has been no official confirmation of this. In addition to producing the regular Thomas line of cars, it is planned, also, to place a small six-cylinder machine on the market.

SLATER GOES WITH MICHIGAN.

William J. Slater, former advertising manager of the Firestone Tire & Rubber Company, has been added to the forces of the Michigan Buggy Company at Kalamazoo, Mich., maker of Michigan cars, as assistant sales manager. Mr. Slater is best known to the automobile industry and trade through his connection with the Firestone company, where his ideas, both in manufacturing and selling, have been adopted by a number of tire makers.



News Notes of the Industry



AGAIN INCREASES SPACE.

Maker of Paige-Detroit Cars Finds It Necessary to Secure Second New Factory Building.

It is announced in Detroit that the Paige-Detroit Motor Car Company has just closed a deal whereby it has acquired and will take over one of the United States Motor Company's plants located on Lieb and Larned streets, that city. This large factory will be devoted entirely to the manufacture of Paige motors, the motor department thereby being separated from the main plant, and leaving all the space in the latter for the other departments. The new motor plant is being equipped with the finest automatic machinery of the latest design and will have a capacity of 75 motors a day.

The latest addition by the Paige-Detroit concern has caused considerable talk in automobile circles, for it is the second time this company has increased its factory capacity this season. In March the demand for its product was so heavy that it was decided to double the factory capacity and for this purpose an entire building, located on the property adjoining the original Paige plant, was acquired.

CHANGE OF NAME.

Kelly-Racine Rubber Company Drops the First Portion After Two Years of Business.

The Kelly-Racine Rubber Company, Racine, Wis., has changed its firm name to the Racine Rubber Company. The concern has been organized for two years, during which time it has done an exceedingly good business in the manufacture of automobile and bicycle tires. The officers are: President, George B. Wilson; secretary and treasurer, Stuart Webster; general sales manager, H. L. McClaren.

The latter but recently joined the forces of the company. He has been in the rubber business for the past 12 years, starting with Morgan & Wright in 1900. He was with that company until the formation of the United States Tire Company, from which company he resigned as assistant to the central district manager in order to go to Racine.

SIMMS COMPANY PLANS.

Reorganizes with Additional Capital and Will Begin Production at Once.

The Simms Magneto Company, Bloomfield, N. J., has been reorganized with a capital stock of $1,750,000, of which $1,000,000 is represented by the old stock of the company, all common; the remaining $750,000 representing the new issue, of which $500,000 is preferred. The new preferred stock has been subscribed, and after the proceeds have been used in paying outstanding debts it is expected $350,000 will be left to take care of production, which will commence at once. The reorganized company will manufacture practically the same line of products as did the old Simms organization.

C. G. Stoddard, formerly connected with the Dayton Motor Car Company, and more recently with the Edwards Motor Car Company, has been elected president, F. R. Simms, who up to the reorganization was president, having resigned. Simms remains a director, and his associates are Edwards, A. A. Fisher, acting treasurer, who occupies a similar position with the Assets Realization Company of New York City, which company is financing the project; Campbell Carrington and H. M. Kilborn, the latter vice president of the National City Bank.

WILL DOUBLE OUTPUT.

Maker of Cutting Automobiles Will Occupy New Factory Addition This Month.

The Clarke-Carter Automobile Company of Jackson, Mich., maker of the Cutting automobiles, has nearly completed the large and extensive four-story addition to its present plant. The completion of this new building, which will so greatly facilitate manufacturing for the season of 1913 that the company will be enabled to double its production, will be occupied, it is expected, some time this month.

At present the Clarke-Carter factory is so congested that the concern has been experiencing difficulty in keeping abreast of its orders. Consequently the addition to the plant was made necessary, and it is planned to supply all the 1913 cars that can possibly be sold by the company's able corps of salesmen.

For Month's Trade Information and Industrial News See Last Section of This Issue.

NEW LOZIER MODEL.

Plans for Reorganization Completed with Election of Jewett as President.

Plans for the reorganization of the Lozier Motor Company of Detroit and Plattsburg, N. Y., which have been under way for several weeks, were completed at a recent meeting of the directorate in Detroit. H. A. Lozier, president of the company, resigned, and Harry M. Jewett of the Paige-Detroit Motor Car Company, also of Detroit, was named as his successor. Raymond B. Fosdick of New York was elected vice president and treasurer, and E. P. Earle and H. E. Kahler of New York were made members of the board of directors.

Coincident with the reorganization comes the announcement that the Lozier company will increase its capacity very materially and also add to its line of cars. Heretofore the Lozier has had nothing to offer except a 50 horsepower machine. It plans to have ready for delivery in about 10 weeks a model of less horsepower, but in every way up to the standard set by the Lozier company—the best for the money. The company will also add in the near future to its machine shops and the necessary financial backing for the increase in capacity and building have been made.

Harry M. Jewett is best known as one of the most successful coal operators in the country, although he has gained consideration since Jan. 1, 1911, as an important factor in the automobile industry, that date marking his connection with the Paige-Detroit concern. Raymond B. Fosdick, the new vice president, recently tendered his resignation as commissioner of accounts for New York City, to take effect Sept. 1. Mr. Earle is one of New York's best known business men, and Mr. Kahler is the junior member of the firm of O'Connor & Kahler, Wall street bankers.

The addition of Messrs. Jewett and Fosdick to the staff of the Lozier Motor Car Company does not mean a change in policy. On the contrary, it will continue along practically the same lines as in the past. Mr. Lozier will continue to take an active interest in the affairs of the concern. The balance of the organization, made up principally of Detroit men, will remain the same.

WILL STAY IN CLINTONVILLE.

Four Wheel Drive Concern Decides Not to Accept Offers from Other Cities.

After having received offers from several cities in the Middle West, the Four Wheel Drive Automobile Company, maker of the Four Wheel Drive car, has decided to remain in its present location, Clintonville, Wis. Among the offers made to the firm when removal from Clintonville was considered was one from a combination of business men in Appleton, Wis., who agreed to buy $100,000 worth of stock and provide shops.

Following its decision not to accept any outside offers, the company at once commenced plans for enlarging its factory at Clintonville and start its first regular issue of cars, including 11 commercial vehicles in 1.5 and three-ton capacities for the United States War Department. The directors have been given authority to place $25,000 of the treasury stock on the market for purchase. The capitalization of the concern is $250,000.

GROWTH IN OHIO.

Census Figures Show Remarkable Increase in Automobile Industry During Five Years.

The report of E. Dana Durand, director of the 13th census, shows a remarkable growth in the automobile industry in the state of Ohio. Ohio ranked second among the states of the Union in the manufacture of automobiles, including bodies and parts, both in 1909 and 1904. The total value of the products in the former year was $38,838,754. This represents an increase of $32,480,590, or 510.9 per cent., in value of products in five years.

In 1909 the total number of automobiles manufactured in Ohio was 14,299, valued at $23,550,112. The number was 409.2 per cent. greater than in 1904 and the value 353.1 per cent. greater. In 1909 Ohio was first among the states in the number and value of both electric and steam machines, producing 42.9 per cent. and 72.1 per cent., respectively, of those manufactured in the country. As all the steam cars were made by one establishment, they are included under the item "Electric and Steam" to avoid the disclosure of the operations of an individual concern.

In the item for "All Other Products" which includes the manufacture of additional parts, supplies, and other items not separately called for, an enormous increase is shown—from $1,160,804 in 1904 to $15,288,642 in 1909.

The following table indicates the increase in the industry in the five years, and other points of interest:

	1904.		1909.	
	No.	Value.	No.	Value.
Buggies, runabouts and touring cars..	*2,808	$5,197,360	11,539	$18,356,985
Limousines and cabs	**	**	1,185	2,775,891
Service vehicles.....	**	**	904	1,788,186
Delivery wagons....	**	**	469	242,105
Trucks and all others	**	**	202	386,945
Other products, including bodies, parts and repair work		1,160,804		15,288,642
Totals	2,808	$6,358,164	14,299	$38,838,754
Gasoline cars........	1,811	3,853,621	10,947	17,999,332
Electric and steam cars	997	1,343,739	3,352	5,550,780

*Includes "business vehicles" to avoid disclosure of individual operations.

**Not reported.

In another way the growth of the industry is shown as follows:

State of Ohio.

	1904.	1909.
Number of establishments......	22	75
Persons engaged...............	2,939	13,458
Proprietors	8	42
Salaried employees.............	209	1,286
Wage earners..................	2,722	12,130

Primary horsepower	1,877	14,433
Capital invested	$4,226,000	$30,892,000
Salaries paid	254,000	1,430,000
Wages paid	1,617,000	7,746,000
Cost of materials	2,553,000	18,522,000
Value of products	6,358,000	38,839,000
Value added by manufacture	3,805,000	20,317,000

City of Cleveland.

	1904.	1909.
Number of establishments	10	32
Persons engaged	1,949	7,115
Proprietors	3	20
Salaried employees	146	687
Wage earners	1,800	6,408
Primary horsepower	*	9,135
Capital invested	$3,095,000	$16,600,000
Salaries paid	194,000	875,000
Wages paid	1,027,000	4,023,000
Cost of materials	2,030,000	10,417,000
Value of products	4,624,000	21,404,000
Value added by manufacture	2,594,000	10,987,000

*Figures not given.

NEW COMPANY FORMED.

Organization in New Orleans to Build Trucks and Conduct Service Station.

The Automobile Maintenance Company is a new enterprise just organized in New Orleans, La., with the support of a number of automobile owners. It is proposed to manufacture motor trucks and delivery wagons, and at the same time operate a maintenance plant, equipped to do every kind of work on all kinds of automobiles.

While the concern will begin in a modest way, the promoters expect to develop along lines that will eventually result in a real live industry. J. Raynaud is president; J. L. Blair, mechanical and consulting engineer, is vice president and Abner Powell is secretary and treasurer. Negotiations are pending for the erection of a building in Canal street to house the plant, and it is expected that operations will commence in a few months.

ABBOTT COMPANY'S HEAD.

Senator Knapp Succeeds the Late President Jamieson in Directing Concern's Policy.

State Senator F. M. Knapp of Warren, Penn., was elected president of the Abbott Motor Company, Detroit, at a meeting of the directors of the company July 27. His election fills the vacancy caused by the recent death of President C. W. Jamieson. H. M. Preston, also of Warren, formerly second vice president of the company, was elected vice president to fill the place made vacant by Senator Knapp's promotion. F. B. Jackson, who several months ago was appointed manager of the Jamieson estate, was elected a member of the board of directors. No other changes were made in the board.

President Knapp is heavily interested in a number of large business enterprises in the East. but will arrange to pass a considerable portion of his time at Detroit. At the meeting of the directors the company's business was reviewed in detail and expressions of gratification at the progress made during the last year were voiced. General Manager M. J. Hammers stated that announcements concerning the 1913 models would appear immediately. The company has already contracted for the disposal of practically its entire output of 1913 cars, 3500 in number, and new connections with many of the most enterprising agencies in the country have been effected.

ADDS MERCEDES TRUCK.

General Vehicle Company Will Manufacture Gasoline Vehicles as Well as Electrics.

The General Vehicle Company of Long Island City, N. Y., has secured the American right to manufacture and sell the Mercedes gasoline truck, built in Europe by the Daimler Motoren Gesellschraft, and President P. D. Wagoner of the company says that after 12 years of deep study on the manufacture of commercial vehicles, he has concluded that the Mercedes is the best truck in the world for long haul work in America. President Wagoner, accompanied by his factory manager and engineer, made a three months' tour of Europe in an effort to find what they regarded as a suitable gasoline truck for manufacture in this country.

P. D. Wagoner, President, General Vehicle Company.

The General Vehicle Company has held strictly to the manufacture of electric trucks, these being especially adapted to city work and all short haul demands. For longer haul cross country work, the gasoline vehicle was admittedly superior and when demands for trucks for that kind of work were received the General Vehicle Company cheerfully advised its customers of that fact. It was realized that the company should possess a complete commercial vehicle equipment for all lines of business and the acquirement of the American manufacturing and selling rights to the Mercedes fills this need.

A study of the American trucks convinced President Wagoner that they were built mostly for competition in the field of the electric vehicle and in his opinion were not well adapted to long cross country hauls. The Mercedes, he found, gave exceptional service in mountainous sections and rural districts and after some difficulty he succeeded in securing the right to import and sell the German commercial vehicles. The machines will be imported pending the completion of manufacturing arrangements. The American built Mercedes will be constructed from the original drawings of the Daimler Motoren Gesellschraft, which will also furnish materials, tools, jigs and fixtures.

BUYS BUICK PLANT.

Imperial Automobile Company Is to Quadruple Its Present Output of Pleasure Cars.

The Imperial Automobile Company of Jackson, Mich., has closed a deal for the purchase of the Jackson plant of the Buick Motor Company, with headquarters in Flint, Mich., which gives the Imperial two splendidly equipped factories. The new plant will have an additional capacity of 8000 cars, bringing the total output to 10,000 or over. It will employ 800 men and afford eight acres of floor space.

The Imperial company has been making cars for the past five years, and Col. T. A. Campbell, general manager, and the organization behind him, have been known for almost a quarter of a century from coast to coast as makers of carriages of exceptional merit. The additional production of cars and the possibilities of this greatly increased plant place the Imperial firm among the really big manufacturers in the automobile business in this country.

FORMS FOREIGN ALLIANCE.

American and British Engineers Combine to Promote Accessory Business Abroad.

Joseph A. Steinmetz of Janney, Steinmetz & Co., Philadelphia, and a member of the Society of Automobile Engineers, has become associated with R. W. A. Brewer of London, England, in a consulting capacity with a view to an exchange of opinions relating to American inventions and devices that may be used to advantage in Europe. Mr. Brewer will in turn advise Mr. Steinmetz as to such foreign improvements and inventions as may be applied with success to the American automobile output. The arrangement should prove of decided value to manufacturers in the United States, particularly those engaged in the production of motor car accessories.

In addition Mr. Steinmetz has purchased the American rights under a series of United States patents for the manufacture of the famous Sharpe silencer or muffler for automobiles. This device is known all over Europe and won the first, second and third awards at the official Autocycle Club tests relating to gasoline engine mufflers. It is made in all sizes and for all capacities, and can be designed for any case requiring individual consideration. As marketed by Janney, Steinmetz & Co., it will be produced in seamless steel, rather than in cast aluminum or cast iron, thereby increasing its efficiency, it is maintained.

Mr. Brewer has ordered a complete sample line of the seamless gasoline tanks, made by the Philadelphia concern, and will recommend these goods to the European pleasure and commercial car trade.

NEEDS OF EXPORT TRADE.

Striving to Secure Better Representation of American Interests Abroad.

American manufacturers and exporters have long recognized the need of some additional facilities by which they could be placed in closer touch with foreign buyers, particularly those in South America, Africa, Asia, Australia and other parts of the world where the markets are open. The lack of definite plan in this regard has impelled the Commercial Bureau Company of 50 Church street, New York City, to undertake the establishment of a foreign commercial bureau, which is sending to all American consulates card catalogue files, showing American manufacturers of all interests.

Branches have been located in South America, Africa, Asia and Australia, which points will act as distributing centres, and in which catalogues may be examined by buyers requesting them. It is estimated that this service will place the American manufacturer in direct touch with at least 10,000 purchasers from all parts of the world, each being an actual prospect, with a credit standing, and concerning whom information will be supplied.

MANUFACTURERS IN SESSION.

Midsummer Meeting of National Association Takes Up Several Important Matters.

The midsummer meeting of the National Association of Automobile Manufacturers was held at the summer home of the general manager, S. A. Miles, Christmas Cove, Me., July 30. This was a meeting of the executive committee, but arrangements were perfected for a convention of the entire association, to be held late in the fall or early winter. It is anticipated that a date some time in October will be selected, inasmuch as it will be at that time that drawings will be made for the shows in New York City and Chicago.

The Motor Car Manufacturing Company, Indianapolis, and the Warren Motor Car Company, Detroit, were admitted to membership, the former being represented by W. C. Teasdale and the latter by Lucius E. Wilson. H. F. Campbell of the Ideal Motor Car Company, Indianapolis, was selected to succeed E. G. Sourbier, Gleason Murphy to succeed J. F. Corl of the Rapid Motor Vehicle Company, Pontiac, Mich., and H. S. Stebbins to succeed A. M. Bentley of the Reliance Motor Truck Company, Owosso, Mich.

In considering the matter of the show circuit, St. Louis was eliminated, because the dealers in that city will hold an exhibition in October. Some discussion of the proposition to hold a midsummer truck show in 1913 was had, and the opinion of the members seemed to be about equally divided. The secretary of the commercial vehicle committee was instructed to secure the views of the motor truck manufacturers upon the subject.

Albert Pope, chairman of the traffic committee, reported progress in connection with freight rates, and also on insurance on commercial vehicles. He stated that fire underwriters were of the opinion that the risk was greater while the truck was on the road than while in the garage, and that the Automobile Underwriters' Conference is considering a reclassification of rates on these.

DEPARTMENT HEADS CHOSEN.

President Handley of Marion Motor Car Company Announces Factory Assistants.

President J. I. Handley of the Marion Motor Car Company of Indianapolis, Ind., announces the names of four men of particular prominence in the automobile world as the men who will constitute his executive staff in the reorganized Marion company. They are J. M. Edsall, M. B. Morgan, J. B. Myers and W. McKay White, all of whom are widely known in connection with their successes in the industry in recent years. For several weeks Mr. Handley has been arranging to secure men of most extensive experience to handle the big plans made for the production and distribution of the Marion cars. Already the factory has been occupied by the new interests and manufacturing on a large scale is thoroughly under way.

Mr. Edsall will be in charge of the finances and general accounting; Mr. Morgan will direct the designing and engineering; Mr. Myers is in charge of the factory production, and Mr. White of the advertising. All these men have been connected with the automobile industry in their respective departments for several years and each has an enviable record in the trade. During the next few weeks it is probable that one or two others will be added to the organization Mr. Handley is gathering about him and it is already known that the new men will be those of equally extensive experience and note in the motor car industry.

COLER MADE MANAGER.

To Have Charge of Advertising with Willys Group of Factories.

Ernest Coler, for a number of years connected in one way and another with the automobile industry, was recently appointed advertising manager of the John N. Willys group of motor car factories. He will supervise the work of the departments of the Garford Company at Elyria, O., the Gramm Truck Company, Lima, O., and the Willys-Overland Company, Toledo, O. His headquarters will be established in the general executive offices of the Willys interests.

Identified with the automobile business for a number of years, the new head of the advertising department of this immense concern is an expert on technical matters. Previous to joining the Willys forces he was assistant general advertising manager of the United States Motor Company, going to the latter concern after being advertising manager for the Maxwell-Briscoe Motor Company.

NEW SALES ORGANIZATION.

Well Known Tire Men Combine to Handle Lee Company's Entire Product.

No combination of recent years in the automobile tire industry should prove of more interest than that just completed by Charles F. U. Kelly, formerly president and principal organizer of the Kelly-Racine Rubber Company, and Harry E. Field, formerly vice president and general sales manager of the Hartford Rubber Works Company. They have just closed a deal with the Lee Tire & Rubber Company, of Conshohocken, Penn., to market its entire production of tires, tubes and other automobile accessories.

This combination brings together in one selling organization, two of the strongest, best known and most popular salesmen known to the trade, men who have the confidence of motorists from the Atlantic to the Pacific. Mr. Kelly began his tire career in 1893, with the Hodgman Rubber Company, then manufacturing bicycle tires. Shortly afterwards he joined the forces of the B. F. Goodrich Company, with which company he was associated for several years. He has since been continuously in the rubber field. Mr. Field, also a pioneer in the rubber tire business, is president of the T. B. Jeffery Company of New York, where he will remain until the expiration of his contract, which was accepted after his resignation from the Hartford Rubber Works Company, at the time of the formation of the United States Tire Company.

ADDITION TO MERCER PLANT.

New Structure to House Assembling, Finishing and Painting Departments.

Ground has just been broken in Trenton, N. J., by the Mercer Automobile Company, maker of the Mercer car, on which an additional factory building will be erected. The new structure, which will be 160 by 161 feet, was made necessary because of the growing business of the concern and the plans for an increased output in 1913.

The building will be of the saw-tooth type, and will house the assembling, finishing and painting departments, as well as the tin shop, riveting shop and storeroom. New machinery has been purchased and will be installed. Plans are also being drawn for a new office building.

TRADE INFORMATION EXCHANGE

BUSINESS PROPOSITIONS.

Opportunities Are Offered Below for Agents to Secure New Lines, for Manufacturers to Extend Their Representation, and for Producers to Get in Touch with Those Who Are in the Market for Equipment and Supplies. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without Names, Those Interested Desiring the Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding.

MANUFACTURERS' OPPORTUNITIES.

1001—Indiana Manufacturer, producing more than 5000 trucks annually, desires full information concerning combined electric starting and lighting system.

1012—New England Manufacturer would like to get in touch with producers of all parts for light commercial vehicles.

1015—Well Known Boston Jobber, who will leave on an extended foreign trip in January, visiting England, France, Germany and other countries, with a view to buying and placing supplies, desires to correspond with manufacturers who are interested in such foreign trade.

1025—Chicago Manufacturer wants to get into correspondence with producers of automobile accessories for use on its pleasure cars.

1027—Tire Filler Concern, well located in respect to shipping facilities, etc., desires agents in all sections of the country.

1033—Massachusetts Manufacturer of two-ton commercial vehicles, desires information concerning the purchase of channel iron for chassis and other parts.

1034—Arizona Truck Manufacturer seeks information concerning steel or wood block tires for such vehicles.

CAR AGENCIES DESIRED.

1062—Kentucky Firm, recently organized, would like agency for pleasure cars selling from $500 to $5000; and commercial vehicles from $750 to $2500.

1067—Utah Concern, well established, wants agency for pleasure cars and trucks selling at about $1000.

1071—Ohio Sales Company, in large city, desires information concerning cars listing from $1000 to $3500, with a view to taking an agency.

1073—Dealer in Washington State would like agency for cars selling at medium price.

1079—Tennessee House with numerous distributing branches in the South is interested in cars selling up to $8000 and in trucks listed at $1500 to $6000.

1082—Wisconsin Dealer, well established in good location, wants agency for cars selling at $900 to $1900.

1087—Pennsylvania House, with sub-agencies in several counties, would add agency for cars selling at $1750 to $3500.

1091—Kentucky Agency, already representing one line, wants to add cars selling at about $1000.

1095—Tennessee Concern, also covering parts of Mississippi and Arkansas, would take agency for cars selling at $1150 to $1750 and trucks selling at $900 to $2200.

1097—Michigan Dealer, well established, desires agency for pleasure cars selling at $800 to $1200.

1099—New Jersey Company, recently opened, wants agency for pleasure cars selling at $800 to $1700 and trucks from $600 to $1200.

2001—Boston Dealer seeks information concerning pleasure cars or trucks fitted as camp wagons.

2003—Vermont Agency, with well established repair business, wants agency for cars selling at about $2000.

2004—Louisiana Supply Company, representing two lines, desires information concerning pleasure cars selling at $1000 to $2500.

2006—Idaho Dealer seeks agency for pleasure cars selling at or below $1600.

2009—Massachusetts Dealer, well acquainted with managers and superintendents of electric lighting companies throughout New England, desires agency for electric and gasoline commercial vehicles, capable of climbing hilly streets at fair speed, and going over good roads at from 15 to 20 miles an hour.

EQUIPMENT NEEDED.

907—New Jersey Concern, recently established, desires equipment for garage and repair shop.

908—Seattle Tire Dealer, is interested in repair shop supplies and equipment for such work.

909—Milwaukee Company, just incorporated, is in need of garage and repair shop equipment and supplies, including machine tools, etc.

911—Iowa Concern, now building cement garage, wants equipment for garage and repair shop, including machine tools, etc.

915—Service Station in Salt Lake City is in the market for all kinds of garage and machine tool equipment.

923—Garage in New Jersey, recently opened, wants equipment and machine tools.

927—Concern in Kentucky, engaged in rebuilding automobiles, desires garage and repair shop equipment.

933—Chicago Manufacturer, recently incorporated, is in the market for machine tools, etc.

936—Tennessee Company, with well established garage, is desirous of adding to its garage equipment.

939—Taxicab Company in Ohio is interested in securing garage and machine tool equipment.

941—Pennsylvania Concern, now erecting building, wants garage and repair shop equipment.

947—New York Dealer in large up-state city desires garage, repair shop and machine tool equipment.

949—Baltimore House is in the market for gasoline storage systems, pumps, vulcanizer, vehicle washers, welding equipment, lathes and other miscellaneous equipment.

951—Michigan Garage, well located for tourist trade, seeks information concerning garage and repair shop equipment of all kinds.

953—Vermont Garage, in heart of touring country, would install needed garage equipment.

955—Connecticut Concern, well established, wants information concerning garage and repair shop equipment of all kinds.

957—California Company, recently incorporated, is in the market for garage equipment and supplies.

960—Ohio Concern, well fitted to take care of all sorts of repair work, is interested in repair shop equipment.

961—Michigan Garage, recently opened, seeks information concerning garage and repair shop equipment.

ACCESSORY AGENCIES.

970—Wisconsin Company, recently incorporated, seeks the agency for pleasure car accessories and supplies.

975—Dealer in Washington State, with well established garage and salesrooms, desires agency for pleasure and commercial car accessories and supplies.

978—Iowa Distributor, well located, wants agency for pleasure and commercial car accessories and supplies.

979—New York Garage, in growing city, would like agency for all kinds of accessories and supplies for all types of vehicles.

982—Michigan House, engaged in general repair business, wants agency for automobile accessories and supplies for garages.

986—Kentucky Dealer, well located, wants agency for pleasure and commercial car accessories and supplies.

992—New Jersey Garage, recently established, wants agency for pleasure car and garage accessories and supplies.

993—Tennessee Tire Concern, in large city, would add full line of automobile accessories and supplies.

999—San Francisco Jobber, well established, desires agency for all kinds of accessories, as sales representative for the entire Pacific Coast, including British Columbia.

1007—Idaho Company, just starting in business, seeks agencies for well known automobile and garage supplies and accessories.

1010—Louisiana Agency for pleasure and commercial cars would add full line of accessories and supplies for these vehicles.

1014—Connecticut Garage, recently opened, has splendid opportunity to develop good trade in representative line of automobile and power wagon accessories and supplies.

1010—Vermont Dealer, on line of summer tourist travel, seeks agency for pleasure car accessories and supplies.

1019—Michigan Concern, erecting new modern garage, wants agency for standard automobile supplies and accessories.

1022—Maryland Dealer, in excellent location, wants agency for tires, oils and similar goods.

1023—Baltimore Garage, now erecting new building, is interested in agency proposition for automobile accessories and garage supplies, **and later will be in the market** for repair shop equipment.

1028—Massachusetts Concern, well located in large city, is interested in securing the agency for automobile accessories of all kinds.

1029—Boston Dealer is interested in securing information concerning accessories and parts pertaining to the automobile industry.

1030—California Garage, in well established location, desires agency for automobile accessories and supplies.

TWO-CYCLE VS. FOUR-CYCLE MOTORS.

Two Somewhat Differing Views of Their Respective Merits by Men Who Have Given the Subject Much Thought and Attention—A Discussion Which Should Prove of Decided Interest and Value to the Trade.

Editor, Accessory and Garage Journal,

Sir:

Your July issue has been read with interest, but I am obliged to disagree with the article on two and four-stroke cycle engines in a number of respects.

Your article very correctly calls attention to the fact that the two-cycle does not begin to compress until the exhaust port is closed, and you very rightly assume that the compression pressures are the same. This should be the case, for proper comparison, but if it is the case, it means that the compression chamber of the two-cycle is about 25 per cent. smaller than the compression chamber of the four-cycle, and that, therefore, expansion of the working charge is carried farther in a two-cycle than in a four-cycle, because it is evident that the exhaust port of the two-cycle need not open any earlier than is customary to open the exhaust valves of the four-cycle; so that the working stroke length would be the same in each engine. This, while not strictly true, is not so far from common practise as to be an objectionable statement as understood by your readers. They will, therefore, see that if the compression chamber of the two-cycle if only half the size of that of the four-cycle, the gas would be expanded twice as much with great gain in economy. This is not an actual arrangement, but is mentioned to show that there is opportunity in a two-cycle for a considerable gain in economy, due to longer expansion of the gases.

I think your statement that the exhaust port opens at about 35 per cent. of the piston stroke, is not correct. Robert claims that the exhaust port for a high speed engine should open at 59 degrees ahead of the lower dead centre, and this is very closely 25 per cent. of the piston stroke, as above stated. My own practise is to open the exhaust port about 45 to 50 degrees, or practically the same as the four-cycle engine. This makes a very appreciable difference in your figures, but even with this correction, your figures are wrong, for plenty of two-cycle engines are running which develop 1.6 to 1.7 the power of a four-cycle of same bore and stroke. Facts like these are stubborn things and the theories must fit the facts.

If a three-port engine is used it is possible to ram into the crankcase by the inertia of the gas in the carburetor pipe, an amount somewhat above atmospheric pressure, but this is a matter that is not much understood, and, doubtess, this result is seldom obtained. I prefer to use the two-port engine with very light check valve into the crankcase, and this check valve permits drawing in mixture during the full piston movement, and does not permit any of it to escape, so that the new charge at moderate speeds can be just as big as in a four-cycle. It seldom is this big, however, because the crankcase has so much space or clearance that the piston working into it does not act like a good pump piston. The piston of the four-cycle has some clearance space, and so is also not a good pump piston, but this is better than the piston of the two-cycle and gets somewhat larger charges. This difference in charges taken into the crankcase is the principal difference between the two engines and accounts mostly for the difference in power and impulse.

Whatever charge is taken into the crankcase can be quite fully transferred and can be put on top of the old charge, completely expelling it so that when large charges are wanted, as for hard work in mud, or on hills, the two-cycle engine takes in as much fuel, or nearly so, as a four-cycle, and crowds all this fuel into the compression chamber with resultant purer charge and more power and impulse than a four-cycle can have, because it always retains its compression chamber full of old gas. This explains why the two-cycle pulls twice as good as a four-cycle at hard work and moderate speeds.

You assume that an ordinary muffler must have back pressure, but experiments show that mufflers can be built which actually suck on the cylinder, and this is easily done, so that a good muffler and its pipe will assist in transferring the new charge from the crankcase into the cylinder.

You are quite right in saying that the two-cycle is used much and performs well under certain conditions. When it has been so well perfected as the four-cycle we will wonder why we ever used that complicated device.

Very truly,

CHAS. E. DURYEA.

Saginaw, Mich., Aug. 12.

Editor, Accessory and Garage Journal,

Sir:

The recent abandonment of the two-cycle engine by two motor car builders, who for years have strongly advocated this type, leads one to wonder whether the limitations and operation of this motor are really understood by its adherents.

When Otto successfully applied the Beau de Rochas principles, the gas engine industry was put on a solid foundation. No sooner had he done so, however, than many tried to accomplish the results obtained by the four-stroke cycle by means of a two-stroke cycle. The Clerk cycle is today the method used exclusively in two-cycle engine work.

The four-cycle engine piston makes an out-stroke to draw the new charge into the cylinder, a return stroke to compress it, a second out-stroke to expand the burning charge, and another return stroke to push out the spent gases. The two-cycle engine combines these operations so that every out-stroke is a power stroke, and every return stroke a compression stroke. The functions of pushing out the burnt gases and the charging of the cylinder with fresh gas, are performed by compressing the fresh charge slightly in another chamber and connecting this chamber with the power cylinder when the pressure in the latter has been reduced by the opening of the exhaust valve or port. The entry of this new charge is supposed to displace the burned gas, so that only the fresh gas remains in the cylinder.

There are many theories regarding the state of the power cylinder just before the entry of the new charge, and it is at this point in the cycle that the two methods differ. The power and compression strokes of the two-cycle ought to be mechanically and thermodynamically superior to those of the four-cycle; mechanically, because there is no leakage from valves in the combustion space as in the poppet valve motors, or cylinder head packing rings in sleeve valve motors; thermodynamically, because the combustion space is of the ideal form without side pockets or irregular shapes. In spite of these advantages the brake mean effective pressure is usually about one-half that of the best valve-in-the-head or sleeve valve type four-cycle; what it would be if it had big overhanging pockets as in the usual T head four-cycle it is hard to conjecture.

At the instant of exhaust-opening the cycles differ.

The exhaust port of the two-cycle opens suddenly and the gases under pressure rush out. If the exhaust pipe is of some length the inertia of the exhaust leaves a partial vacuum in the cylinder. That this is true is shown by the exhaust-inertia engines and turbines which have been built and operated by French and American experimenters.

Lepape and Baldwin have shown that such engines will run very regularly if conditions are favorable. Kararodine has sold many gas turbines in which a small combustion chamber, fed at one end through a very light spring check valve, operated by the exhaust pulsation in a pipe 10 feet long. At the end of this pipe an ordinary De Laval turbine wheel is placed. The pulsations, depending upon the weight of the valve and the strength of the spring, average about 40 a second. Of course, in the usual two-cycle with different lengths of exhaust pipe and bends, elbows, etc., it is pretty hard to know just when the oscillations occur, and the partial vacuum induced often reacts upon the outgoing column of gas, drawing it back into the cylinder with a ramming effect, thus interfering with the recharging.

While such a situation makes the problem very complex, there are other considerations not to be overlooked. If by reason of high speed or slow combustion the cylinder pressure has not dropped to atmosphere when the inlet port opens then the higher cylinder pressure flows into the connecting pipe and forces the new charge back into the compression storage chamber until equilibrium is established. Then the flow into the cylinder begins. If a piston deflector is used it is not of much value as the flow is gradual and mostly over the top to the open exhaust port; if the engine is of the valve-in-the-head type, the flow is in straight lines to the exhaust port.

In the case where the cylinder pressure has fallen below the incoming charge pressure at the moment of its entry, then there is a strong tendency for the latter to pierce the old charge, intermingle with it and pass out of the exhaust port. There seems to be no set of conditions where the new charge enters the cylinder and forces the burnt gas ahead of it by a real displacement. Even in the latest Diesel engine, where an excess of pure cold air is pumped in through two valves at the head end, with the exhaust ports extending around the cylinder and uncovered by the piston at the end of its out-stroke—with all this care to prevent intermingling, the economy of the two-cycle is slightly less than the four-cycle.

The Clerk engine had its displaced cylinder so timed that during the second half of its pumping stroke the power cylinder was at the charging period of its cycle. The latest change in automobile two-cycle engines was to duplicate this action, therefore since its inception the principle of operation has remained unaltered.

The throttling action of the two-cycle type of engine is peculiar and has seldom been explained. When a four-cycle engine exhausts, the piston pushes out a certain definite amount of gas regardless of the throttle opening. If the cylinder volume is 100 cubic inches, with a clearance of 25 cubic inches, the piston will sweep out 75 cubic inches of burned gas at all positions of the throttle. The result is that if a small quantity of fresh charge is aspired there is but a small quantity of burned gas to weaken it.

The two-cycle system is just the opposite. With a cubic capacity of 100 cubic inches, assuming perfect displacement, at full throttle the new charge will be fouled with 25 cubic inches of burned gas which represents the clearance volume. At half-throttle only 37 cubic inches enter the power cylinder from the displacer, which even theoretically would push out only 37 cubic inches of burned gas; thus there remains 63 cubic inches of neutral gas to dilute 37 inches of fresh charge.

Similarly, 15 cubic inches of new gas would be mixed with 85 cubic inches of old gas. A point is soon reached in throttling where the resultant mixture will not burn, and as shown this point is reached much sooner in the two than in the four-cycle. Indeed some of the early motor car and motorcycle engines of the four-cycle type were governed by this method, more or less of the exhaust being retained in the cylinder on the exhaust stroke to dilute the charge drawn in on the suction stroke. As there was no throttle on the carburetor, the amount aspired depended upon the amount of dead gas held in the cylinder. This method was quickly abandoned because of the weakening effect upon the combustion.

The starting of the two-cycle liquid fuel engine has always been more difficult than the four-cycle. In the latter if the liquid separates out of the mixture it is swept in drops into the combustion cylinder. The subsequent compression re-evaporates it so that some kind of an explosion results. With the two-cycle, however, the mixture first enters the displacer. If settling occurs, the liquid falls to the bottom so that the transfer to the power cylinder may be almost pure air. "There's many a slip 'twixt the cup and the lip" is only too true of this type of engine, for although a fine mixture may be drawn into the displacer, there is no guarantee that it will reach the cylinder in the same state. Due to this rehandling of the mixture, the displacer may load up (called flooding) if the mixture is too rich for the temperature of the air. If speed has been attained, the results are better as a strong draft will push along much of the liquid. It would seem that a reliable self-starter would be a very necessary part of a two-cycle outfit. The four-cycle gets the mixture only where it is going to burn it.

Back firing is common to both types of engines, and is due to a slow burning mixture, flame being present in the cylinder when the inlet should occur. This slow burning may be due to a very late spark or to the improper proportions of fuel and air. When back firing occurs in the four-cycle it merely burns out the small volume of mixture in the inlet pipe, which is usually less than a cylinderful. This small quantity is quickly removed from the inlet pipe in a revolution or two of the engine. With the two-cycle crankcase compression type there is usually stored in the crank chamber three or four cylinderfuls of mixture, so that when this is ignited, it takes a number of revolutions to clear it out. The engine slows down perceptibly at each such backfire and often stops. The separate displacer type of two-cycle is better in this respect as the volume stored is less, but even in this case it is much more than in the four-cycle.

Many devices have been used to prevent back firing, all depending upon the principle of the Davy safety miner's lamp. These flame arresters are of the screen, cellular and spiral types. When kept clean so that soot and oil do not clog them they seem to be fairly efficient; they are, however, apt to restrict the free passage of the displacing charge. Most of the pioneer builders of the two-cycle marine engine after thoroughly testing them, build their engines without them.

Where the two-cycle fires every other stroke regularly the phenomena is termed four-cycling. This is due to an improper mixture for that speed. By weakening the mixture the engine will promptly two-cycle. Or if a heavier load be placed upon it, the speed will diminish and two-cycling will begin. This is often seen when travelling on a level road; the engine will four-cycle until a slight grade is encountered, when it will at once two-cycle with a lower rate of speed.

The brake power developed by this type of engine at high speed is, except in special cases, lower than in the four-cycle in spite of the more frequent impulses, and it is for this and the above reasons that many a two-cycle car builder has been disappointed in his product after building and testing same.

R. MILLER.

2136 La Fontaine Ave., New York City, Aug. 10.

BEAUDET IS SUPERINTENDENT.

T. J. Beaudet recently retired from the driving end of the automobile industry to become superintendent of the San Francisco agency of the Cadillac Motor Car Company, Detroit. Having been in connection with the automobile business practically since its inception in this country, he is credited with being one of the best mechanics in the United States. He is perhaps best known as the man who drove a car down the west coast of Mexico through a territory never before reached by a motor car and who holds many western road records. He has always driven a Cadillac.

WITH OLDS MOTOR WORKS.

L. Clyde Smith has been appointed advertising manager of the Olds Motor Works, Lansing, Mich. Mr. Smith has had long and exceptional training in preparing literature relative to the automobile business, on both the commercial and pleasure car ends. Recently he has been assistant to the director of advertising for the General Motors Company, Detroit. He was chosen for his new position by O. C. Hutchinson, general manager of the Olds Motor Works, who, in making his selection, followed a policy he has always observed, that of securing the services of men of broadest experience in their particular line.

MECHANICAL POINTERS *for* GARAGEMEN AND OWNERS

SIMPLE TOOL HOLDER.

Some repairmen jumble their tools together in an indiscriminate pile and lose considerable time in hunting for a particular instrument. A simple holder and one that is made easily is shown at Fig. 1 A. It consists of two strips of sheet metal .5 inch wide and as long as desired. A block of wood is inserted between the plates at either end and holes drilled to permit the use of screws for fastening the device across a window or wall as shown. In it can be placed screw drivers, files, etc.

HOME MADE KEYWAY CUTTER.

Many shops are not equipped with the proper tools to cut keyways in shafts and are obliged to have the work done outside. A straight keyway can be cut by the kink outlined at Fig. 1 B. It consists of two L shaped pieces of wood bolted together with another strip of the width of the keyway to be cut. This section is placed between the larger members. Hacksaw blades are then fitted, as shown in the illustration, and the parts drawn together and locked by the nuts on the bolts. The cut is made to the required depth and the metal chipped out with a keyway cutter.

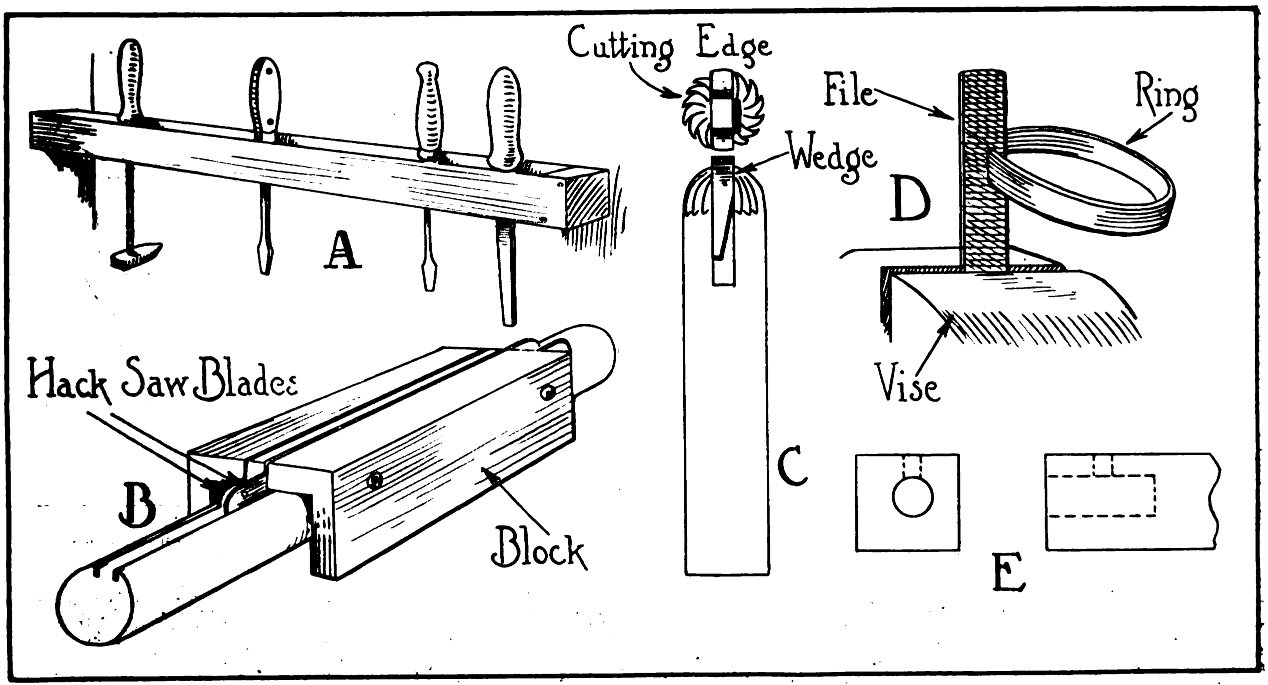

Fig. 1—Some Shop Repair Kinks: A, Inexpensive Tool Holder; B, Device for Cutting Keyways on Shaft; C, Adjustable Rose Reamer; D, Method of Filing Rings; E, Jig for Drilling Cotter Pin Holes in Small Rods.

ADJUSTABLE ROSE REAMER.

Often it is necessary to ream holes that previously have been drilled a size a little smaller than the desired furnished gauge. When it cannot be accomplished by redrilling with a twist or flat drill, and when a driving or good running fit is desired, it is imperative to make a tool, especially if the nearest flute reamer be too small or large. At Fig. 1 C is shown what is called a rose reamer, which is made quickly by turning a piece of steel to the correct size and length, and relieving it slightly from the cutting teeth back toward the shank. After the end is rounded the teeth are cut with a sharp half-round file and the tool hardened. It can be made adjustable by cutting a slot about .5 inch deep with a hacksaw, and inserting a thin wedge which is utilized for springing the sides apart. This will enable a slight increase in the size.

JIG FOR DRILLING COTTER HOLES.

Drilling holes in small rods to take cotter pins will be rendered easier by making a jig as shown at Fig. 1 E. The device is made readily and will prove a time saver where several holes are to be formed. A piece of cast iron is used and near one edge of the metal is drilled a hole to take the rod. Another aperture is made for the drill. The jig is then clamped on the drill press and the tool run through the opening as indicated in the sketch. With this a hole can be drilled through an ordinary wire nail and it also has the advantage of keeping the holes the same distance from the end of the rod.

FITTING PISTON RINGS.

In fitting new piston rings it is sometimes difficult to make the ends of the split fit close against each other. It also is an easy matter to spoil them when filing to size. At Fig. 1 D is indicated the use of a fine file clamped in a vertical position in the vise. The ring is held in the hands, pressed against the file and moved up and down.

ADJUSTABLE CARBON SCRAPER.

Some motors are fitted with the spark plug openings directly over and in the centre of the piston chamber and when such is the case the operation of removing the carbon and soot is an easy matter if one be provided with the proper tools. At Fig. 2A is depicted an inexpensive and easily made scraper which has an advantage over the ordinary form inasmuch as it is adjustable and may be constructed to be utilized on several different makes of engines.

It is produced from a round piece of mild steel, one end of which is looped for a handle. The other end is employed to carry the blade which is made with the sides hollowed slightly to hold the carbon. The top and bottom are provided with the usual scraping edges. The two pieces are fastened together by means of a screw and locknut.

NEW END FOR CRANKSHAFT.

A machinist who owned a motor car found that the end of the crankshaft had broken off, carrying with it the fan driving pulley and starting pin. The fracture was close to the bearing, making remedy difficult, and as a new shaft could not be obtained a repair was made in the following manner: The member was mounted in the lathe with the flywheel end in the chuck, the other being supported by a steady rest, while a .25 inch hole was bored about 2.5 inches long, as shown at Fig. 2B. This opening was coned out to a depth of approximately 1.75 inches, the largest diameter of the cone being within .125 inch of that on the bearing. The bottom portion of the first hole bored was then tapped, a piece of tough steel was turned to fit that in the crankshaft and enough metal left at the other end for machining to size. When this work was completed the shaft was placed with the damaged end upwards, the plug screwed in for about two threads, and the piece brazed. During the latter operation the new part was screwed down snugly as the spelter began to flow freely. The work was then mounted in the lathe and the repaired end turned between the centres in the usual way.

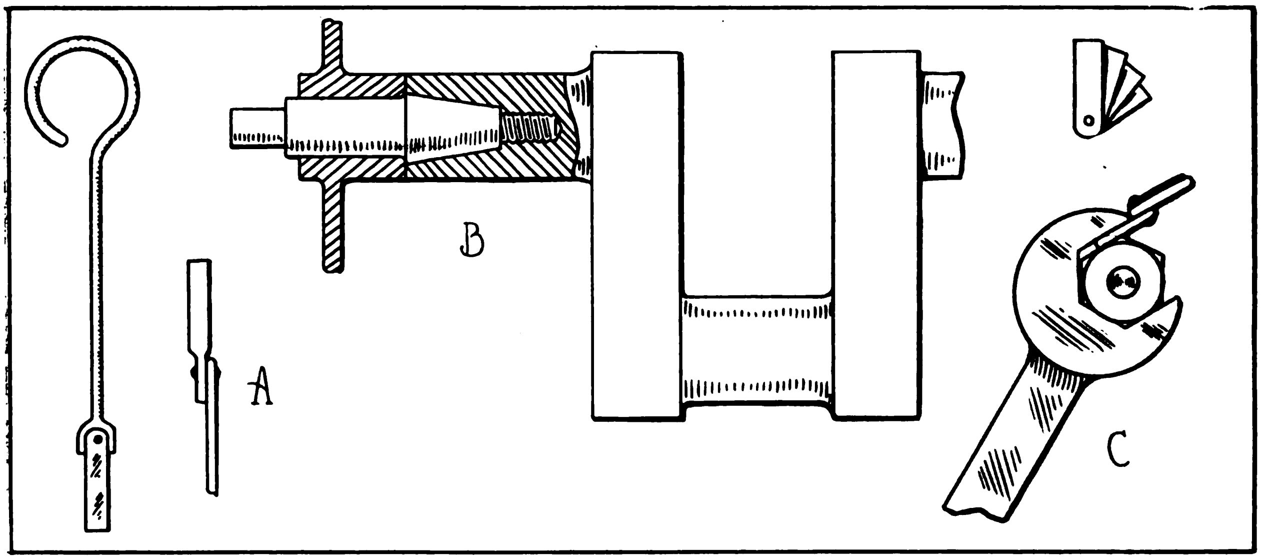

Fig. 2—Some Repair Shop Hints: A, Adjustable Carbon Scraper; B, Fitting New End to a Broken Crankshaft; C, Handy Wrench Device for Use on Odd Sized Nuts.

CLEANING CHAMOIS SKINS.

Chamois skins become dirty and coated with grease from continued use, but may be restored to a serviceable condition by first removng the caked dirt with a stiff brush, covering the skin with soft soap and allowing it to remain immersed for several hours in a bath of warm water to which should be added a little washing soda. The chamois is then removed and rubbed well, after which it is washed in a weak solution of soda, soft soap and warm water and hung up to dry.

THREAD MARKING ON BOLTS.

Sometimes bolts have to be shortened and the thread does not permit of the proper adjustment of the member or the nut. Where a die is not available the bolt can be marked for threading and new threads cut by the following kink: A piece of board is cut so that the notch will fit the nut, and a hole made at the other end by driving in a nail and drawing it out. A pencil is next inserted in the hole and the bolt rubbed with chalk. By turning the nut and attached wood device the pencil marks the bolt so that new threads may be cut with a three-cornered file.

REMOVING STUDS AND BOLTS.

When broken studs or bolts cannot be removed with the ordinary wrench the work may be accomplished by employing a larger tool and inserting a piece of a rough, round file. The wrench should be larger than the bolt to be loosened, in order to allow the file to be inserted, but it must not be wide enough to permit the latter to pass the centre, otherwise it would not be possible to obtain a hold. When the tool is moved to the right, the file bites, and the part may be moved.

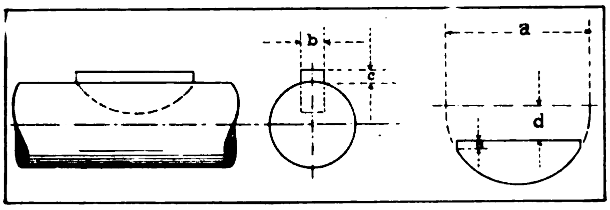
GAS ENGINES AT HIGH ALTITUDES.

The efficiency of a gas engine is affected by altitude, experiments developing the fact that there is a loss of about one per cent. of the indicated horsepower for each 1000 feet elevation above the sea level. The effect of an increase of elevation on a motor with a low ratio of compression is slightly less than that on an engine with a high degree.

USEFUL WRENCH DEVICE.

The repairman is called frequently to make some slight adjustment outside of the shop and often the work takes him some distance from the garage. It is not unusual to find that he lacks a certain S wrench to loosen an odd sized nut. At Fig. 2C is shown a simple device which can be made in a few minutes without any expense. It consists of a number of pieces of an old bandsaw fastened together by a rivet. One or more of the strips of metal are used as a packing.

SPECIAL WOODRUFF KEYS.



While most repairmen are more or less familiar with the regular or standard Woodruff keys and possess information relative to their sizes, the standard forms are not always as long relative to diameter and width as is desirable, hence, the common practise of using two of them side by side for long key slots. This does not meet with the favor of everyone, and a series of relatively long keys has been devised for the use of such.

These are similar to the standard, except that the distance from the centre of the circle to the top of the key; that is, the amount by which the key is less than a full half-circle, is materially increased. This greatly decreases the distance which the key is set down into the shaft, the latter being diminished proportionately to the former. To guard against a light, thin corner which would give trouble, these keys are cut off slightly on each end. In the table above, the figures correspond to those of the cut elsewhere on this page.

No. of key	Diameter a	Thickness b	Depth in gear c	Less than half diam. d	Width of flat e
26	2.125	.1875	.0937	.5313	.0937
27	2.125	.2500	.1250	.5313	.0937
28	2.125	.3125	.1562	.5313	.0937
29	2.125	.3750	.1875	.5313	.0937
30	3.500	.3750	.1875	.8125	.1875
31	3.500	.4375	.2187	.8125	.1875
32	3.500	.5000	.2500	.8125	.1875
33	3.500	.5625	.2813	.8125	.1875
34	3.500	.6250	.3125	.8125	.1875

POWER IN THE MACHINE SHOP.

In fitting up the garage machine shop the different sources of power are usually the first thing to be considered. In the specialized plant, repairing only one or two makes of cars, this is not the factor it becomes in the general shop, due to the fact that spare parts are carried in the stockroom and utilized to replace worn members, while in the general garage few if any parts are carried, and a saving of time and often of cost can be effected by making them.

The established repairman knows as to whether or not his present power plant is satisfactory and economical for the work he does, but the man equipping a shop for the first time must judge as to what his requirements will be. He must consider the number of hours a day he is likely to have work for his machines, whether the jobs will be short or long, how many machines will be in operation at once, the most economical location for the power plant, and others pertinent to the particular case. His choice will fall upon one of two sources of power; the gas engine or the electric motor. Steam is not applicable, except in unusual instances, as a steady steam pressure must be so low speed is resorted to, this giving the slowest speed of all, but the greatest tractive effort on account of the very large gear reduction.

This tractive effort can be expressed as a product of speed times pulling power, reducing speed causing corresponding increase in pulling ability. Thus if an engine has a pulling power of 300 pounds at 1000 revolutions, but the three gear reductions of the car were four to one on the high speed, 10 to one on the intermediate and 20 to one on low, the pulling power at these various speeds would be 1200, 3000 and 6000 pounds, respectively. If the road wheels were 34 inches in diameter, this would also give speeds of 26, 10.5 and five miles an hour, respectively.

Pitch is the distance from the centre of one tooth of a sprocket, chain roller, or gear tooth to the centre of the next one. This is called circular pitch and is expressed in inches and even fractions of an inch. It can be readily measured on a chain, while on a sprocket or gear, count the number of teeth and measure the pitch diameter (diameter of the circle on which the chain rollers revolve or the diameter of the intersecting circles upon which the two gears work). Figure the circumference of this circle, and divide by the number of teeth. The result is the pitch.

Diametral pitch is beginning to be widely used, but this is an abstract figure, representing the number of teeth for each inch of pitch diameter. To find this, measure the pitch diameter as before, and divide the number of teeth by it.

As a practical example, suppose a gear of five-inch pitch diameter and 40 teeth. The circular pitch is the circumference (five times 3.1416 or 15.708 inches) divided by the number of teeth or .3927 inches. The diametral pitch is the diameter five divided into the number of teeth 40, or eight.

A GEARBOX REPAIR.

The repairman is called upon frequently to exercise his ingenuity when making a repair on a car the owner of which objects to the expense of a new part or to losing the service of the machine. At Fig. 3 is depicted how a gearbox was repaired. The recess in the aluminum holding the bronze bearing had worn oval shaped, owing to the retaining screw having been left out in a previous overhaul or repair, and the bearing having revolved with the shaft. The method illustrated was adopted to obviate the necessity of reboring the aluminum and making and fitting a new bearing.

The bronze member was removed and a lining fitted accurately as shown in the sketch. Four .25-inch holes were drilled and tapped in the aluminum casing and four set screws fitted, these being utilized to adjust the bearing, as well as to line up the shaft and its gears. A paste was then made of clay and the inside and outside faces of the bearing covered with this material. White metal was next poured through the oil hole, filling up the oval space, after which the heads of the set screws were cut off. The metal filling the oil hole served as a retainer for the bearing, a new hole being drilled for the purpose of lubrication.

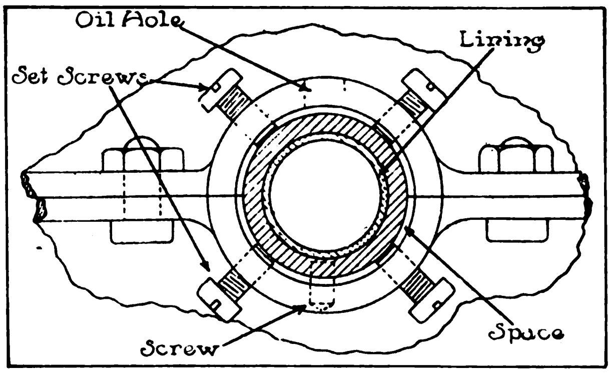


Fig. 3—Depicting How Loose Bearing of Gearbox Wore Casing, and Method of Repairing Damaged Part.

SIMMS MAGNETO AUTOMATIC CONTROL.

One of the features in the accessories displayed at the Olympia show, London, England, was the Simms automatic magneto controlling device, the object of which is to eliminate the use of any hand arrangement for regulating the firing point, thus rendering the advancing and retarding operations of the magneto entirely automatic.

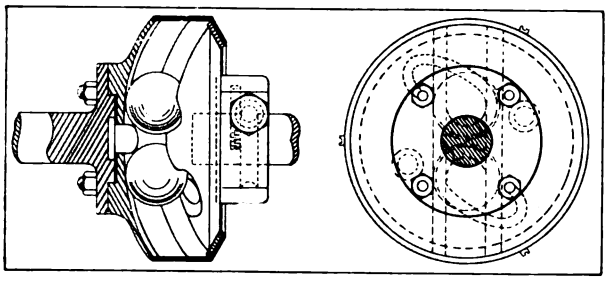

Fig. 4—Components of Simms Automatic Controlling Device for Magnetos.

This arrangement is very simple, and consists principally of a divided coupling, one-half of which is concave and the other convex, the latter being fitted to the armature shaft and the former to the driving member. On the surface of the convex portion are milled two helical slots, as shown at Fig. 4 at the right, and in the concave portion are two straight slots. Two loosely fitted balls work in these recesses, as depicted at the left. The faces of the latter are both held by means of two other balls, not shown, a sufficient distance apart to allow them to move freely. It is through the medium of the two larger members that the drive to the magneto is transmitted.

When the motor is not running, the two balls both converge towards the centre of the coupling as far as the recesses will allow them, but when the engine starts, and begins to gain in speed, centrifugal force causes the spheres to move outward, which owing to the curve of the milled recess, tends to alter, or automatically advance, the firing point. When the speed of the motor decreases, the reverse motion takes place, and the balls begin to travel toward the centre of the coupling.

THERMAL PROPERTIES OF GASOLINE AND AIR.

Many repairmen have a general idea of the value of increasing the compression and its effect upon greater thermo-dynamic efficiency, and the table given will serve to show the value of the various gas and air mixtures, the time required for thorough ignition, the explosive force in pounds a square inch, and the actual and theoretical temperatures at the time of combustion. The time given for ignition is at atmospheric pressure, the gas burning quicker as the compression is increased. Three atmospheres is 45 pounds a square inch cold air pressure, four atmospheres is 60 pounds, while five times normal air pressure of 14.7 pounds a square inch is nearly 75 pounds. The gas mixture which has the greatest heat value is the one that will give the most power. The explosive force increases as the compression becomes greater. It will also be noted that as the proportion of air in the mixture is increased the charge is made slower burning and has a lower heat value, except in the case of one part gasoline vapor to four parts air, where the proportion of gas is too great for satisfactory ignition. There is also considerable difference between the amount of heat actually obtained and that which theoretical consideration of the heating value of the gas mixture would indicate.

Gasoline vapor and air.	Time in secs. between ignition and highest pressure.	Explosive force in lbs. a sq. in. Compression in atmospheres.			Temperature of combustion in F. degrees.	
		3	4	5	Actual	Theory

PACKING BOX FOR VALVE GUIDES.

Where the valve stem guides are worn badly, a condition existing on old motors, considerable oil works from the crankcase, especially if the latter be not fitted with breathers to relieve the compression. This wear is due to the dirt that is attracted by the lubricant. Under such circumsances there is considerable loss of the latter and the engine always looks unclean.

The usual remedy is new bushings and tappets. A repair can be made, however, by fitting a packing device as shown at Fig. 5. Here the top of the guide has been turned for a distance of about .75 inch and a fine thread cut. The member is recessed as depicted. Four brass caps with internal threads are made, and slipped over the tappet, being fitted with a packing consisting of soft leather and spun yarn. When these are screwed up snugly the leaks are stopped. The filler should be oiled before insertion.

Simple Extension Drill—A very satisfactory extension drill may be made by taking a piece of iron or brass pipe, having an internal diameter equal to that of the hole to be drilled. With a flat pein hammer two dents are made directly opposite each other and about 1.5 inches from one end. Two flats are filed on the end of the drill, which is then driven in the pipe with a lead or copper hammer until the flats engage with those made in the walls of the pipe.

It is an excellent practise to have one or more chemical fire extinguishers in the garage to put out incipient blazes. The members should be so mounted that they may be grasped readily yet maintained in an upright position. The simplest method is to attach a hook to the wall or post as when mounted on an ordinary shelf the extinguisher is liable to be jarred from its position and become broken.

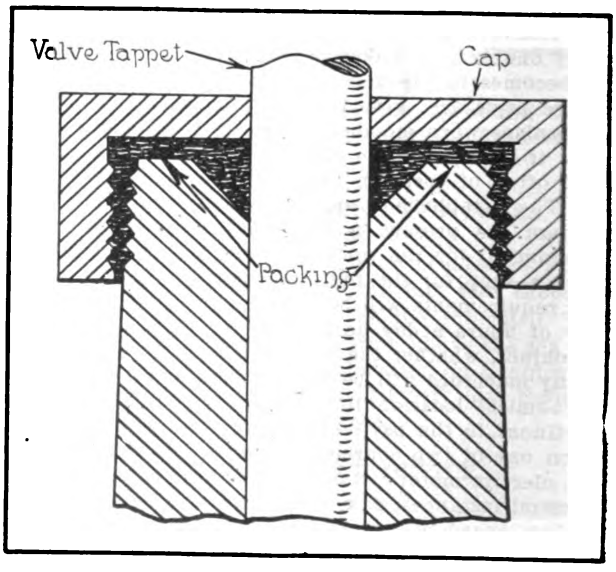

Fig. 5—Method of Preventing Oil from Leaking Past Worn Valve Stem Guides.

RECENT PATENTS of INTEREST

Youngs Fuel Lock.

One of the most practical methods of locking the motor car to prevent theft or its use by other than the owner or operator, is cutting off the supply of fuel to the carburetor. Fred Elliott Youngs, Detroit, has been granted a patent for a fuel locking device which may be operated from the seat, the securing mechanism being fitted to the dash. Interposed in the main line is a valve member which shuts off the supply of fuel. Extending from the device is a housing, carrying a rotating member which actuates the valve. The top of the housing is equipped with a locking device which prevents the valve being opened by others than those possessing the key.

Lutwyche Headlight.

The development of electric lighting equipments for the motor car has stimulated the efforts of inventors and a novel lamp has been patented by Edgar J. Lutwyche, Chicago. The lamp casing proper is open at one end and has a reduced neck at the opposite extremity. Within this member is fitted the electric lamp consisting of a parabola, the larger end of which is secured to the main lamp and cushioning means are also provided. The bulb extends horizontally from its socket and is equipped with the usual means for connecting the wires.

Hylton Hood Hinge.

Water tight hoods are essential on the motor car to prevent rain from reaching the power plant and affecting the operating of the ignition system. John C. Hylton, Chicago, has patented a hinge which differs from those of ordinary construction inasmuch as each of the two companion leaves have the whole of one edge rolled in cylindrical shape and these formations partially enclose each other. Each cylindrical edge being greater in extent than a semi-circle, the leaves are held in pivotal connection at any desired angle to each other. Each end is provided with notches adjacent to the ears and thimbles on the ends of the latter project into these notches.

McKiel Lamp Connector.

Recently, considerable attention has been paid to the development of automatic rotating headlights by inventors and a new design is noted in the device upon which James B. McKiel of Marshall, Tex., has secured a patent. The movement of the light in conjunction with that of the vehicle is obtained through an arm attached to the reach rod of the steering mechanism. The lamp is rotably mounted and is fitted with a spring arm member which is connected to the actuating member by a pivotal link.

Pieper Electrolytic Cell.

A patent has been granted to Oscar H. and Alphonse F. Pieper, Rochester, N. Y., for an electrolytic cell. It comprises a hollow chamber having radiating compartments with connecting passages at the top and bottom, also with the electrode chamber. The bottom of the latter is lower than that of the other members, and is designed to collect any and all sediment that may be present. The chambers and passageways are formed of an integral casting having apertures in alignment with the passageways and clean-out plugs are fitted in said apertures.

Gooderham Windshield.

A windshield of the adjustable type, also permitting the upper part to be displaced when desired, has been patented by Albert E. Gooderham, Toronto, Canada. It comprises an upper and lower sash so arranged to be moved into the same vertical plane, or into a plane at an inclination thereto, so as to present an opening between the top edge of the lower member and the bottom edge of the upper. The upper part is provided with foldable means as well as for holding. Its position is secured by stay rods carrying slidable brackets, and to these members are attached braces pivotally connected.

Kiell Convertible Body.

A convertible automobile body presenting interesting features, inasmuch as it combines the function of touring car and limousine, has been patented by Al-

McKiel Lamp Connector

Latest Ideas of Inventors Along Lines of Interest to the Manufacturer, Agent and Owner, Including Fuel Locking Device, Rotating Headlight, Convertible Body, Etc.

bert Kiell, West Park, O., assignor of one half to Henry Barnes of Cleveland, O. The regular open body is equipped with a laterally projecting border about its top. The closed body is fitted with barrel members, these registering with recesses in the other body, and having rotary locking devices for the purpose of fastening securely both bodies. It is claimed by the inventor that the upper body may be removed or replaced in a short time and that the design is such that it does not detract from the appearance of the vehicle.

OTHER PATENTS GONE TO ISSUE.

Lamp Support, James B. Eastes, Konowa, Okla. A support for automobile headlights connected with the steering reach rod, so that lamps are turned as the car turns.

Horn Bulb, H. W. Lester, assignor to the Post & Lester Company, Hartford, Conn. A horn bulb provided with a metal ferrule covering the neck and flaring back toward the body preventing undue distortion of the rubber and consequent cracking.

Tire Tool, Adam A. Long, Rochester, N. Y. A bar, one end of which fits around the wheel hub and other is formed as a handle, bears a plate which guides the tire into the rim. Placing the plate on the rim and the bead of the tire on the plate, it is only necessary to swing the bar around the wheel to force the tire into the rim.

Electric Horn, Solomon Rosofsky, Brooklyn, N. Y. A wheel rotated by a motor strikes against the arms connected to a diaphragm, the bearing of these arms on the wheel being adjustable from the outside, regulating the sound.

Motor, James F. Hopper, Sherman, Tex., assignor of one-half to Hamlet C. Smith. Motor in which compressed air is injected into explosion chamber to ignite charge.

Limousine Top, Oscar N. McCallister, Mount Vernon, Ind. A top adapted to transform the usual touring car into a limousine.

Top, Alexander Ritchie, Detroit. Has only one bow at each side of the seat, being held at the front and the rear by straps.

Hydrometer, Edward W. Smith, Philadelphia. A hydrometer for storage batteries consisting of a syringe containing the hydrometer proper, the nozzle of the syringe being closed by a block containing an S shaped passage which excludes air, so that the syringe full of fluid may be inspected where convenient.

Windshield, James E. Stevenson, Puyallup, Wash. A windshield adapted to fold on itself at the side of the car, the transparent part being of flexible material carried on rollers on the dash.

Whistle, Emmet P. Gray, Detroit. An exhaust whistle attached to the side of exhaust pipe, with which it connects by means of a valve, normally closed. The opened valve extends into the pipe, directing part of the gases into whistle.

Spark Plug, Luther H. Wattles, Providence, R. I., and Matie C. Messler, Pawtucket, R. I. A spark plug containing a piston actuated by the motor compression and revolving the armature of a generator to produce an electric current.

Nut Lock, Elmer L. Minnig, Harrisburg, Penn. Nut is provided with a pin bearing an eccentric pawl which engages with the threads of the projecting end of the bolt, preventing loosening of nut until pawl is thrown out of engagement with threads.

Indicator for Acetylene Generator, Joel E. Hill, Lexington, N. C. An indicator for acetylene gas generators, by means of which the amount of carbide unconsumed is shown.

Seat, Ludwig Wilkening, Hanover, Germany. A spare seat for automobiles, made of wire with a curved spring beneath the side member.

Control Lever, Alfred T. Sturf, Flint, Mich., assignor to Buick Motor Company. A control lever for fore door bodies, the sector being attached to the top of the door, inside. This lever is provided with a handle and is adapted to engage and manipulate other levers not so provided, beneath the sector.

Steering Rod, Jacob H. Stull, Fremont, O. A universal jointed steering rod which may be tilted in any direction and is provided with means for holding it in any determined position.

Air Pump, Frank C. Virtue, Toronto, Can. Has inlet valve at bottom and outlet valve to hose at top. The foot irons are adapted to fold along the pump cylinder.

Spring, Herbert Austin, Barnt Green, near Birmingham, England. A full elliptic spring, the middle of the upper member of which is pivotally attached to the frame while the inner end is linked to the pivot connection of the corresponding end of the lower member to the frame.

Spark Plug, Vincent G. Apple, Dayton, O. The ends of the centre electrode are fused intimately with the insulating material of the core, effectually closing the passage through which the electrode is inserted.

Motor, Harry Whidborne, Plymouth, and J. J. Lishman, Salcombe, England. A motor of the two-cycle type, with a two-diameter piston. The cylinders are arranged in pairs, the larger end of one piston compressing a charge for the explosion chamber of the other cylinder. The large end works in an annular chamber in two parts and compresses two independent charges of gas and air.

Oil Can Holder, Amos Hutton, Chicopee Falls, Mass. A bracket holding a bar which is provided with an aperture guarded by jaws which grip the spout of an oil can.

Motor, Robert McKee, Philadelphia. A reversible four-cycle motor, in which means are provided for advancing the lead of the cams when reversing and at the same time keeping the direction of revolution of the camshaft unchanged.

Windshield, Frederick Schimpfer, Union, N. J. A windshield in three parts, the lower one fixed, the middle one hinged to this, and the upper one pivoted to the frame.

Carburetor, Frederick Barthel, Detroit, assignor of one-half to F. E. Wadsworth. A carburetor for two-cycle engines, in which the needle valve opens directly into the cylinder. The crankcase compression is communicated to the gasoline in the device, forcing it into the cylinder at the same time that the air escapes through the port into the cylinder.

Spark Plug, Charles C. Eldridge and Edwin J. Beebe, Marshalltown, Ia. The main body of the shell of the plug is fitted with two extensions, these being so designed that the space between them and the central electrode may be altered as desired.

Lamp Attachment, Harry A. Lewis, Chicago. A hinged hood attachment for acetylene headlights projecting forward from the upper portion of the light and adapted to intercept the upwardly radiating rays from the source of light.

Wrench, Charles T. Melhorn, Amsbry, Penn. The shank of the wrench is provided with teeth which mesh with a pawl arrangement on the movable jaw of the tool and means are provided for engaging and disengaging the member.

Lamp Cover, William T. Phillips, Berkeley, Cal. Flexible covers in sections are pivotally mounted on the support of the lamp and these are so constructed that the sections meet for locking. When the use of the lamp is desired these covers fold compactly and by means of a flap are protected from foreign elements.

Fuel Filter, Joseph Remi Tourangeau, Windsor, Ontario, Can. The device comprises an upper and lower compartment separated by a perforated partition. The fuel is led to the lower chamber through a tube which is also perforated at a point below the partition. The lower chamber is provided with a petcock for draining off deposits of water and dirt.

Shock Absorber, Horace B. Stanton, Boston. The device comprises a cylinder, a piston rod, a main piston on the latter and two auxiliary pistons at each end of the main piston, and means for the additional members to slide freely through the main piston.

Grip Tread and Mud Shoe, Cortez V. Pugh, St. Louis, Mo., assignor of part to Edward Brockschmidt and others. It comprises a pair of endless chains on opposite sides of the wheel, having a plurality of chain grip treads each of which is provided with a base portion conforming to the tire. These mud shoes have a blade projecting outwardly.

Automobile Heater, Frank W. Dilks, Philadelphia, and Davis Reyam and Eugene E. duPont, Wilmington, Del., said Dilks assignor to said Reyam and said duPont. A casing is utilized to form a heating chamber and is provided with openings for the exhaust pipe, also tubes for air, as well as a hot air outlet and means for detachably connecting same.

Gearing, Joseph Dain, Ottumwa, Ia. A transmission device comprising a pair of discs which engage with a similar member, slidably connected to the crankshaft of the motor and operated by a lever. It is designed to secure a low speed and reverse only.

Automobile Starter, Wilbert B. Speice, Payne, O. A self-starting mechanism for internal combustion motors comprising a clutching device, a spring and two wheels and means for winding said spring and for throwing into and out of engagement the wheel actuating the crankshaft of the motor.

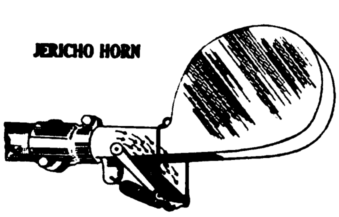
Tire Inflating Apparatus, Mason F. Stolberg, Toledo, O. A device for pumping up a tire by utilizing a friction wheel in contact with the revolving wheel of a motor car, said friction member actuating a plunger pump which is mounted upon a frame carrying the driven member.

Non-Freezing Water Device, Howard S. Campbell, Baltimore, Md., assignor of one-third to Jacob Zill and one-third to Percy Teixaira de Mattos, of the same city. A valve is incorporated in the circulation system of a motor and is fitted with an armature. An electro magnet is in proximity to the armature which is operated by a temperature actuated element. When a predetermined temperature is reached, the device automatically opens the valve and allows the water to drain out of the system.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

The Jericho Warning Signal is made by Randall-Faichney Company, Boston, and as the firm's slogan, "Warns without offense," would indicate, it produces a very mellow note of pleasing nature. The sound is brought forth from a section of a cylinder by the passage of the exhaust gases over a narrowed opening. The latter is controlled in width by an exterior gate, which is moved by a cable attached to one pedal. Pressing on this draws the closing member up and reduces the area of the passage to a small slot. As this is narrowed, the noise from the sound chamber gradually increases in volume and the tone steadily rises, until at the smallest aperture, the maximum warning signal issues. The sound box being a casting with rough interior, the resulting noise is mellowed in this manner as well as by the method of its production. At the forward end, a clamp allows of attaching to the extremity of the exhaust pipe in such manner as to disturb nothing else. The whole is simple, cannot get out of order, and may be attached by anyone with few tools. It is shown in the accompanying sketch.

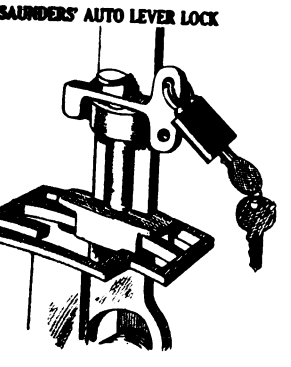
JERICHO HORN



★

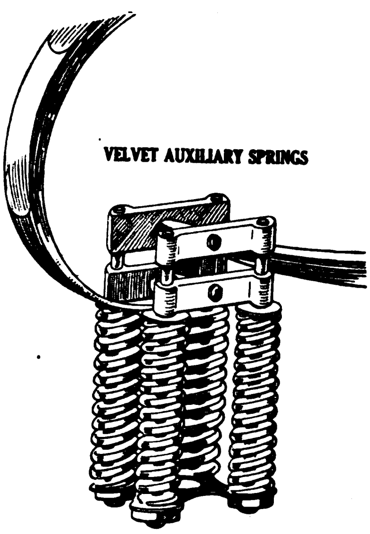
The Auto Lever Lock is an ingenious device for preventing the surreptitious use of the machine. This form fastens the speed operating or brake control lever, as desired. Usually the former is chosen; in fact, the maker recommends it. The base of the lock fits over the ordinary H quadrant, when this lever is in neutral, this being so shaped that after application the latter may not be moved. The base portion, however, could be removed rendering the fastening ineffective, hence a common padlock is provided to connect this firmly with the lever. To the latter, a clip with two ears must be fastened, each of these having a hole through it of sufficient diameter to accommodate a Yale lock. These two openings correspond with a pair of similar ones on the central part so that when the whole is in place the apertures register. The fitting of the padlock completes the operation, which is extremely simple and occupies but a few seconds. All of the metal parts are made very strong and durable, while duplicate keys are furnished by the maker, F. H. Kelsey & Co., Cleveland, O.

SAUNDERS' AUTO LEVER LOCK



★

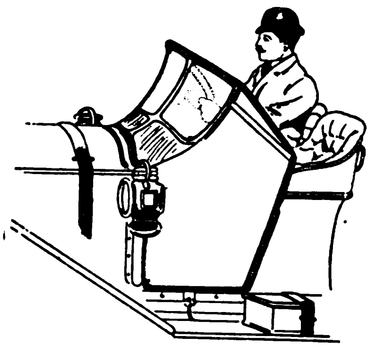
Velvet Auxiliary Springs are for the purpose of lessening the road shocks transmitted to the occupants of the automobile. As shown in cut, this product of the John W. Blackledge Manufacturing Company, Chicago, is attached at the ends of the lower part of a three-quarter semi-elliptic spring. With the platform type, the joint where the side member meets the rear cross portion is the point of attachment. While these are not called shock absorbers, that is their real function, although the maker claims to prevent broken springs, save tires and protect car and occupants. According to the nature of the springing into which they are introduced, the details of construction vary, although in general they consist of four coil members joined at the bottom by means of a plate which is connected with one vehicle spring. The tops are also united by a second plate, which is connected with the other half of the laminated member. In addition to through bolts which connect top and bottom of the spirals, there are guides for the prevention of side sway. The combination is supposed to make a car ride as if on velvet, hence the name.



VELVET AUXILIARY SPRINGS

★

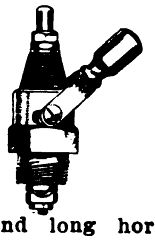
The Auto Windshield is one of the latest developments in the way of comfort and safety for the motorist. This has a curved shape, scientifically worked out, so that it deflects all air currents from the front, upward and thus harmlessly over the driver's head. In this construction, the protector may be cut off below the line of the operator's vision, thus making it possible to look over rather than through the transparent upper portion as in the ordinary case. It is made of fabric with celluloid panels, and supported upon brass fittings which attach to dash, floorboards, or both. The side curtains are detachable and need not be used in warm weather, while the entire device may be removed, rolled up and stored under the seat in less than 10 minutes. The use of celluloid does away with possible breakage, while the comfort and protection leave nothing to be desired. This accessory is made by the Auto Wind Shield Company, Cambridge, Mass.



AUTO WIND SHIELD

★

The Winestock Spark Plug, as shown herewith, is made in two forms; solid and quick detachable. The latter being the one shown will be described first. This has a single central member to which both terminals are attached. A two-armed lever is pivoted on this and forms the locking device as well as the lifting handle. The outer shell, which is screwed firmly into the cylinder, has a pair of vertical narrow and long horizontal slots. By fitting the pivoted lever in this, dropping down the upright part and then placing the level portion over this, the

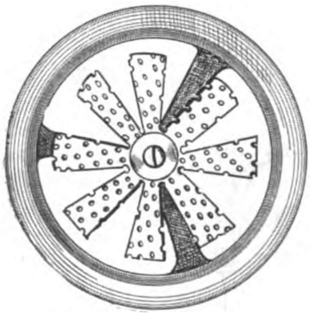


WINESTOCK SPARK PLUG

cone seat on the central electrode is jammed against that on the shell.

* * *

Gyrex the Mixer is a small whirling paddle wheel, to be placed in the inlet manifold above the carburetor, where its function is to revolve at a rapid rate, and thus increase the evenness of the mixture. In bringing about a more complete diffusion of the particles of air with the gaseous fuel, it produces a more homogenous charge in the cylinders, and in that way more regular power results from successive strokes. Besides, its use in the inlet pipe is said to reduce materially the amount of fuel needed for a given power or specified speed, in fact the maker, the Royal Equipment Company, Bridgeport, Conn., states that it gives an economy of 25 per cent. The device as seen in cut is described as a compact, nickel steel turbine, mounted on balls, encased in a brass shell.



GYREX MIXER

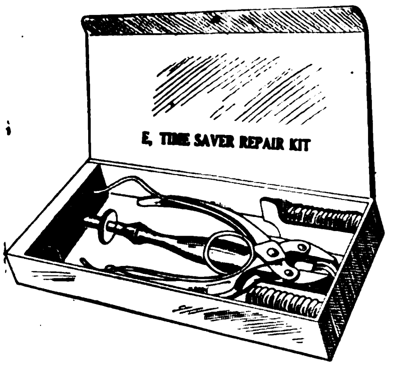
The Time-Saver Repair Kit is a new addition to the ordinary list of tools, which the motorist feels obliged to carry. This is depicted in the drawing and consists of a handsome black case, lettered in gold, the size of which is so small as to go in any tool box. In one compartment is located the wire spreader, while the others contain respectively: Screw rubber cutter, pair of Rand's patented pliers, and a dozen Time-Saver rubber plugs, an extra one of which is placed in the pliers, ready for use. The whole is for tire repair work, in which the new plug is a very important addition. This is constructed of solid rubber, having a pliable metal skeleton. When compressed it has 10 times the strength necessary to close puncture, requiring the use of a tool to compress it into position. There is no way in which the tire can be injured by it, as the metal is imbedded in solid rubber. Being used directly upon the tube without cement, the work of repair is much shortened and simplified. The kit is made and sold by the Auto Time-Saver Repair Kit Company, Boston.



E, TIME SAVER REPAIR KIT

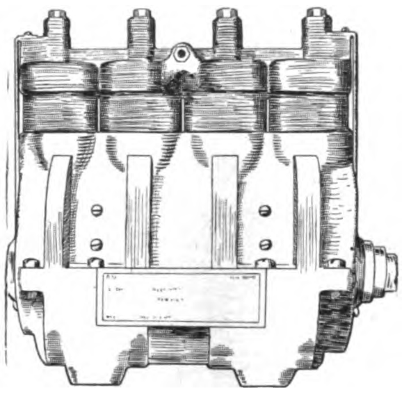
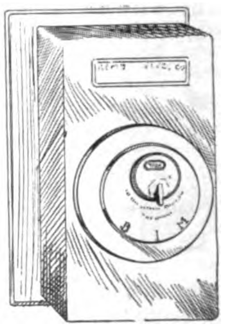
The Kellogg Air Pump is a four-cylinder mechanically actuated source of air pressure replacing the old back-breaking form. It is made by the Kellogg Manufacturing Company, Rochester, N. Y. As the sketch shows, in construction it follows closely along the lines of the ordinary gasoline engine, but on a much smaller scale. Some idea of this may be gained from a statement of its size; length nine inches, width four and height seven. Cylinders are 1.5 inches in diameter and the stroke 1.125 inches. The maker fixes the most advantageous speed as 400 revolutions a minute, at which it will deliver a pressure of 200 pounds a square inch.



KELLOGG FOUR-CYLINDER AIR PUMP

* * *

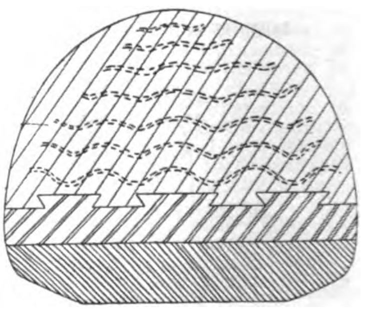
The Blackburn Lock Switch has been brought out by the Blackburn Specialty Company, 1132 Prospect avenue, Cleveland, O., and offers a means of locking the ignition circuit so as to prevent the operation of the car. The device is very simple, the idea being that of substituting for the usual ignition key and socket which is so easily manipulated, a Yale lock of the pin and tumbler type. The key of this lock acts as the ignition plug for turning the switch from "off" to "battery" or "magneto" or vice versa, and when it is removed the switch cannot be turned with any but the proper key. This gives as much security in locking the automobile as in locking the front door of the house. The switch cover cannot be removed even if unscrewed, until after the key has been inserted and turned to the releasing point. When the switch is mounted on a coil, it is impossible to short circuit the wiring.



Blackburn Lock Switch

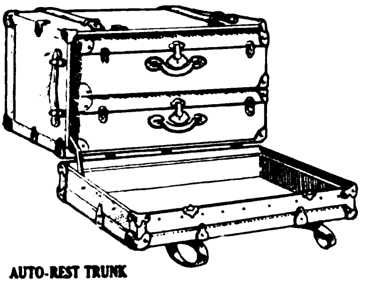
* * *

The Dow Tire is a new type of solid tire which has been invented by Alexander Dow, 104 West 42nd street, New York City, and has as its distinctive feature a number of layers of fabric embedded in the rubber. The idea of this construction is to prevent the tearing of the tire, and confine the loss of rubber strictly to what might be called legitimate wear. Rubber when enclosed offers great resistance to compression, and therefore the alteration of a tire under load is distortion. This free distorsion is permitted in the Dow tire by the fabric being corrugated, and as these corrugations run diagonally with the circumference of the tire, provision is made for both lateral and circumferential distorsion. Elasticity of the fabric along the crests of the corrugations is taken care of by laying the fabric with the diagonal of the weave in line with the crests.



Dow Solid Tire

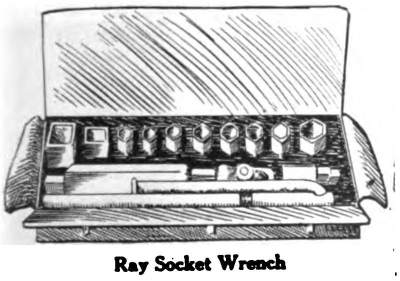
The Auto-Rest Trunk, as shown in sketch, possesses a number of new ideas and in convenience and strength, which the maker, the M. C. Lilley & Co., Columbus, O., feels should make it a popular accessory. This concern makes a specialty of automobile trunks, and as this new auto-rest is the latest addition to the line, it should possess more than usual merit. It is described as a portable restaurant, providing means for serving a hot dinner while on tour. As a secondary feature, by the addition of two suit cases, it can be changed immediately into a regular touring trunk. The exterior is of three-ply leather, covered with heavy enamelled duck, and has fibre bound edges and reinforced brass corners. Two 1.25-inch straps serve to fasten it on.



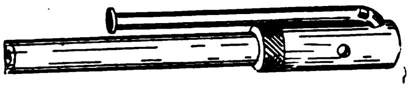
AUTO-REST TRUNK

★

The Ray Socket Wrench is being manufactured by the Packer Auto Specialty Company, Chicago, and distributed by the Fulton-Grubb Company, 1146 South Michigan avenue. It is made in two sets, the smaller being illustrated. With the wrench comes a complete line of sockets made of pressed steel, cold drawn and case hardened, an assortment of screw drivers, a universal joint, permitting the use of the wrench at any angle up to 90 degrees, one long and two short extension bars, and a long socket for use on spark plugs, enabling their removal without cracking the porcelain. The wrench itself is of the ratchet type practically noiseless in operation, nickel plated and polished, and with the use of the various sockets and attachments it is possible to get into almost any place, no matter how difficult of access.

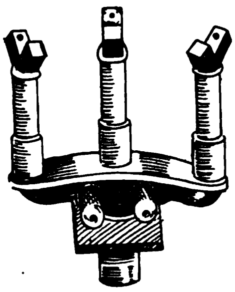


Ray Socket Wrench



★

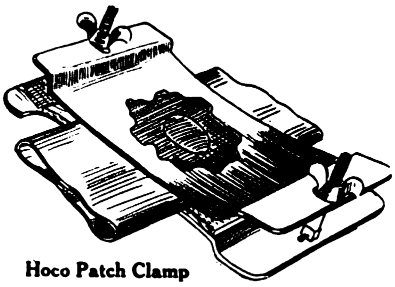
The Tri-Radiant Fixture is made by the Lenhart Manufacturing Company, 246 North Delaware avenue, Philadelphia, and is an attachment for acetylene lamps which enables three burners to be used. The fixture, as illustrated, bears the three burners on an arm, the two outside ones turned so as to present the broad surface of the flame to the surface of the mirror or reflector opposite it. The result of this construction is that a broad beam of light is projected from each side of the lamp, the illumination spreading wider than when only one central burner is employed. The light to the extreme right and left is as strong as at the centre, with no intermediate lines of darkness, and the illumination is held to be highly satisfactory. The broadness of the burner insures that all parts of the road are covered, preventing accidents in passing cars or in running into them at curves. The light covers a greater angle than one in which a car can be turned. The fixture is substantially made of brass, nicely finished and nickel plated throughout, and furnished with the best hexagon burners. These burners have a much smaller capacity than those ordinarily used, thereby cutting down the gas consumption. In fact the effect of the fixture is virtually to divert the gas which is usually sent to the central burner to the three burners and thus spread its illumination wider. Either one or both of the side burners may be turned off at will.



Tri-Radiant Fixture

★

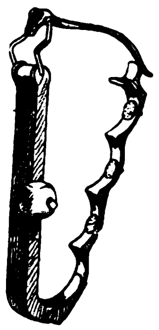
The Hoco Inner Tube Patch Clamp will be appreciated by motorists who have made repairs on inner tubes. It is made by Hoeft & Co., Chicago, and will fit any tube. In repairing a tube with a patch, pressure on both is desirable, as it spreads the cement and aids the vulcanizing agent thoroughly to bind and incorporate the two surfaces, making them homogeneous. Motorists on the road, realizing this sometimes adopt ingenious expedients to secure this pressure, as for instance, sitting on the patch, placing a board and a miscellaneous collection of tools on top, etc. With the Hoco patch clamp this is unnecessary. Thumb screws draw together the two plates between which the tube is held, applying a firm pressure through the spring metal of which the back is constructed. The device will take any tube, and is made of steel, nickel plated. The weight is 24 ounces.



Hoco Patch Clamp

★

The Bair Top Holder is being placed on the market by the Auto Specialties Manufacturing Company of Chicago and is a device for holding the top bows rigidly together when the top is down. This prevents rattling and undue distortion of the bows, and is such an advantage that it is already standard equipment on a number of cars. It is made in two sections, hinged together at the bottom so that when the clamp at the upper end is loosened the holder opens, and allows the bows to be raised. The small hand lever attached to the clamp enables it to be manipulated easily and without delay. One side of the device is provided with a clamp and set screw for attaching to the side of the car. The hinged section which is provided with sockets to hold the bows is so made of steel covered with leather that the bow is not

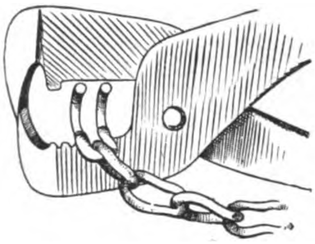


Bair Top Holder

scratched or marred, and the leather seam in the covered bows is not injured.

★

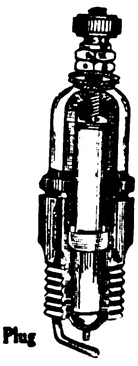
The Necessity Tire Chain Tool is manufactured by J. N. Macdonald & Co., Wethersfield, Conn., and is being distributed by T. F. Russell & Co., of Boston. As its name implies, this is a device for repairing tire chains. The jaws are of a special construction, and by means of the instrument the hooked ends of the chain links may be forced apart easily, or compressed just as readily. Those who have tried to repair tire chains with pliers, chisels, screw drivers, and other tools not at all adapted to manipulate the heavy wire links of which the chain is made, will thoroughly appreciate this tool, which renders repairs easy and enables them to be effected in a short time.



Necessity Tire Chain Tool

★

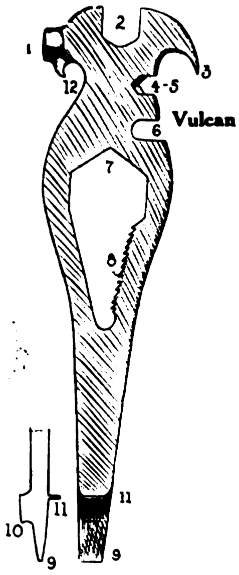
The Sturdy Spark Plug is made by the Sturdy Manufacturing Company, 2637 Michigan avenue, Chicago, and is marketed in sets for four and six-cylinder cars, the set consisting of the requisite number of plugs with an extra one in a leather case for tool box. A feature of the construction is that the main porcelain is suspended against the bushing in such manner as to permit the upper spring washers to take up the contraction and expansion caused by the cooling and heating of the engine. In cleaning there are practically only two units, as the bushing unscrews from the shell, and in replacing it is drawn down to the shoulder with no possibility of cracking the porcelain. The plug is guaranteed against everything but abuse.



Sturdy Spark Plug

★

The Vulcan Auto Tool is being placed on the market by J. H. Williams & Co., Brooklyn, N. Y., and is a combination tool which should be of especial value to automobilists. It is drop forged and tempered, and in its canvas cover forms a handy hip pocket companion, as it is not bulky or unduly heavy. The various parts are used as follows: 1, hammer; 2, tire lug wrench; 3, cotter pin puller; 4, gas tank wrench; 5, insulation scraper; 6, air tank wrench; 7, spark plug wrench; 8, alligator wrench; 9, 10, 11, cotter pin spreader and three screw drivers; 12, bottle opener.



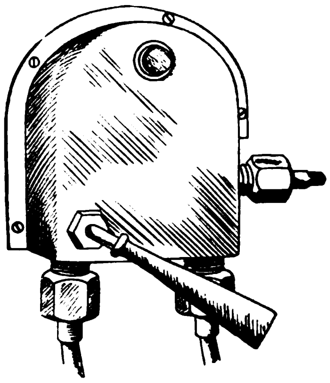
Vulcan Auto Tool

★

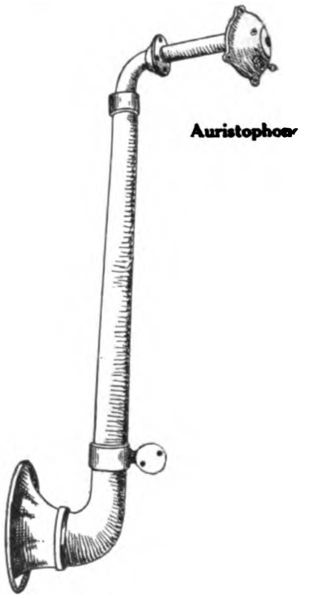
The Disco Lighter is made by the manufacturer of the well known Disco self-starter, the Ignition Starter Company, Detroit. This ensures that it possesses the merits of the starter, and will be reliable in action. It is a system for igniting the gas headlights of a car from the seat, and consists of a dash controller, piping, single unit vibrating coil, wire, burners with spark gaps and all fittings. The controller is illustrated, and consists of a neat and highly polished bronze member which is screwed to the dash. Turning the handle of the controller to the left opens the valve and sends the gas to the lamps, while a pressure on the button at the top of the controller sends the current to the coil and produces sparks at the points of the burners, igniting the gas. The maximum flow of gas through the controller is regulated by a needle valve, preventing undue consumption of acetylene, and if desired the handle may be partly closed in cities to dim the lights.

★

The Auristophone is an electric speaking annunciator, made specially for automobiles by the H. G. Pape Electric & Manufacturing Company, Buffalo. It is similar in construction to the electric announcer in use in the large railway terminals, but is smaller and not so loud. It is adapted to be placed beside the chauffeur of a limousine car, with the transmitter attached to a cable in the inside of the machine. The convenience of this will be appreciated by those who have tried to make a chauffer understand sign language through the glass of the limousine partition or words shouted through an ordinary speaking tube. The apparatus is in effect a powerful telephone, and the receiver at the chauffeur's side repeats distinctly the words spoken into the small watch case transmitter. The wiring is simple, and the system requires only a six-volt storage battery or dry cells.

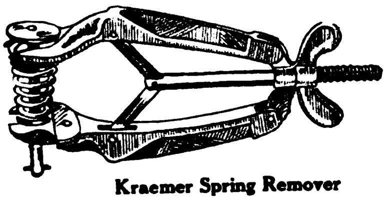


Disco Lighter



Auristophone

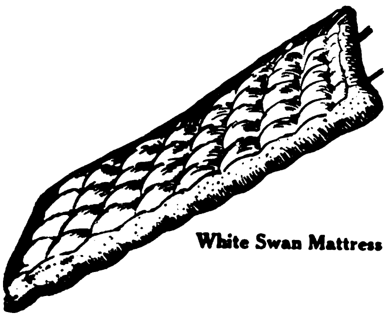
The Kraemer Spring Remover is made by the United States Compass Company, Cedarburg, Wis., and is a simple tool for releasing valve springs. The construction and method of operation is easily understood from examination of the illustration. The jaw is adjustable and may be set in a few seconds to fit any size motor, large or small. When the tool is in place with the two jaws at opposite ends of the spring, turning the thumb screw on its threaded rod draws the jaws together and thus compresses the spring, enabling the valve and then the spring to be removed. The spring is held compressed by the device, enabling both hands to be used in removing the valve. It is light in weight, compact in size, and reasonable in price.



Kraemer Spring Remover

⋆

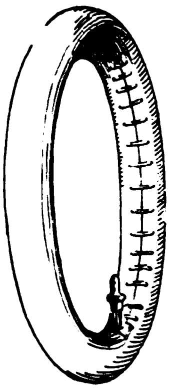
The White Swan Camp Mattress is made by the T. B. Burnett Company, Dallas, Tex., and should be of much service to motorists during the coming touring season, as it affords the comfort of a bed combined with portableness. It is made with heavy waterproof duck sides and bottom, so that it does not absorb moisture, or become cold and uncomfortable. It may be rolled up into a neat compact water tight bundle that can be carried conveniently in the automobile, a canvas bag being provided for this purpose. It is built up of 1400 layers of cotton felt, made from long staple Texas cotton, and is sterilized so as to be free from danger of disease. It comes in standard length of 6.5 feet and varying widths, weighing up to 25 pounds.



White Swan Mattress

⋆

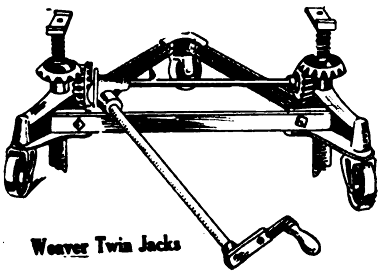
The Brownie Liner, made by the States Manufacturing Company, 1029-35 West Adams street, Chicago, will be appreciated by motorists who have had experience with punctures and blow-outs. As its name indicates, it is a liner to go between the tire casing and the inner tube. It is claimed that it will prevent 90 per cent. of the punctures and all of the blowouts, thus enabling new tires to make 10,000 miles. It consists of what is virtually an extra casing of very tough fabric which is neatly laced around the inner tube. The fabric is almost impenetrable, it being practically impossible to drive a nail through it when attached to an inner tube.



Brownie Inner Liner

⋆

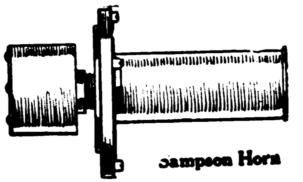
Weaver Twin Jacks are made by the Weaver Manufacturing Company, Springfield, Ill., and are a combination of lifting jack, turntable, truck and tire rest. As may be seen, the device consists of a triangular wheeled frame supporting two jack members, both operated by a crank through bevel gears. By it the front or rear axle of a car may be raised clear at one operation, and the car pushed where desired on the jack wheels.



Weaver Twin Jacks

⋆

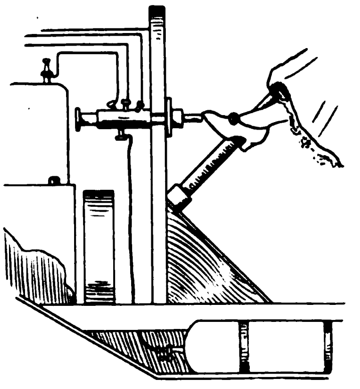
The Sampson Horn is a new style of this well known product of the American Electric Company, State and 64th streets, Chicago. It is of the torpedo type, and is designated No. 4, with a straight cylindrical projector of spun brass. It is an electrical horn, and requires little current, being operated on four dry cells or a six-volt storage battery. The magnets are large and powerful, wound to a high resistance with enameled wire and therefore require a minimum of current. Sparking is reduced as low as possible and the mechanism is enclosed in a neat enameled iron case. This case is the same in all the horns, the projectors being interchangeable on it. Six types of projector or horn may be had.



Sampson Horn

⋆

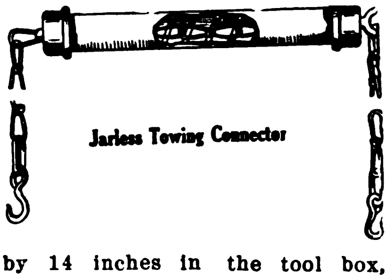
The Rekar Automatic Starter is made by the Rekar Automatic Starter Company, Sixth and Market streets, San Francisco, and provides means whereby a charge of acetylene gas is introduced into the motor cylinders and then fired, to start the motor. The starter consists of a controller which is attached to the dash, from which piping leads the gas to the cylinders. Pushing the rod on the controller admits the gas to the cylinders and affords a mixture to be exploded by the usual spark.



Rekar Starter

⋆

The Jarless Towing Connector will be appreciated by those who have towed a car or have been towed, and have experienced the jars and jolts to which the machines are subjected in starting. A heavy spring takes up and absorbs the jerk, acting as a shock absorber and turning the quick pull into a slower and easier one. It takes up a space of four by 14 inches in the tool box, so that it is convenient to carry. It is made by the Jarless Auto Towing Device Company, Cleveland, O.



Jarless Towing Connector

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Motor Knocks.

(92)—I am having trouble with my ———— motor. I cannot open the throttle wide without getting a knock although the spark may be well retarded. With a slight opening of the throttle I can advance the spark to its utmost without the engine knocking. The timing gears have been removed once by an expert from the factory. Can you not locate the trouble for me?

N. H. HARRISON.

Macon, Miss., Aug. 8.

It may be possible that the car is being operated with too rich a mixture and this may be determined by noting the odor of the exhaust as it leaves the muffler. If the mixture be correct it will be well to check the ignition timing and note the position of the piston. It is possible that in replacing the gears the factory expert may have set them a trifle too early.

The position of the piston may be checked by inserting a rod or bicycle spoke through the opening of the priming cock, and with the switch off, turning the motor until the cylinder is compressing. A further movement of the starting crank will cause the rod to rise and when the latter stops, it will denote the top of the stroke or dead centre.

When the switch is thrown on the coil should buzz and a spark be noted at the gap of plug if the motor be timed at dead centre. The operation may be facilitated by removing a plug and placing it on the top of the cylinder as is done in testing a plug.

When a spark does not materialize, the motor should be turned slightly so as to start the piston down on the firing stroke. It should be moved but little and at the same time it should be noted whether a spark appears at the plug. If timed correctly one should be seen when the piston has begun its downward movement.

If not, the piston should be brought back to dead centre again and the motor turned so that the flywheel moves in the direction opposite to that in operation. By moving the member slowly until the piston has begun to descend, if the timing be early it will be indicated by a spark at the plug. If this condition exists it should be corrected. With the spark lever fully retarded the spark should occur when the piston begins its downward movement or firing stroke. The amount of this lead varies according to the design of the motor, etc., but the writer favors about .5 inch which provides a safe lead for cranking and this retard can be taken care of by advancing the spark lever.

Mixture of Gasoline and Oil.

(93)—Will you please explain to me if it is feasible to mix lubricating oil for cylinders and pistons with the fuel, thus dispensing with a lubricator, its driving means, and considerable bother as well? Do you think this a good scheme, and if so in what proportion should the two be mixed?

R. De V. KUHN.

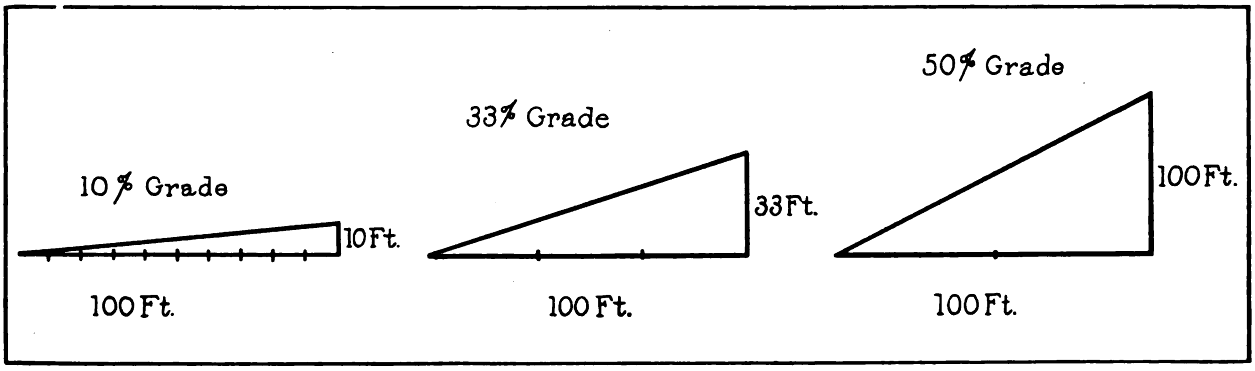
Westerly, R. I., Aug. 3.

This is a practise which often has been advocated for use on four-cycle engines but has never been tried with any particular success. With two-cycle engines, especially for marine work, this method has been utilized to a large extent, and is still in vogue. The difference in the action of the two forms makes this possible. In the two-cycle, particularly with base compression, much of the oil is left in the crankcase during the compression stroke, where it acts as a lubricant for the crankshaft bearings, connecting rod, and other parts.

The extraction of a large amount here through gravity, centrifugal force at the many bends, etc., leaves a very small quantity which is actually carried into the cylinder. The action of this form is so coarse, so wasteful of fuel, and generally results in such a large amount of smoke from the exhaust that a little more odor, some additional smoke and a slightly poorer result with oil substituted for gasoline, hardly would be noted.

For good, reliable lubrication, however, this hit-or-miss method can not be recommended. It is practically impossible that the cylinder or piston walls shall be oiled effectively or evenly, while the excessive use of the oil surely will result in extra carbonization. If the walls be not coated with an even film of the unctuous material, heating at some uncovered spot is sure to develop.

When the mixing method is employed, the general proportion of the two liquids is about one of oil to 20 of fuel. This would be one quart of lubricant to every five gallons of gasoline. Those wishing to do so can, however, use more or less than this quantity to suit any specific case.



Sketch of Various Grades, Presenting the Relation of Base to Altitude and Rise of the Latter in a Given Length.

Percentage of Grades.

(94)—Will you please explain to me what is meant by the per cent. of various grades? Is a 10 per cent. grade one which rises one-tenth of the possible total (360 degrees) or how does it rise? I have often talked with other motorists about this, and there seems to be considerable misunderstanding about it.

P. W. HAMEL.

Bridgeport, Conn., August 2.

The per cent. of a grade is the amount of its rise in 100 feet and has nothing whatever to do with the angle of the ascent. Thus a rise of 10 feet in 100 is one-tenth or 10 per cent. Similarly, 33.3 feet in 100 would be one-third or 33.3 per cent. In the accompanying figure, these two grades and another of 50 per cent. are shown graphically, bringing out the relation of the vertical rise to the horizontal length. To make this clear, the base lines have been divided into 10 parts in the first case, three in the second and two in the third.

When reference is made to a grade by means of angles, the included angle between the horizontal and the slope is meant. In the three instances shown, this would be respectively: Five degrees 45 minutes, 18 degrees 15 minutes, and 26 degrees 35 minutes. About

30 degrees slope, or 57.8 feet in 100, is the limit on which the traction is superior to gravity, hence it is the greatest which any self-propelled machine can traverse.

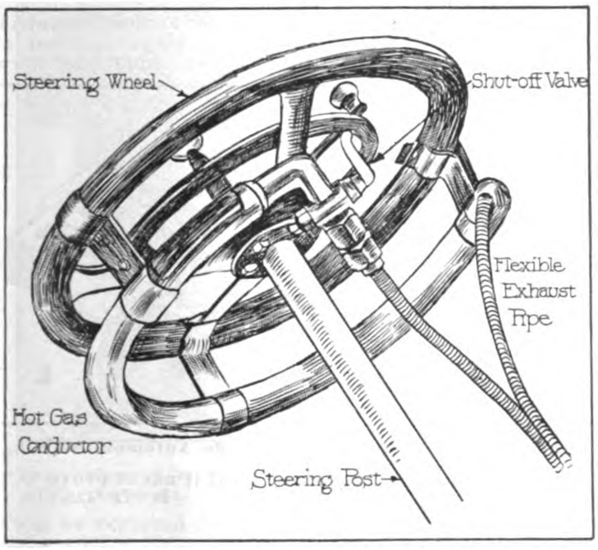
Hand Warmer for Winter Driving.

(95)—What material should one add to the water in the acetylene generator to prevent it from freezing and at the same time have no chemical effect that will alter the quality of the gas produced? Would common salt be suitable? Is there any simple hand warmer that can be applied to the steering wheel of a motor car among the standard accessories marketed by dealers?

JEROME K. GREEN.

Burlington, Vt., Aug. 2.

One may add grain or denatured alcohol up to about 25 per cent. to water for the generator without interfering with the lighting effect, this reducing the freezing point to about 10 degrees above zero. Wood alcohol is better, 30 per cent. added to the water bringing the freezing point to about zero. Calcium chloride or sodium chloride (common salt) should not be used because the salt will change the color of the flame, making it yellow instead of white. The best method is to make a hood of padded cloth, something like a cover used to keep the coffee pot on the breakfast table warm, to fit over the generator. As there is considerable heat evolved from the chemical action producing the gas, the generator will be warm enough to keep the water or alcohol and water solution from freezing at temperatures considerably less than zero.



Showing Application of Simple Hand Warmer to Steering Wheel.

The writer does not know of any hand warmer marketed in this country, but the simple fitting shown in cut is marketed in England, and as it is easily made, there should be no difficulty in applying it to conditions obtaining on this side. The device consists of a tube fixed to the periphery of the steering wheel, having sufficient space between it and the wheel so the hand can be placed between the wheel rim and the pipe. The clamps securing it to the wheel are sufficiently strong to enable one to grasp the heated pipe for steering if necessary. Special flexible tubes lead to the exhaust pipe, suitable shut-off valves being provided, and a portion of the hot gases are passed through the tube to heat it. As only a portion of the gas is by-passed through the heater pipe, the free passage of the main column of inert gas to the muffler is not interfered with. The warmer can be fitted above the wheel if desired where the wheel is normally too low for the comfort of the driver. It would seem possible to pass part of the water from the cylinder jackets through the pipe to heat it instead of the exhaust gases, if desired.

Pressure of Compression.

(96)—Please instruct me as to the pressure of compression of a 5.5-inch bore and 5.75-inch stroke opposed engine at say 45 revolutions. Please send rule for figuring pressure if it is convenient. W. R. HIGGINS.

Mott, N. D., July 17.

The pressure at a speed of 45 revolutions under normal conditions would be about 70 pounds. In the case of higher speed, an addition of from 15 to 20 per cent. may be made as it is expected that some loss of compression will be caused by the piston rings at slower speed. The rule for figuring pressure is as follows: Find ratio of combustion chamber to cylinder capacity. Ordinarily this is one to five. Then multiply the atmospheric pressure 14.7 by the ratio 5 which gives absolute pressure. If the gauge pressure be desired, deduct from the product 14.7.

Soldering Aluminum Gearcase.

(97)—Will you kindly advise me whether an aluminum transmission case can be soldered? The case in question has a piece about two inches square partially broken out. A small crack on either side permits the grease to escape, but the rest of the section is tight.

E. H. DEWEY.

Great Barrington, Mass., Aug. 5.

Various aluminum solders are produced that will work satisfactorily if properly handled. Whether they can be used in your transmission case depends upon the alloy of which it is composed, which should be very nearly the same as that of the solder used to obtain the best results. A mechanical patch can be applied, this consisting of a packing of thin sheet cork or cardboard placed over the injured portion and held in place by a plate about three inches square riveted or screwed to the case. The most workmanlike way of repairing the case would be to have it welded by the autogenous process. If the cracks are not large, it is sometimes possible to seal them with a paste made from litharge and glycerine, which is forced into the crack and allowed to harden. Heating the case with a torch before the litharge paste is applied will facilitate the hardening process.

Testing Spark Coils.

(98)—Will you please let me know how a person can tell when a spark coil is broken down? And when one suspects this is the case, how can it be tested and proven? F. L. L.

North Attleboro, Mass., July 27.

If on coupling the defective unit to a set of cells one does not get any movement of the vibrator it is a sign that a wire in the primary circuit is broken, probably where a conductor fastens to the vibrator bridge or the armature block, or that the primary coil is defective. It is assumed that the vibrator is mechanically right and the spark points and armature spring tension properly adjusted. If there is a vibrator movement, but a very brilliant spark between the contact points, and a weak secondary spark it is a positive indication of a punctured condenser. If the vibrator functions properly, but there is no secondary spark, one should look for a broken secondary wire, usually at the high-tension terminal. These wires are often twisted off when the terminal nuts are screwed up with a pair of pliers so that the entire terminal turns in the coil box. If the secondary wire connection is as it should be, then one should suspect the secondary winding, which is probably burned out. A new condenser or secondary winding can only be inserted at the factory where the coil was made, though the local electrician may find and repair broken internal connections.

Full Floating Rear Axle.

(99)—Kindly answer through your columns if there is more power delivered to the rear wheels of an automobile through the full floating rear axle than through the semi-floating type. I have heard many comments on this subject, some claiming that the full floating axle takes off considerable friction and results in more power at the driving wheels. C. H. S.

Bridgeport, Conn., July 13.

With the full floating type there is slightly less friction and consequently more energy is delivered to the driving wheels. The difference is very small, however. Both the semi and full floating designs are utilized by leading manufacturers of motor cars.

One Way Tires Are Injured.

(100)—Will you please tell me what may be the trouble with my car? I have trouble continuously with the tread of my tires showing deep cuts and signs of very hard wear, yet I never run my machine in car tracks or over anything which might cut them in this manner. It has puzzled me for a long time, as well as several of my friends to whom I have appealed. After I have put on new rear tires and run about 400 or 500 miles these deep gashes begin to appear on the treads of the new tires. What do you think is the trouble?

V. W. TALLMADGE.

Brockton, Mass., Aug. 7.

From the facts given and without seeing the car, it is a matter of conjecture what really is the matter. The fender clears the tires more than the permissible depression of the springs, but projecting below it are bolts which come down several inches. This brings the end of the bolts down to a place where a very heavy load will throw them into the tire. After that every jounce, every bump crossed or every movement of the car body will drive the end of the bolt into the tire. As these are stationary, while the wheels are revolving, it requires but a short time to dig up the whole surface of the tire.

Examine the bolts on your fenders, directly over the tires, and you will doubtless find one or two which are too long, and may be cut off close up to the fender. This will without a doubt remedy your trouble, which is both bothersome and expensive.

Calibrated Carburetors.

(101)—Will you please explain to me what is meant by a calibrated carburetor and what it is used for, as well as in what manner it is superior to the usual type? Are many of them made in this country?

De VOLSEN WOOD.

Pittsfield, Mass., Aug. 8.

A calibrated carburetor is simply one which is so constructed as to measure the fuel; that is, the size of the various openings through which the liquid flows is such that a certain amount must always pass when they are in use. Similarly with the amount of air entering: The arrangement is such that this will vary in a constant relation to the speed of the engine. This construction obtains in a number of devices which are regularly sold for the improvement of vaporization, as well as on the carburetors of a number of car makers, producing their own instruments.

Causes of Backfiring.

(102)—Will you please advise me as to the cause of the backfire from a carburetor when all valves are too tight? A weak mixture causes it, but why? I would also like to know the reason for the noise of a carburetor knock. It is not an advanced spark pound, with which I am familiar. With my car, a weak mixture or one perfectly suited for running on the level will cause a pronounced knock in sand, on a hill, or in other cases of a hard pull, and also with a quick opening of the throttle, when the spark is nearly "off"; all this on an engine which is timed very slow. I will appreciate your advice.

A. H. S.

Toronto, Can., July 16.

A weak mixture backfires for one or two reasons; either it is not ignited sufficiently early to permit of complete combustion or else the mixture is so streaked or stratified that the spark runs back through it and the open valve to the carburetor. In the former case, two results may be obtained; a continuous burning which is carried right through the exhaust and muffler, some of these burning gases there bringing about an explosion of the next charge carried through in the same manner. The second result will be a popping noise in the vaporizer.

It is agreed by scientists that the air and gas furnished an automobile cylinder are stratified, being composed of a layer of comparatively rich gasoline vapor, then one of pure air, then possibly another of mixed air and gas, the whole process then being repeated.

If the firing back be very sharp and positive, it may mean that the ignition is too early, causing the actual explosion in the inlet manifold, instead of within the combustion chamber. A third possibility is clogging of the fuel pipe to the carburetor or from it to the cylinders, so that little or no gas flows in. In that instance, there is nothing to ignite, and the spark runs back through the open valve to the fuel.

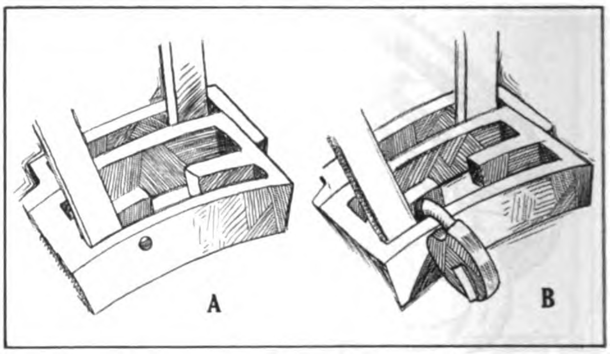
A quick opening of throttle will cause a knock in any but a new engine, the change in fuel flow being more rapid than that to which the motor can accommodate itself. The same is sometimes caused by the reverse operation; that is, when running on a very rich mixture, a rapid closing down to a very weak one will produce a marked pounding.

Making a Simple Car Lock.

(103)—Will you please give in the columns of your valuable magazine a method of making at small expense and not too much work a simple but effective form of lock to prevent the use of the car by anyone except the owner. Several states now require these and not all owners wish to buy an expensive and complicated form, no matter how efficient or convenient it might prove to be.

R. L. DAVIS.

Jersey City, N. J., Aug. 5.



Construction of Simple, Homemade Automobile Lock.

A very simple method of locking the automobile and one that anyone can devise in a very few minutes, with a minimum of expense, is presented in the accompanying sketch. To go about this: First, buy a small lock with a round bar of considerable length and not very large diameter. Next, borrow a bit and brace with a drill for steel of a size just a little larger than that of the lock bar. For instance, if the bar is .25, a G drill (.261) would be about right, such drills being known by letters.

Throw the gear shifting lever back into the reverse position, which will usually be at the back of the quadrant and either inside or outside. If the latter, the work is simple, but in the former case, it will be a trifle more bothersome. Fasten this lever back as tightly as possible and with the bit bore a hole through the quadrant bar close to the top, so that the side of the drill will just pass the front edge of the lever as fastened back. This will be as shown in A. When the car is not in use, throw into reverse gear, push the lever back as far as possible, slip the padlock into the hole in the quadrant bar and clasp it as shown at B of the drawing. This locks the machine against any but reverse movement, and while it would not prevent operation in that direction, it would work against its theft or use during daylight, as such a proceeding, running a car along the street backward, would excite unusual comment and call for investigation by the first policeman passed.

"FAST LIMITED" AUTOSUIT.

The driver or the man who cares for his own car no doubt has had such experience as will cause him to appreciate any form of practical protection for his clothing while working about his machine, and because of the possibility of being compelled to make a repair or adjustment at any time, either on the road or in the garage, it is desirable for every man who tours to provide what will adequately shield his garments from soil. The old dust coat may be used, but every motorist knows the annoyance of the loose sleeves and shirt of the duster, which will either work up the arms or catch on the mechanism and expose the cuffs and coat sleeves, or will not effectually prevent the trousers coming in contact with dusty or oily parts. If it is necessary to work under the car the coat is in every way insufficient, and the overall and jumper will always separate at the waist when the wearer is writhing about on his back and cause his clothing to soil from the road dust or the garage floor.

The "Fast Limited" Autosuit.

The "Fast Limited" autosuit, made by the Detroit Overall Company, Detroit, is a one-piece garment of heavy pin check denim that may be slipped on over a suit and buttoned snugly, so that the motorist is protected fully, no matter what may be the work. It is closed tightly at the collar and wrists, and being of light weight, makes for decided comfort. There are four pockets in which tools may be carried. It is made with the deep continuous side and relieves the shoulders from the strain of the suspenders and in any position it is a complete protection. When it becomes soiled it may be washed and will be restored to its original appearance. It may be rolled and carried in any convenient place.

BARNES RESIGNS TWO OFFICES.

Claire L. Barnes resigned as third vice president and a member of the board of directors at a recent meeting of the board of directors of the Motor & Accessory Manufacturers in New York City. William H. Crosby was elected as a member of the board of directors, to fill the unexpired term of Mr. Barnes, whose office will continue until January, 1914. F. C. Billings, already a member of the board, was elected as third vice president, to fill the unexpired term of Mr. Barnes, which office will continue until January, 1913. The following concerns were elected to membership: Hood Rubber Company, Boston, Mass.; the Lefever Arms Company, Syracuse, N. Y.; the American Hardware Corporation, New Britain, Conn.

GASOLINE PRICES RAISED.

The fifth advance in the price of gasoline to garages in New York City within a period of six months was made recently, and it is believed this is only a forerunner of a general increase all over the country. The advance just made was one cent a gallon, and brings the price up to 15 cents.

ILLINOIS CENSUS FIGURES.

During the five years, from 1904 to 1909, the automobile industry in Illinois shows a remarkable gain, according to the report of the 13th census recently issued by Director E. Dana Durand. The establishments increased from 12 to 65, and the value of the product from $357,000 to $7,154,000. The number of people employed in 1904 was 167 and in 1909, 2382. The following tables give comparative figures that show the growth:

State of Illinois.

	1904.	1909.
Number of establishments	12	65
Persons engaged	192	2,804
Proprietors	8	41
Salaried employees	17	381
Wage earners	167	2,382
Primary horsepower	136	1,786
Capital invested	$401,000	$4,084,000
Salaries paid	28,000	426,000
Wages paid	107,000	1,653,000
Cost of materials	112,000	3,979,000
Value of products	357,000	7,154,000
Value added by manufacture	245,000	3,175,000

City of Chicago.

Number of establishments	11	41
Persons engaged	190	1,725
Proprietors	7	17
Salaried employees	17	248
Wage earners	166	1,460
Primary horsepower	....	734
Capital invested	$399,000	$2,094,000
Salaries paid	28,000	305,000
Wages paid	106,000	1,131,000
Cost of materials	111,000	1,707,000
Value of products	$54,000	3,940,000
Value added by manufacture	243,000	2,233,000

LION COMPANY LOCATES.

The Lion Motor Car Company of Adrian, Mich., whose plant was destroyed by fire, June 20, is again in the field. A reorganization has been effected and the new plant obtained. It is claimed that the first car will be marketed within a very short time. Within 90 days, it is announced, the company will be turning out its full quota of cars. The firm is to remain in Adrian, despite many reports to the contrary. The Industrial Association of the city has guaranteed $100,000 to keep the factory, and the new plant is considerably larger than the one destroyed. The factory organization remains practically the same.

UNITED STATES TIRES.

All five brands of the United States Tire Company's tires, United States, Hartford, G & J, Morgan & Wright and Continental, are to be merged into one brand, the United States, this fall, according to an indication by Elisha S. Williams, president of the Rubber Goods Manufacturing Company, which is a subsidiary of the United States Rubber Company, and which owns the United States Tire Company and the plants grouped in it.

It was predicted when the new brand was created a few months ago that a consolidation would eventually result, and that the new one would supersede all others. Although it is said that after fall there will be but one brand, there will be several grades to meet market conditions.

According to information from Mr. Williams no decision has been reached regarding a location for the new tire factory that the United States Tire Company is to erect at a cost of from $3,000,000 to $5,000,000. He intimates, however, that it will probably be built in the West.

MERCER AGENCIES COMBINE.

The Whiting Motor Company of New York City recently acquired the Philadelphia branch of the Mercer Automobile Company, 620-622 North Broad street, which will hereafter be conducted as an agency of the Whiting company. The Philadelphia agency will have the territory including Pennsylvania, Delaware and Maryland in addition to the present territory of the Whiting Company of New York and New Jersey, excepting Mercer county, the home of the Mercer factory. The Whiting Motor Company's New York headquarters are at 1802 Broadway with a Newark branch at 486 Central avenue.

BOILLOT USED MOBILOIL.

It appears that while American drivers were not successful in the recent Grand Prix race over the Dieppe course in France, American supplies were victorious. At least, the Vacuum Oil Company, Rochester, N. Y., is in receipt of the following cablegram from its Paris representative: "Boillot driving Peugeot car won Grand Prix, Dieppe, using Mobiloil." Naturally, the result of this test abroad is particularly gratifying to the Vacuum Oil Company, and should prove of interest to all American motorists.

K-D MOTOR COMPANY FORMED.

The K-D Motor Company (Knight-Davidson Motor Company) was recently incorporated for $100,000, for the purpose of manufacturing the K-D motor, the invention of Miss Margaret E. Knight of South Framingham, Mass. The incorporators are Margaret E. Knight, Anna F. Davidson and Beatrice M. Davidson. It is intended to have the principal office of the concern in New York City. Nothing has been done except to file the certificate of incorporation and hold a stockholders' meeting. It is proposed, however, in the near future to open an office in New York City and to vigorously prosecute the business.

PROMOTION FOR NASH.

Following the resignation of W. J. Mead as vice president of the General Motors Company, Detroit, to become president of the Amplex Motor Car Company, Mishawaka, Ind., comes the announcement that C. W. Nash, for the past two years vice president and general manager of the Buick Motor Company, Flint, Mich., a subsidiary of the General Motors Company, has been elected vice president to succeed Mr. Mead. This promotion does not mean that Mr. Nash will relinquish the management of the big Buick plant at Flint. On the contrary, he will continue to concentrate his attention and efforts upon the operation and further expansion of the Buick business, which, under his management, has maintained a foremost rank in the automobile industry.

PERFEX MAKES APPEARANCE.

The Perfex car, designed and built under the direction of James Fouch, and made by the Perfex Motor Car Company of Los Angeles, Cal., recently made its appearance on the Pacific Coast. Considerable ceremony attended the introduction of the first car to the public, H. B. Gurley, assistant secretary of the Los Angeles chamber of commerce, breaking a bottle of Owens river water over the radiator as it left the factory. Several prominent easterners are said to be interested in the new concern.

YOUNG WITH REGAL COMPANY.

C. S. Young, for some time engineer and designer with the Lozier Motor Company, Detroit, has severed his connection with that firm to become assistant general manager with the Regal Motor Car Company, also of Detroit. Mr. Young's experience in the industry dates back to the early days, and he is one of the most widely known engineers in the Middle West today. Previous to his connection with the Lozier people, he had responsible positions with the Electrical Vehicle Company, Pope Manufacturing Company and the American Locomotive Company.

HAYES MADE ADVERTISING MANAGER.

Frank M. Hayes, who has been in the employ of the Luke Horsfall Company, Hartford, Conn., for the past three years, resigned recently to accept a position as salesman and advertising manager of the Lovell-McConnell Company, Newark, N. J., maker of Klaxon and Klaxonet automobile horns.

ADD TO AMERICAN PLANT.

With the completion of the three-story brick and steel addition to its plant No. 2, the American Motors Company, Indianapolis, Ind., maker of American cars, now has what is believed to be the largest manufacturing plant in Indianapolis. This increase in factory space is said to be due to the unusual demand for the underslung types, which are produced by this concern.

At the beginning of the 1912 season it was found necessary practically to double the available space, and again just before the 1913 announcement, plans were made and the foundation laid for a further increase in this respect. This second addition is now completed and ready for occupancy. It is 85 by 120 feet, providing about 30,000 square feet of floor space. The equipment is new and of the latest design. One piece of machinery is a 36-ton hydraulic press to be used in connection with the sheet metal work and in shaping the bodies.

GOODYEAR BOOKLETS ISSUED.

The Goodyear Tire & Rubber Company, Akron, O., recently issued two booklets, entitled "Get All the Mileage from Your Tires," and "Make Inner Tubes Last Longer." Both are small, but contain a fund of information appertaining to its own particular line. The company also recently issued the second number of "Aviation." This contains several photographs of leading aviators and aviation meets, and is extremely interesting.

DURGIN WHEEL PLANT MOVES.

As a result of efforts on the part of the Commercial Club in Hutchinson, Kan., the Durgin Auto Wheel Company has decided to move its plant from Lawrence, Kan. The move was made as the plant required greater facilities. The Durgin wheel is made so as to abolish tire blow-outs, prevent skidding and yet be durable. It has a tire made of selected blocks, which give it exceptional wearing qualities.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from July Issue.)

Fig. 51 represents an ideal method of magneto placing and is one followed by a large number of manufacturers. In this, the device is being fitted to a four-cylinder engine, and as the armature must be driven at the same speed as the crankshaft, it is necessary to use but one extra gear, that being the same size as the engine shaft pinion and driven by the camshaft speed reduction gear. Incidentally, the sketch illustrates the best method of timing the magneto, which is one of the direct high-tension type. The position of the various parts is clearly shown.

Having fixed the magneto to the engine crankcase, the driving pinion, or one of the members of a flange or Oldham coupling, is put loosely on the tapered end of the armature shaft, and the cover to the distributor and the dust cover of the contact breaker are removed to allow one to control the position of the armature. The motor is now turned over by hand so the piston in the first cylinder is at top centre, which can be determined either by watching the crankshaft through a suitable opening in the engine base or by inserting a wire through a compression relief pet cock or spark plug hole, if either of these are at the top of the cylinder.

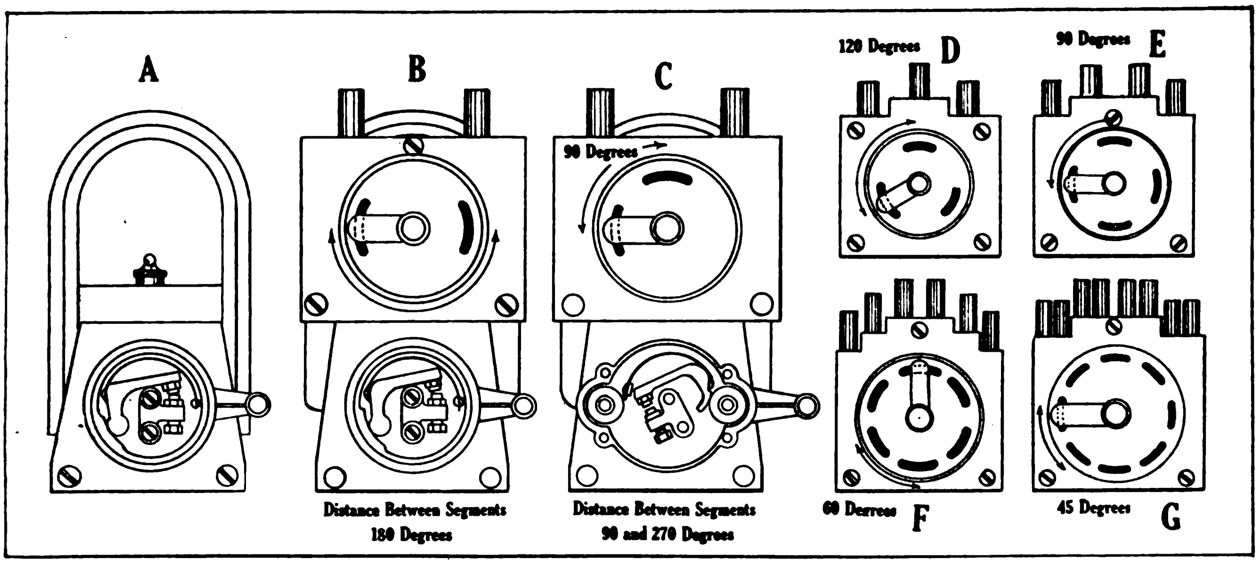

Fig. 50—Important Components of Simms High-Tension Magneto.

The armature of the magneto is then brought to the position indicated in sketch, which represents the fitting of a magneto that is turning clockwise when viewed from the driving end. The distance between the end of the armature and the pole piece should be 15 mm or about .4375-inch. This represents an advance of about .5-inch on a motor with a five-inch stroke. The armature is uncovered by removing the flat casing lying between the horseshoe magnets, this often carrying the safety spark gap (Fig. 49, July issue) and normally serving as a lid. If earlier timing be desired for any special purpose the gap may be widened a trifle, if it be thought the timing is too far advanced, the gap may be lessened. The contact breaker is fully advanced at this time and the contact points are just about to separate. Having placed everything in position as described, tighten the coupling on the taper shaft and ream out for a small taper pin.

The connections to the various cylinders are then made in the order they fire, which can be ascertained by watching the inlet or exhaust valve movements. When the cover to the distributor is off, see at which segment the brush is contacting. The wire to the spark plug in the first cylinder is then led to the terminal corresponding to this segment. Then the plug in the cylinder that is next to fire is coupled to the next segment and so on. The numbers on the distributor show the order in which the various contacts are brought in contact with the rotating distributing brush and not that in which the cylinders fire. In the sketch the cylinders fire 1-2-4-3. Therefore, the segment number 3 is coupled to the plug in cylinder 4, and the segment 4 is connected to the plug in cylinder 3, which is thus the last to fire if the explosion takes place first in cylinder 1. The direction of the distributor brush rotation, if driven by the usual form of gearing is opposite to that of the magneto armature. Obviously, if one cylinder is timed correctly, the remaining members will also fire at the proper time in the cycle of operations. The positions of the armature, distributing brush, contact breaker cam and piston are easily ascertained by inspection of drawing.

Wiring and Plugs.

A magneto should be thoroughly enclosed, if practicable, to protect it from moisture, and the contact breaker and distributor covers should be tight to prevent the entrance of dust. Moisture, metallic or carbon particles and old oil in a distributor will cause internal short circuiting, so the device should be as well protected as possible and the parts frequently cleaned to prevent accumulation of such foreign matter, which acts as a conductor of electricity.

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company.

The wiring should be of the best quality, and at least .1875-inch of good insulation should be provided. Multiple strand wire is superior to the single conductor, because the many vibratory stresses which exist in a motor car would tend to crystallize a less flexible conductor, though this should have the conductivity of a No. 14 B. & S. gauge copper wire at least.

The spark plugs commonly used for battery and coil ignition are not satisfactory for a magneto, as the current generated by this device is of greater amperage and has a greater heat value than that obtained from coils excited by battery energy. This greater heat has a tendency to burn the slender points thought necessary, and plugs with heavy points are needed to withstand the heating effect. The gap on a magneto plug should be less than that on a coil plug because the current, while of greater amperage and heating value, is of less potential than coil transformed current and manufacturers of such appliances do not advise gaps more than .015625 inch in width. The widening of a gap from burning of the points will introduce too great resistance and the current will not leap the increased gap, so for this reason the most efficient magneto plugs have a plurality of points, so that when the distance between one set becomes too great, the spark will take place between another.

Maintenance of Magneto.

The most important points in the care of a magneto are lubrication and keeping the distributor and contact breaker clean. When ball bearings are used, these should receive a few drops of light oil once a week, and when plain bearings are employed, the oil cups, which feed lubricant to the bearings through the medium of a wick feed, should be kept properly supplied. If lubrication is neglected, the bearings will wear and the armature will strike the pole pieces, a condition which is not conducive to efficiency. Cleanliness is important and most cases of irregular ignition can be attributed to dirty oil or metallic particles in distributor or contact breaker. This matter can be easily removed with gasoline and a clean cloth.

In order to amplify the drawings which have been previously presented, illustrations of some of the leading types of magnetos are shown in various stages of completion to outline the construction of the principal parts. The important components of the Connecticut magneto are shown at Fig. 52. As previously stated this device is a low-tension generator having a single winding on the armature utilizing a high-tension transformer or coil housed under the arch of the magnets. The distributor and contact breaker are removed, as is the coil, and practically all of the points that will need attention are shown. A good feature of this device is the slot in the side of the contact breaker housing through which a small file can be inserted to clean the contact points, as shown at Fig. 53.

The Volta magneto is a true high-tension instrument in which the armature has a double winding, and as the various parts shown at Fig. 54 are clearly marked, the general features of construction can be grasped readily. The relation of the parts to each other can be determined by referring to sectional drawings previously shown. The Splitdorf magneto is shown in a dismantled condition at Fig. 55, this view being especially valuable because the contact breaker housing is removed, the distributor cover is dismounted and the armature is taken from the space between the field magnets it usually occupies. In this connection it is well to impress upon the reader that whenever the field magnets are left as shown, the gap should be bridged with a heavy piece of iron which acts as a keeper to prevent loss of magnetism. Obviously this was omitted to make for clearer illustration.

The Splitdorf magneto with the only parts that would ordinarily need attention removed is shown at Fig. 56. Special attention is directed to the small brushes in the distributor and also the two in the contact breaker housing cover, which are practically the only ones used on the instrument. The contact breaker arrangement is also clearly shown in this view. To adjust the points, the check-nut on the insulated platinum tipped screw is backed off and the screw turned with a small spanner wrench to bring the points nearer together or screwed out to make the gap wider.

The principal parts of a Bosch magneto that may need inspection are shown at Fig. 57. The peculiar arrangement of the contact breaker should be noted, this differing from the more conventional types in that small fibre rollers are placed at the sides of the contact breaker housing which merely oscillates, while the entire contact breaker mechanism mounted at the end of the armature revolves. On one occasion, the writer traced a case of ignition trouble to one of these fibre rollers sticking on its bearing, causing it to wear flat on the surface with which the contact lever toe came in contact. After a time the worn contact roller did not break the circuit and the engine missed badly on two cylinders, but ran well on the other two because the revolving roller was breaking the circuit as it should. A new roller was secured and put in place and the trouble ceased. In all cases, these rollers should be a free fit on their bearing pins, but there should be no lost motion at that point.

The moving arm on the contact breakers of the

Bosch, Simms, and some other high-tension magnetos is pivoted in a fibre bush by a short steel stud. To avoid lateral rocking, this stud has to be a fairly tight fit in its fibre socket, and if either the stud becomes rusted, or the fibre swollen by damp, the contact breaker arm may stick.

INTERRUPTER IN HOUSING.
INTERRUPTER HOUSING-COVER.
DISTRIBUTOR COVER SHOWING SAFETY-GAP WINDOWS.

Fig. 52—Principal Parts of the Connecticut Magneto.

The trouble is particularly frequent in bad weather, or when a machine has been laid by in a damp atmosphere for some weeks or months, and is rather elusive. Its nature is invisible until the dustcap has been removed, and very frequently the arm is freed by a touch of the fingers when the contact breaker is being examined. Then the cover is replaced, and ere long the mishap is repeated. It is easily remedied by polishing the steel stud with emery cloth, or by very gingerly enlarging the hole in the fibre with the aid of a rat-tail file.

Obviously, every type of instrument has peculiarities in construction that may result in troubles that would only occur with that specific type, but there are a number of minor derangements that all magnetos are heir to and the few general suggestions which follow are intended to apply to practically all forms. For instance, direct high-tension instruments have no separate coils, and any electrical trouble must exist in the instrument itself, whereas in the types that employ a step-up transformer irregular operation may be due to the coil or the magneto, if not at the plugs or in the wiring.

In Event of Trouble.

Should there be any irregularity of action of the motor it is well to examine other conditions before tampering with the magneto, especially if it has operated satisfactorily after installation. If other adjustments are right, the ignition system can be suspected. When a double ignition system is used the engine operating correctly with the independent battery and coil system must indicate that the magneto group or its components are at fault.

If the missing is confined to one cylinder, there is either something wrong with the spark plug or the wire leading thereto from the magneto. See that there is no break in the insulation or the wire, and that there is a positive connection at either end. Note the condition of the plugs, see that they are clean, that the insulation is not cracked or punctured and make sure that the spark plug points are separated by a suitable air gap. If, however, the missing is first in one cylinder and then in the other, it may be possible, if the wiring and plugs are all right, that the platinum contact breaker points need adjusting or cleaning. Make sure that the inside of the secondary distributor is clean, free from all old oil, water or metallic particles which short circuit the current.

The most fertile source of trouble in a magneto of any type using carbon brushes is poor contact or breakage of these small but important members. In a high-tension instrument the collecting brush at the driving end should be inspected in event of failure to generate current. This is housed in an easily removed bushing screwing in the magneto base and if the brush is broken it may be easily removed and a new one substituted. On low-tension magnetos using transformer coils, the primary collecting brushes sometime fail, or wires become loose at the coil and contact breaker terminals. It is well to have a few spare brushes on hand at all times, as they are not costly and easily renewed, and the magneto is out of commission should either one of the main collecting or distributing members break. Some instruments use small wire gauze members that are not likely to break, but the carbon members are fragile and sometimes fail in service at an inconvenient time.

Function of Switch.

An important point of difference between magneto and battery ignition which often causes some confusion in the minds of the motorist is in the interruption of the magneto energy by a switch. In this it is well to remember that when it is desired to discontinue battery and coil ignition, a switch is provided which opens the circuit, with a magneto the conditions are the opposite. A switch is closed and a short circuit established between the primary and the ground when energy is no longer needed, as when shutting off the motor, this grounding the current.

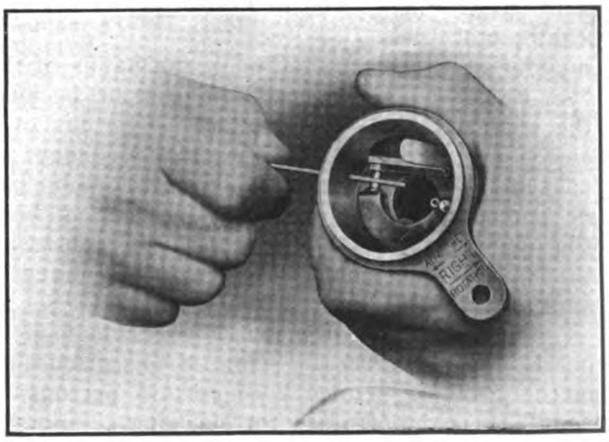

Fig. 53—Method of Cleaning Contact Points of Connecticut Magneto.

(To Be Continued.)

PROTECTING THE CAR AGAINST THEFT.

Conditions Warrant the Assumption That Organized Bands Are Operating in Many Sections---Means Should Be Provided for Safeguarding the Machine When Left Unattended---Some Devices Now on the Market.

TWO hundred and eleven motor cars stolen within seven months is the substance of the report recently made public by the police department in Detroit. This means an average of one automobile theft a day in that city, and the situation may be regarded as an example of what is taking place in practically every city of consequence in the United States. Of the 211 machines stolen in Detroit 209 were recovered, but in each instance the owner was called upon to face losses, which were it possible to secure authentic figures, must aggregate a decidedly substantial sum. Even if insurance companies were called upon to make good this sum, the owners were still losers, through inability to use their machines for a given period.

Automobile theft may be divided into at least two classes. First, there is the organized gang which either drives the machine to some secluded spot and strips it of such parts and accessories as can readily be turned into money, or completely renovates and sells the car. Then there is the party which starts upon what has come to be termed a "joy ride."

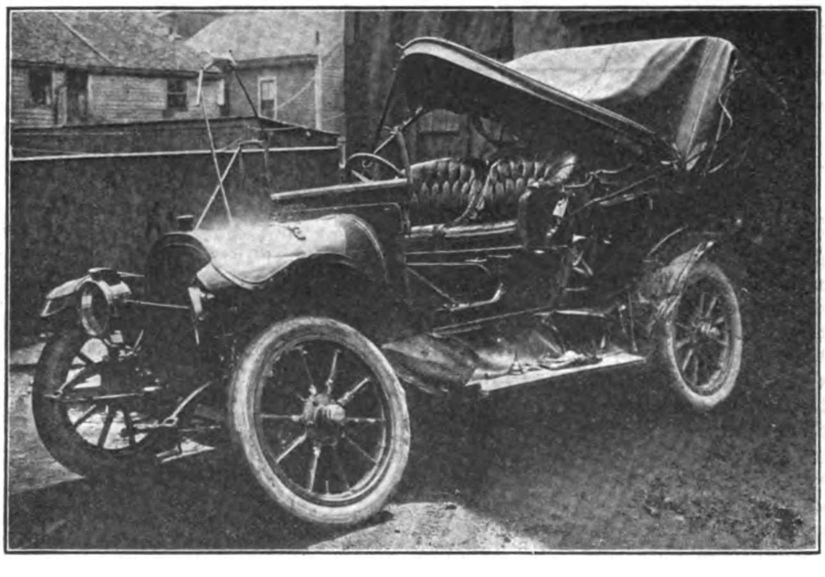

Fig. 1—A Striking Example of What May Be Expected as the Result of the So-Called "Joy Ride."

Fig. 1 presents a striking example of the manner in which cars suffer at the hands of the "joy rider." This situation may arise because the chauffeur utilizes the machine for his own enjoyment without the owner's knowledge or consent, and the possibility of such results has occasioned no little worry on the part of both the owner and the garage proprietor. However, that is a subject which can best be considered in another manner.

While this condition exists, that which more nearly comes within the scope of this discussion is the growing tendency of certain persons to watch their opportunity for securing temporary possession of a car when it is left unattended outside the garage, in front of the owner's home or place of business, or elsewhere. Within the past few months, comparatively speaking, almost every city, and even many of the smaller towns, has developed thievery of this character. That the owner needs to be protected from his own folly in this respect semes to be borne out by the clause in the motoring law of Massachusetts, and in the laws of several other states, providing that "no person having control or charge of a motor vehicle shall allow such vehicle to stand in any public street or way and remain unattended without first locking or making it fast."

Fig. 2 depicts a car which has been stolen for the purpose of stripping it of the accessories. So prevalent has this form of theft become, both in this country and abroad, that organized bands of automobile thieves have come into being, with a splendid system of obtaining plunder and disposing of it by means of "fences." Judging from the fact that 209 of the 211 cars stolen in Detroit were recovered by the police, it seems probable that a large proportion of the thefts were committed by some such band.

Within two years, the practise of stealing cars outright, the vehicles being completely overhauled and sold to unsuspecting purchasers as second hand machines, seems to have been gaining rapidly. This situation becomes the hardest of all with which the police have to deal, and the owner naturally is subjected to the greatest loss. Whenever the cars have been recovered, which has been seldom indeed, it has been found that they have been stolen in New York City, for instance, and disposed of in some middle western city. This would indicate that those engaged in this form of theft operate upon a large scale, and many times the condition of the recovered machine has been such as to suggest that they had access to a well equipped plant for the renovation of automobiles, including painting, replacement of parts and other extensive alterations.

A fruitful field for the activity of either band of thieves mentioned above may be found at Fig. 3, which represents an open air stand for automobiles utilized by the business men of a large city in the East. Here the machines have been permitted to remain throughout the day, and often long into the night, absolutely unprotected, except in such manner as can be afforded by the occasional visit of the patrolman in making his rounds of duty. It may be argued that as this open air garage is within full view of office buildings, and the public is passing to and fro at all times, there is little possibility that anyone other than the rightful owner or chauffeur would attempt to drive away a car, but this condition has not obtained in practise. Thieves so well organized as has been indicated herein do not hesitate to take chances of being discovered, and it will be admitted that the public generally is too busy with its own affairs to make a mental note as to whether or not the man seen entering an automobile in an open square is entitled to do so.

It is well enough to provide insurance against theft, which aims to reimburse the owner for all losses of this character above $25, whether the loss is occasioned by the so-called joy ride, in which the machine may be as thoroughly damaged as indicated in Fig. 1, or it is the result of dismantling as presented in Fig. 2. It will be admitted, however, that this protection by no means satisfies the owner, when his machine is missing, and he is in need of a car to carry on his business or to prevent rearrangement of his plans in other ways.

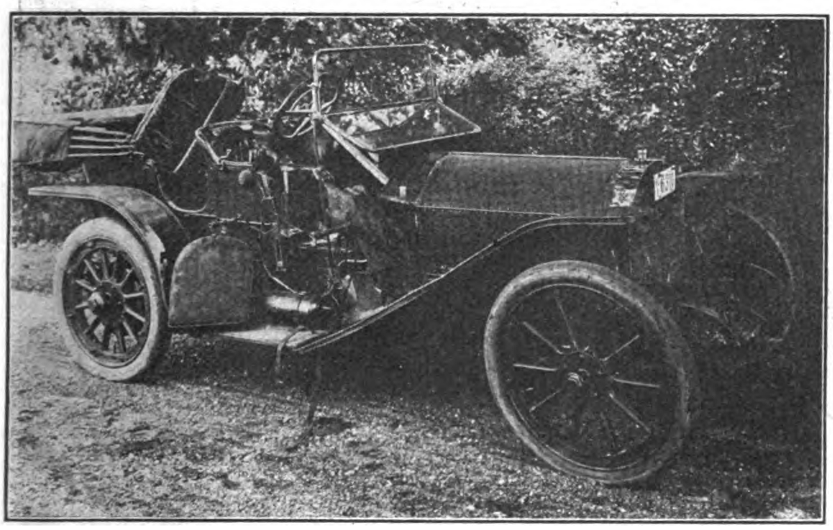

Fig. 2—Car Abandoned by Automobile Thieves After Being Stripped of Articles That Can Be Turned Into Ready Money.

These conditions have resulted in the production of numerous devices, designed for the absolute protection of the car at all times, when left unattended. The object of this discussion is to present the merits of these various offerings, as outlined by the manufacturers, and it is assumed that the motoring public will be interested in comparing their particular features.

Those familiar with the components of the motor car realize that gasoline must be fed to the carburetor where it is vaporized and that the mixture in the cylinder must be exploded by a spark. If the main supply be cut off it is obvious that the machine can be operated but a short distance, a few blocks or so, as the fuel soon falls below the vaporizing level in the float chamber or becomes utilized. Similarly, if the ignition circuit be broken on one side by means of a locked switch, it will be impossible to start the motor until the connection is re-established.

Two other factors are essential for the operation of the automobile, namely the clutch and transmission. With the former held out of engagement and locked, even with the motor in operation, it would be impossible to move the machine under its own power. With the sliding gearset, the retention of the gear shift lever in neutral would prevent theft of the vehicle, as a set of gears would have to be brought into engagement before the energy of the motor could be utilized. The design of the planetary transmission does not lend itself readily to locking, but with this type use may be prevented by locking the steering wheel, fuel or ignition systems. The various applications of the above methods are described and illustrated herein.

The Gasolock, shown in Fig. 4, is marketed by the International Sales Company, 412 Scherer building, Detroit. It comprises a Yale cylinder lock enclosed in a brass head or ball connected by a tube to a valve inserted in the line between the gasoline tank and carburetor. The cylinder lock is gear meshed with the stem of the valve in such manner that the operation of the key locks and unlocks the fuel supply.

The device is securely bolted to the dash and in locking the gasoline every portion of the Gasolock is locked. It is maintained that it cannot be shakened off or removed in any way without first working the lock. Inasmuch as this portion of the device is made by the Yale & Towne Manufacturing Company, each key is distinctive. The valve, stem and head are produced by the Detroit Lubricator Company.

The Troy Carriage Sunshade Company, Troy, O., manufactures the Troy automatic auto-lock shown at Fig. 5. This is one of the combination, keyless devices, in which the combination may be changed at the will of the owner. This latter operation is performed by simply removing the face of the lock, utilizing a special key provided for that purpose, and manipulating the little levers seen in the illustration, as is desired. However, it is impossible to employ this special key before the original combination has been worked and the bolt drawn up to a given point, so that a person ignorant of the combination would be helpless even if he secured temporary possession of the special key.

The cut presents the location of the lock on the speed lever, and in applying it it is necessary to make a slot through the lever so that the locking dog or flattened bolt can slide up and down in the slot. This dog projects on each side beyond the faces of the speed lever to such an extent that when the lever is in neutral and the bolt is forced downward it slides snugly between the inner sides of the quadrant, preventing the movement of the lever from its neutral position. It is maintained that if attempt be made to wrench the lock from the lever, the lock itself takes none of the strain and the lever would be broken off before the lock would yield.

The Campbell locking control lever at Fig. 6 A is particularly unique, in that it is impossible to suggest how the device is operated, unless previous knowledge has been obtained. There is held to be no manner in which the lock may be picked as a four pin tumbler Yale lock is employed, and of course, the entire apparatus is worked from the seat. It is the product of the Auto Specialty Company, Toledo, O.

It will be noted that the locking mechanism apparently is located in the top of the lever, which is substituted for that furnished with the car. In reality, however, the locking shaft extends down through a hollow steel lever to engage in the neutral point of the sector. The key is inserted in the top of the handle, as indicated, and when removed the thief is puzzled to understand why he cannot manipulate the lever in any manner.

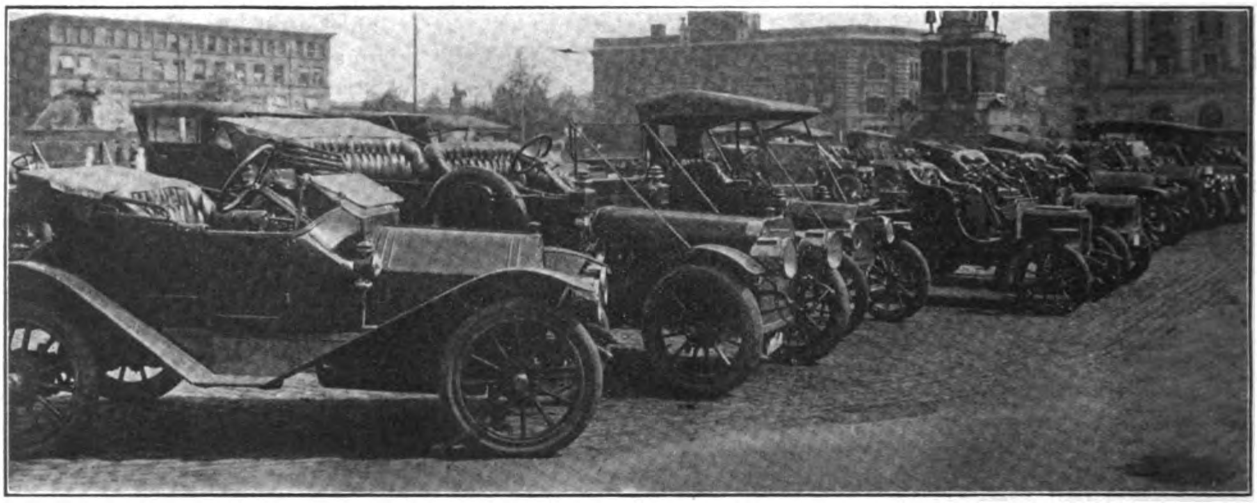

Fig. 3—Cars Parked in Public Square Without Attendant—A Fruitful Source of Trouble from Automobile Thieves of Every Class.

The Globe Auto Lock is presented at Fig. 6 B. This is manufactured by the Globe Auto Lock Company, Canisteo, N. Y., and is a simple, compact valve attachment with provision for inserting in the fuel line. It may be fitted to the outside of the car body, under the seat or any other convenient place. When the lever is moved it shuts off the supply of fuel positively and locks the device. The entire arrangement is outlined in the drawing.

Another device which locks the gear shifting lever is the Crown, made by the Wiener-Barnet Company, 312 Adams street, Newark, N. J., and illustrated at Fig. 6 C. This differs materially from those previously described in that there is no drilling, filing or changing of any of the mechanism by means of which the car is operated.

In the drawing the padlock can be seen underneath the quadrant. About the lever which has been locked in neutral may be noted a notched bar, which is slipped into place, when it is desired to lock the car. The padlock is fastened into a hole at the lower end of this bar and renders it impossible to release it, and consequently the lever, until this lock has been unlocked in the customary manner.

The Fetterlock at Fig. 6 D is somewhat similar, in that a small bent plate slips over the quadrant, this having an opening for receiving a lip with a hole in it. Through this hole the padlock, fitted with either Corbin or Yale tumbler lock, is slipped. In practise the lever is thrown into neutral and the plate, lip and lock applied. It is claimed that it will fit any make of car having selective or progressive transmission. It is made by the Autolock Company, 2828 Smallman street, Pittsburg, Penn.

The principle involved in the Rochester safety lock at Fig. 6 E is entirely different. The lock itself is a three tumbler combination, keyless device, capable of a large number of different combinations, and in this respect it affords the same possibilities as the Troy device described above. It is made by the Rochester Safety Lock Company, 530 Main street, Rochester, Ind.

This apparatus is applied to the steering post. It will be noted that there is a .25-inch lug or pin projecting inwardly from the hasp of the lock. This is supposed to enter a .25-inch hole drilled in the steering column, about eight or 10 inches below the steering wheel, and in the front side of the bar as the driver sits in the seat. This will put the lock at the right hand of the driver and make it possible to operate it from the seat. The idea of application is that, in most cases, one part of the steering column is stationary, while the other rotates with the steering wheel. The lug in place holds the bar rigid and makes the car useless.

The Blackburn lock switch at Fig. 6 F offers a means for locking the ignition circuit. The

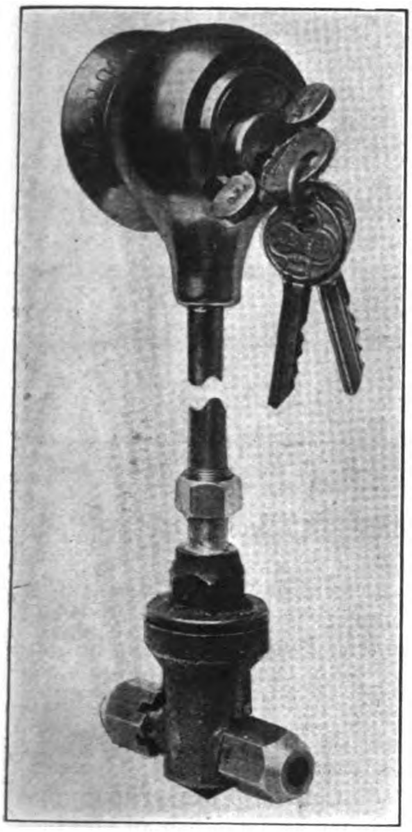

Fig. 4—Gasolock for Securing Fuel Supply.

plan is that of substituting for the usual ignition key and socket, supplied by the maker of the unit, a Yale lock of the pin and tumbler type, the key to this acting as the ignition plug. Obviously, when this key is removed the switch cannot be turned except with a duplicate. It is maintained that the switch cover cannot be removed even if unscrewed, until after the key has been inserted and turned to releasing point, and that when the switch is mounted on the coil it is impossible to short circuit the wiring. The maker is the Blackburn Specialty Company, 1120 Prospect avenue, S. E., Cleveland, O.

Still another means of locking the gear shifting lever is presented in the Saunders automatic lever lock at Fig. 6 G. This is the product of F. H. Kelsey & Co., 408 Frankfort avenue, N. W., Cleveland, O. It will be noted an attachment fitted with a spring is permanently fixed to the side of the lever, its bottom portion engaging with the quadrant when the lever is in neutral and the top of the spring device is pushed downward. Pushing this down, either with the hand or foot, automatically operates the Corbin tumbler lock, which cannot be unlocked except with the individual key. Unlocking the lock automatically throws the bottom portion of the device out of engagement with the quadrant and permits the use of the lever in any position desired.

The Johnstone ignition lock at Fig. 7 A differs from the Blackburn in that it is worked by a combination lock instead of a key. It is made by the Johnstone Auto Lock Company, Cleveland, O., and is composed of a pressed steel box, fastened over the coil box and attached to the dash by screws inside. When in position, it is maintained that the engine cannot be started unless the combination is known, and that the latter can be changed at the will of the car owner.

The Parker lock at Fig. 7 B is another supplemental device for insertion at the quadrant in order to secure the gear shifting lever. It is the product of the General Utility Company, 1326-1330 Ogden street, Philadelphia, Penn. The attachment is hinged, so as to slip around the lever when in neutral, and locks by means of a Yale lock. The maker calls attention to the fact that no filing or drilling is required.

The Watch Dog, made by S. Breakstone, 1712 Michigan avenue, Chicago, and shown at Fig. 7 C, consists of a pair of hinged arms which slip around the steering wheel spider, and the throttle and spark levers. It may be had either with or without padlock, that furnished with the device being of the Corbin make. It is claimed by the maker that it is possible to leave the car with the engine running, as when the lock is applied under such conditions the machine can be operated in a circle only.

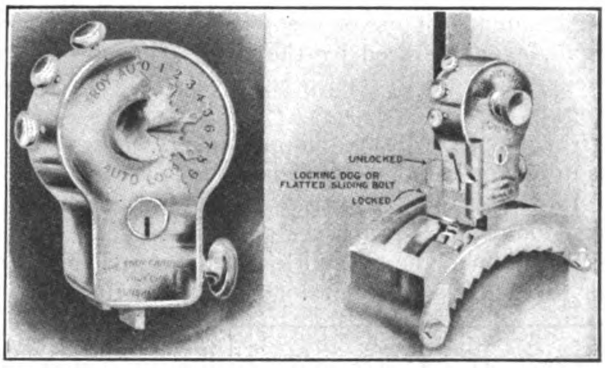

Fig. 5—Troy Automatic Auto-Lock: At Left, the Lock Itself; at Right, Applied to Gear Shifting Lever.

A device for locking the clutch pedal is depicted at Fig. 7 D, this being the Auto safety lock made by Daniels & Woods, Los Angeles, Cal., and marketed by Smalley Daniels, 23 Motor Mart,

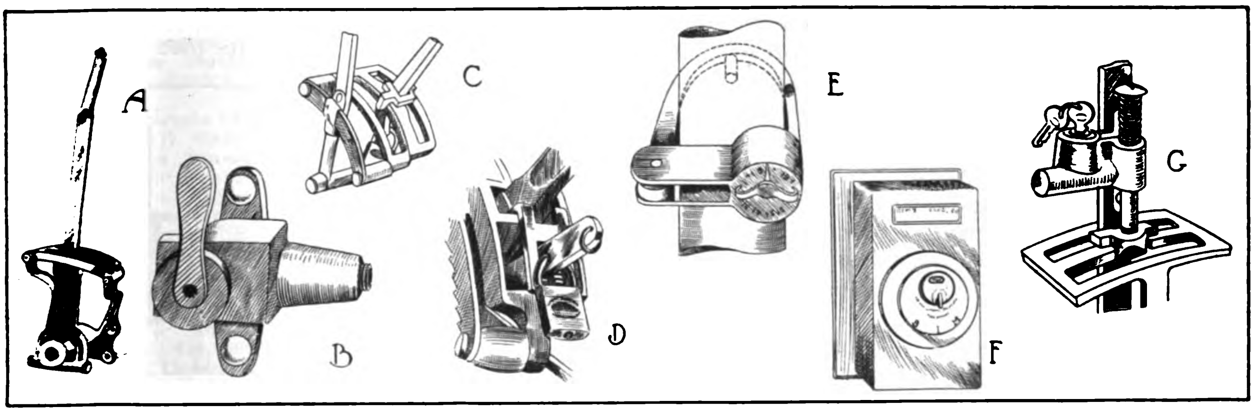

Fig. 6—Some Interesting Types of Automobile Locking Devices: A, Campbell Lever; B, Globe Fuel Lock; C, Crown; D, Fetterlock; E, Rochester Safety Lock; F, Blackburn Lock Switch; G, Saunders Automatic Lever Lock.

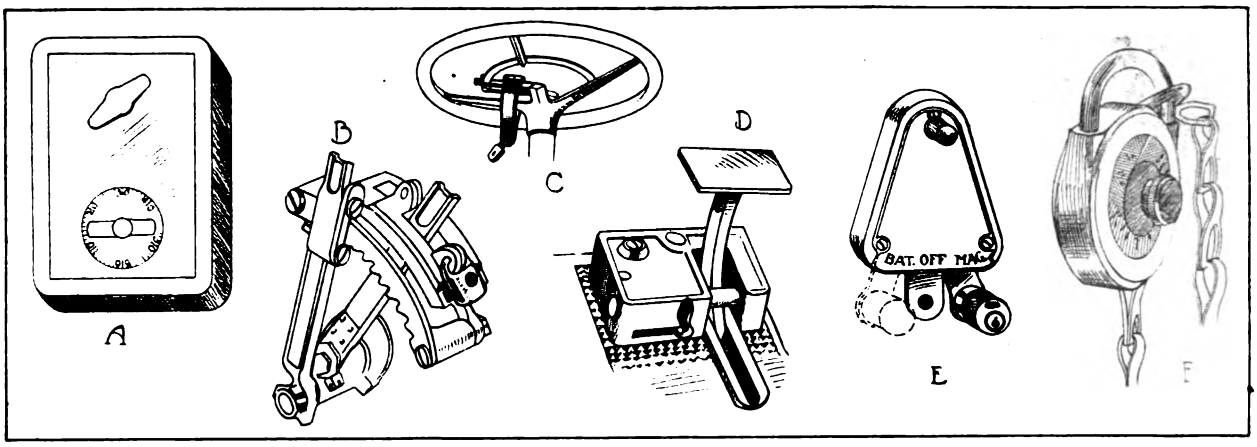

Fig. 7—Other Devices for Securing Cars Against Theft: A, Johnstone Ignition Lock; B, Parker; C, Watch Dog; D, Auto Safety Lock for Clutch Pedal; E, Yale Ignition Lock; F, Miller's Keyless Padlock.

Boston. The apparatus is neat in appearance and is always ready for service. The locking arrangement comprises a short bar, which slips across back of the clutch pedal, and holds it out of engagement. This is thrown into action by a small lever operated by the foot, while a key is needed in order to release it when it is desired to operate the car.

As has been stated most makers of ignition equipment supply some form of lock with the coil switch, and the Yale & Towne Manufacturing Company, 9 Murray street, New York City, has developed the special lock shown at Fig. 7 E for this purpose. When locked in the neutral position the switch lever cannot be moved until released by the individual key.

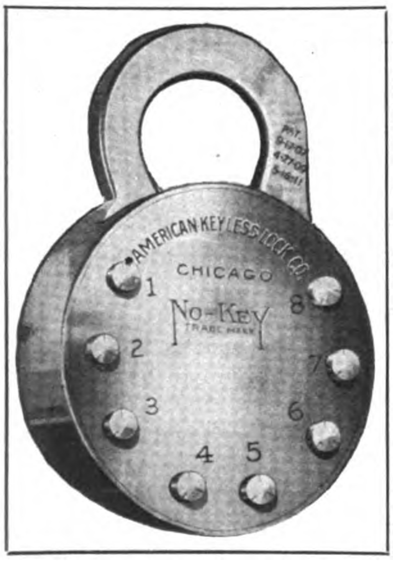

Fig. 8—No-Key, a Combination Padlock.

The J. B. Miller Keyless Lock Company, Kent, O., manufactures the padlock presented at Fig. 7 F, this being a combination device. That in the drawing is more commonly used on motorcycles, although the padlock can be utilized either with or without the chain. The concern is engaged upon the production of a special device for locking the steering gears and levers of an automobile, but this is not yet ready for announcement.

Still another combination lock is the No-Key, produced by the American Keyless Lock Company, 619 West Jackson boulevard, Chicago, and depicted at Fig. 8. This is made entirely of brass, and is utilized in the same manner as any padlock, with the exception that it is opened by working the combination. Any of the numbers from 1 to 8 on either side of the lock may be employed in the combination and it is claimed that more than 40,000 different combinations are possible on each lock.

Besides making locking devices for its ignition equipment, the Connecticut Telephone & Electric Company, Meriden, Conn., produces the Autolock presented at Fig. 9. This is a simple form of padlock, so small as to be carried in the vest pocket with ease, and is designed to be applied to the ratchet brake lever as depicted. The construction is from a solid block of brass, machined out to receive the mechanism which is of the ball bearing pin tumbler design. The shackle and steel inserts are hardened so they cannot be filed.

No attempt is made to include all of the devices upon the market, but rather to present the varying features of those which have been brought to the attention of the motoring public. That there is need for some kind of protection against theft is being borne home to the automobile owner almost daily. The market affords ample opportunity for securing this protection, it would appear. There are other features of the situation which might be considered, but space does not permit of their presentation here.

TAKES OVER SALES END.

Aug. 1 the Hood Rubber Company, Watertown, Mass., took over the entire business of the Shawmut Tire Company, which had up to that time acted as its selling agent for automobile tires, tubes and accessories. In the future the Hood Rubber Company will not only manufacture, but will also sell, bill and collect all accounts and carry on the business in its own name.

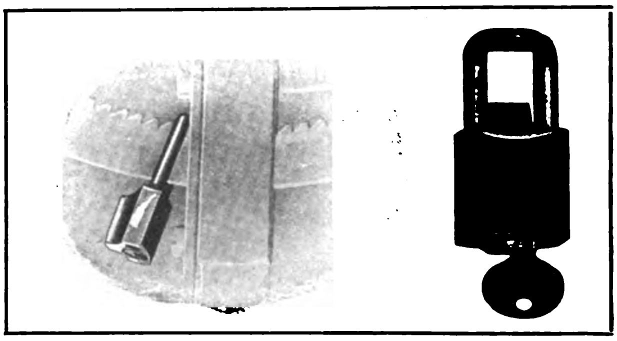

Fig. 9—Connecticut Autolock and Method of Attachment.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.

Commercial Motor Sales Company, Cincinnati, O.; $10,000; incorporators, Walter G. Voesler, George Schorr, Edward W. Hoelscher, William G. Hoelscher, George Saline.

Kernodle-McDaniel Manufacturing Company, Frankfort, Ind.; $10,000; incorporators, W. T. Kernodle, P. McDaniel.

A. S. Lee Company, Providence, R. I.; $5000; incorporators, Daniel J. Healy, H. Ladd Walford, G. Otis Washburn.

Skaneateles Garage Company, Skaneateles, N. Y.; $6000; incorporators, George D. Cuddleback, Edward J. Scott, Florence K. Scott.

Premier Manufacturing Company, Newtown, Conn.; $10,000; to deal in automobile accessories; incorporators, Alfred C. Griscom, Julius Hartwig, Louise Hartwig.

Everett Auto Sales Company, Columbus, O.; $30,000; incorporators, Horace K. Dobson, Amos F. White, Elmer F. McConaha, H. H. Kellenberger, A. W. Raving.

Audobon Auto Service Company, New York City; $500; to operate an automobile service; incorporators, Michael P. Caffe, Edmond Huertstel, Julius M. Ferguson.

R. F. Flick Automobile Company, Cuero, Tex.; $10,000; incorporators, R. C. Flick, R. F. Flick, N. M. Crain.

Harlem River Garage & Repair Company, New York City; $900; incorporators, Edward Meltzer, Frank D. Tice, William T. Hookey.

Waite's Motor Vans & Storage Company, New York City; $25,000; incorporators, Francis T. Germain, Philip J. Dunn, Louis Burgess.

Chillicothe Automobile Supply Company, Chillicothe, Mo.; incorporators, John F. Heger, Asa T. Kirtley, Byron B. Stevens.

Simpson Automobile Supply Company, Grand Rapids, Mich.; $35,000; incorporators, Earl R. Corbin, E. W. Simpson, Frank J. Goders.

Darby Motor Car Company, Westfield, N. J.; $25,000; to manufacture automobiles and motorcycles; incorporators, L. D. Darby, H. C. Darby, A. B. Darby.

Model Auto & Sales Company, St. Louis, Mo.; $3000; incorporators, Oscar Sontag, Roy E. Stutts, Otto F. Karbe.

Burns-Ramsden Motor Car Company, St. Louis, Mo.; $10,000; incorporators, Louis N. Burns, James H. Ramsden, Harry C. Barker.

Galva Auto Company, Galva, Ia.; $10,000; to deal in motor cars; incorporators, G. W. Johns, R. B. Clemens and others.

Penn Tire Filler Company, Coudersport, Penn.; $5000; to manufacture tire filling compounds.

Central Garage Company, Indianapolis, Ind.; $5000; to operate a garage; incorporators, Walter Howe, Kirke Howe, H. R. Sterling.

Republic Motor Company, New York City; $500; incorporators, Frank H. Twyeffort, Stephen C. Fiero, Ernest J. Ellenwood.

American Steam Truck Company, Saginaw, Mich.; $500,000; to manufacture steam motor trucks.

Check-Spring Motor Company, Washington, D. C.; $100,000; incorporators, C. E. Hooper, A. S. Check, C. L. Lambert.

Auto Distributors Limited, Camden, N. J.; $200,000; incorporators, F. R. Hansell, I. C. Clow, John A. MacPeak.

Perth Amboy Transportation Company, Sewaren, N. J.; $25,000; incorporators, I. J. Freeman, Lena Chester, Isabella Robbins.

Orange Automobile Garage, Inc., East Orange, N. J.; $20,000; incorporators, S. L. Gedney, Jr., J. D. Gedney, H. R. Picking.

Scott Motor Company, Memphis, Tenn.; $10,000; incorporators, J. C. Scott, W. H. Hayley, C. L. Hunt, O. N. Bonney, J. C. Sims.

Southwestern Motor Car Distributing Corporation, Memphis, Tenn.; $50,000; incorporators, J. W. Bondurant, Noble S. Bruce, George C. Love, Thomas B. Crenshaw, H. J. Reiner, P. H. Phelan, Jr.

W. S. Motor Company, New- [illegible] N. J.; $300,000; incorporators, J. M. Woods, C. H. T[illegible] and L. F. Fetser.

King Valveless Automob[illegible] Company, Cleveland, O.; $25,000; incorporato[illegible] Feffield, Orville C. Snyder, Geo. H. Burrows, R. E. McMasters, C. J. Lowrie.

Consolidated Automobile Supply Company, New Brunswick, N. J.; $1,000,000; incorporators, B. F. Hardesty, Arthur V. Dennan, Samuel A. Ross.

Metrix Automobile Company, Joliet, Ill.; incorporators, Earl D. Fuller, W. O. Dayton, J. T. Wilcox.

Overland-Wisconsin Company, Milwaukee, Wis.; $50,000; incorporators, George W. Browne, Mark F. Browne, Thomas C. McMillan.

Sheagren-Hunt Company, Burlington, Ia.; $2500; Chalmers, Reo and Peerless agent; incorporators, W. B. Hunt, J. P. Sheagren, Fred Sheagren.

South Bend Auto Body Company, South Bend, Ind.; $20,000; to manufacture automobile bodies and parts; incorporators, V. E. Paxson, S. W. Nicholson, J. C. Paxson.

Dillman-Helin Motor Company, Richmond Hill, N. Y.; $20,000; directors, William C. Dillman, Richard A. Dillman, Bero W. Holin, W. J. Bissell, Fred G. Hoerlein.

Spencer-Wilkie Motor Car Company, Morristown, N. J.; $30,000; incorporators, E. A. Carpenter, C. P. Spencer, William W. Wilkie.

Medoc Motor Company, Chicago, Ill.; $2500; incorporators, S. Heberling, William A. Curtis and others.

R. L. Bishop Company, New Haven, Conn.; president and treasurer, Raymond L. Bishop; secretary, Frank P. Sargeant.

Consolidated Auto Company, Columbia, S. C.; $5000; to sell motor cars and supplies; incorporators, J. P. Roddey, John J. Cain, J. P. Matthews.

Capitol City Garage Company, Hartford, Conn.; $50,000; incorporators, Conway Hale Brooks, James Leslie Burton.

Vermont Cadillac Company, White River Junction, Vt.; $500; to purchase, repair and sell automobiles; incorporators, G. H. Miller, Richard Hoar, H. G. Bennett, H. R. Miller.

Indianapolis Tire Company, Indianapolis, Ind.; $300,000; to manufacture tires; incorporators, A. A. McKain, E. J. Holliday, A. C. Ayres.

Northwest Auto Company, St. Joseph, Mo.; $5000; incorporators, Ben F. Ellington, Claude C. Tanner, Lena M. Ellington.

Mutual Motor Car Company, Buffalo, N. Y.; $125,000; incorporators, Albert Poppenberg, Fred C. Carter, Orson Yeager.

East Palestine Rubber Company, East Palestine, O.; $50,000; incorporators, E. E. Jones, Ulrich Winter, C. A. Oatsdean, Joseph Hick, O. L. Shumate, A. S. Mauk, Abram Hartley.

Folberth Carburetor Company, Youngstown, O.; $70,000; to make carburetors and automobiles; incorporators, E. A. Hegg, N. A. Emery, E. A. Tobey.

Sutton-Miller Company, Indiana, Penn.; $5000; incorporators, R. S. Sutton, J. Blair Sutton, J. N. Miller, J. W. Clement, Ernest Stewart.

Stocker Rubber Company, Dayton, O.; $50,000; to manufacture automobile tires and accessories; incorporators, A. D. Stocker, Ira J. Cooper, W. H. Brennerm, F. W. Johnston, J. W. Brumbaugh.

D. Henry Bonner Company, Cambridge, Mass.; $20,000; incorporators, David H. Bonner, Edward S. Howland, William E. Furniss.

Studebaker Sales Company, Buffalo, N. Y.; $25,000; incorporators, A. W. Haile, B. H. Phillips, E. C. Schlenker

Auto Transportation Company, Dixonville, Penn.; $85,000; incorporators, W. C. Carr, G. W. Carr, J. H. Prescott, Thomas E. Boyd, F. Bertolette.

Essenby Sales Company, Fresno, Cal.; $10,000; to deal in automobiles, supplies, etc.; incorporators, H. M. Shaffer, P. W. Cypher, T. R. Becker.

Brown Machine Company, Winchester, Conn.; $5000; to repair motor vehicles, engines, etc.; incorporators, Edward E. Brown, Edward E. Brown, Jr., William A. Brown.

Davies-Bach Manufacturing Company, Cleveland, O.; $300,000; to manufacture motor car accessories; incorporators, George R. Nash, C. H. Davies, O. Nelson, O. Lampus, P. D. Metger.

Fox Spring Tire Company, Spokane, Wash.; $1,000,000; to manufacture motor car tires; incorporators Porter C. Fox, D. D. Woolsley, W. E. Allen.

Sullivan Automobile Company, Newark, N. J.; $25,000; to deal in motor cars; incorporators, J. Sullivan, C. Bagnole, W. N. Frankel.

Central Motor Car Company, Canton, O.; $25,000; to deal in motor cars; incorporators, R. F. Wilson, D. L. Tachants, D. B. Wilson, Anna Herr.

Modern Tread Company, Seattle, Wash.; $20,000; to manufacture motor car tires; incorporators, L. V. Fox, A. H. Shoemaker and others.

Geo. W. Browne, Automobiles, Inc., Milwaukee, Wis.;

$5000; agent for Overland, Marmon and Stutz; incorporators, George W. Browne, Mark F. Browne, Thomas C. McMillan.

Automobile Lamp Control Company, Dayton, O.; $15,000; to make automatic lamp controls for automobiles; incorporators, Henry Ehlen, Ernest A. Eastman, William B. Meeker.

Thomas G. Wolverton Company, Jersey City, N. J.; $10,000; general automobile business; incorporators, C. A. Cole, H. T. Letts and others.

Tesla Auto Light Company, Chicago, Ill.; $6000; to manufacture automobile supplies; incorporators, Charles B. Stafford, Harry C. Levinson, Albert Jacobs.

Akron Airless Tire Company, Akron, O.; $50,000; to manufacture tires and rubber goods; incorporators, William S. Brooks, Joseph J. Surbey, Ira N. Thompson, Frank H. Beyea, G. E. Gilmore.

Swing Wheel Company, Cleveland, O.; $50,000; to manufacture automobile wheels; incorporators, A. J. Swing, B. Gross, H. C. Cummings, Harry Pott.

Pugh Auto Chain Company, St. Louis, Mo.; $5000; to make non-skid chains; incorporators, John Schulz, Webster Groves, A. A. Van Cleve.

Wallace Automobile Company, Wilmington, Del.; $300,000; to manufacture, sell and deal in all kinds of motor vehicles; incorporators, Clarence J. Jacobs, S. E. Robertson, Harry W. Davis.

Central Automobile Company, Newport, Ky.; $15,000; incorporators, Walter P. Dickerson, Gus Koehler, Clyde Emrick.

Union Motor Car Company, Tacoma, Wash.; to deal in motor cars; incorporators, R. A. McCormack, George A. Stewart and others.

Michigan Motor Specialties Company, Detroit, Mich.; $20,000; to manufacture motor car devices; incorporators, Nelie M. Beck, Charles W. Beck, Charles Wright, Jr.

Western Massachusetts Essenkay Company, Springfield, Mass.; $6000; to deal in automobiles, etc.; directors, Frank E. Driscoll, John L. Flanagan, Raymond L. Flanagan.

Penn Auto Company, Brooklyn, N. Y.; $5000; incorporators, Louis L. Bendell, Harry C. Patridge, Morris Wolf.

Elliott Motor Engine Company, Boston, Mass.; $300,000; incorporators, Elmer E. Lane, Charles H. Card, Harry C. Brandt.

Mutual Oil & Auto Supply Company, Cleveland, O.; $10,000; incorporators, H. L. Stouer, H. C. Killiman, Herbert House, C. F. Franke, A. S. Kraus.

Marrs-Lingo Motor Company, Dallas, Tex.; $7500; incorporators, A. A. Marrs, D. C. Lingo, J. W. Fox.

Pomeroy Auto & Garage Company, Pomeroy, O.; $2500; incorporators, A. H. Clifton, W. L. Davis, W. T. Dorst, W. N. Davis, P. L. Clifton.

Swap-Beynon Auto Repair Company of St. Louis, St. Louis, Mo.; $2100; incorporators, C. A. Madill, F. W. Swap, Albert Beynon.

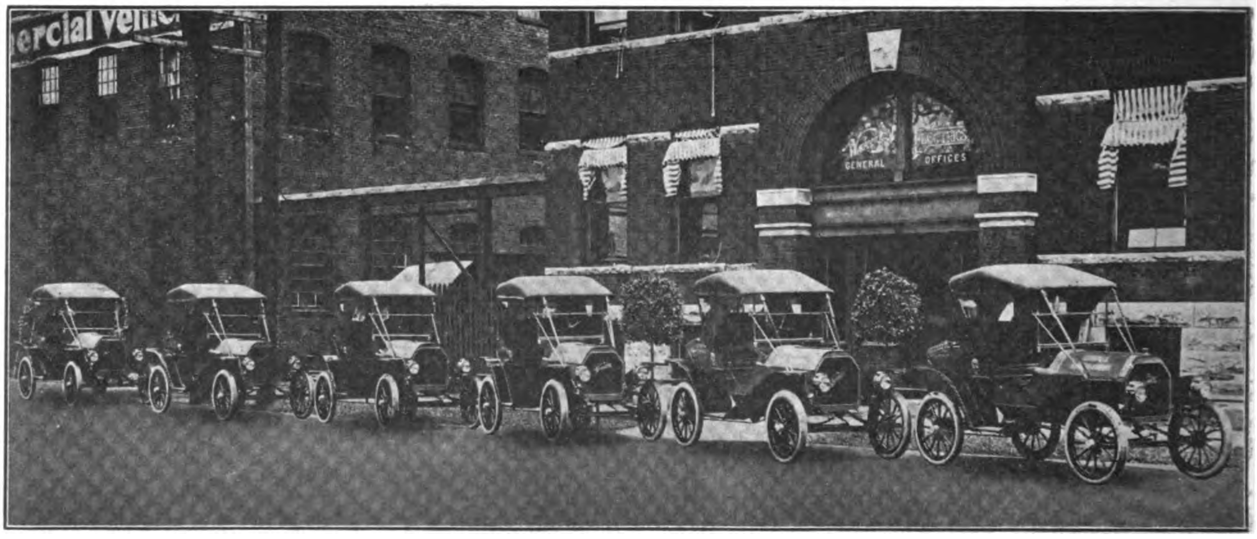
Southern Taxicab Company, Columbus, O.; $10,000; incorporators, James J. Keating, James A. Allen, Jack B. Williams, A. P. Carmichael.

Heath Method Company, Newark, N. J.; $24,000; to manufacture automobile supplies; incorporators, H. H. Wilcox, F. C. Overbury, F. A. Heath.

E. Reineking Automobile Supply Company, Brooklyn, N. Y.; $5,000,000; to manufacture automobiles and their appliances; incorporators, Emil Reineking, John Laugh.

Industrial Motor Car Company, Middletown, N. Y.; $350,000; to manufacture self-propelled vehicles; incorporators, W. A. Courtland, C. W. Jewell, M. C. Crawford.

International Trolleymobile Company, Portland, Me.; $1,000,000; incorporators, Robert E. Ahern, Dennis A. Meaher, Charles H. Gilmore, J. Ralph Wellman, Charles W. Noyes.



Fleet of Waverley Electrics Recently Shipped by Waverley Company, Indianapolis, Ind., to Lighting Concern in Louisville, Ky.

Arter Auto Carriage Company, Cleveland, O.; $20,000; to manufacture motor cars; incorporators, John G. Arter, B. Hexter, James B. Ruhl.

Majestic Rubber Company, Akron, O.; $3000; to manufacture motor car tires; incorporators, E. Christman, A. L. Neiswanger, C. W. Baum, J. H. Ault.

Mack Auto Company, Reno, Nev.; $50,000; incorporators, M. D. Mack, E. D. Mack.

Barlow's Electric Garage Company, Newark, N. J.; $20,000; incorporators, W. W. Scofield, D. A. Barlow, William T. Benjamin.

Faultless Starter Company, Racine, Wis.; to manufacture engine starters; incorporators, C. I. Schoop, J. L. Barker, M. E. Walker.

Warren Street Garage Company, Hudson, N. Y.; $3000; directors, John T. Hester, Henry B. Hester, Dennis Hester, Jr.

Garrison Gasoline Engine Specialties Company, Camden, N. J.; $125,000; to manufacture motors; incorporators, F. A. Kuntz, F. S. Saurman, F. S. Muzzey.

International Automobile League Tire & Rubber Company, Wilmington, Del.; $1,000,000; to manufacture, sell and deal in all kinds of motor vehicles; incorporators, William J. Seltzer, Samuel Morrell, Robert Gibson.

Victor Auto Parts Company, Cincinnati, O.; $20,000; incorporators, William J. Corcoran, Edward S. Corcoran, John L. Corcoran, Harvey B. Corcoran, H. R. Kerana.

A. J. Meyer Motor Car Company, Cedarburg, Ws.; $25,000; incorporators, John Armbruster, Jacob Dietrich, John F. Bruss.

Automobile Supply Company of Illinois, Chicago, Ill.; $10,000; to manufacture automobile supplies; incorporators, Albert Norwald, Samuel Rubinsky, Harry Simmons.

Queen City Cycle Company, Wilmington, N. C.; $25,000; to deal in motorcycles; incorporators, Eugene R. Pickard, James D. Pickard, Dora B. Pickard.

Thirty-Five Percent Automobile Supply Company, Augusta, Me., $1000; incorporators, E. M. Leavitt, M. M. Spinney, E. L. McLean.

United Garage Company, Boston, Mass.; $15,000; incorporators, Jesse Good, James R. Jones, William F. Waters.

C. & C. Auto Company, New York City; $500; incorporators, John H. Wiancimino, E. R. Wiancimino, F. L. Wiancimino, 202 Carrol street, Brooklyn.

WITH THE MANUFACTURER

The Sheboygan Machine Company of Sheboygan, Wis., incorporated recently, is to commence the manufacture of pump jacks and gasoline engines of various types in the old Kohler Machine Company's plant. The company, capitalized for $10,000, has the following officers: President, F. Karste, Jr.; vice president, C. Kummer; secretary, A. L. Steffin; treasurer, L. Nelson. The selling agent is the Carbo Light Com[illegible] Anderson, Ind.

J. M. Ward, who fo[illegible]st two years has been connected with the Waverley Company, Indianapolis, Ind., maker of Waverley electric cars, has accepted a position as assistant sales manager of the American Motors Company, also of Indianapolis, maker of American cars.

F. S. Rowan, who has been engaged in newspaper work along special lines in various parts of the country, particularly in the Southwest, has become advertising manager of the Clarke-Carter Automobile Company, Jackson, Mich., maker of Cutting cars.

The Otto Gas Engine Works, Philadelphia, original manufacturer of the Otto car, has no corporate connection with the OttoMobile Company of Mt. Holly, N. J., which has been acting as sales agent for the past year. It is understood that in the future the Philadelphia concern will handle its own product direct with dealers in this country and abroad.

The Connecticut Telephone & Electric Company, Inc., Meriden, Conn., maker of Connecticut ignition equipment, etc., has established a New England branch office at 224 Pleasant street, Boston, in charge of F. C. Whitman, who has covered this territory for the company during the past few years. The Connecticut Shock Absorber Company of the same city, maker of the Connecticut shock absorber, will occupy space in the showroom.

The Adamson Manufacturing Company, East Palestine, O., has obtained a patent on its vulcanizer, and the plant is being remodelled for the production of the device in larger quantities.

The Chevrolet Motor Company, Detroit, has purchased the plant of the Imperial Wheel Works, Flint, Mich. It is understood that a new building will be erected, which will be operated in conjunction with the present plant in Detroit.

The Havers Motor Car Company, Port Huron, Mich., has purchased the factory buildings formerly occupied in that city by the E-M-F Company, Detroit. The additional structures will enable the company to increase materially its production of Havers cars for 1913.

The Leech Automobile Company, Lima, O., which has been carrying on experiments with a new motor for the past three years, is erecting a new plant for its production. The officers of the company, which is capitalized for $100,000, are: President, Charles M. Leech; vice president, H. H. Hughes; secretary, Frank Leech; treasurer, A. M. Kelchner; general manager, W. H. Allen.

The R. J. Irvin Manufacturing Company, Indianapolis, Ind., maker of automobile bodies and tops, has awarded the contract for a two-story factory building to cost approximately $50,000. Russe J. Irvin, president of the concern, announces that the company also will occupy two other buildings of large dimensions near the site of the proposed new plant.

STEWART MOTOR CORPORATION
STEWART MOTOR CORPORATION

Buffalo Factory That Was Acquired by Stewart Motor Corporation of That City.

The Stewart Motor Corporation, recently organized in Buffalo, N. Y., by T. R. Lippard and R. G. Stewart, who withdrew from the old Lippard-Stewart Motor Car Company, has secured the plant vacated by the Niagara Machine & Tools Works at Randall and Superior streets, in which manufacturing operations will begin at once. An accompanying illustration presents the building, where the new Stewart light trucks will be made.

The Broad-Oak Automobile Company, Columbus, O., has been purchased by R. M. Weaver and W. J. Miller, until recently connected with the Columbus Machine Company. Mr. Miller was superintendent of the machine company and was at one time a member of the Miller-Frayer Automobile Manufacturing Company. Mr. Weaver was general manager.

The Standard Motor Car Company, Scranton, Penn., recently purchased the plot of ground adjoining its plant in Dupont court and is arranging to build a two-story addition of glass and steel. The present buildings are to be torn down.

The Nyberg Automobile Works, Anderson, Ind., maker of the Nyberg line of pleasure and commercial cars, recently entertained the 150 skilled mechanics in its employ at a dinner, at which a number of invited guests discussed matters concerning the welfare of the industry.

The Hampton Manufacturing Company, Hamilton, O., has removed its factory to Indianapolis, Ind., where it will continue the production of interliners for automobile tires.

The American Castings Company, Mishawaka, Ind., has installed new equipment, including molding machines, pneumatic tools and other apparatus, and will increase its force of active workmen.

W. L. Tust, Dubuque, Ia., is president of a new independent oil concern, which is erecting a $25,000 plant in that city.

The Ford Motor Company, Detroit, recently entertained the delegates to the convention of motorcycle manufacturers and dealers in that city, by inviting them to inspect the plant in which Ford cars are produced. An accompanying illustration shows some of the prominent delegates upon this occasion.

The A & M Sales & Service Company has been formed in Indianapolis, Ind., to handle the sales of the American and Marion cars, made by the American Motors Company and the Marion Motor Car Company of that city. The following officers have been named: President, J. I. Handley; vice president and general manager, Thomas L. Marshall; secretary and treasurer, L. R. Wilbur.

The New York Lubricating Oil Company, New York City, has found it necessary to open larger quarters at San Francisco, owing to the increase in the sales of Monogram oil in that territory. An office also has been opened in Spokane, Wash.

The Benz Auto Import Company, New York City, announces a change in management. Paul R. Pelz, representative of the Benz factory in Mannheim, Germany, has become president and treasurer. Paul V. Clodio, for the past two years connected with the company, has taken the position of secretary, succeeding Walter Maas, who has returned to Europe.

A. E. Reid of Toledo, O., has taken the agency for the Overland car, made by the Willys-Overland Company, Toledo, with headquarters at Louisville, Ky. Mr. Reid takes charge of the sales in the city and surrounding territory, which includes nearly 40 counties altogether, taking in three in Southern Indiana. The agency has been located in larger and more commodious quarters than was the case when it was held by the Glosebrenner Commercial Car Company.

The American Ignition Company and the Knop Battery Company, both of Detroit, were merged recently under the name of the Electrolamp Company, for the manufacture of the Knop line of spark plugs and storage batteries, as well as a motorcycle electric lamp. The officers are: President, W. J. Sculley; vice president, N. G. Begle; secretary, C. R. Baxter; treasurer, R. L. Aldrich.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has appointed the following agencies: King Auto & Repair Company, Charleston, S. C.; Blodgett Bros., Leads, S. D.; John Christensen & Co., Galveston, Tex.; Gasper Machine & Garage Company, Gasper, Wyo.; Boyle & Jeffe, Cheyenne, Wyo.; Cole & Co., Lander, Wyo.

R. C. Anderson, Racine, Wis., for several years vice president of the J. I. Case Plow Works of that city, has taken the position of general manager of the reorganized Simms Magneto Company, New York City.

George Fitzsimons has resigned as sales manager of the E. R. Thomas Motor Car Company, Buffalo, N. Y.

George H. Lloyd announces his retirement from the Velie Motor Vehicle Company, Moline, Ill., maker of Velie cars. He has been in charge of the sales since the incorporation of the company in 1908.

The Crosby Company, Buffalo, N. Y., manufacturer of automobile frames and stamped metal goods, is building an addition to its plant, 125 by 180 feet. It will be four stories high and of steel frame construction.

The American Top Company, Jackson, Mich., manufacturer of automobile tops, has merged its business into a stock company with a capitalization of $350,000. The company is considering an enlargement of its plant.

The Dayton Body Company, Dayton, O., has purchased a building site upon which a new factory will be erected for the manufacture of automobile bodies.

The Fisk Rubber Company has made E. L. Duffee the manager of its branch in Pittsburg, Penn. The offices are located in Baum street.

The Willard Storage Battery Company, is building an addition to its plant in Cleveland, O. The firm will have, after the building is completed, 25,000 feet of floor space. New offices were recently taken at 5716 Euclid avenue.

The Suspension Roller Bearing Company, Sandusky, O., is to erect a plant east of that of the Sandusky Auto Parts & Motor Truck Company on First street, to cost approximately $30,000.

The Louisville Lighting Company, Louisville, Ky., recently purchased six Waverley electric roadsters, made by the Waverley Company, Indianapolis, Ind., for the use of its trouble department. These are in addition to four light delivery wagons of the same make and for the same service. An accompanying illustration shows the latest shipment, with its equipment to carry tools and supplies for quick repair work.

Sales Manager Benson of the Studebaker Corporation, Detroit, recently announced the promotion of A. H. Brown, manager of the firm's branch in Spokane, Wash., to be the northwestern sales manager. In his new capacity, Mr. Brown will have charge of the distribution of more than $2,000,000 worth of Studebaker cars.

Walter C. Barnes of Springfield, Ill., was recently appointed publicity manager for the Moon Motor Car Company, St. Louis, Mo. Formerly Mr. Barnes was connected with the advertising departments of several newspapers in Illinois, Idaho and Oregon, and for the past year has been with an advertising agency in Chicago.

Fred A. Crooks, was recently appointed sales manager for the American Locomotive Company, Providence, R. I., and New York City, in the New York branch. Mr. Crooks has been identified with the automobile industry for five years, being formerly associated with the Darracq Motor Company and the Palmer & Singer Manufacturing Company.

Members of the Motorcycle Manufacturers' Association Visiting the Ford Motor Company's Plant During Recent Convention in Detroit.

Charles E. Riess of New York City, president of the American-Marion Sales Company, 1896 Broadway, recently closed 1913 contracts with the American Motors Company and the Marion Motor Car Company for the New York district.

The Indiana Garage & Sales Company, 3316 East 15th street, Kansas City, Mo., recently closed a contract with the Lincoln Motor Car Works, Chicago, becoming distributing agent for Kansas City and vicinity for the Lincoln light delivery wagon.

The R-C-H Corporation, Detroit, Mich., maker of R-C-H cars, has closed agencies for 1913 as follows: H. A. Walton and C. W. Ellington, Roswell, Ga.; Dothan Carriage Company, Dothan, Fla.; W. L. Wittich & Co., Pensacola, Fla.; Independent Auto Sales Company, Columbia, S. C.; H. L. Marvil, Waycross, Ga.; H. W. Burrell & D. J. Case, Little Valley, N. Y.; L. H. Farnsworth & H. J. Welcher, Newark, N. J.; A. C. Adams, Elkhart, Ind.; Hansen Auto Company, Dixon, Ia.; G. A. Jacobs, Chicago, Ill.; Reid Motor Company, Quincy, Ill.; A. A. Blakewell, Peru, Ill.; Salem Auto & Repair Co., Salem, O.; J. W. Lytle, Uhricksville, O.; Norman Garage Company, Newcommerstown, O.; William Thorney Auto Company, Denver, Col.; Gagetown Auto Company, Gagetown, Mich.; John Nelson & Son, Ottawa, Kan.; J. C. Vanier, Topeka, Kan.; J. I. Warren, Honey Grove, Tex.; R. A. Minor, San Luis Obispo, Cal.; Blaine Auto Company, Redfield, S. D.; Ralph Prom, Milton, N. D.; Walter P. Cowan, Windom, Minn.; Finch & Stiner, Lakefield, Minn.; E. J. Tisdale, Winona, Minn.; George Haab, Babylon, N. Y.; E. B. Delamater, Poughkeepsie, N. Y.; The Uncas Garage, Norwich, Conn.; E. A. Myers & C. M. Lippincott, New London, Conn.; A. B. Adams, Tuckahos, N. J.; Daniel H. White, Norristown, Penn.; J. F. Wright, Benton, Penn.; G. H. Guerrant, Witt, Va.; D. M. Dorman, Geneva, N. Y.; G. F. Wolter, Dodge Center, Minn.; Vest & Anderson Co., Knoxville, Tenn.; P. Watt Richardson, Greensboro, N. C.; Crane Bros., Machias, Me.; Patterson & Patterson, Yates Center, Kan.; Cowles Toleman, New Haven, Conn.; Rowe & Sikes, Oswego, N. Y.; John B. Hargis, Cleveland, Tenn.; Otis Motor Car Company, South Bend, Ind.; Fletcher & O'Neal, Andalusia, Ala.; A. O. Williams, Luthersville, Ga.; Central Garage, Quincy, Mass.; Hoyt Bros., Ware, Mass.; Fred D. Morse, Portland, Me.; John P. Agan, Danville, Ill.; Clifford Auto Company, Monticello, Ind.; Gus A. Baumetz, Cleveland, O.; Sitgraves & Boyd, Columbus, O.; G. S. Hamnett, Greeley, Col.; Ralph H. Love, Mount Pleasant, Tex.; Clay & Gilmore, Moody, Tex.; Mutual Auto Company, Faribault, Minn.; E. I. A. Reis Meyer, for a number of years a well known automobile man, recently took a position in the new motor wagon department of the O. Armleder Company, Cincinnati, O.

The Piano & Heavy [illegible] Truck Manufacturing Company, Toledo, O., has been incorprated with a capital stock of $20,000 to manufacture heavy trucks. A. T. Raynor, W. F. Runkle and others are the incorporators.

The Motor Manufacturing Company, Geneva, N. Y., is moving its plant to Dunkirk. David Reed is president of the company and R. J. Hall superintendent.

The Kenton Gas Engine Company has added a motor car repair department to its plant in Kenton, O. The company will handle a full line of accessories as well as the Kenton agency for the Knight tires. T. A. Taylor is the general manager.

The Railroad Motor Car Company, Marion, Ind., was recently formed with a capitalization of $200,000. The purpose of the company will be to manufacture and repair motor vehicles used on railroad tracks. The following are directors: William O. and John D. Worth, Hiram Beshore, George R. Stewart and Eben H. Walcott.

The Frontier Tire & Rubber Company, Buffalo, N. Y., has plans in preparation for an addition to its plant.

The Paris Auto Starter Company, Paris, Ill., has changed its name to the Paris Electric Starter Company, and increased its capital from $10,000 to $100,000.

The Kelsey Wheel Company, Detroit, Mich., manufacturer of automobile wheels, is erecting additions to its plant which will about double its capacity. The new structures will include a main building 180 by 360 feet.

The Cadillac Motor Car Company, Detroit, Mich., is to build a one-story factory building, 70 by 120 feet. The cost will be approximately $15,000.

The Shop of Siebert, Toledo, O., maker of the Siebert truck and automobile bodies, has commenced the erection of a three-story factory building, 75 by 105 feet, of brick and concrete construction.

The Hayes-Ionia Company, Ionia, Mich., manufacturer of automobile accessories, has arranged for the construction of a large addition to its machine shop. Four new dry kilns will be installed.

The Reo Motor Car Company, Lansing, Mich., has plans under way for the construction of several additional factory buildings. The cost will be approximately $100,000.

The Pullman Taxicab Company, Philadelphia, Penn., is preparing to build a new garage to cost approximately $25,000. The building will be 80 by 86 feet, and of fireproof construction.

The Columbus Auto Parts Company, Columbus, O., has purchased the plant formerly occupied by the Jauney Company and will begin manufacturing operations in the immediate future. The directors of the company are: F. H. Penfield, Fletcher Goodwell and Benjamin S. Dean of Jamestown, N. Y., and J. I. Handley of Indianapolis.

The Standard Motor Car Company, Dayton, O., has moved into new quarters at Third and Perry streets, that city, where rooms affording ample accommodations for a rapidly increasing business have been secured. An important and convenient innovation in garage equipment is an immense turntable, upon which a car with 145-inch wheelbase can be turned with ease. The showrooms are also roomy and attractive.

GARAGE & DEALER

The Blackwood Tire & Vulcanizing Company, a new Nashville, Tenn., concern, has begun business in that city. H. O. Blackwood, the proprietor, has taken the Nashville agency for the Fisk tires.

C. J. Witbeck has opened a new garage and agency for the Ford car, made by the Ford Motor Company, Detroit, at Ridgefield, Wash.

The Benjamin Eastwood Estate, Paterson, N. J., has completed plans for a new machine shop and garage to be erected at 18-26 Rampo avenue. The garage will be three stories in height and will cost $35,000.

The Barker Auto Company, Bristol, Conn., has begun operations in the erection of its new garage on Riverside avenue.

William Daly and George A. Boyd have signed a lease for 10 years for a new garage at Wadsworth avenue and 167th street, New York City, at a cost of $40,000.

H. C. Dies of Clinton, Ind., is to erect a garage on East Mulberry street, that city. It will be of brick construction and two stories high.

Mullen & Hunter of Gillmore City, Ia., have secured plans for a garage to be one story high and cost $6000.

Manager J. R. Hall of the Campbell Auto Company, Salt Lake City, Utah, agent for Michigan and Premier cars, has established new headquarters in that city at 49 West Fourth street.

George C. Boldt has awarded a contract for remodelling the quarters at 1401-1403 Locust street, Philadelphia, Penn., to be used as a garage. The new location adjoins his present building at 1405-1407 Locust street.

The Detroiter-Baltimore Company, 2207-09 Madison avenue, Baltimore, Md., recently incorporated for $50,000, has a two-story building 40 by 145 feet, and will deal as agent for the Detroiter line of automobiles, made by the Briggs-Detroiter Company of Detroit, in Maryland, Virginia and West Virginia. The company will also conduct a modern, up-to-date garage and service station, maintaining day and night service. Machinery will be installed for an automobile machine shop. R. H. Croxton is president and Gilbert A. Jarman, secretary-treasurer of the new company.

The Roberts & Sherburne Company, Boston, Mass., composed of Frank Roberts and Edward R. Sherburne, has been formed to take over the agency for the American car, made by the American Motors Company, Indianapolis, Ind., and salesrooms have been opened at 121 Massachusetts avenue.

The Standard Garage Company, Charlotte, N. C., has opened one of the best equipped garages in the state, and has taken agency for Pullman cars, made by the Pullman Motor Car Company, York, Penn.

Charles Lord has opened salesrooms and a service station at Sanford, Me., where he will handle the Peerless, Pope-Hartford, Stevens-Duryea and Paige-Detroit lines.

The A. R. Wilson Company, Hartford, Conn., has awarded a contract for the erection of a new four-story garage at 341 Trumbull street.

The Malden Electric Company, Malden, Mass., is to erect a new garage on Middlesex street at a cost of $15,000. It will be modern in every respect and equipped with all the latest appliances.

H. A. Testard, New Orleans, La., has signed a long term lease of a new three-story building to be erected at Baronne and Rudido streets, in that city, where he will handle Hudson cars, made by the Hudson Motor Car Company, Detroit.

Don P. McClure has purchased the garage established at Oskaloosa, Ia., by Anderson Bros., and will operate it in conjunction with the general jobbing business conducted at Second street and A avenue. This branch retail salesroom will be in charge of E. Dorman, who has had 22 years' experience as travelling accessory salesman for this house.

The Cole Motor Car Company, Indianapolis, has new representation in Omaha under the name of the Cole Motor Company. E. E. Butler is in charge of the new branch, which is temporarily located at 1102 Farnum street.

Keohler & Hanson has purchased two store properties at Odebolt, Ia., and will build a cement block garage.

The Co-Operative Motor Company, Long Beach, Cal., has secured plans for a new two-story garage to be of brick and concrete, representing an investment of $100,000.

The North River Garage, Inc., New York City., is to erect a one-story garage on West 26th street, at an estimated cost of $15,000.

M. H. Perin has secured a permit for a garage of brick and stone two stories in height, at Cincinnati, O. The structure will cost $23,000.

The Autocar Company, Ardmore, Penn., has taken a 10 years' lease of a four-story garage at 418 Washington street, Newark, N. J.

The W. J. Burt Motor Car Company, Los Angeles, Cal., has taken a 10 years' lease of a new garage and salesroom which is to be erected by Dec. 1.

J. B. Pell has leased the garage recently built at Corcoran, Cal., and is installing new machinery.

The Automobile Supply Company, Miami, Fla., has opened a garage on Sullivan street, that city. The concern will deal in supplies.

M. G. Van Nice has established a garage at Murray, Ia. In addition to conducting an agency for the Marathon, Moline and Cutting cars, he will do repair work and carry a line of supplies.

The Chicago Electric Motor Car Company, Chicago, has taken a lease for five years of a one-story building on South Morgan street.

W. A. Newby and E. D. Barels have formed the Newby Automobile Company, Wall Lake, Ia., and have purchased the garage formerly owned by H. J. Jensen.

Pierce Bros., South Pasadena, Cal., has moved into a new garage, features of which are a repair shop, vulcanizing department and women's waiting room.

Smith & Furnas, Letts, Ia., engaged in the automobile business, has dissolved partnership and L. J. Turner has joined the firm, which will hereafter be known as Smith & Turner.

G. Duithuis has purchased the stock of automobile supplies, garage and repair shop formerly conducted by Palmer & Gilley, Parkersburg, Va.

The Winkler Auto and Supply Company has opened a garage and vulcanizing plant at Chanute, Kan.

The Elton Auto & Repair Company, Youngstown, O., is erecting a modern garage in which to locate its business.

F. G. Withrow and G. E. Finch, agents for the Republic tires, have opened a tire repair shop at Grand Rapids, Mich.

P. W. Devendorf, owner of a garage at La Fargeville, N. Y., has taken control of the Arsenal Street Garage at Watertown, N. Y. He will conduct both establishments.

The Cutting Auto Sales Company, Rochester, N. Y., will build a garage in that city, a feature of which will be a row of stalls with iron grating doors, in which owners may leave their cars and keep the keys.

The Anna Motor Car & Livery Company has opened a garage at Cairo, Ill., which is in charge of R. O. Buford, recently of the Studebaker factory in Detroit.

F. C. Abrams, who recently acquired the San Diego, Cal., agency for the Rambler cars, has established headquarters in that city.

The Jefferson Garage Company, Inc., Syracuse, N. Y., is reconstructing into a garage the Freeman block, recently partially destroyed by fire. The alterations will cost $10,000.

The Kaukauna Motor Sales Company, organized by T. W. McFarlane, Green Bay, Wis., has opened a garage in that city. The agency for the Marathon cars also has been secured.

The Western Auto Company, St. Paul, Minn., has opened a new automobile repair shop at the corner of Rice and Fuller streets in that city.

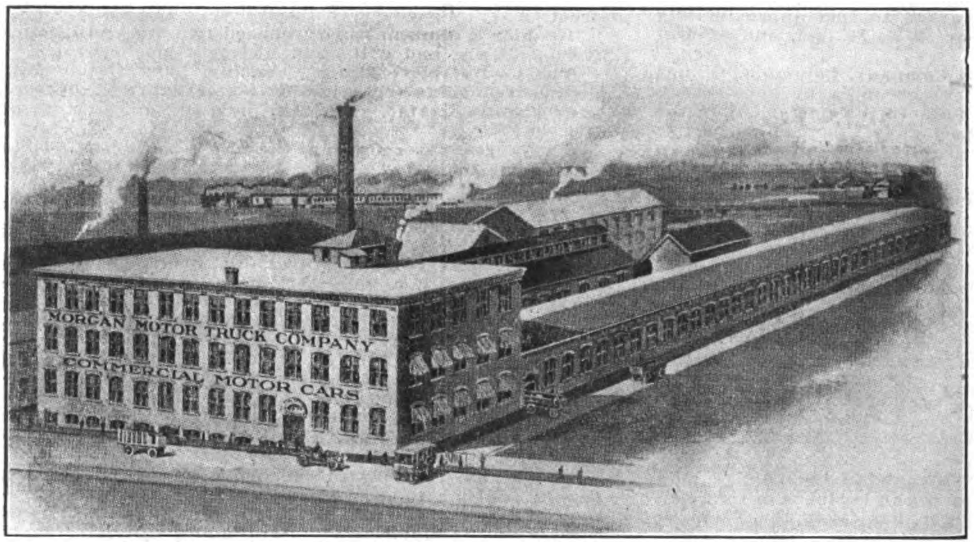
The Yuba machine shop and garage at Marysville, Cal., has been opened to the public.

J. M. Jones & Sons, Manchester, Mo., is to enlarge and improve its plant this fall. The concern operates the Main Street Garage.

The Co-Operative Motor Company, Los Angeles, Cal., will soon build a two-story brick and concrete garage in that city at a cost of $100,000.

The Brown-Symonds Company, distributor of the Stutz car, made by the Ideal Motor Car Company, Indianapolis, will move into new quarters on Pico street, Los Angeles, Cal., in the near future. Plans have been completed for one of the most complete garages and salesrooms in the West, the proposed building being of brick and two stories high. The showroom will be of tile and mahogany. Frank Kincaide, formerly final tester at the Stutz factory, will have charge of the well equipped machine shop.

George T. Burdeau, real estate operator in St. Louis, Mo., has signed a 10 years' lease with A. M. Zerweck of East St. Louis, representative of the Warren Motor Car Company, Detroit, for the lot at 3048 Locust street, St. Louis, at $1800 a year. One of the most modern show and salesrooms in the country will be erected on the lot, the area to be covered being 42 by 126 feet. D. W. Iseminger, special western representative of the Warren company, assisted in the negotiations to secure the property.



Factory of the Morgan Motor Truck Company, Worcester, Mass.

The J. W. Maguire Company, Boston distributor for the Pierce-Arrow motor cars, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., has secured the store adjoining the present quarters and the plant will be materially enlarged, the entire establishment, salesrooms and service station, occupying more than 6000 feet of floor space.

J. B. Sloan of the Sloan & Mason Tire Co., which is equipped to do any work in vulcanizing and repairing of tires, has purchased the interest of his partner, Thomas Mason, and will conduct the business at Jacksonville, Fla., under the same firm name.

The Burns-Ramsden Automobile Company, St. Louis, Mo., agent for the Rambler machine, made by the T. B. Jeffrey Company, Kenosha, Wis., will soon occupy salesrooms at 5033 Delmar boulevard, St. Louis. A garage and repair shop will be in the rear of the offices.

The White Automobile Company, Baltimore, Md., formerly agent for White cars, has been merged into the White Company, which will in future conduct a direct factory branch in that city.

The Corinth Auto Company, Corinth, Miss., will erect a building to be equipped with light machine tools for automobile repair work.

W. F. Siegmund is at the head of the Detroit Electric Car Company, which has been formed at St. Louis, Mo., to take over the business of the branch, discontinued some time ago.

Arthur E. Wheeler has opened a garage and salesroom at Syracuse, N. Y., it being his purpose to handle the Stoddard-Dayton and Haynes pleasure cars and line of trucks.

George Meeley, who maintains a garage at Philadelphia, has established in that city a tire sales office.

Philip Le Page of Methuen, Mass., has opened a new garage on Lowell street.

Fred Crosby, Syracuse, N. Y., owner of the garage formerly occupied by the Kerr-Doane Motor Company and the American Sales Motor Company, is planning a three-story addition to the establishment. He will install an elevator having a capacity of 10 tons.

L. E. Huddle, manager of the Overland garage at Lancaster, O., has leased the building adjoining it for an addition to his present plant.

The Regal & Metz Motor Company has taken over the garage and building formerly occupied by the Acme Garage Company at Worcester, Mass.

The Ohio Auto Repair Company, Cincinnati, O., has taken the agency for the Imperial car, made by the Imperial Automobile Company, Jackson, Mich., which enters Cincinnati for the first time.

Daniel Conway, Jr., and James N. Bussey have formed a partnership at Troy, N. Y., to establish an agency for the R-C-H car, made by the R. C. H. Corporation, Detroit.

Eugene L. Caton and L. D. Brewster are now the Worcester, Mass., representatives of the Pope Manufacturing Company, Hartford, Conn., maker of the Pope-Hartford car.

Richard C. Plater has purchased the site at Vauxhall street and Broadway, Nashville, Tenn., embracing 20,000 square feet, upon which he will build the largest garage in the state, to adjoin new stores and a hotel, which also are being planned.

William M. Hall, George W. Kilpatrick and Joseph C. Bily, Pittsburg, Penn., are to make application to the governor of Pennsylvania for the charter of an intended corporation to be called Gardner Garage & Supply Company. A general garage business will be conducted.

The N. C. Corbitt Automobile Company, Henderson, N. C., is planning the erection of a one-story factory building, 60 by 510. The building, it is said, will cost approximately $20,000.

The Colonial Motor Company is having a two-story garage erected at North avenue and Lovegrove street, Baltimore, Md. The building will be of ornamental concrete and brick.

The J. M. Dunn Auto Company, incorporated with J. M. Dunn as president and manager, Parker Barrett, vice president, and J. F. Dunn, secretary and assistant manager, has taken over the M. & F. Garage, Bakersfield, Cal., from Mason & Flickenger, and will continue to carry on a general garage and automobile supply and service station.

The Marathon Motor Sales Company has been formed at Baltimore, Md., to take the agency for the Marathon car, made by the Marathon Motor Works, Nashville, Tenn.

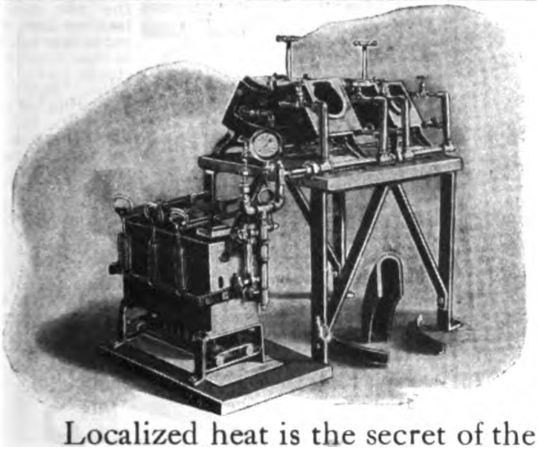
The Painter-Dunn Company is the reorganized name of the Robinson-Painter Company, the Pittsburg, Penn., representative of the Willys-Overland Company, Toledo, O., maker of Overland cars. Thomas F. Dunn, the junior partner, has had a wide experience in handling various lines of automobiles. He was formerly vice president and general manager of the Maxwell-Briscoe Pittsburg company and also of the United States Motor Company. The new firm starts under exceptionally favorable circumstances.

Charles E. Riess, president of the American-Marion Sales Company, New York City, is closing up contracts throughout the New England states with agents for American cars. He will cover every mile of New England territory in order that the company may be adequately represented in that section of the country.

G. E. & H. J. Habich Company, Boston, Mass., state distributor for the Cole car, made by Cole Motor Car Company, Indianapolis, Ind., recently increased its sales force by the addition of Edgar A. Ordway, one of the best known automobile salesmen in the East.

M. M. Spear and W. L. Tozier have taken a lease of the garage building on the causeway, opposite the depot in Gardiner, Me., and have opened a general accessory business.

The Emil Grossman Company, New York City, will not renew its contract for the sales management of the Vanguard Manufacturing Company, Joliet, Ill., and hereafter will confine its energies to the manufacture of its Red Head spark plugs and other specialties.



Large Profits in Tire Repairing

EITHER as part of a garage and general auto repair business or as a separate venture. Requires very little capital to equip a shop completely with the best tire repairing outfit in the world. The equipment can be paid for and a good profit made by the first season's work. Every motorist must have tires repaired---every motorist in your vicinity is a possible customer for tire repairing. Get the right kind of equipment---one that produces work that you can guarantee---the Akron-Williams Tire Repair Equipment which was designed by practical tire factory repairmen.

Localized heat is the secret of the Akron-Williams. Three separate steam chambers in each of our sections, our exclusive patented feature, limit the curing process to the repaired part. Proof that the Akron-Williams is the best is the fact that the big tire manufacturers use it—Firestone, Goodyear, Diamond, Republic, Pennsylvania, Revere, Hartford, Consolidated, Empire, Manhattan, Shawmut and many other tire manufacturers are among our customers. They know by experience what is most practical. We can equip a tire repairing plant of any desired capacity. Don't delay getting into this profitable business. Get into correspondence with us to-day. Write for Bulletin 12 anyway.

IF IT'S USED TO REPAIR TIRES, WE MAKE IT

U. S. MOTOR'S REORGANIZATION PLANS.

KisselKar Acquires Additional Plant in Milwaukee---Branch Factory for Swinehart Tires---Empire Line Increases Production Capacity---Two New Buildings for Remy Magnetos---Promotions for Department Heads.

The situation with reference to the financial condition of the United States Motor Company, New York City, capitalized for $42,500,000, was brought to a decided head Sept. 12, when the Brown & Sharpe Manufacturing Company, Providence, R. I., filed a bill of complaint in the United States court of equity, alleging that the concern was insolvent and asking for the appointment of a receiver. Later that same day Judge Charles M. Hough of the United States district court for the southern district of New York, appointed W. E. Strong, a representative of the banking interests and recently chosen a director of the United States Motor Company, and Robert Walker, an attorney, as receivers. These men have instructions to continue the business of the concern and report to the court by Oct. 28. Still later the same men were appointed ancillary receivers to look after the business of the various subsidiary companies.

The present difficulty had its origin some time in June, when it became known that the company would be unable to meet some $750,000 in paper then due, and an extension of 90 days was granted by a creditors' committee. At that time an advisory committee was appointed, some of the members being representatives of the financial interests involved, its object being to continue the business and to give equal protection to all creditors. This grace period expired Sept. 13.

Several plans for reorganizing the company, or at least of refinancing it were considered by the advisory committee, and a number of interviews were granted in which it was stated that the condition of the company was such that if it could secure necessary money all difficulties would be met. It is stated that the action of the Providence concern was taken with the approval and at the request of a majority in amount of the entire indebtedness, representing claims of some $7,000,000. The Brown & Sharpe company is a creditor for $70,000 in merchandise.

According to the petition the liabilities of the company are estimated at $12,250,000, consisting of $6,000,000 of debenture bonds and claims against the company by banking interests and for merchandise totalling $6,250,000. The assets are claimed to be valued at $15,000,000, these consisting of cash, bills receivable, etc., and are held to be embarrassed by the factory plants of the subsidiary companies, which are scheduled at $6,250,000, against which there is a mortgage of $200,000. Quick assets of July 31 are said to be $9,250,000, of which $4,000,000 represents factory inventories and the remainder cash in hand and bills receivable.

The suit involves all of the subsidiary companies, including the Maxwell-Briscoe Motor Company, Tarrytown, N. Y.; Columbia Motor Car Company, Hartford, Conn.; Dayton Motor Car Company, Dayton, O.; Brush Runabout Company, Detroit, and Alden Sampson Manufacturing Company, Detroit. It is understood that the capital stock of the E. R. Thomas Motor Car Company, Buffalo, N. Y., also was acquired by the United States Motor Company, some time within a year, and as this concern already is in the bankruptcy court it appears to be difficult to determine just how the suit affects this. There also are a number of companies engaged in manufacturing parts, etc., which are subsidiary concerns of the United States Motor Company.

It is stated that all of the subsidiaries, with the possible exception of the Brush Runabout Company, and of course, the E. R. Thomas Motor Car Company, are continuing production in about the same manner as they were 90 days ago. The receivers are said to have obtained permission from the court to advance sufficient money to meet the payrolls at the various plants from the general funds of the company and to make provision for administration.

Briefly stated, it would appear that the total indebtedness of the United States Motor Company is divided into two classes, the first of which is represented by commercial paper bearing two indorsements, one by the parent organization and the other by at least one of the subsidiary companies. The other class has paper with only one indorsement, and it is stated that practically all of the claims for merchandise are of this class.

Under the receivership action there are held to be two courses of action open to the company. The first is reorganization under some plan that will take care of the creditors and permit the company to secure sufficient working capital to manufacture and sell its product. It is stated that about $5,000,000 is needed for these purposes. The other course is a sale in open court.

The committee is still at work formulating a plan for reorganization, and any attempt to state the amount of assessment or the method proposed is held to be premature by the committee. However, some mention has been made of a possible assessment of $20 or $25 a share, which former figure is said to be sufficient to raise about $4,600,000. At $25 a share, some $5,750,000 would result, and this is held to be sufficient for all present needs.

According to the petition filed in court it would appear that the subsidiary companies are indebted to the parent organization and are liable as makers or indorsers of notes as follows:

Alden Sampson Manufacturing Company.	
United States Motor Company	$1,069,278.72
Notes and accounts	50,014.13
Total	$1,119,292.85
Brush Runabout Company.	
United States Motor Company	$1,027,663.38
Notes and accounts	6,650.29
Total	$1,034,313.67
Columbia Motor Car Company.	
United States Motor Company	$256,134.23
Notes and accounts	149,406.92
Total	$405,541.15
Dayton Motor Car Company.	
United States Motor Company	$2,045,358.72
Notes and accounts	416,578.67
Total	$2,461,937.39
Maxwell-Briscoe Motor Company.	
United States Motor Company	$69,929.83
Notes and accounts	1,909,949.25
Total	$1,979,879.08

The total money on hand and receivables of the subsidiaries on Sept. 7, 1912, according to the same source of information, were as follows:

Alden Sampson Mfg. Co	$40,315.79
Brush Runabout Co	79,787.21
Columbia Motor Car Co	31,036.02
Dayton Motor Car Co	247,252.69
Maxwell-Briscoe Motor Co	282,761.27

WILL REMOVE TO MILWAUKEE.

Maker of KisselKar Acquires Additional Plant, Which Will Double the Output.

The most important move in the history of the Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure and commercial lines, was announced Sept. 25, when it was made known that the company had acquired an additional plant at Milwaukee. The new factory has floor space of 200,000 square feet, and it is stated that this will be sufficient to double the output of the concern. It is understood that the general offices will be removed to Milwaukee and additional details of the move will be awaited with interest.

It has been known for some time that in spite of the fact that two commodious buildings recently were added to the Hartford plant, the production facilities were by no means adequate for the increasing demand for KisselKar pleasure vehicles and trucks. Double the early orders of 1912 have been booked for the 1913 season. It is interesting to note in this connection that the Kissel Motor Car Company has enjoyed a wonderful expansion during the past six years, the capital stock having been increased from $50,000 to $100,000 in that time, besides doing a splendid business in the two lines represented by it.

ESTABLISHES BRANCH FACTORY.

Swinehart Tires to Be Produced in Large Quantities in New St. Louis Plant.

J. A. Swinehart of Akron, O., has made the announcement that a factory and distributing station will be established at St. Louis, Mo., for Swinehart tires, the new company being capitalized at $500,000, all of which, except that provided by Mr. Swinehart, has been subscribed by St. Louis capitalists. A building in the centre of the city, near the motor row, has been secured and it is expected that the value of the annual output of the new plant will be $1,000,000.

The inducements which are said to have operated strongly in establishing the St. Louis factory, were the cheap electric power from Keokuk dam, low cost of coal, the excellent water supply, the advantage of St. Louis as a distributing point and excellent labor conditions. It is pointed out that rubber comes from South America mostly and with the opening of the Panama canal it can be shipped to St. Louis on attractive terms, making that city superior to an eastern location. Besides making the full line of solid and pneumatic tires and inner tubes, the company will feature the Krots tire, a solid member for light delivery wagons and electric broughams.

ACQUIRES NEW PLANT.

Empire Automobile Company Prepares for Splendid Year's Business During 1913 Season.

The Empire Automobile Company, Indianapolis, Ind., manufacturer of the Empire line, has contracted for the building of 5000 Empire touring cars and roadsters during 1913. The programme as prepared provides for the manufacture of the product at three points, one at Greenville, Penn., another at Knightstown, Ind., and the third in the largest factory, Connersville, Ind.

The first move in the realization of the project to increase the output of the Empire machines was made when the stock and machinery of the Connersville Wheel Company was purchased recently by the Muncie Wheel Company, Muncie, Ind. The latter company is to move the machinery of the Connersville plant into its own factory at Muncie, thus making room for the occupation of the Connersville buildings by the Empire company. Before its sale the Connersville Wheel Company was owned by W. B. Anstead, E. W. Anstead, C. C. Hall, M. R. Hall and J. M. Heron.

These men also control the Central Manufacturing Company, Rex Buggy Company, Indiana Lamp Company and the Anstead Spring & Axle Company, all Connersville enterprises, through which are produced nearly all the parts which enter into the Empire automobiles. Last year the parts were shipped to the factory at Greenville, Penn., where they were assembled, but the evident advantage of having an Empire factory located in the same city where most of the parts were manufactured resulted in the deal between the wheel concerns.

Since the completion of that deal the Empire Automobile Company has entered into a contract with W. B. and E. W. Anstead, C. C. and M. R. Hall and J. M. Heron for the building of the Empire cars for a period of five years. Besides the building vacated by the wheel company, two new buildings are under construction and deliveries from the plant are expected by November.

This season 2000 cars will be built there by June 1, 1913, 2500 at Greenville and 500 at Knightstown. The Empire company was reorganized this year with additional capital and with C. E. Gibson as general manager.

WORKING DAY AND NIGHT.

Many New Structures Urgently Needed to Take Care of Goodyear's Increasing Business.

As an indication of the wonderful growth of the Goodyear Tire & Rubber Company, the new buildings now in course of construction afford ample conception of the progress made in the past two or three years. In addition to those recently completed other structures to accommodate the increased business are being erected. A new office building, modern in every particular and housing 500 employees, was occupied recently, thus relieving the congestion which previously existed.

Adjacent to the old administration building is a new two-story garage, almost completed, with an extra story at the front to be used as an assembly room. The structural iron work of the new No. 6 building also is nearing completion. This factory will be 403 by 80 feet and will be six stories in height with a basement. Excavations are being made for a new five-story building measuring 250 by 60 feet and an extension 325 by 40 feet is being made to building No. 14.

These three structures are expected to be completed by the end of the year and will be utilized to meet the increased demand for automobile tires, bringing the capacity of the plant up to 8000 automobile tire casings a day. Two stories have been added to No. 13 shop, making it a five-story structure and increasing the capacity of tire output. The Goodyear plant is now working night and day turning out its product.

DAY JOINS GENERAL MOTORS.

Former Head of Mitchell Sales Force to Conduct Motor Truck Business.

William L. Day, General Manager. General Motors Truck Company.

The automobile world was much interested in the announcement by President Thomas Neal of the General Motors Truck Company, Pontiac, Mich., that William L. Day, formerly general sales manager, Mitchell-Lewis Motor Car Company, Racine, Wis., had been elected vice president and general manager. Mr. Day accepted the appointment and resigned from the Mitchell-Lewis Company, the resignation taking effect the first of this month.

Previous to his advent in the automobile business, Mr. Day was for 27 years a prominent figure in the implement industry, being associated in an official capacity with the Parlin & Orendorff Plow Company, Kansas City, Mo. He bears the reputation of being an able and efficient executive and his years of marketing and production will be invaluable in his new duties.

TWO NEW BUILDINGS.

Contracts for 1913 Remy Magnetos Make Necessary Substantial Factory Additions.

The Remy Electric Company, Anderson, Ind., has broken ground for two additional new fireproof buildings to its plant, which are expected to be completed and fully equipped within two weeks. This substantial addition was made necessary by the great volume of magneto business for which the Remy company has contracted with car manufacturers for the 1913 season.

The new buildings will give the concern an increase of 10,600 square feet of floor space. The Remy company claims its factory is the largest of its kind in the world, employing over 1000 men and working day and night shifts. The company also makes the statement that during the next 12 months it will deliver more magnetos to the automobile trade than all other makers combined.

GOES WITH CHASE TRUCK.

R. B. Curtiss Leaves Royal Equipment Company to Manage Chase Branch in Cleveland.

Royal B. Curtiss, formerly sales manager of The Royal Equipment Company, Bridgeport, Conn., has become district manager of Chase Motor Truck Company, Syracuse N. Y., maker of the Chase truck, with headquarters at Cleveland, O. Mr. Curtiss will have jurisdiction over territory embracing Ohio, West Virginia, Kentucky, Indiana, except in the vicinity of Chicago, Michigan and the western part of the state of Pennsylvania.

Royal B. Curtiss, District Manager, Chase Motor Truck Company.

Mr. Curtiss is well known to many who are interested in the manufacture of motor cars or accessories and he has the well wishes of many friends in his new connection with the Chase company. He regretted sincerely being obliged to sever his relations with the Royal Equipment Company, but the idea of connecting himself with the delivery wagon feature of the industry appealed to him strongly. He is succeeded as sales manager of the Royal company by Mr. Everitt.

ANOTHER TRUCK CONCERN.

Brockway Company to Produce Three-Cylinder, Two-Cycle, Air-Cooled Models.

The Brockway Motor Truck Company, Cortland, N. Y., has recently been incorporated with a capital of $100,000 for the purpose of manufacturing a line of popular priced, high grade commercial motor trucks, of which three models will be made with load carrying capacity of 1000-1500 pounds, 2000-2500 pounds and 3000-4000 pounds, respectively. The officers of the company are: President, George A. Brockway; vice president, C. S. Pomeroy; treasurer and general manager, F. R. Thompson.

George A. Brockway, president of the concern, is well and favorably known throughout the United States as a successful manufacturer of high grade carriages and wagons, at present being also president of the W. N. Brockway Company, Homer, N. Y., a company known in this country for over 60 years. The Brockway trucks will also be a high grade product, manufactured to rival the quality of the horse drawn vehicles made in the past.

Rodman S. Reed is chief engineer and superintendent of the company, in which capacity he was formerly connected with the Chase Motor Truck Company, Syracuse, N. Y., for six years. Every part of the Brockway vehicle, including the motor, which is a three-cylinder, two-cycle, air-cooled unit, is built in the new plant under the supervision of widely experienced engineers.

THE NEW YORK SHOW.

Application Blanks Are Issued and Plans Call for Two Big Displays in One.

Like the automobile shows of the last two years the forthcoming exhibition at New York, to be held Jan. 11-25, will be two shows in one, in both the Grand Central Palace and Madison Square Garden. During the time between Jan. 11 and 18, known as the Part 1 period, passenger carrying or pleasure vehicles will be shown in both buildings and during the Part 2 period, from Jan. 20 to 25, commercial vehicles will be displayed in the same manner, while accessories will be exhibited during the two weeks.

The show committee of the Automobile Board of Trade, under whose direction the exhibition will be held, has been working on the details since early spring. It will be the 13th national automobile show and application blanks for exhibition space were issued a few days ago. Judging by the requests, which have been received rapidly, the indications are that the show next winter will eclipse any exhibition of its kind ever held. Merle L. Downs, secretary of the show committee, 7 East 42d street, New York, has increased his staff of employees in order to meet the demand for information and application blanks. A plan of decoration for both the Garden and the Palace is being worked out, which will be unusually attractive.

REMOVE CARBURETOR PLANT.

Marvel Company Interests Flint Capital and Purchases Building in That City.

The Marvel Carburetor Company, Indianapolis, Ind., which recently accepted a proposition of the Flint Board of Commerce, has completed the removal of its plant from Indianapolis to Flint, Mich., and manufacturing operations in the new factory have been begun.

Several Flint business men have become financially interested in the company, the management of which still remains in the hands of A. G. Schonacker. The new plant is a three-story building on Mill street, 50 by 150 feet, and a total output of 300 carburetors a day will be accomplished.

CONSIDERING SALES METHODS.

National Convention of Automobile Sales and Advertising Men for Indianapolis.

An idea which originated with President J. J. Cole of the Cole Motor Car Company, Indianapolis, is to result in the holding of a national convention of automobile sales and advertising men in that city, Oct. 8-9. The main object is to discuss ideal salesmanship, and it is expected that between 3000 and 4000 men connected with the industry will attend the sessions. While the programme is by no means complete, it is announced that the following will deliver addresses:

E. LeRoy Pelletier, director of publicity, Flanders Manufacturing Company, Pontiac, Mich.; A. D. Sheldon, president, Sheldon School of Scientific Salesmanship, Chicago; John Lee Mahin and W. D. Nesbit, Mahin Advertising Company, Chicago; John Wetmore, Evening Mail, New York City; A. W. Shaw, publisher, System Magazine; C. F. Kettering, Dayton Engineering Laboratories Company, Dayton, O.; David Beecroft, Class Journal Publishing Company, New York City; Elbert Hubbard, East Aurora, N. Y.; Will P. Brown, Brown Motor Car Company, Peru, Ind.; E. A. Deeds, president, National Cash Register Company, Dayton, O.; Arthur Brisbane, American, New York City; Norman Hapgood, Collier's Weekly; G. A. Leroy, La Salle, Ill.; S. A. Leland, Cadillac Motor Car Company, Detroit; Henry Ford, Ford Motor Company, Detroit; H. C. Durant, Detroit, and Benjamin Briscoe, president, United States Motor Company, New York City.

It will be noted that the speakers selected are all well qualified to discuss topics pertaining to salesmanship, publicity and kindred matters, and the session is expected to be productive of benefit to these important factors of the automobile industry.

ADVERTISING ABBOTT-DETROIT.

Company Occupies Unique Position with Woman as Manager of This Department.

The Abbott Motor Company, Detroit, maker of the Abbott-Detroit line, claims the distinction of having the only woman advertising manager in the industry. An accompanying illustration presents Miss Dorothy Kanes, who has been in charge of this department for some time. That she has made a success in her field is evident, despite her claim to be the only woman following automobile advertising as a profession.

It may be added that Miss Dorothy Kanes really is no longer entitled to that name, although she continues to use it in her professional capacity. She was married recently, and in addition to her work for the Abbott company she finds time to direct the household problems in an apartment in town, a country home and the usual servants.

MICHIGAN ESTABLISHES BRANCH.

Entire Business on Pacific Coast and in the Orient to Be Directed by It.

The distribution of the Michigan cars, made by the Michigan Motor Car Company, Kalamazoo, Mich., which is the new name of the Michigan Buggy Company in charge of manufacturing automobiles, in California, Nevada, Hawaii and the Orient, will be directed by the California branch, which was organized recently with capital of $1,000,000. The following are the officers: President, V. L. Palmer; first vice president, F. B. Lay, Jr.; second vice president, W. H. Cameron; third vice president, George H. Daugherty; treasurer and general manager, C. P. Kiel; secretary, C. C. Bobb; directors, the above and H. L. Kiel, son of C. P. Kiel.

The Michigan Motor Car Company, California branch, will occupy a handsome, modern metropolitan office building, probably in San Francisco, although the exact location has not been determined. This will include display rooms, service station and all the equipment necessary to look after the interests of Michigan users in the territory named. It is stated that the organization of the company will in no way interfere with the agencies already established, excepting that it will have direct supervision over these and all future agencies.

Miss Dorothy Kanes, Advertising Manager, Abbott Motor Company.

INCORPORATE HARRIS OIL COMPANY.

Associates of the Founder of the Concern Organize for Conduct of the Business.

The A. W. Harris Oil Company, Providence, R. I., has been incorporated to succeed the company of that name formerly conducted by A. W. Harris, recently deceased. The company is incorporated under the laws of Rhode Island and the capital stock is $75,000. The officers are: President, Benjamin S. Terry; treasurer, Arthur D. Greene; secretary, George F. Heywood. The officers named were associated with Mr. Harris for years and they propose to continue the business to the same policy that has been followed for over a quarter of a century.

NEW FORD BUILDINGS.

Factories to Be Erected at Denver, Col., and Memphis, Tenn.

The Ford Motor Company, Detroit, has purchased five acres of land at Kentucky avenue and Broadway, Denver, Col., and will erect a four-story plant, 75 by 200 feet, and will give employment to 200 men. Contracts have also been let for the assembling factory of the company at Memphis, Tenn., and building is to commence at once. The site is a triangular lot and the entire plant when completed will cost about $200,000.

LAMP CONCERN EXPANDS.

Guide Motor Lamp Company to Erect New Plant at Cleveland, O.

Because of a rapidly increasing business the Guide Motor Lamp Company, with a plant in East Fourth street, Cleveland, O., will erect a new factory building on Madison avenue, N. W., that city. When the structure is completed it will occupy the entire block on Madison avenue between West 114th and West 115th streets. Construction will be commenced at once.

TAKES NEW QUARTERS.

United States Tire Company Moves General Offices in New York City.

The United States Tire Company has moved its general offices to the United States Rubber Company's building, Broadway and 58th street, New York City. The structure is the tallest north of 42d street, and will be utilized in the future as the home of the United States Rubber Company and its subsidiaries. The building is 20 stories high. The basement and sub-basement will be occupied by the United States Tire Company as a stock room, and the 15th, 16th and 17th floors will be utilized as general offices.

MOTZ TIRE BRANCH.

New Headquarters to Be Established in Pennsylvania Coal Mining District.

Because of the large increase in the use of Motz double tread cushion tires, made by the Motz Tire & Rubber Company, Akron, O., in Pittsburg, Penn., and vicinity, it has been deemed necessary to establish a factory branch at 300 North Craig street, in that city. In keeping with the policy of the company this action carries with it the operation of a thoroughly equipped service station, with a full corps of workmen and tire experts. S. H. Frensdorf is in charge as manager. He was associated for some time with the Diamond Rubber Company's branch in Boston, before joining the Motz interests.

WILL DISTRIBUTE FIAT CARS.

Motor Car Sales Company Incorporated to Take Over Retail Selling End.

The Fiat Motor Car Sales Company has been incorporated to succeed the Fiat Automobile Company of New York City, distributor of Fiat cars, that the managers of the latter company may devote their energies exclusively to development of the Fiat factory at Poughkeepsie, N. Y. J. S. Josephs and Benjamin Eichberg, who have for years been engaged in the sale of Fiat automobiles in New York, retire from the selling organization and will devote their entire time to production at the factory.

The officers of the new company are: President, E. R. Hollander; vice president, Henry M. Sage; treasurer, Charles L. A. Whitney; secretary, R. D. Willard. The new company will control the New York, Albany, Boston and Providence, R. I., and New England territory.

STOCKHOLDERS REORGANIZE.

Dahl Punctureless Tire Company Increases Capital Stock to Assume Patent Rights.

The stockholders of the Dahl Punctureless Tire Company at the annual meeting at Minneapolis, Minn., recently reorganized the company. The capital stock was increased to $6,000,000. The new company will take over the patent rights of the Dahl Punctureless Tire Company of Minnesota, and in addition will manufacture a line of accessories. The home office will be at 246 West 59th street, New York City, with Chicago as the distributing point for the middle west.

FISK COMPANY IN PITTSBURG.

Well Known Rubber Manufacturer to Increase Facilities in This Field.

The new branch building in Pittsburg, Penn., for the Fisk Rubber Company of Chicopee Falls, Mass., is one of the most finely appointed and up-to-date quarters of its kind in the Pennsylvania city. It is located in the heart of the automobile district and is in a new building two stories high, 95 by 20 feet. The ground floor will be devoted entirely to display and salesrooms, while the second floor will be occupied by the repair department, in charge of competent factory men.

ADD TO FIRESTONE PLANT.

Pioneer Tire & Rubber Company to Make Two Additions to Factory at Akron, O.

Firestone Tire & Rubber Company, Akron, O., is erecting two wings to factory buildings of the same height and construction as these structures. The north wing will be 60 by 125 feet and the east wing 60 by 200. The concern is also erecting a new employment office in Main street.

DEVICES THAT DETECT INEFFICIENCY.

Modern Conditions Require Some Means of Revealing Misuse of Both Pleasure and Commercial Cars—What Has Been Accomplished in Solving the Problem.

WITH the growing importance of the motor car as an economic factor in the business life of the world, certain problems have arisen, many of which are by no means easy of solution, unless some special means is undertaken. The so-called pleasure car is no longer regarded strictly as such. Even when it is employed a considerable portion of the time as a means for securing enjoyment, there are many hours of the day when it is utilized solely for business purposes.

As an illustration in point, let it be assumed that a business man owns a car which is at the disposal of his wife and daughters a greater part of the time. They utilize it in shopping, in making social calls, in taking daily drives in the park or into the country, etc. It is called into service in the morning to take the owner to the office, and in the afternoon to bring him home again. This is the general use to which the car is put, and a false nomenclature has bestowed upon a machine thus employed the designation of pleasure car. It will be seen, however, that the service is in every way necessary, and while it would be equally as incorrect to term it a commercial vehicle, it nevertheless occupies an important place in the daily life of that family—of the business life of the home.

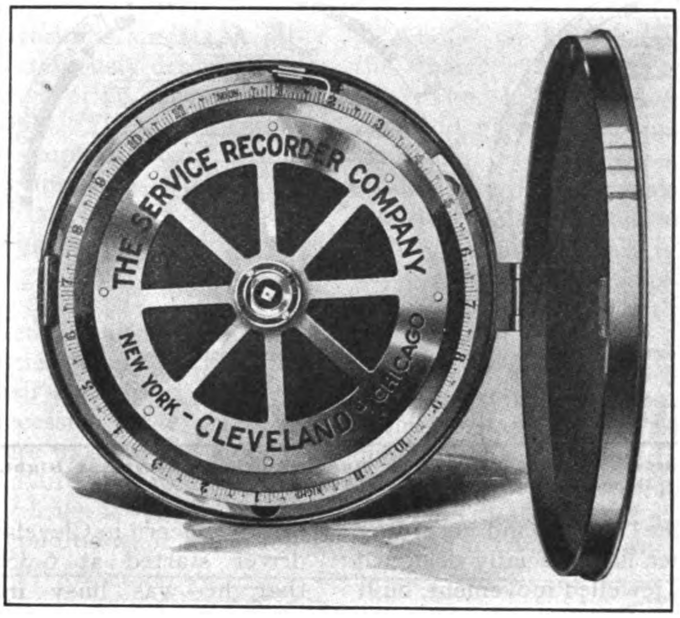

Fig. 1—ServiS Recorder in Its Metal Case, Open for Inspection.

Under such circumstances, and in numerous other instances of a like character, it devolves upon the chauffeur to assume the responsibility for the machine. It matters little whether the car is housed in a private garage or at a public service station, it is to the chauffeur that the owner must look for its proper condition at all times.

This brings up one of the problems that has confronted the public garage proprietor ever since the automobile became a practical institution. Some provision must be made for guarding against improper use of the machine, and it manifestly is unfair for the garage proprietor to be expected to accept a responsibility that should rest upon the owner or the chauffeur. In most cases some rule is adopted with reference to permitting the car to leave the garage at certain periods of the day or night without the owner's knowledge. It may be that a written order is required, or the car will be delivered to the chauffeur upon a telephone message. In any event it is fully understood that the owner must at all times assume the risk of false representation on the part of the chauffeur or others.

In the matter of the motor truck, or the car that is utilized solely for commercial purposes, there are other problems that enter into the consideration. That the mechanical transport is a factor for economy is generally admitted, but it has been indicated by careful study of the situation that the greatest economy is realized only when the maximum efficiency is secured. Certain leaks must be eliminated, but it first becomes necessary to learn where the leaks exist. And here, the chauffeur, or operator, is often called upon to assume responsibilities that do not, in all justice, belong to him, but elsewhere.

It is impossible in a discussion of this nature to point to all the circumstances which make it desirable that the owner of either a pleasure or commercial car shall be in a position to know at all times just how his machine is being employed. Any automobile means an investment of some moment. It is unwise to depend upon chance when it is possible to obtain accurate knowledge. Any owner will be able to supplement examples recalled herein by others which indicate in like manner the desirability of securing absolutely dependable information of this character.

There are a number of instruments in the market which were designed primarily for the purpose of supplying this need. They are applicable to all types of vehicles, whether motor driven or horse drawn, but it will be agreed that the peculiar demands of the motor car situation were responsible for their appearance. It is not the object of this discussion to suggest the advantage of one type over another, but merely to present the demand which they aim to fill and the claims made by the manufacturer of each. It is assumed that the owner, chauffeur, garage proprietor or business man will be interested in these descriptions and be able to decide for himself where they will be applicable to his needs.

"The man in the box" is the name which has been applied to the ServiS recorder, made by the Service Recorder Company, 2344 East 105th street, Cleveland, O. The designation is signally appropriate, since the device is enclosed in a neat little brass case, which may be located at any convenient place on the car—on the dashboard, under the driver's seat, or as is the case with many department store vehicles, fastened on the wooden frame of the top above the driver's seat. It is claimed by the maker that so long as it is installed parallel with the axle it will register.

The principle is one which may not have become noticeable even to many observant persons; that no motor car, horse wagon, locomotive, or other vehicle can be moved in a forward or backward direction without perceptible oscillation. Even the lightest running automobile cannot be moved across the garage floor without the recorder registering the motion. It is claimed, however, that jarring vibrations and the like are not recorded as travel.

The instrument is patented and has two main mechanical features, the timing and recording mechanisms. The former is a specially designed Seth Thomas eight-day, jewelled movement, built and calibrated to withstand vibration, and securely protected in a sealed housing. It revolves a brass disc once every 24 hours, past a jewel pointed stylus, which registers travel and stop periods on a printed chart of sensitized paper which lies flat on the disc and revolves with it. The stylus, being attached to one end of a free swinging pendulum, marks a thin, clear line on the chart so long as the vehicle is quiet and the pendulum at rest. But when the car is in motion the pendulum is agitated to and fro and the stylus records on the chart a broad "travel" line about .25 inch wide. It is said to be absolutely impossible to fake these lines.

The chart is printed to resemble a 24-hour clock dial, the smallest graduation representing a five-minute period. The travel and stop lines are registered faithfully on the margin of the chart, indicating the exact length of every stop and the duration of every travel period, as well as the exact time at which each occurred, so that the owner has at any time a detailed, legible, accurate record of the car's movements—a complete check on his vehicle. The value of this is, of course, obvious at once.

In the case of the pleasure car, the owner always is informed as to when his machine left the garage, how long it was used, how far and how fast it was driven, what time was utilized in waiting; in fact, a complete record of its movement throughout the day or night. The garage proprietor has nothing to worry him concerning the vehicle thus equipped. The reliable chauffeur has nothing to fear, while the unsatisfactory man is detected at once.

With the commercial car, the owner or the delivery superintendent can tell at a glance whether his cars are working to their full capacity, and is enabled to determine just what is holding up the equipment. Not only does the device remove the temptation to use the car improperly or to loaf and then make up time on the road, but the chart brings to light the capable man whose ability perhaps was not fully realized before.

Fig. 2—Typical ServiS Charts: At Left, Utilized by Manufacturing Concern; at Right, by Department Store Delivery System.

Accompanying illustrations present the device and set forth its method of operation in a measure. It so happens that the two charts at Fig. 2 were taken from cars utilized solely for business purposes, but they indicate the completeness of the record obtained. That at the left depicts one day's work with a manufacturing concern in Cleveland, O. It shows that the driver started at 6:35 in the morning, and that he was busy making deliveries, some of them close together and others far apart, some stops being of short duration and others longer, until 11:30, at which time. it is presumed he went to lunch. The car resumed operations at 1 in the afternoon and continued its delivery work until 4:50, when it was through for the night.

The chart shown at the right of Fig. 2 represents one day's work with a department store in the same city. Here the driver was at the garage just before 8 in the morning and took the car around to the store, where it was standing until 8:50, getting its load. It was busy making deliveries, with very few long waits, until 1:30 in the afternoon, when it returned to the store and made another short run before lunch at 2:20. After lunch it was driven to the store, loaded a third load and was busy until 5:50. After returning to the store at this hour, there was nothing more to do that day, and it was driven to the garage.

Another Cleveland product of the same nature is the Travelog, made by W. H. Brown, 706 Rose building. While it may be stated that the principle upon which it works is similar, it differs materially from that previously described, in that it permits the recording of an entire week's work, instead of one day only. The object sought is the same; namely, a complete record of the day's work, showing starting time, time of all runs and stops, quitting time, overtime, and all other details which will enable the owner or superintendent to detect leaks and suggest a remedy.

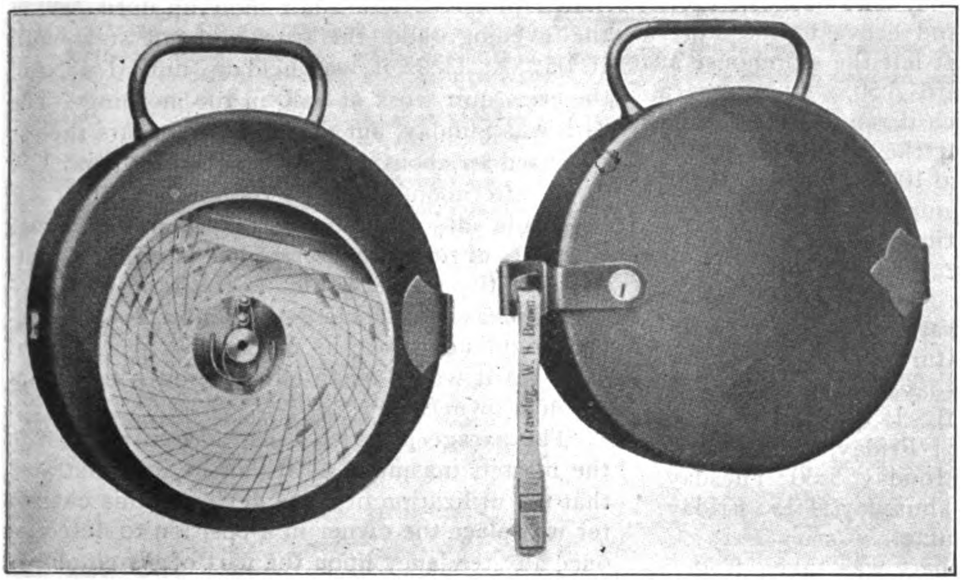

Fig. 3—Front and Rear Views of the Brown Travelog Instrument, Locked and Ready for Installation.

The maker cites the fact that although a large majority of men are conscientiously working for the better interests of their employers, the time clock has been found a necessity. These usually are installed indoors, where most of the work is done under the eyes of the directing foreman. If some method of detecting leaks is recognized as important under such conditions, it must follow that similar arguments will apply outside, where drivers are placed in charge of expensive installations that are utilized under conditions which limit the watchful supervision.

This does not necessarily imply that the driver is lax in his duties, as already has been pointed out. The object of the Travelog is to show where the delays occur, and it transpires more often than otherwise that these are due quite as much to the routing system adopted, as to the inefficiency of the operator. The Travelog possesses a number of special advantages, as well as those already mentioned.

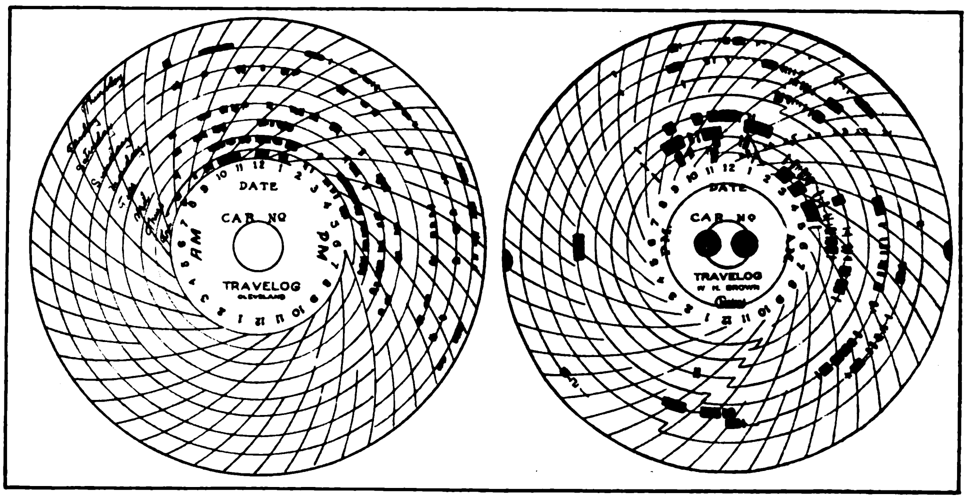

Fig. 4—Specimen Travelog Charts: At Left, Truck Hauling Machinery; at Right, Special Car on Night Work.

The maker claims the device is so sensitive that it records even when the car is touched, the principle employed being that it is actuated by the vibration of the car. The mechanism comprises an eight-day, 11-jewel standard Howard clock movement, with actuating parts of cold rolled steel, enclosed in a pressed steel case and secured with a Yale lock. It may be located on any part of the car, a bracket attachment being furnished with the case.

Two of the Travelog charts are shown herewith, and it will be noted that provision is made for automatically making a whole week's record without removing the chart. The clock also is wound weekly. The instrument is installed with an open or glass front, possessing the added advantage of affording the operator opportunity to see his record in the making, as well as to read the time of day. The case is about 7.5 inches in diameter, and the chart is a six-inch disc of prepared paper divided into 24-hour periods indicated by radial lines with hour numerals at the centre, half-hours being indicated by half-lines and shorter intervals being measured by sight. The marker traces a fine circular line while the vehicle is standing, and a broad brand while running. Each succeeding day the marker drops toward the centre to delineate a new circle.

The Travelog chart at the left of Fig. 4 was made on a truck hauling machinery. In order to explain fully the runs and stops for the first two days, as an example, it may be stated that the first day, Thursday, the chart was put on at 11:30 in the morning. The truck was moving from 12:40 until 1; 1:25 to 1:35; 1:50 to 2:05; 2:15 to 2:20; 2:30 to 3; 3:30 to 3:55; 4:15 to 4:25, and quit for the day. Friday, the crew left the garage at 6:25 and drove to the storehouse, arriving at 6:35. It left the storehouse at 7:10 and was moving until 7:50. There was a wait until 9:15, after which it ran until 9:40, and ran as follows throughout the remainder of the day: 9:45 to 9:50; 10:15 to 10:25; 10:35 to 10:55, with short stops intervening; 11:15 to 11:50; 1 to 1:05; 1:10 for a short time; 1:45 to 1:50; 2 to 2:10; 2:40 to 2:50; 3:50 to 3:55 and 4:15 to 4:20, when it quit for the day. It also will be noted that the truck began operations each day as follows: Friday, 6:25; Saturday, 6:45; Sunday, rest; Monday, 6:45; Tuesday, 7; Wednesday, 7; Thursday, 7; Friday, 7:20. It quit each day as follows: Thursday, 4:25; Friday, 4:20; Saturday, 4:25; Sunday, rest; Monday, 5:30; Tuesday, 5:30; Wednesday, 5:40; Thursday, 4:15; Friday, taken off at 9 in the morning.

The other Travelog chart was taken from a special car on night work. It shows that the crew boarded the truck at 5:50 in the afternoon of the 21st and started work at 7, going off at 11:30 the next morning. The second day the crew took charge at 6 and the vehicle was in service from 7 in the evening until 5:45 in the morning, with a long hold-up between 11:45 to 3. The 23rd the crew did not show up until 7:40 in the evening, and the truck did not start until 10:05. At 11:25 it was held up until 1:45, and the crew quit work at 6:40 in the morning. The 24th was Sunday, but Saturday it appears the car was used for about an hour between 2:30 and 3:30 in the afternoon, evidently on another job.

While all of these charts present examples with cars of the commercial type, it will be admitted that the result would be the same with so-called pleasure vehicles. Undoubtedly the record might not prove as interesting in a general way, but it would mean quite as much to the individual owner.

The garage proprietor also has an interest in the matter, inasmuch as it can be demonstrated that the utilization of some device of this character will place the owner in a position to detect at once any tendency upon the part of his employee to overstep the bounds of proper service, and put him upon his guard against further lapses. This is a phase of the situation which will be taken up in more detail in a subsequent installment.

TRADE INFORMATION EXCHANGE

BUSINESS PROPOSITIONS.

Opportunities Are Offered Below for Agents to Secure New Lines, for Manufacturers to Extend Their Representation, and for Producers to Get in Touch with Those Who Are in the Market for Equipment and Supplies. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without Names, Those Interested Desiring the Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding.

MANUFACTURERS' OPPORTUNITIES.

1001—Indiana Manufacturer, producing more than 5000 trucks annually, desires full information concerning combined electric starting and lighting system.

1012—New England Manufacturer would like to get in touch with producers of all parts for light commercial vehicles.

1015—Well Known Boston Jobber, who will leave on an extended foreign trip in January, visiting England, France, Germany and other countries, with a view to buying and placing supplies, desires to correspond with manufacturers who are interested in such foreign trade.

1025—Chicago Manufacturer wants to get into correspondence with producers of automobile accessories for use on its pleasure cars.

1027—Tire Filler Concern, well located in respect to shipping facilities, etc., desires agents in all sections of the country.

1033—Massachusetts Manufacturer of two-ton commercial vehicles, desires information concerning the purchase of channel iron for chassis and other parts.

1034—Arizona Truck Manufacturer seeks information concerning steel or wood block tires for such vehicles.

CAR AGENCIES DESIRED.

2101—New Jersey Concern desires agency for pleasure automobiles selling from $500 to $1000, and commercial cars from $1000 to $1500.

2102—Ohio Concern, just incorporated, desires agency for commercial vehicles selling from $1200 to $4500.

2103—Pennsylvania Garage, well established, will consider the agency for pleasure cars selling from $985 to $6000.

2104—Newly Incorporated Concern in New York would like agency of pleasure cars listing from $500 to $2000.

2105—New York Garage seeks agency for pleasure vehicles listing from $1000 to $2000.

2106—Missouri Company, already representing one line, desires agency for pleasure cars selling from $1700 to $2850.

1062—Kentucky Firm, recently organized, would like agency for pleasure cars selling from $500 to $5000; and commercial vehicles from $750 to $2500.

1067—Utah Concern, well established, wants agency for pleasure cars and trucks selling at about $1000.

1071—Ohio Sales Company, in large city, desires information concerning cars listing from $1000 to $3500, with a view to taking an agency.

1073—Dealer in Washington State would like agency for cars selling at medium price.

1079—Tennessee House with numerous distributing branches in the South is interested in cars selling up to $8000 and in trucks listed at $1500 to $6000.

1082—Wisconsin Dealer, well established in good location, wants agency for cars selling at $900 to $1900.

1087—Pennsylvania House, with sub-agencies in several counties, would add agency for cars selling at $1750 to $3500.

1001—Kentucky Agency, already representing one line, wants to add cars selling at about $1000.

1005—Tennessee Concern, also covering parts of Mississippi and Arkansas, would take agency for cars selling at $1150 to $1750 and trucks selling at $900 to $2200.

1007—Michigan Dealer, well established, desires agency for pleasure cars selling at $800 to $1200.

1009—New Jersey Company, recently opened, wants agency for pleasure cars selling at $800 to $1700 and trucks from $600 to $1200.

2001—Boston Dealer seeks information concerning pleasure cars or trucks fitted as camp wagons.

2003—Vermont Agency, with well established repair business, wants agency for cars selling at about $2000.

2004—Louisiana Supply Company, representing two lines, desires information concerning pleasure cars selling at $1000 to $2500.

2003—Idaho Dealer seeks agency for pleasure cars selling at or below $1600.

2009—Massachusetts Dealer, well acquainted with managers and superintendents of electric lighting companies throughout New England, desires agency for electric and gasoline commercial vehicles, capable of climbing hilly streets at fair speed, and going over good roads at from 15 to 20 miles an hour.

EQUIPMENT NEEDED.

1131—Maine Concern, erecting a modern garage, desires to get in touch with companies manufacturing thoroughly modern garage equipment, including supplies, etc.

1132—New York Garage, which recently changed hands, desires equipment for garage and repair shop.

1133—New York Concern, well established, desires equipment for garage.

1134—Pennsylvania Company, in the heart of the touring district, desires information relative to a complete equipment.

1135—New Jersey Company, recently organized, desires complete garage equipment.

1136—New Jersey Garage, recently incorporated, desires machinery and equipment for repair shop.

1137—Ohio Garage, well established, desires complete equipment for repair shop, including machinery, tools, supplies, etc.

1138—Pennsylvania Concern, recently incorporated, is in the market for repair shop equipment.

1139—New York Garage, recently established, desires full machine equipment for repair shop and garage.

1140—New York Company, well located, wants information concerning equipment for repair shop and garage.

1141—Maine Concern, recently established, desires complete equipment for garage and repair shop.

907—New Jersey Concern, recently established, desires equipment for garage and repair shop.

908—Seattle Tire Dealer, is interested in repair shop supplies and equipment for such work.

909—Milwaukee Company, just incorporated, is in need of garage and repair shop equipment and supplies, including machine tools, etc.

911—Iowa Concern, now building cement garage, wants equipment for garage and repair shop, including machine tools, etc.

915—Service Station in Salt Lake City is in the market for all kinds of garage and machine tool equipment.

923—Garage in New Jersey, recently opened, wants equipment and machine tools.•

927—Concern in Kentucky, engaged in rebuilding automobiles, desires garage and repair shop equipment.

933—Chicago Manufacturer, recently incorporated, is in the market for machine tools, etc.

936—Tennessee Company, with well established garage, is desirous of adding to its garage equipment.

939—Taxicab Company in Ohio is interested in securing garage and machine tool equipment.

941—Pennsylvania Concern, now erecting building, wants garage and repair shop equipment.

947—New York Dealer in large up-state city desires garage, repair shop and machine tool equipment.

949—Baltimore House is in the market for gasoline storage systems, pumps, vulcanizer, vehicle washers, welding equipment, lathes and other miscellaneous equipment.

951—Michigan Garage, well located for tourist trade, seeks information concerning garage and repair shop equipment of all kinds.

953—Vermont Garage, in heart of touring country, would install needed garage equipment.

955—Connecticut Concern, well established, wants information concerning garage and repair shop equipment of all kinds.

957—California Company, recently incorporated, is in the market for garage equipment and supplies.

960—Ohio Concern, well fitted to take care of all sorts of repair work, is interested in repair shop equipment.

961—Michigan Garage, recently opened, seeks information concerning garage and repair shop equipment.

ACCESSORY AGENCIES.

1200—New Jersey Garage, in well established location, desires agency for automobile accessories and supplies.

1201—Ohio Concern, in leading city, wants agency for pleasure and commercial vehicle supplies and accessories.

1202—Pennsylvania Dealer, well located, would add a full line of accessories and supplies.

1202—New York Concern, recently incorporated, desires complete stock of automobile supplies; also pleasure and commercial accessories. Would also like agency.

1204—New York Garage, newly established, wants agency for full line of accessories and supplies.

1205—Maine Garage, recently established, desires complete line of supplies, also agency for accessories for both pleasure and commercial vehicles.

970—Wisconsin Company, recently incorporated, seeks the agency for pleasure car accessories and supplies.

975—Dealer in Washington State, with well established garage and salesrooms, desires agency for pleasure and commercial car accessories and supplies.

978—Iowa Distributor, well located, wants agency for pleasure and commercial car accessories and supplies.

979—New York Garage, in growing city, would like agency for all kinds of accessories and supplies for all types of vehicles.

982—Michigan House, engaged in general repair business, wants agency for automobile accessories and supplies for garages.

986—Kentucky Dealer, well located, wants agency for pleasure and commercial car accessories and supplies.

992—New Jersey Garage, recently established, wants agency for pleasure car and garage accessories and supplies.

993—Tennessee Tire Concern, in large city, would add full line of automobile accessories and supplies.

999—San Francisco Jobber, well established, desires agency for all kinds of accessories, as sales representative for the entire Pacific Coast, including British Columbia.

1007—Idaho Company, just starting in business, seeks agencies for well known automobile and garage supplies and accessories.

1010—Louisiana Agency for pleasure and commercial cars would add full line of accessories and supplies for these vehicles.

1014—Connecticut Garage, recently opened, has splendid opportunity to develop good trade in representative line of automobile and power wagon accessories and supplies.

1016—Vermont Dealer, on line of summer tourist travel, seeks agency for pleasure car accessories and supplies.

1019—Michigan Concern, erecting new modern garage, wants agency for standard automobile supplies and accessories.

1022—Maryland Dealer, in excellent location, wants agency for tires, oils and similar goods.

1023—Baltimore Garage, now erecting new building, is interested in agency proposition for automobile accessories and garage supplies, and later will be in the market for repair shop equipment.

1028—Massachusetts Concern, well located in large city, is interested in securing the agency for automobile accessories of all kinds.

1029—Boston Dealer is interested in securing information concerning accessories and parts pertaining to the automobile industry.

1030—California Garage, in well established location, desires agency for automobile accessories and supplies.

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. SEPTEMBER, 1912. NO. 5.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building Pawtucket, R. I.
Publisher of
THE AUTOMOBILE JOURNAL THE MOTOR TRUCK
William H. Black, Treasurer. D. O. Black, Jr., Secretary.

EDITORIAL DEPARTMENT:
WILLIAM W. SCOTT. CARL A. FRENCH.
C. P. SHATTUCK.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 West 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4707 Magnolia Avenue.
BOSTON—John W. Queen, 6 Beacon Street.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Entered as second class matter Dec. 30, 1911, at the postoffice at Pawtucket, R. I., under the Act of March 3, 1879.

CARRYING STOCKS OF PARTS.

One of the greatest problems with which agents for motor vehicles have to deal is that of supplying parts necessary for restoration from damage or wear. As a rule ample stocks are carried at the factories, but many agents do not care, or are financially unable, to keep on hand what is necessary to meet every demand, especially as the number of models is considerable. This being so, in the event of need the customer must wait until an order can be sent to the factory, filled and returned, and if there is delay in receipt the manufacturer is always considered at fault. With pleasure cars an interruption of use is keenly felt, but when business is handicapped, or additional expense incurred, the owner is not inclined to be philosophical and he condemns a policy that will not afford him practically immediate service. With a factory in a single location and every requirement primarily supplied from this point, it would seem good business judgment to establish in different sections of the country, in combination with other manufacturers if the expense should be a large influence, stations where parts could be kept and delivered as ordered within such radius as could be satisfactorily served. Garages giving public service cannot be expected to invest their capital for the service of the public without reasonable recompense, and it would appear that cooperation by the makers of cars and vehicles could very much improve conditions.

DELIVERY OF MACHINES.

The demand for service vehicles has been so much in excess of the supply available for the past year that thousands of orders have been lost by dealers who could have made sales with reasonable delivery assured to the customers. This condition has been brought about by the peculiar development of many of the companies, and that agencies had been established and agents were busy while the factory organization was not sufficient to produce anything like the number wanted. Instances are frequent where agents have been unable to get machines for months, and with good prospects and no possibility of obtaining vehicles, the distributors have in self preservation been compelled to take on one or more lines, thus diverting their endeavors and lessening the business possibilities. The agents cannot be censured, when with their money invested and unable to do business they take another agency and become competitors of the manufacturers whose representatives they are, through dividing their time and developing the activities of rivals in the industry. It is decidedly better to limit agencies to the number that can be supplied with cars or wagons, because promotive work is always lost unless deliveries can be promptly made.

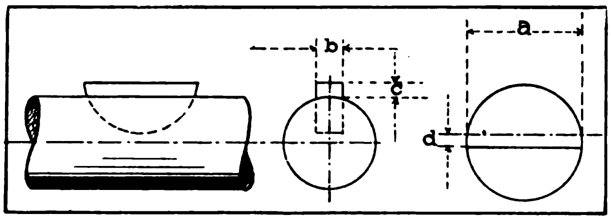
THE STOCK THAT IS DEMANDED.

When a business man learns that he is expected to have stocks of lines that are well known—a fact very quickly impressed upon him—he will also have abundant knowledge that the products best advertised are most called for. It is logical for him to provide that for which a market already exists and to reject what is not equally saleable, for with one known to the people and the other not, it is evident that it requires much more time and salesmanship to sell the latter than the former. The products that are widely advertised and have quality that is understood may be regarded as standard, and when so established in public opinion have a definite value from a business point of view that is well worth considering. Not only this, but known stock is saleable and it does not deteriorate and there is no loss from capital invested.

MECHANICAL POINTERS *for* GARAGEMEN AND OWNERS

WOODRUFF KEY SIZES.

Each year sees the use of more and more Woodruff keys for fastening gears and similar parts to round shafts, for which reason the various sizes are of considerable interest. A table herewith gives the various sizes which are referred to in the sketch above, the letters in the table corresponding with those in the figure. There are 30 standard and many special sizes, the latter of which will be taken up at a later date.



No. of key	Diameter	Thickness	Depth in gear	Less than ½ diam.
	a	b	c	d
1	.500	.0625	.0312	.0468
2	.500	.0937	.0468	.0468
3	.500	.1250	.0625	.0937
4	.625	.0937	.0468	.0625
5	.625	.1250	.0625	.0625
6	.625	.1562	.0781	.0625
7	.750	.1250	.0625	.0625
8	.750	.1562	.0781	.0625
9	.750	.1875	.0937	.0625
10	.875	.1562	.0781	.0625
11	.875	.1875	.0937	.0625
12	.875	.2187	.1094	.0625
A	.875	.2500	.1250	.0625
13	1.000	.1875	.0937	.0625
14	1.000	.2187	.1094	.0625
15	1.000	.2500	.1250	.0625
B	1.000	.3125	.1562	.0625
16	1.125	.1875	.0937	.0781
17	1.125	.2187	.1094	.0781
18	1.125	.2500	.1250	.0781
C	1.125	.3125	.1562	.0781
19	1.250	.1875	.0937	.0781
20	1.250	.2187	.1094	.0781
21	1.250	.2500	.1250	.0781
D	1.250	.3125	.1562	.0781
E	1.250	.3750	.1875	.0781
22	1.375	.2500	.1250	.0937
23	1.375	.3125	.1562	.0937
F	1.375	.3750	.1875	.0937
24	1.500	.2500	.1250	.1094
25	1.500	.3125	.1562	.1094
G	1.500	.3750	.1875	.1094

These sizes vary from .5-inch diameter and .0625 thickness up to 1.5-inch diameter and .375-inch thickness. The general shape of the keys is that of a coin cut into halves, although to be exact the half is not complete, as the sketch shows. The key is set down into the shaft less than its full depth by almost the amount of its thickness, so that the portion projecting above the shaft and into the gear or other part is nearly square in section.

One great advantage of this form over a square ended key is the ease of placement or removal, a slight tapping on one end, causing the semi-circular form to rise out of the other end of the key seat, until it is loose enough to be picked out.

IMPACT TESTING MACHINE.

With impact testing machines it is desirable that the load should be applied directly, so that as little as possible of the energy of the falling weight is lost in the intermediate connections. An English contemporary describes a machine on the principle of a weight falling on a plate and applying an impact tensile load. The plate that receives the blow is made very stiff and is securely fastened to the specimen. Care is taken that the blow from the weight on the object is a fair one, and that there is no bending as well as tension stress on the specimen. The weight weighs 82.04 pounds and is turned accurately to fit the central rod. A small key on the weight runs in a key-way on the central rod, to insure that there is no rotational motion of the weight when falling.

Two ways are employed in measuring the energy absorbed in fracturing the specimen: First, the velocity of the falling weight is measured; second, the kinetic energy of the weight after the fracture is recorded. The latter method is not considered as satisfactory as that of measuring the change in velocity. Preliminary tests are recorded.

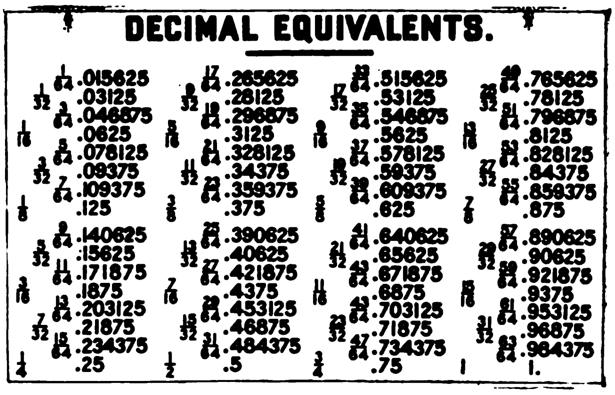
A bar of .5625-inch mild steel of commercial quality was selected. Test pieces were screwed .5 inch and turned and ground accurately to .25 inch diameter for the middle two inches.

In order to determine the effect of heat treatment on the power of the material to resist shock, the specimens were treated to different tests. In all cases the elongations due to impact testing are greater than those due to tension testing. The increase of temperature during annealing appears to reduce the total extension under the static load and impact load. In cooling the specimens in water the effect is very marked, the elongation in both static and impact tests being much reduced.

UTILITY OF DECIMAL EQUIVALENTS TABLE.

One of the great disadvantages of the measuring units used in the United States lies in the necessity for reverting to decimals for all very small measurements, as well as in every case where metric sizes are to be compared or used. This requires a frequent consultation of a decimal equivalents table. While there are many of these, too many in fact, the majority of them do not serve the purpose well for one reason or another. Some lack a logical arrangement, others are incomplete, still others rearrange the fractions in an unnatural sequence, making quick reference impossible.

For all these reasons, a good table, well and logically arranged, is very desirable. The one accompanying this is presented as embodying all these needs, besides having the great utility of being legible and of small compass. It is small enough to go on the back of a calling card yet more legible than any yet seen. It was taken from a wall hanger, being sent out by the Garvin Machine Company, New York.



DECIMAL EQUIVALENTS.

DRILL PROTECTOR AND HOLDER.

In drilling holes .125 and .0625 inch in diameter in hard metal with a hand or breast drill it is often difficult to prevent breakage. Considerable pressure is required to make the tool cut and sometimes this is so great that it snaps off like glass. A device that can be constructed easily is shown at Fig. 1 A, and consists of a piece of hardwood about .5 inch shorter than the projecting end of the drill when it is in the chuck. A hole is bored through the centre with the tool and is attached as shown. The wood reinforcing stiffens the drill so that it will withstand three or four times the usual pressure. Should it be necessary to drill a hole more than .5 inch deep, when the wood comes in contact with the metal it can be cut off as much more as required.

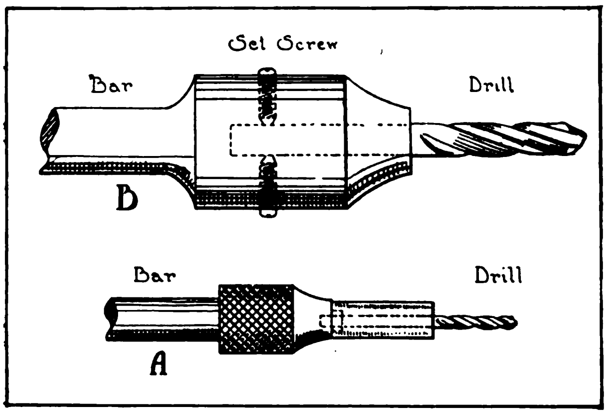

Fig. 1—Some Drill Kinks: A, Protector for Small Tools; B, Holder for Utilizing Broken Drills.

A holder for broken twist drills is shown at B. These are not very costly and form a valuable addition to the kit. Frequently expensive high speed drills are broken just at the end of the flutes through carelessness, and usually these are thrown away. A hole is bored the size of the drill and setscrews with rounded points are placed opposite each other. These enter the flutes of the tool and make a positive drive. The other end of the holder is turned so as to fit the chuck.

HOW FIRE LURKS IN WASTE.

Care should be exercised in the disposition of oily rags and waste in the shop and these should not be thrown about carelessly or allowed to accumulate as fire from spontaneous combustion is likely to follow. Many blazes from this cause are recorded as mysterious as unless discovered at their start they soon destroy all evidences of their inception.

Decomposition is a slow combustion. Oxygen uniting with carbon produces heat, and if they combine rapidly enough, in sufficient quantities, the combustion is visible in the flame. If slowly, as in the decay of inorganic bodies, the heat escapes unnoticed. Rapid chemical action will start visible combustion as easily as the application of a torch. Vegetable oil spread over easily carbonized substances such as cotton rags or waste will ignite the latter very quickly as the cotton fibre furnishes a sort of tinder.

STICKING VALVE CAPS.

When a car has been operated for a considerable period without attention to valve seats, it is sometimes difficult to remove the caps which have become rusted into place. If it be impossible to remove them with the ordinary tools or those designed for the particular make of machine, they can be started by running the motor long enough for them to become hot and pour on water or lay a piece of ice in the recess or hollow provided for the wrench. The latter should be applied immediately and given a sharp pull or tap with a mallet. This will invariably loosen the most refractory member.

Before replacing, the threads should be coated with a mixture of oil and graphite as this will not only prevent rusting but will facilitate removal when desired. If graphite be not handy, beeswax can be utilized. The threads should be heated before applying the wax.

HARDENING TAPER REAMERS.

The hardening of long taper reamers of small diameter, so as to prevent them from coming through bent or curved, is a difficult operation. The following method has been used successfully and consists of annealing the steel a second time before the finishing cut is taken, and heating slowly in a low fire by packing it in an iron tube or box with powdered charcoal, fine sand or clean ashes, then finished. The heating for hardening should be performed in the same manner as the re-annealing.

When the box and reamer have been heated thoroughly to a bright cherry red the tool should be carefully withdrawn endwise, so as to prevent the possibility of bending while hot, and immediately quenched vertically in an oil bath. Any variation from the latter position while dipping is liable to warp the work, through one side cooling faster than the other. In drawing the temper care should be taken to heat the metal evenly on all sides, so as to bring it to the same straw color, brown or light blue. Long delicate reamers always should be ground to size after the hardening and tempering operations.

REPLACING WORN VALVES.

Occasionally an owner brings a car into the shop, complaining that the engine does not run satisfactorily and misses when throttled down. This is due to wear of the valve stems or in the guides, which condition allows auxiliary air to be drawn into the cylinder and weakens the mixture. If new valves and guides can be secured it is an easy matter to remedy the trouble, but if the expense of replacing them be heavy, or if the guides be integral with the cylinders, other means must be adopted.

The valve guides should first be reamed out true, and this may be done with a fluted reamer. If they are cast in a unit with the cylinders, the member should be bolted down to the table of a drilling machine, so that the cutter can be put through the guide in position. The tool should run true.

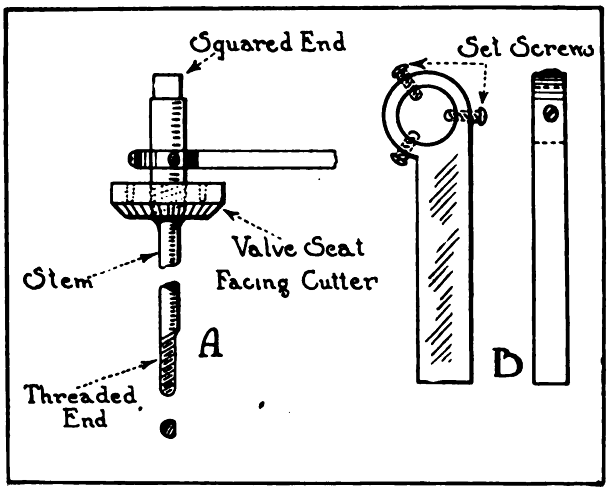

Fig. 2—Valve Cutter and Rest for Steadying Tool.

A valve cutter to recut the valve seat is shown at Fig. 2. The spindle is made of good mild steel and the cutter of the same material and case-hardened. It is not absolutely essential that the teeth be spaced equally and these may be from 19 to 23 in number. The end of the spindle is squared to take a tap wrench utilized to revolve the tool which should be made considerably larger than the valve seat.

If sufficient pressure cannot be brought to bear by hand, the lower end of the instrument can be threaded to take a nut and a flat surface should be filed on this section so that a D washer may be fitted. If the valve cap opening will not permit of the insertion of the cutter, it can be introduced from the cylinder and dropped on the valve seat. The stem is then inserted and screwed by utilizing the drilled holes in the head of the cutter.

Where new valves are required and when these are larger than can be used, they have to be turned to size. Sometimes old ones may be utilized and usually these are better than new as there is little danger of flaws. If the latter are to be used they will, as a rule, require but little turning. They should be centred quite true and if the shop equipment does not include a steadying rest, one can be made as shown in Fig. 2. A piece of .3125-inch plate is drilled to take three brass screws. The device should be held in the slide rest, and the valve chucked true by the projection on the head. The valve may then be centred with a square centre in the usual way.

When new valves are used the cotter or key holes must be made. In Fig. 3 is shown a jig for this purpose. It is made out of a piece of .75-inch square or round mild steel, on which two flats are filed parallel to one another. A hole is drilled through it from end to end to fit the valve stem. Another is also drilled and tapped to take a setscrew which is utilized to hold the stem.

A line is then marked on the jig true to the valve stem, when the base is square, and for the holes. The stem is then placed in the jig, the screw tightened, and one hole drilled on each valve. The first one is then replaced, a tight fitting cotter pin pushed through the jig and stem and the second hole drilled. This is repeated with the other valves. The third hole is made with the pin in the second hole and so on until all have been drilled.

The reason for the use of the cotter is that in marking the jig, the holes should be made just to break into one another. When drilling one at a time if the pin is in the adjoining hole the drilling is done against solid metal, and there is no danger of the tool breaking through.

LIGHTING SYSTEM NEGLECTED.

Many a motorist has been obliged to drive slowly as well as cautiously at night on a country road because of a faulty lighting system. This important member of the motor car is easily neglected and usually receives attention only when necessity demands an overhauling. The rubber tubing deteriorates and minute cracks appear, through which the acetylene gas escapes.

This also applies to that section of the tube attached to the outlet leading to the burner. Tubing should be examined and replaced as soon as its surface becomes hardened. It should also be wired to the metal piping where the latter is employed. Leaks will appear in rubber tubing especially if it is old and the gas burners clogged, as with gas tanks, a considerable pressure is developed.

The gas burners should be cleaned as the openings through which the gas passes are very small and easily stopped by particles of dust. Some owners complain that they do not get good results from gas tanks; that they vary considerably in the number of hours of light. This is usually due to leaks or the system being dirty. Aside from annoyance, leaky tubing is dangerous as the gas is easily ignited and liable to set the car on fire.

CLEANING CIRCULATING SYSTEM.

A clogged circulating system may be cleaned thoroughly by a solution of soda, followed by hydrochloric acid. The former dissolves the greases in the tubes, while the latter removes the rust and scale. In the average case a 25 per cent. solution of the commercial grade of the acid would probably do the work in from 15 to 20 minutes. The system should be washed out thoroughly after using both solutions.

LEAKY RADIATORS.

Some owners of cars complain that they cannot effectually stop radiators from leaking, although they have been removed from the car and soldered, after which, being tested with air pressure, the cooling member was apparently tight. Often vibration will create a leak especially if corrosion has begun. Leaks are sometimes caused by the device holding the radiator being sprung or the frame bent. An owner who was annoyed by a leaky radiator and who expended a large sum for repairs, effected a remedy by placing strips of rubber between the radiator and its seat, thus minimizing the vibration.

LUBRICATION TROUBLES.

With the approach of warm weather the owners of some cars are experiencing difficulty in preventing grease working from the differential out through the axle housing to brake drum from whence it is thrown about by the revolving wheel. This results in the tire becoming plastered with dirty grease, as well as the fender and the adjoining members.

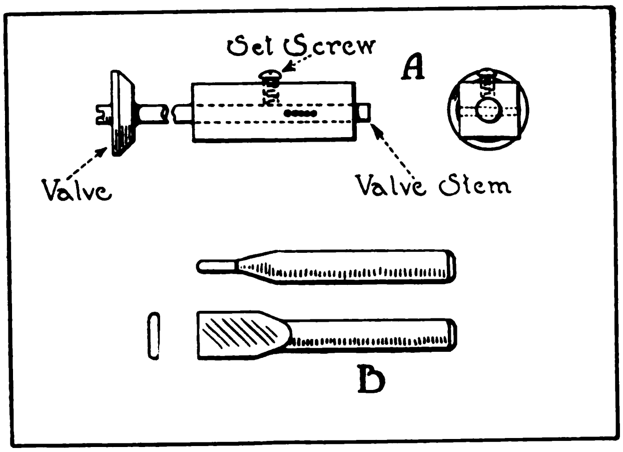

Fig. 3—Jig for Drilling Valve Stems and Drift for Clearing Holes.

Oil is decidedly injurious to rubber and the task of cleaning the casing as well as the car is not pleasant. In packing the differential a good grade of grease or non-fluid oil should be used, one that has a sufficiently high melting point to withstand frictional heat. The old lubricant should be removed and gears thoroughly cleaned before applying new. Should this fail to prevent the grease working out, felt washers may be inserted on either side of the differential.

To Harden Iron Superficially—(a) Mix two parts potash, 16 parts burned ox-hoofs, or burned leather parings and eight parts of soot-black, all finely pulverized, with ox-blood or tallow to a dough and spread the mixture thickly on the iron, heated to a dark red. The iron is then to be heated to redness and cooled in clean water. (The hoof horn and leather scraps must be heated to a brown, not black, coal, in an iron kettle and then pulverized.) (b) Thirty parts horn charcoal, five parts rasped wood, 10 parts potash niter, 60 parts common salt, 7.5 parts glue (salt previously roasted). (c) Eight parts soot, eight parts sal ammoniac, 20 parts charcoal powder, mixed to a paste with a solution of carbonate of ammonia.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Protecting Pouring Fuel from Cans.

(104)—Can you tell me if there is any way of pouring gasoline from cans fitted with screw tops on one side of the container without spilling the fluid? I buy my fuel and store it in five-gallon cans used formerly for oil. I have tried the usual method of pouring with the vent at the highest point, but am not successful. As my garage is not wired for electricity and I use gas lights, I am afraid of the fuel exploding while filling my tank at night. JOHN WILLIAMS.

Savannah, Ga., Sept. 8.

A device has been brought out by an English concern called "The Liquall Safety Petrol Filler," a sketch of which is shown at Fig. 1. The large threaded end is screwed on to the ordinary gasoline can, and as shown in part section a division is formed in the filter whereby air can enter the container as the fuel is poured out. The position of the air vent is clearly shown in the drawing. At the small end of the filler is fitted a gauze cup which strains the liquid as it passes out. It is claimed that owing to the design of the air vent, a two-gallon can may be emptied in 40 seconds. The large threaded end is "stepped," allowing it to be used on cans of differing sizes.

Relative to Horsepower.

(105)—To settle a dispute please advise me of the meaning of the letters A. L. A. M. as applied to motor horsepower rating? Also, the difference of horsepower between a straight line drive and that of a shaft at any angle? C. A. WINTER.

Wellsville, Kan., Aug. 15.

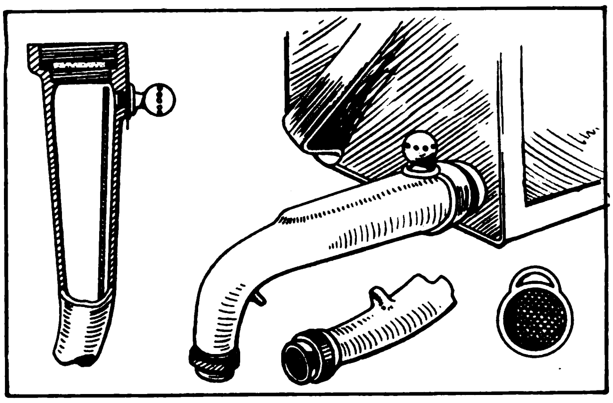

Fig. 1—Filler Device Admitting Air to Fuel Container.

The letters referred to are an abbreviation of the Association of Licensed Automobile Manufacturers which organization utilized a standard formula for approximate rating of gasoline engines used in automobiles. It is based on an assumed piston speed of 1000 feet a minute, and was originated by the Royal Automobile Club of Great Britain. The A. L. A. M. has been reorganized as the Automobile Board of Trade and the horsepower rating adopted by it has been accepted by the Society of Automobile Engineers, and will be known in the future as the S. A. E.

The efficiency of a straight line drive such as a chain is estimated at 90 per cent. while that of a shaft with gears delivers approximately 86 per cent. These figures are based upon experiments of the chief engineer of a leading motor car factory.

Flooding of Carburetor.

(106)—I have a 1910 model ——— car and my ——— carburetor always leaks when I shut the engine off, but does not do so when it is running. The float seems to be level, and the gas valve tight. At least I cannot blow through the latter when I hold the float up. RALPH SEIPP.

Hazel, S. D., Sept. 11.

Flooding is caused usually by dirt on the inlet valve seat, or poor seating of the valve and this may be brought about by some injury when cleaning or installing the device. If the float be too high the fuel will overflow and the conditions described result. The correct position or level of the gasoline should be between .03125 and .0625 inch below the tip of the spraying nozzle. When flooding is due to dirt it can be stopped sometimes by priming and allowing the fuel to flush out the foreign elements by opening the petcocks. It is possible that the inlet valve does not seat properly and grinding this may help. This is a delicate task and the use of emery should be avoided.

Carburetor Troubles.

(107)—Will you please help me in the following trouble? I have a ——— car with a ——— carburetor from which I only get half power. This is when the throttle is wide open, but I get better results with it only half open. I wrote the manufacturers of the car and they said they would give me a new ——— carburetor with ball valve. Would it be wise to put this on, as the old one gives fair results? What is the ——— with ball valve? What is the reason I cannot get more power from the old one when the throttle is wide open? G. G. WHITE.

Elkader, Mass., Aug. 21.

The trouble with the present form is that the needle has not been properly set. The gasoline needle valve should be set to the proper amount of flow for slow speed, while the auxiliary air valve should be arranged to give the right amount of air at highest speeds. Since your trouble is at the latter, it would be well to look that over first. This is done as follows:

Run the engine as fast as possible. Turn the auxiliary air valve regulating screw up and note if the speed increases or decreases. If it decreases, turn the screw down and note the result. This can be varied by large amounts, turning the screw rapidly so as to get a result quickly. If the direction of turning which brings about the highest speed is not clear, turn more slowly, first in one direction and then the other. Having found the approximate point, try for the highest possible speed close to that.

While highest speed does not always agree exactly with greatest power, it does approximately, and the setting of the valve should not be changed until one is certain that it is not right for power. A good way to do is to try out the adjustment on the level for car speed, then go to a steep hill and try it out for hill climbing ability. If you can improve the old carburetor to give the best results, it is well to stick to it and not use the new one, although the fact that the manufacturer recommends a change and offers to give you a different make may mean that others have found the same fault, and the new device is offered as a better substitute.

Carbide Impelled Engine.

(108)—I am one of your Journal readers, very much interested in gas engines and have an idea for a design of a carbide gas engine upon which I would like some advice. This engine will, I think, be cheaper to operate than gasoline. Please answer the following questions: (1)—To what pressure, in pounds, can carbide generate gas? (2)—What amount of carbide and water are necessary to give a pressure of 50 pounds a cubic foot? (3)—What is the average heat generated in the formation of gas by carbide and water, and would the gas give the same pressure hot or cold? (4)—Could this gas be used in a six-cylinder engine, working two-cycle? (5)—What is the price of carbide in 100-pound lots? Has any one ever tried to build an engine of this character? E. H. SLAVIC.

New York City, Aug. 20.

No one has ever tried to build an engine of this character, for the simple reason that it is not a practical scheme. To begin with a heat engine must produce a very large amount of heat and reject but a small portion of it. Acetylene gas, the product of calcium carbide and water, is a medium which would not furnish either, hence it would be inefficient. Moreover, it is expensive, comparatively speaking. In 100-pound cans, carbide is $4.50, or 4.5 cents a pound, while in smaller amounts it varies from twice that upwards.

The average gravity of gasoline today is from 58 to 66. At the latter figure it weighs 5.5 pounds a gallon, so that at 16 cents a gallon, the price a pound is 2.91 cents. At 60 degrees, the weight is but five pounds a gallon, so the price of 16 cents is equivalent to 3.2 cents a pound. The first figure is 35 per cent. and the last 29 per cent. cheaper than carbide even when buying the liquid in small lots and the calcium in large quantities.

The various pressures cannot be given with any degree of accuracy, but the opinion ventured is that no pressure above a few pounds could be obtained. If a pressure in excess of the weight of water in the tank plus the value of its head or height above the carbide, were generated the gas pressure would prevent the water from flowing, and thus stop the further generation of gas. Such being the case, a generator would have to be used in which the gas was drawn out as fast as it was formed, this requiring a vacuum pump. Even then, to obtain higher pressures than say 15-20 pounds would require a source of outside pressure, as a power driven compressor.

Similarly, the exact amount of water necessary for gasification of a given weight of carbide cannot be given for the reason that water varies greatly in purity as does also the calcium product. No information is available as to the heat generated, but it is considerable. Finally, it is doubted if this gas, even separately compressed, could be used with success in any form of engine, while as shown above, even were this possible and the engine developed to an efficiency equal to the best gasoline engines, the cost of power would be greater than under the present method.

Valve Timing Angles.

(109)—Please tell me through the very valuable columns of Queries how to time the valves and spark in two-cylinder and four-cylinder automobile engines. Give a diagram of the workings, as there are no marks on the balance wheels of the cars I am interested in.

W. J. HILL.

Boston, Mass., Sept. 13.

In timing an engine of any number of cylinders, it is only necessary to have a valve timing diagram for one cylinder, then all four or two as the case may be, are timed from this, taking them in the order in which the pistons rise. That is to say, the crankshaft as the maker designed and machined it will govern the firing order of the cylinders. Each one should have its valves timed according to the diagram, taking the four in this firing order sequence.

Fig. 2 shows a valve timing diagram. This is self sufficient but will be gone over in detail to emphasize the main points. Starting with the inlet valve, for it is necessary to get a charge into the cylinder before it can be compressed or fired, this may open at 15 degrees past the upper dead centre. To determine the dead centres, open the top of the cylinders, either taking out a spark plug or otherwise making an opening through to the piston. In this place a stick which will rest on the top of the piston. Turn the engine over slowly, noting where the stick comes out of the cylinder the greatest distance. After turning over several times this can be noted accurately and marked on the stick, as well as on the flywheel with a temporary mark.

It will be well at the same time, to mark the lower dead centre. This will be found in the same way, except that the point to be noted then is the lowest point of the piston, which will be the point at which the stick goes down into the cylinder the greatest distance.

Having these two points marked, the flywheel will be turned in the direction in which it runs normally for 15 degrees. On your flywheel mark this as the point of inlet valve opening. Then continue turning down to the lower dead centre and 25 degrees past it. Mark this the point of inlet valve closing. Continue turning in the same direction up to the upper centre again and from five to 10 degrees past it. This will be the firing point. For slow speeds like at starting, 10 degrees or higher should be used, while at higher speeds and normal running about five or less is used. For very high speeds as in racing the firing point goes back past the upper centre.

Turning once more in the same direction go down to within 35 degrees of the lower centre and mark this point exhaust valve opening. Continue past the lower centre and around up past the upper centre five degrees. Mark this exhaust valve closes. Between this and the point of beginning there will be an interval of 10 degrees, the flywheel at this point having made two complete revolutions.

Now having all of your points marked on the flywheel, take off the valve caps, so as to observe the valve action. You will also require a very thin sheet of paper, like a cigarette paper folded once. Place this latter between the top of the inlet valve lifter and the lower end of the inlet valve of the cylinder you are going to start on, and turn your flywheel as before.

Turn first to the point marked inlet valve opening. Up to within a very little bit of the exact point of opening, it will be possible to pull the paper out of the clearance space, but at the opening point, it will be held firmly. Going around to the next point, that of inlet valve closing, the paper will be held firmly, until the exact point of closing is reached when it will be free and you can pull it out. Do not depend entirely upon the paper, but observe the valve motion through the valve cap opening, using if necessary a stick as with the piston to observe its rise and fall. If the valve does not open and close at the points indicated, the cam must be shifted or the adjustment changed so as to get this action. This statement is, however, subject to the modification that if the opening be adjusted to agree with the flywheel marks, the closing may differ slightly, as the maker may have designed his cams for a slightly different diagram.

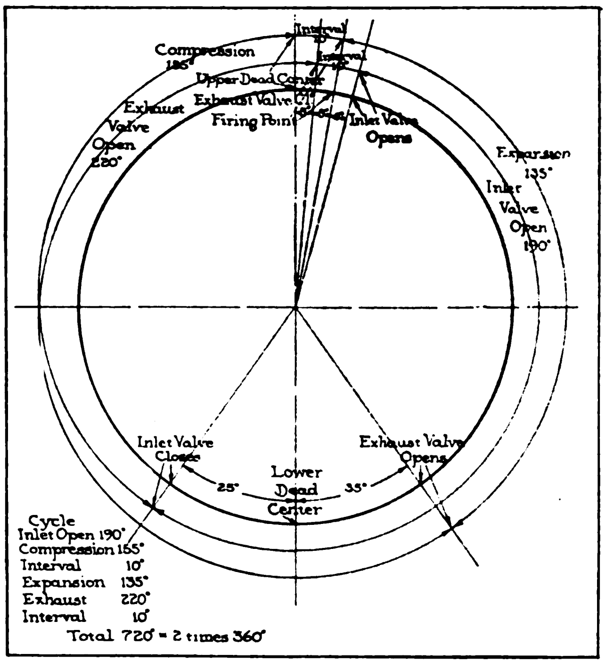

Fig. 2—Chart Outlining Standard Methods of Valve Timing for Two and Four-Cylinder Engines.

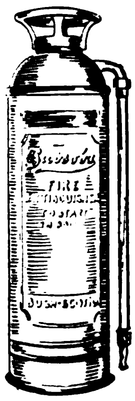
Transfer your paper and sticks to the exhaust valve of the same cylinder, and continue turning the flywheel. At the mark exhaust valve opening, just above the lower dead centre, note if the valve does actually open. If it does not, change adjustment or cam, or both, so as to make it. Then try for the point of exhaust closing just past the upper centre.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

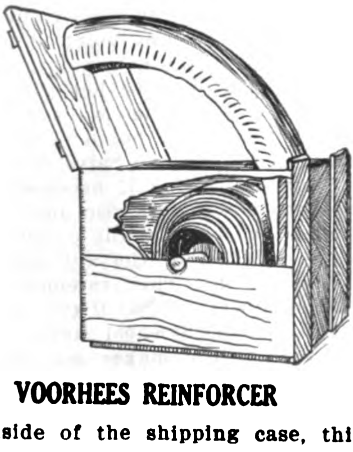
The Buscoba Fire Extinguisher is made by the Bush-Scott Company, 31 Woodward avenue, Detroit, and is of the liquid variety. It is of the conventional type, in which it is only necessary to turn it bottom up with a jerk to start the extinguishing fluid. It is tested to 350 pounds pressure, and is strongly constructed so that neither bottom nor top can be blown off, or the hose torn off. The metal is heavy Lake Superior cold rolled copper. The capacity of the extinguisher is three gallons, which is ample to take care of a good sized blade. The liquid liberates carbon dioxide gas, which smothers the fire effectually.

Buscoba Extinguisher



★

Voorhees Ideal Reinforcer is manufactured for the convenience of tire repairers and comes in reels of 50 and 150-foot lengths, mounted on a spindle which fits inside of the shipping case, this arrangement making for accessibility as well as keeping the material clean. It is utilized for the reinforcement and protection of tires, and is produced by the Voorhees Rubber Manufacturing Company, which concern maintains offices at Jersey City, N. J., New York City and Boston.

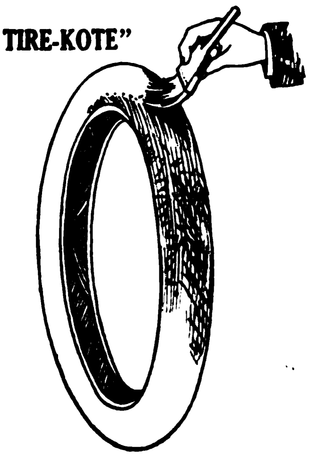


VOORHEES REINFORCER

★

Tire-Kote is a liquid preparation made by the Page-Lester Company, Chicago, for preventing the deterioration of tires when not in use, as well as when in service. The fluid is applied with a brush after the surface has been cleaned thoroughly and it is said that it will dry in about 10 minutes. By its use cracks, crevices and cuts are filled and the preservative prevents action of oils, water, sun or other deteriorating influences. A feature emphasized of Tire-Kote is that shabby and travel-stained shoes are made to look like new as it imparts a white color. It is stated by the maker that the composition is not affected by mud and is thoroughly water and weather proof.

"TIRE-KOTE"



★

The Burn-Boston Liquid Battery, made by the Burn-Boston Battery & Manufacturing Works, Boston, is produced in two forms, water and moisture proof, the latter type being known as the No-loss. They are similar to the usual square dry cell and require the same number in a set, but it is claimed that they will give considerably longer service and will not deteriorate when out of service. This is due to the composition of the electrolyte which is liquid, non-freezing and non-sulphating, and will not evaporate. The zinc connection of each cell is a flexible wire, permanently attached. Each carbon terminal is equipped with a lock washer, preventing a connection from working loose by vibration. The voltage of each member is 1.5 and amperage about 20.

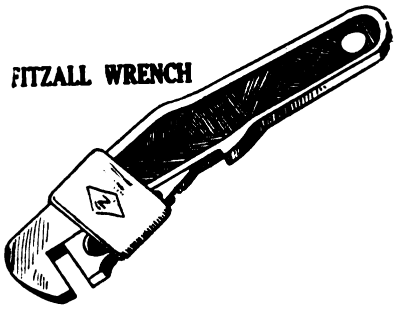
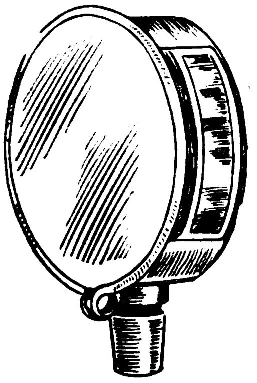
Fitzall Wrenches, so named because of their fitting and adjustable qualities, present a new application of a well known mechanical principle, that of the inclined plane or wedge. They consist of a shank having a fixed jaw, a wedge shaped slideable jaw or tooth block, and a movable locking band. The latter two members slide easily and are locked positively when pressure is applied. In addition to being instantaneous in action they are free from knurled nuts, screws, etc., and permit of openings of varying dimensions very quickly. The only wearing part is said to be the tooth block which is removable and may be renewed at a very slight expense. They are manufactured by the Standard Wrench & Tool Company, Providence, R. I.

FITZALL WRENCH



Edmunds & Jones Tail Light, produced by the Edmunds & Jones Manufacturing Company, Detroit, is operated by electricity and has in addition to the usual red semaphore a white lens by means of which the license plate is illuminated. The lamp is constructed of a high grade material, compact and very neat in appearance. By removing a set screw the member may be dismantled for inspection or adjustments. It is dust, moisture and weather proof.



EDMUNDS & JONES

Young's Self-Lighter is a practical device which will appeal to motorists whose cars are equipped with acetylene. By it the lamps may be lighted or extinguished without the driver leaving the seat, the operation involving but a turn of a valve and a throw of a switch lever. A feature of the equipment is its simplicity. Anyone may attach the entire outfit in a few minutes and once installed it does not require any attention whatsoever. The burners consist of the usual members but carry a wire which is utilized for jumping a spark across the gap, which ignites the acetylene. The construction of the burners is such that the heat does not affect the lighting device or its operation. The system includes a special switch, a gas valve and the burners. The switch is fastened to the dash and a wire leads from it to one of the burners and a second lead to the secondary terminal of the regular coil. The gas regulating device is also mounted upon the dash and is operated easily. When the use of the lights is desired the valve is turned and the switch lever moved, thus closing a circuit and causing a series of sparks to jump across the gap in the wires at the burner. Another position of the lever extinguishes the lamps and shuts off the gas. The self-lighter is not expensive and does not interfere with the use of the lights in the ordinary manner. It is manufactured by A. G. Young, Pittsburg, Penn. William H. Pollack, 607 Webster avenue of the same city, is selling agent.

YOUNG'S SELF LIGHTER

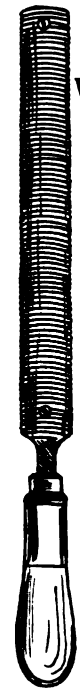
The Vixen File, for which the maker claims non-clogging and superior abrasive qualities, is the product of the Vixen Tool Company, Philadelphia. It was invented by Alexis Vernaz of Switzerland and has deep semi-circular teeth on either side, the design of which produces, it is stated, a keen cutting edge as well as a shearing cut. The tools are made of a very high grade crucible steel and the teeth are cut one at a time with an end mill shaped like a hollow cylinder, and the edge beveled off to an angle of 60 degrees. This method of forming the teeth leaves the steel untouched as regards its constituent parts. The Vixen file will permit of resharpening from four to six times. It is made in different styles and sizes.



VIXEN FILE

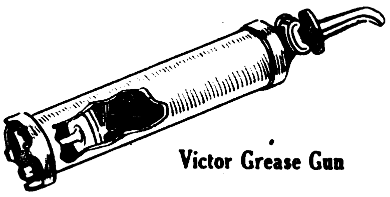
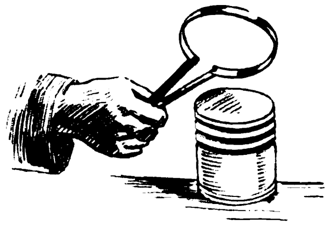
The Victor Grease Gun, marketed by the Judd & Leland Manufacturing Company, Clifton Springs, N. Y., will appeal to motorists as the device holds two pounds of lubricant which is not injected into the differential or other part by the usual method, but by the utilization of a tire pump. The spout end of the gun is removable, and having a three-inch aperture is filled easily. The pump is then attached and a few strokes produces sufficient compressed air to force the lubricant out of the gun when the stop cock, with which the instrument is fitted, is turned to an open point. The gun is equipped with a reducer adaptable to the spout for service when lubricating universal joints, etc.



Victor Grease Gun

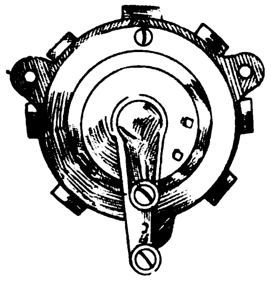
* * *

The Sword Piston Ring Remover, made by the Sword Manufacturing Company, Inc., New London, Conn., is designed to make easy the removal and replacement of piston rings, it being claimed that these members may be handled without danger of breaking. It will appeal to the owner who repairs his own car as the rings may be held securely when replacing a cylinder without danger of pinching the fingers. The device resembles a pair of pliers and its ends are so constructed that they will fit any type of ring. In practise the ends of the tool are fitted to the ring and when the jaws are expanded the ring may be removed easily. The replacement of the member is also a simple matter.



Sword Piston Ring Holder

The Crary Self-Starter, made by the T. C. F. Manufacturing Company, Detroit, differs from those of ordinary form, inasmuch as the acetylene may be admitted to both

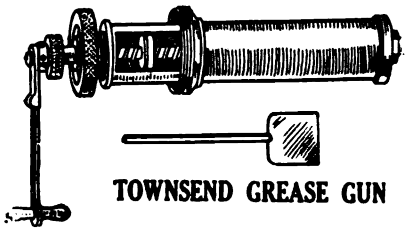


Crary Self-Starter

the cylinders and the intake manifold. The flow of the gas and the proportions thereof are controlled by a special distributor and the needle valve member is included in the dash device. The latter is equipped with two levers, these serving to operate the needle valve and distributor. The smaller member is removable, locking the device. It is pointed out that the gas may be shut off from the dash as well as the amount regulated to secure a proper mixture.

★

The Townsend Grease Gun differs from the usual device utilized for the handling of hard lubricants as it may be completely filled, is clean to handle, and is operated easily and quickly. It comprises two seamless brass tubes, telescoped together. The outer member is equipped with a threaded cap which is movably mounted upon a rod or plunger. The outer end of the larger barrel is threaded for the purpose of attaching a cap when the grease gun is being operated and to allow the inner barrel to be moved out when lubricant is being inserted. The inner tube is open at the forward end and closed at the rear. A screw .375 inch in diameter and eight inches long is journalled in

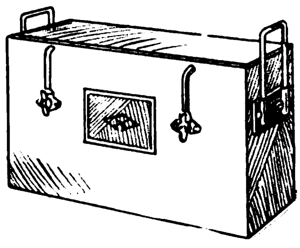


TOWNSEND GREASE GUN

the rear end of the inner tube, and is fitted with a jointed handle. Attached to the screw member is a piston with a lip which fills the opening and also stops the lubricant from crawling backward. This lip prevents the piston from turning, but when the handle is rotated the screw revolves and the piston travels along the tube, pushing the grease before it. The inner tube has a section cut away and this is filled with lubricant by means of a steel paddle. When the compartment is filled, the inner tube is moved inward and the cap screwed on. The device is 2.5 inches in diameter, eight long and holds about one pound of lubricant. The nozzle member is slightly curved and its opening is approximately .1875 inch in diameter. It is said that the gun may be filled and emptied in about 40 seconds and that it may be loaded without soiling the hands. Owing to the liberal sized opening in the inner tube and the fact that this member is loaded separately, air pockets are avoided and the gun may be completely filled. It is made by S. P. Townsend & Co., Orange, N. J.

★

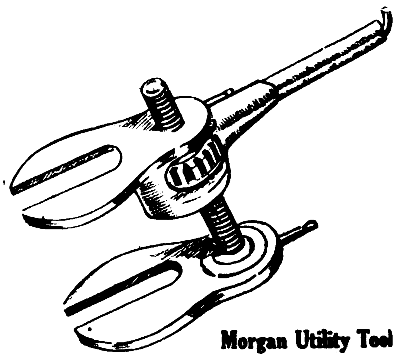
The Philadelphia Storage Battery is a new product of the Philadelphia Storage Battery Company,



Philadelphia Storage Battery

Ontario and C streets, Philadelphia, Penn., and was designed especially for motor car service and for utilization both for ignition and lighting. A feature of the battery is the use of thin plates, an arrangement decreasing the weight of the cells, and it is claimed by the maker that the amperage capacity is augmented. They are made in three types, the ampere-hour capacity being 54, 72 and 90, respectively, and the voltage six, which is standard. These batteries are very compact for a given capacity, the smallest member being approximately eight inches high, six wide and eight long. The largest battery is of the same dimensions except length which is 13 inches. They are fitted with neat handles, facilitating the replacement and removal of the member and the terminals are easy of access and are said to be non-corrosive.

The Morgan Utility Tool is manufactured by B. Morgan, Newport, R. I., who has placed upon the market a number of practical accessories. It is a useful device

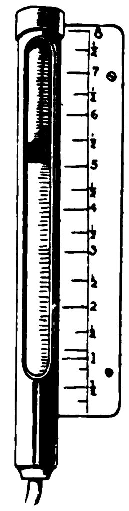


Morgan Utility Tool

inasmuch as it may be utilized for a number of purposes in the repair shop and garage, or upon the automobile. It comprises two slotted jaws, one of which is securely fastened to a threaded bolt while the other member is actuated by a ratchet. This arrangement permits of contracting or compressing the jaws when removing or replacing valve springs or stretching these members. Another use to which the tool may be put is that of holding patches on an inner tube, and it may also be attached to the running board and employed as a vise.

★

Rudell's Gasoline Register is made by the California Novelty Art Company, 618 South Olive street, Los Angeles, Cal., and, as its name indicates, registers the amount of gasoline in the tank. It is not dependent for its operation upon floats, springs or compres-



Rudell Gasoline Register

sion parts which may wear and get out of order. It is simple in construction and may be attached in less than 20 minutes and its advantages are obvious.

MAGNETOS FOR GAS ENGINE SERVICE.*

Principles Involved in the Design of Standard Instruments, Features of Construction and Conditions Essential to Efficient and Continued Operation of This Generally Adopted Source of Electric Energy.

(Continued from August Issue.)

Sometimes the grounding wire leading from the magneto to the switch may become short circuited with the frame at certain points before it reaches that member, and of course this will cause irregular ignition or put the magneto out of commission altogether. With a battery and coil system a shorted ground wire makes no difference with the engine operation.

If the spark produced is regular but weak, the magnets may have lost a portion of their strength and must be remagnetized. A rough test to determine if the magnets are sufficiently strong is to remove two pairs of them from the pole pieces and see if either couple will support the weight of the other. Care should be taken to always replace the magnets so the like poles will all be on the same side of the base. If the magnets will not sustain their own weight, they should be remagnetized preferably by the manufacturer, or other capable electrician.

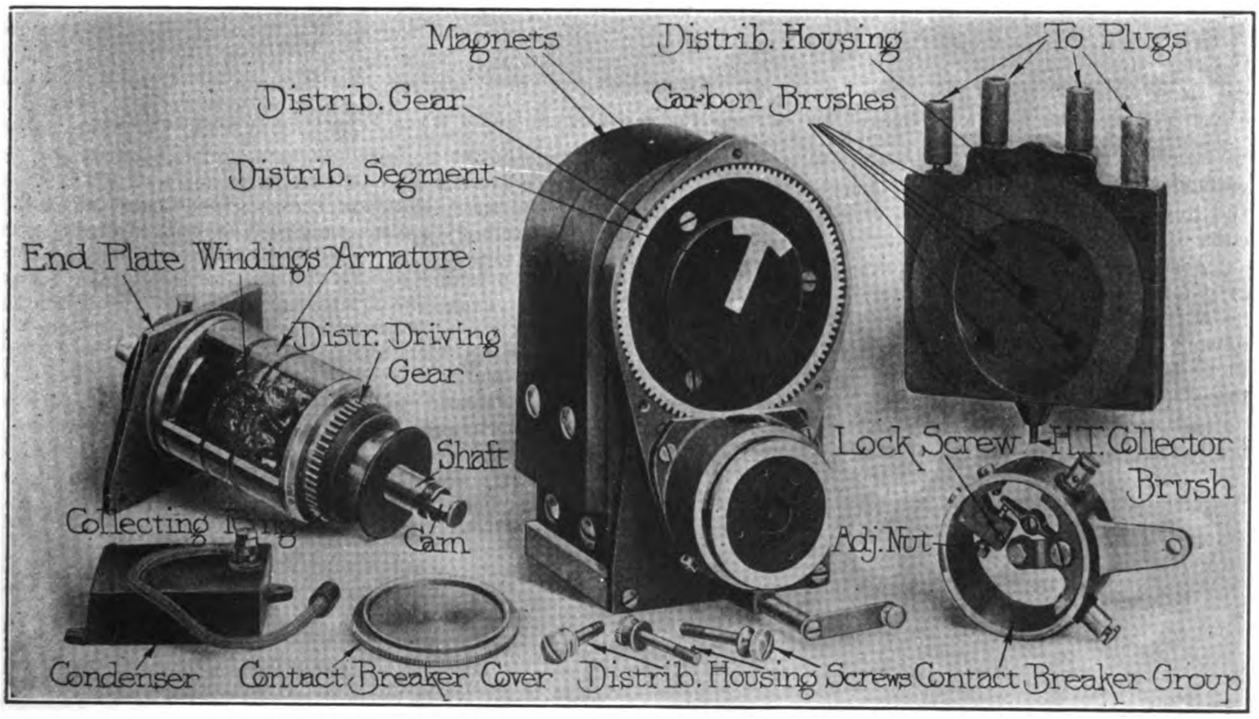


Fig. 54—Volta High-Tension Magneto Dismembered to Show Construction of Important Parts.

Cleanliness Important.

If the magneto be unclean, wash it out with gasoline, and let it dry thoroughly before starting the car. If the secondary current sparks between the disrupter points it means that there is a broken or detached plug wire. There have been cases, in the writer's experience, where a magneto had not been properly installed; of the driving gear on the armature shaft, which was simply forced on a taper, slipping, which, of course, changed the proper timing. It is advisable to securely fasten these driving gears to the armature shaft by means of suitable keys or taper pins after proper timing has been ascertained. Never take a magneto armature or condenser apart, as there is no need, there being little liability of internal derangement. If such is suspected, have repairs made by the manufacturer or by an electrical expert familiar with magneto design and construction.

Adjusting Contact Points.

In adjusting the platinum points at the contact breaker several conditions should be noted, first that these are firm in the screw and lever, and that the surfaces are not burnt, pitted or otherwise roughened. Beads of metal on one surface will cause a closed circuit even when the points are separated, as will deposits of carbonized oil or metallic or carboniferous particles. The sole precaution to be observed, after the surfaces are trued (if they need this) is that the points are adjusted so that the gap when the circuit is fully broken will conform to the gauge furnished by the makers, which is approximately .015625-inch, sometimes less. The lock nut is loosened, the screw moved up or down as the case may be, and the lock nut again tightened.

Timing Low-Tension Magneto Igniter Plates.

On cars fitted with low-tension make and break plates it is sometimes necessary to retime the engine in order to obtain the best balanced operation. There are several points where deterioration will soon cause lost motion, and as the points wear down they should be retimed that the ignition of all cylinders will remain synchronized.

All low-tension systems, whether or not current comes from a magneto, are arranged to separately adjust the ignition time in the cylinders by varying the point of make and break on the igniter plate, and

---

*This article, which is descriptive of a number of the best known magnetos to be found in the market, and which are standard with motorists, is reproduced from the "A B C of Magneto Ignition Systems," one of the series of Standard Handbooks of Automobile Mechanics published by The Automobile Journal Publishing Company.

in event of trouble it is well to see that this timing coincides with the point of armature position where the lines of magnetic force are deflected through the coils of the armature.

Assuming that the adjustment of some particular cylinder is in proper condition, the crankshaft should be turned in the direction of its working rotation, never backward, until the piston in the cylinder known to be in proper time is nearly at the end of its compression stroke. Then the spark lever should be advanced carefully until the points on the igniter are just about to break contact, and the spark lever should be left in this condition until all cylinders are tested.

The crankshaft is then turned forward half a revolution at a time and each piston brought up to within one-quarter to three-eighths inch of the end of its compression stroke and the necessary adjustment made to cause the igniter to just about break contact. This may be timed with great exactness by the use of an electric bell and a few cells of dry battery. The wiring circuit is as shown in Fig. 16 and the exact point of breakage can be detected because the bell will stop ringing, starting again as soon as contact is made. In order to prevent con-

stant ringing of the bell, it is well to have a small switch in the circuit, or to have one wire attached to either the bell or the battery in such a manner that contact may be broken until one wishes to test the time of breaking contact at the igniter plate.

The reason for not turning the crankshaft backward is that this will cause any lost motion in the gears and connections to show itself in the spark timing. The magneto should never be removed or its gears taken out of mesh without first assuring one's self that they are marked, so that they can be replaced as before. If they are not so marked, they should be before they are unmeshed.

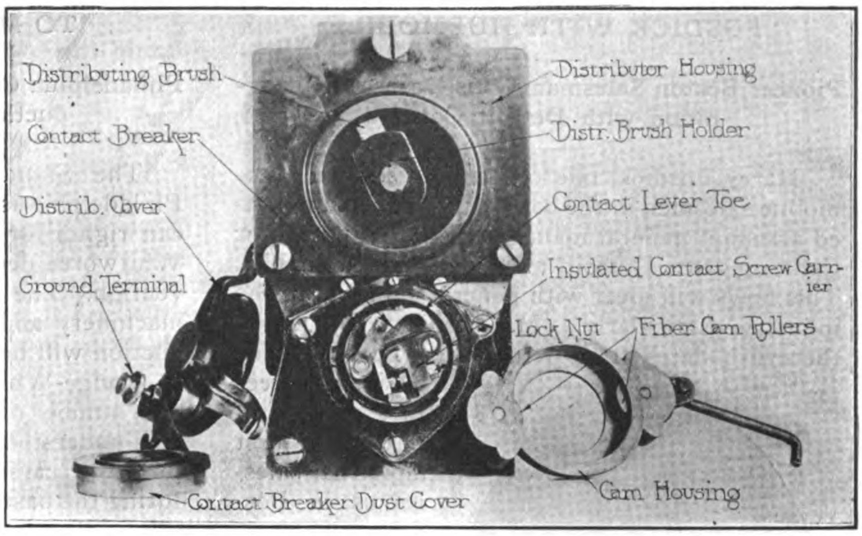

Fig. 57—Showing Distinctive Contact Breaker Employed on Bosch Magneto.

Armature Position Important.

The relation which should exist between the position of the armature and the point of break of the points at the igniter plate is very important. The correct angular engagement of the magneto armature with its driving gear is that at which the armature is practically vertical when the spark lever is advanced the limit. This position is shown in sketch at Fig. 16. By vertical is meant that the iron poles of the armature are bridging the gaps between the pole pieces of the magnets. In other words, the armature core may be likened to a letter H which is lying on its side. The exact position of the armature core should be a little backward from the vertical position rather than a little forward if the position of the gear teeth make this choice necessary. The armature of the magneto should never be removed without a piece of soft iron being placed across the poles of the fields of the magnets to prevent the latter from gradually losing their strength.

LOCATING LEAKY CYLINDER.

When water is leaking from a water jacket into one of the cylinders of a multi-cylinder internal combustion motor, it is often a difficult task to ascertain which is at fault. One method of locating the trouble is to fill the radiator to its top and turn the engine slowly, noting which cylinder is compressing. If for instance the leak is in the No. 1 cylinder, the water will flow out of the radiator when that cylinder is compressing. This will be brought about by the gas in the combustion chamber blowing through the leaky place and forcing the water out of the jacket into the radiator, thus causing an overflow. By watching each cylinder the troublesome member may be located.

ROAD REPAIR FOR GASOLINE UNION.

A motorcyclist accidentally broke the gasoline pipe where the cone end is soldered on to the pipe, and being some distance from a place where the damaged member could be resoldered, made a temporary repair in the following manner: Possessing a piece of soap and string, he moistened the latter and covered it with soap. The twine was then wrapped around the broken end of the pipe until it stood in a little ridge, in shape something like the useless cone. The end of the string was threaded under the nut which was slipped down and the end of the pipe pushed into the union of the carburetor. The nut was then screwed home and the balance of the string twisted tightly around the exterior of the joint and smeared with soap.

To Make Wood Acid Proof—Some storage batteries carried in wooden battery boxes on cars, annoy the owners by leaking or slopping of the acid. To make the wood acid proof take six pounds of wood tar and 12 pounds resin, and melt them together in an iron kettle, after which stir in eight pounds of finely powdered brick dust. The surface to be covered must be thoroughly cleaned and dried before painting with the warm preparation.

Working Steel and Iron—Steel never should be kept hot longer than necessary for the work to be done, as if left too long in the fire it will lose its steely nature and grain, assuming more of the qualities of cast iron. When steel has been subjected to heat not absolutely uniform over the whole mass care for annealing should follow. Hot steel always should be put in a perfectly dry place of even temperature while cooling. A wet floor might prove sufficient to cause serious change. It is hard to make the average worker in steel believe that very little annealing is necessary, and that a very slight change is more efficacious than a great deal.

Iron heated and suddenly cooled in water is hardened, and the breaking strain, if gradually applied, is increased, but it is more likely to snap suddenly. If heated and allowed to cool gradually it is softened and the breaking strain is reduced. If brought to a white heat iron is injured if it is not at the same time hammered and rolled.

To Make Corks Impermeable and Acid Proof—Should the gas vent cap of a cell in a storage battery become lost or broken, a cork can be utilized provided it is properly treated. Select the corks carefully. Bore a hole to allow the escape of the gas from cell. Prepare a solution of gelatin or common glue, 15 parts, in 24 parts of glycerine and 500 parts water. When preparation comes to a boiling point, immerse corks, taking care to weight them down. After boiling several hours remove and dry in the shade until free of all moisture. To render acid proof add a little ammonium dichromate to the gelatin solution.

To Clean Aluminum—Although aluminum is one of the metals most inalterable by air, nevertheless it will tarnish. It can be restored to its mat whiteness in the following manner: Immerse the articles in a boiling bath of caustic potash; next plunge them quickly into nitric acid, rinse and let dry. Gray or unsightly aluminum may be restored to its white color by washing in a mixture of 30 parts borax dissolved in 1000 parts water, with a few drops of ammonia added.

FOSDICK WITH HUPMOBILE.

Pioneer Boston Salesman Wins Deserved Recognition with Detroit Concern.

Harry Fosdick, one of the best known automobile salesmen in the country, has been appointed assistant general manager of the Hupp Motor Car Company, Detroit, maker of the Hupmobile. This news will meet with general approval in the industry, particularly as Mr. Fosdick's connection therewith dates from 1899, when he began his business career in charge of one of the first motor car salesrooms in Boston.

Harry Fosdick, Assistant General Manager, Hupp Motor Car Company.

It was under his direction that the Winton first made its appearance in New England, and later he was identified with a number of foreign importations. At one time he was vice president of the Hol-Tan Company of New York, handling the American sales of the Fiat, and afterwards he was associated with Vincenzo Lancia in introducing the Lancia car in this country. He went to the Hupp concern from the Stevens-Duryea Company, where he was sales manager for some time.

JONES SPEEDOMETER EXPANDS.

Manufacturing Facilities Almost Trebled by Additional Factory in Brooklyn.

In order to meet the greatly increased demand for its product, the Jones speedometer, recorder and other like devices, and to fill large speedometer contracts with various car manufacturers for the 1913 season, the Jones Speedometer Company, New Rochelle, N. Y., has secured additional factory facilities in the Bush Terminal, Brooklyn, N. Y. This new plant is much larger than the one in New Rochelle, and it is estimated that the production facilities will be trebled by the move.

Although it is not the intention of the company to abandon its present plant, the general offices and shipping department will be removed to the new location, Oct. 1. On that date the commercial vehicle department, now at Canal place, New York City, where recorders, hub odometers and truck speedometers are manufactured, will be moved to and consolidated with the speedometer service station in the Speedometer building,

TO MAKE WIRE WHEELS.

Philadelphia Concern Will Engage in Their Production Under British Patents.

The Standard Roller Bearing Company of Philadelphia is said to have acquired the American rights for the manufacture of the Rudge-Whitworth detachable wire wheels, a British invention. The concern is installing the necessary machinery and it is anticipated that active production will begin within the near future.

Rudge-Whitworth wheels are utilized abroad on a number of well known pleasure vehicles, and it is understood that several American manufacturers of cars have become interested in them during the past few months. It is stated that blue prints showing specifications and requirements for particular models have been filed with the Standard Roller Bearing Company for sufficient wheels to warrant production in quantities.

BAKER ELECTRIC POLICY.

Follows Example of Many Gasoline Car Producers in Abandoning Yearly Model.

While a number of makers of gasoline pleasure vehicles have announced their intention of abandoning the yearly model within the past two years, the Baker Motor Vehicle Company, Cleveland, O., is believed to be the first producer of electrics to adopt this policy. Concerning this step, O. B. Henderson, sales manager of the concern, says:

"Continuity of development is our watchword. Instead of once a year giving the purchaser the benefit of added refinements, we have found it more satisfactory to all concerned to continuously incorporate in the manufacture of the Baker electric all the improvements created up to date, so that each car we produce is the best possible car we can make, embodying everything of merit which we can put into it."

WITH INTERNATIONAL MOTOR.

Vice President Lloyd of General Vehicle Company Enters the Gasoline Field.

R. M. Lloyd, who has been connected with the General Vehicle Company, Long Island City, N. Y., maker of G. V. electric trucks, as vice president for several years, has resigned to become assistant to President Coleman of the International Motor Company, New York City, maker of Mack, Saurer and Hewitt gasoline commercial vehicles.

Following the announcement of his retirement many of his old associates were entertained by him at a dinner at his home in Oyster Bay, N. Y., at the conclusion of which he was presented with a handsome silver smoking set. The full significance of the move has not been made public, although it has been suggested for some time that the International Motor Company was anxious to enter the electric field.

NEW FACTORY BUILDINGS.

Demand for New Departure Ball Bearings Makes Necessary Additional Facilities.

Because of the largely increased orders for New Departure ball bearings, the New Departure Manufacturing Company, Bristol, Conn., finds it necessary to work all of its departments 127 hours a week and some of them 152 hours. It is stated by the company that this condition is assured for months to come, but the situation is to be relieved in a measure by the erection of additional factory buildings.

These additions will give nearly 75,000 square feet of floor space, but this will not be available until late in the fall. Three outside machine building plants, and the company's own extensive manufacturing machine shop are busy on special machine equipment for the new buildings.

DeWitt Page, secretary of the company, states that during the past year numerous leading automobile manufacturers gave the product of this concern a very exhaustive test, and as a result contracts were signed which will triple the output of the last 12 months. Naturally, the company is very much gratified, and Mr. Page is of the opinion that the entire industry should be more than ordinarily interested in the supremacy of this American product in the home market.

NEW TRUCK CONCERN.

Well Known Men Interested in Standard Company Now Being Organized in Detroit.

The list of commercial vehicle manufacturers in Detroit is to be increased by the addition of the Standard Motor Truck Company, which has been incorporated for $50,000. Among those who are active in the new concern are Howard Wilcox, for some time past connected with the Kelsey Wheel Company, and W. K. Ackerman, formerly assistant manager and purchasing agent for the Reliance Motor Truck Company, located in Owosso, Mich.

A factory at 975 Bellevue avenue, 35 by 140 feet in dimensions, has been secured, and the work of producing trucks will be begun in the near future. The vehicle is to have a capacity of three tons, and will be of standard construction throughout. The motor will be a Continental.

RESPONSIBLE FOR CARTERCAR.

Success of Well Known Friction Driven Line Now Devolves Upon H. R. Radford.

At a recent meeting of the board of directors for the General Motors Company, Harry R. Radford was elected vice president and general manager of the Cartercar Company, Pontiac, Mich., maker of the well known friction driven Cartercar line. In the future he will have complete charge of the factories of this concern, bringing the engineering, purchasing, manufacturing, advertising and selling organizations, with all of the branches in New York City, Philadelphia, Detroit, Chicago, Kansas City, Omaha and San Francisco directly under his personal direction, and making him solely responsible for their success.

That he is eminently well qualified for this position is evidenced by the remarkable ability displayed while he held the position of sales manager during the past several years. Because of his record along this line he was made general sales manager about a year ago, and since that time his personality and energy have enthused the other members of that organization.

Vice President Radford announces that during the coming season the company will construct and market about 5000 Cartercars. The total production this year was in the vicinity of 3500. He points to this increase as ample justification for continuing the friction transmission, which has been a feature of this line for the past eight years.

Harry R. Radford, General Manager, Cartercar Company.

MARMON TRUCK NOW.

Indianapolis Maker of Pleasure Cars Springs Decided Surprise upon Industry.

The Nordyke & Marmon Company, Indianapolis, Ind., maker of the well known Marmon line of pleasure vehicles, has announced the production of a Marmon light delivery wagon. The information that the concern would add a commercial car to its line came as a distinct surprise to the industry, but it is stated that the question has been under advisement for some time, and that a few of these wagons were built for use about the factory some months since. The design may be regarded as thoroughly tested and not as an experiment in any sense of the word.

The Marmon truck is a light delivery car with capacity of 1200-1500 pounds. The motor is the same as employed on the 32 horsepower Marmon pleasure car, with the exception that the bore has been reduced from 4.5 inches to four. An additional mechanical feature is the automatic governor, which is held to limit the speed to a maximum of 20 miles an hour. Another new idea in truck construction is the use of dual pneumatic tires on the rear wheels.

GOES WITH GRAMM.

Another Official Follows His Old Chief into the New Business Venture.

W. H. Moore, General Sales Manager, Gramm-Bernstein Company.

W. H. Moore, for some time manager of the sales department with the Gramm Motor Truck Company, Lima, O., control of which was purchased recently by John N. Willys of the Willys-Overland Company, Toledo, O., has resigned to accept a similar position with the Gramm-Bernstein Company of Lima, although his new title will be general sales manager. Mr. Moore has grown up in the sales end of the motor truck business, and is well known as a salesman of ability.

Since the retirement of B. A. Gramm, and his association with M. Bernstein, formerly a director of the Gramm company, in the establishment of a new manufacturing enterprise along similar lines, several of the members of the old organization have joined him. Among the others is Fred Biszantz, designer and general superintendent.

Recently John N. Willys brought suit at Toledo against A. L. White and W. T. Agerter of the Gramm Motor Truck Company, asking for a cancellation of a contract involving the purchase of this concern, alleging fraud, in that the financial condition was not as represented to him.

OHIO TAKES OVER JEWEL.

Former Carriage Concern in Cincinnati Loses Its Identity in Motor Company.

The secretary of state in Ohio has authorized the merger of the Jewel Carriage Company and the Ohio Motor Car Company, both of Cincinnati, O. In the past the Jewel company, which formerly was a well known maker of horse vehicles, has been in charge of the sales of the Ohio gasoline car, made by the Ohio company. The carriage end of the business was sold to the American Carriage Company of Cincinnati some months ago.

The Ohio Motor Car Company is constructing an additional plant at Colborne, Ont., which will be operated by the Canadian branch. The officers of the concern are: President and general manager, Charles F. Pratt; vice president and factory manager, A. E. Schafer; secretary, Charles M. Anderson; treasurer, O. M. Blake; sales manager, H. F. Boulden; engineer, R. E. Northway.

NEW DISCO STARTER.

Maker of Well Known Gas Device Brings Out Combination Electric Equipment.

The success of the Ignition Starter Company, Detroit, Mich., in connection with the production of an acetylene gas starting device for automobile engines, has been such as to warrant it in increasing its capitalization to $500,000. Coincident with this announcement comes the information that an addition to the line has been perfected in the Disco electric lighting, starting and ignition equipment.

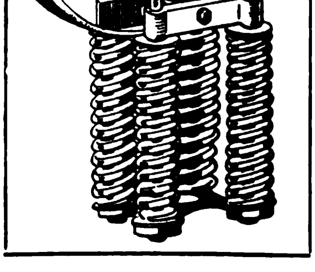
In order to manufacture this latest product the plant of the Gray Motor Company in Detroit has been taken over, giving the Ignition Starter Company 20,000 square feet of additional floor space.

VELVET AUXILIARY SPRINGS.

Ingenious Device for Absorbing Road Shocks and Vibrations.

The pleasures of motoring are enhanced when the machine rides easily over obstructions and rough roads, and it is essential to equalize the variance in loads. These qualities are secured in the Velvet auxiliary springs, which are so designed that shocks and vibrations are absorbed.

As will be noted in the accompanying illustration these comprise four sensitive adjustable coils or compression members, two of which are secured at the bottom by plates retained by cup washers and nuts. The blocks are bolted to the car spring, when attached to three-quarter elliptic members, and the weight is supported by the four coils. The other portion of the spring is equipped with similar blocks which prevent side sway. The first named set of blocks slides freely up or down upon four studs and a plate is utilize to properly space these members, preventing binding.



Velvet Auxiliary Springs.

A quality of the device is that it may be attached to any spring easily and without altering the parts or employing special fittings. Replacing as they do the stiff, solid link of the rear spring, both downward and upward movements are equalized. The Velvet auxiliary springs are fully guaranteed and moderately priced. George Sumner, Inc., 1843 Broadway, New York City, and 755 Boylston street, Boston, is distributor.

HUBER PATENT NOW.

Invention Held to Cover All Forms of Three Point Suspension of Main Frame.

Following closely upon the announcement that the Automobile Board of Trade has secured the right to licenses under the so-called Dyer transmission patents, comes information that the North American Vehicle Company, Detroit, proposes to enforce its rights under the invention of Emil Huber, which was made the subject of patent 88,407, granted to Huber, April 25, 1905. This is held to cover all forms of three point suspension of the main frame and many of the unit power plants now in use.

Briefly outlined, the company claims that the Huber patent covers "any driving mechanism of an automobile wherein the parts that go to make up the same are brought together in what is termed a unit power plant, suspended at three points upon the main frame, and wherein one of the points forming the triangle is arranged to swivel."

It is stated that already two or three manufacturing concerns have taken steps to secure licenses under this patent, based upon a fee of $1 for each $1000 of catalogue selling price, and that suits for infringement are to be brought in the near future.

ANOTHER COMPANY IN FLINT.

Concern Organized with Capital of $300,000 to Produce Six-Cylinder Machines.

The Sterling Motor Company of Flint, Mich., has been organized with capital of $300,000 to engage in the manufacture of six-cylinder cars. While no authoritative announcement has been made, it is understood that the new concern will constitute one of the units of the Republic Motor Company, which was organized recently by W. C. Durant and others.

The new plant is to be equipped with modern machinery, made especially for its requirements, and will be ready to begin operations before the close of the year. The initial output is to be taken by the Little Motor Car Company of Detroit.

PERFECTION TIRE FILLER.

New Resilient Material Designed for Replacing Air in Pneumatics.

An elastic, resilient material designed for replacing air in pneumatic tires, known as the Perfection tire filler, is being introduced by the Perfection Tire Filler Company, 619-621 Old South building, Boston, with factory in Somerville, Mass. It is the result of experimentation covering a period of years, the initial test having been made in December, 1907, and is being sold with a guarantee that it will not disintegrate, oxidize, rot or run, and that it is absolutely unaffected by extreme heat or cold.

It is expected to appeal to all motorists, and particularly to those concerns which have found difficulty in utilizing hard rubber tires on light delivery wagons, etc. The policy of the officials has been that of demonstrating under all road and weather conditions that the new filler was a success, before placing it in the market. Among the claims made for it, are that it will double tire mileage, eliminate tire troubles, hold its original form and maintain resiliency. It is stated that under tests made by the company, shoes in which the Perfection filler was employed remained in service until the fabric eventually wore through entirely.

The company is composed of men who are prominent in New England motoring circles, and the factory has been especially fitted for the manufacture of the product. The laboratory is in charge of an expert chemist, and it is maintained by the concern that it is in a position to carry on an aggressive sales campaign.

SPEEDWELL EXECUTIVE FORCE.

Several Department Heads Assume Additional Responsibilities in Management.

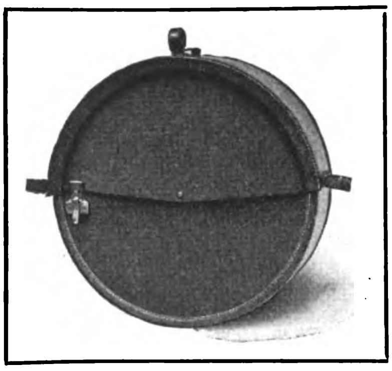
Frank A. Groves, Sales Manager, Speedwell Motor Car Company.

The Speedwell Motor Car Company, Dayton, O., maker of Speedwell pleasure and commercial lines, has reorganized its executive force, the changes bringing about promotion and entailing new duties for several of the officials. President P. D. Schenck, who has been acting in that capacity since the organization of the concern, has assumed in addition the duties and responsibilities of general manager. J. E. Schneider, who also has been with the company since its formation, has been elected secretary and treasurer.

Another promotion is that of Frank A. Groves, who becomes sales manager. This information will come as a pleasant surprise to a large number of friends, particularly in the Middle West. Like many other successful salesmen in the industry, Mr. Groves is a graduate from the sales force of the National Cash Register Company of Dayton. After 14 years with that concern he found himself financially able to assume an interest in the Chicago agency for Speedwell cars. That was nearly five years ago, and his success in that field has been sufficient to warrant his selection for his present responsibilities.

S. C. S. TIRE TRUNK.

The advantages of a tire trunk are many. It serves to protect the inner tubes from the weather or foreign elements, makes for accessibility when the tubes are needed, and being equipped with locks prevents theft of the tubes as well as other material which may be carried in the trunk. The S. C. Simon & Co., 1020 Race street, Philadelphia, is marketing the S. C. S. revolving door tire trunk which is constructed of high grade material and guaranteed in every respect. The solid basswood rim is .1875-inch thick and is covered with a high grade material, water and dust proof, and the maker points out that it is practically indestructible. The trunk is equipped with a revolving door, as will be noted by the accompanying illustration, an arrangement making for convenience.



The S. C. S. All Wood Body Tire Trunk.

NEW IDEA IN GEAR SHIFTING.

William D. Hughs of Atlanta, Ga., has invented a new gear shifting device which is of considerable interest. It does away with the usual side lever, and substitutes a controller on the steering wheel operating in conjunction with the clutch. The gears are shifted by the movement of the clutch pedal, selection of the gear being made by the controller, so to change speed it is only necessary to depress the clutch, turn the controller to the proper point, and re-engage the clutch. The first movement of the returning clutch engages the proper gear, the engagement being complete before the clutch takes hold. The device, besides rendering it unnecessary to remove the hands from the steering wheel to change gears, prevents stripping, as the gears are shifted only when the clutch is out.

PROSPEROUS YEAR AHEAD.

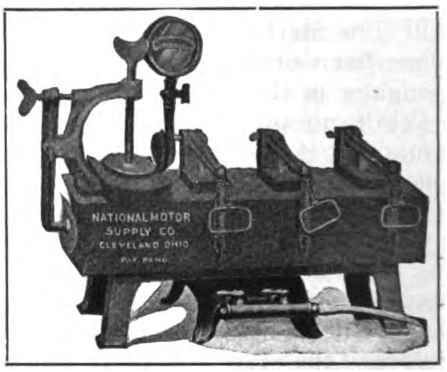
George M. Dickson of the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, returned recently from a business trip throughout the West. He is decidedly optimistic concerning the outlook for the coming year. He says:

"Of course, with motor cars, as with almost everything else, success depends largely upon the crops. I find Kansas has harvested the second largest crop of wheat in its history, a gain of 70 per cent. over last year, and that corn is expected to exceed its 1911 record by about the same figure. In Missouri corn will show more than 1,000,000 bushels increase over last year. The acreage of this crop in Illinois is larger this year than last. In Nebraska, it is expected almost to double last year's production, and approximately the same is anticipated of wheat. There is a reported increase of wheat in Iowa. Oklahoma promises 196,000,000 bushels of corn as against 37,000,000 bushels in 1911, and wheat, 21,000,000 bushels as against 9,000,000. Arkansas expects at least 13 per cent. increase in corn. In Texas, the figures on corn are 211,000,000 bushels for 1912 and 69,000,000 in 1911. In fact, taking the country as a whole, the reports indicate increases throughout."

NATIONAL GARAGE VULCANIZER.

Many proprietors of garages and repair shops realize the large profits from repairing inner tubes and shoes, but have not installed suitable equipment owing to the cost of the apparatus as well as knowledge of proper operation. Realizing that there is a demand for a simple, practical vulcanizer, adaptable for the garage, the National Motor Supply Company, Cleveland, O., has produced a tire repair outfit, which is moderately priced, and which is styled the National Garage Vulcanizer. The machine, which is depicted in an accompanying illustration, will repair three tubes and two casings at the same time and in an efficient manner.

The vulcanizer was designed by a man of extended experience with a leading tire manufacturer. The water is placed directly in the machine and heated by a gas or gasoline burner, these coming with the outfit. The vulcanizer may be connected, if desired, to a steam line. It takes less than 25 minutes to generate steam with the burner device and the cost of fuel to maintain the proper temperature is about .5 cent an hour.



The National Garage Vulcanizer, the Product of a Cleveland, O., Concern.

A high grade steam gauge and safety valve are provided. The body of the machine is of semi-steel and all other parts are of cast iron. All vulcanizing surfaces are carefully machined and the maker points out that there is nothing to get out of order. It is claimed that about $120 worth of work can be turned out in 10 hours and that the entire outfit weighs but 70 pounds. The company is making a special offer for the present. the market.

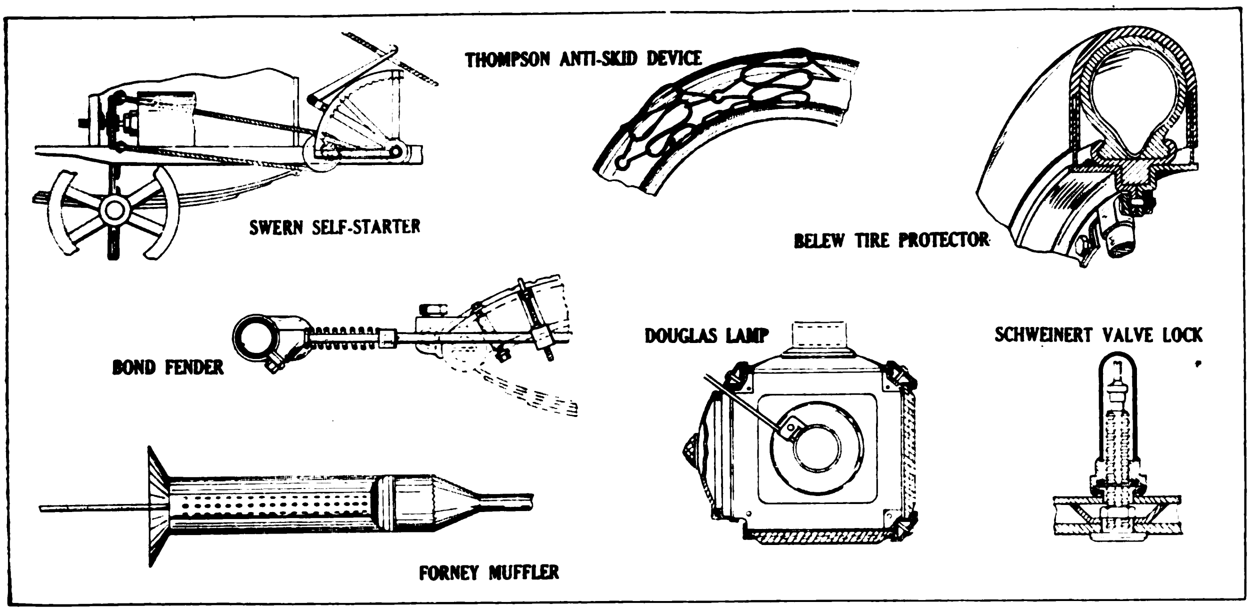
RECENT PATENTS of INTEREST

Swern Self-Starter.

Among the recent patents granted for starting devices for attachment to internal combustion motors is that of Ernest V. Swern, Denver, Col., assignor of one-fourth to John H. East of the same city. The self-starter is manually operated by pedal located in a position convenient to the driver and depressing the pedal actuates a lever which in turn imparts energy to the starter proper which is attached to the front of the motor. The mechanism comprises a sleeve mounted upon the engine shaft and having an external spiral groove, and a clutch member loosely mounted on the sleeve. The clutch has a projection within the spiral groove whereby a rotary movement of the member is converted into a simultaneous movement of the same in one direction with relation to said sleeve, and a spring between the sleeve and a stationary surface opposes its movement in the opposite direction.

Douglas Lamp.

A patent for a motor car lamp has been granted to Harry A. Douglas, Chicago, assignor to the Adams & Westlake Company of the same city. It has an upper and lower section which are united by a set of frame bars, the marginal portions of which are bent to form seat panels and panel engaging shoulders. A set of panels engage these seats and have instanding flanges slidingly engaging the upper shoulders and the margins of the top and bottom sections. Clamping bars bind the panel sections to their seats.



Some Recent Patents Applicable to the Motor Car, Including a Self-Starter and Other Accessories.

Thompson Anti-Skid Device.

An anti-skid device which resembles in construction the usual tire chain, has been patented by Langdon S. Thompson, Jersey City, N. J. It comprises a series of multiple reversed loop bands arranged around the shoe, connected by intermediate links. The anti-skid members are alternately reversed and the loop members are graduated in size, increasing from the retaining chain to the centre of the tire.

Forney Muffler.

With the authorities of the various cities and towns enforcing the laws against the use of cut-outs, inventors are devoting their efforts to devise a muffler which will reduce back pressure to a minimum as well as be silent in its operation. Samuel W. Forney, Pulaski, Va., has been granted a patent for a muffler which comprises an outer casing having a flanged end and a pipe mounted therein. This tube is enclosed in a second casing and is provided with perforations. Branch pipes are also fitted, these having their inner ends secured in said perforations and their outer extremities connected to the openings of the casing. The burnt gases are broken up by a conoid deflector before entering the mixing chamber.

Schweinert Tire Valve Locking Cap.

Maximilian Charles Schweinert, West Hoboken, N. J., has patented a locking cap for tire valves and the like. A nut is utilized in combination with a swiveled part, these members having a recess formed between them in which is fitted a notched disc, which is adapted to engage one of the parts. A spring is connected with the other and employed to engage with the corrugated disc. The latter rotates with the nut and has an opening any diameter of which equals that of the bore of the nut.

Belew Pneumatic Tire Protector.

Charles A. Belew, San Diego, Cal., has been granted a patent for a pneumatic tire protector which not only is claimed to protect the shoe from contact with sharp stones, etc., but it completely envelops the casing. It conforms to the tread of the tire and completely encloses it. Extensions are provided on either side of the protector and these pass under the rim of the wheel and are secured by means of bolts and locking nuts. The inventor claims that not only is the shoe protected from injury but all dirt and moisture are excluded from the casing.

Bond Fender.

Jayson K. Bond, Milwaukee, Wis., assignor of one-half to Kenneth W. Jacobs of the same city, has been granted a patent for a fender applicable to the motor car. It is secured in a manner similar to those of usual construction and is equipped with a buffer carried by a pair of plunger rods. These extend through eyed brackets and the openings of guide blocks. Coiled springs are interposed between the brackets and the buffer and stops are fitted for limiting the forward movement of the plunger rods.

OTHER PATENTS GONE TO ISSUE.

Wheel Rim, James Ellis Hale, Akron, O., assignor to the Goodyear Tire & Rubber Company, Akron, O. Dual detachable rim having split expansion rings and means for securing same.

Water Cooling System, Russell Huff, Detroit, assignor to the Packard Motor Car Company, Detroit. Comprising water jackets, radiator and a multiplicity of conduits leading from upper and lower sections of cooler to pump and water manifold of cylinders.

Lamp Attachment, George S. Sherman, Great Neck, N. Y. A vehicle lamp bracket in combination with a support having a ball and socket bearing and means for swinging said bracket.

Automatic Headlight, George T. Tribe and John M. Bemis, Worcester, Mass. Lamp standard rotably mounted, including hinged plate, a lever plate and a screw plate, as well as means for raising and depressing the lamp to any desired angle.

Resilient Wheel, James R. Wright, Trenton, Mo. A wheel having a hub, a rim comprising a plurality of loosely coupled sections, links arranged at right angles to and offset from centre of hub and connecting the sections, also bowed springs for connecting the adjacent ends of the sections.

Acetylene Generator, Fay H. Young, Rockford Ill. The end, forming a water reservoir in the upper compartment. The fluid flows between the casings to the carbide which is contained in a removable holder.

Shock Absorber, Charles O. Browne, Norwood, O. Two cylindrical casings telescoping and having a piston in a compression chamber and so designed that the movement of the piston in one direction will draw out the compression cylinder against the vacuum pressure.

Guy for Tops, Helen M. Ormsby, Xenia, O. An attachment plate is secured to the frame of the car or vehicle and a similar member has a stud adapted to engage with the permanent plate.

Vehicle Tire, George E. Starn, Camden, N. J., assignor by mesne assignments to Starn Tire Manufacturing Company of the same city. The traction member is of solid material and resiliency is obtained by means of an inflatable tube positioned between the outer tire and the rim of the wheel.

Lamp Attachment, Arthur Gale Thompson, San Francisco. The headlights are rotated with the front wheels, the actuating mechanism comprising a turntable plate, an arm and means for attaching same to the steering gear of the motor car.

Explosive Motor, Gustav A. F. Ahlberg, Chicago. The engine is of the two-cycle type and is fitted with an air compression chamber and means for conveying the air to the crankcase and combustion chamber of the motor with each compression stroke of the piston. A valve is incorporated for regulating the volume of air admitted.

Spring Wheel, George Dorffel, Oakland, Cal. Two rims are employed, a traction and an inner member, and between these are placed coil springs. Every other spoke of the wheel passes through the inner rim and is provided with a spring secured to the hub.

Headlight Operating Mechanism, James Madison Fryer, Middletown, O. The lamp is carried upon a shaft which is actuated by the steering gear of the automobile and a spring is utilized to maintain the engagement of the operating mechanism with that of the steering gear.

Grip Tread for Tires, Carlton L. Hoff, York, Penn. The traction members comprise chains, one of which is extended around the tread of the casing and secured by three other chains having links, securing and adjusting means.

Automobile Bumper, Friedrich Lederer, Milwaukee, Wis. A bumper or fender for motor cars comprising means for securing to extension of frame, a bumper carrying arm and a coil spring slidably mounted on said arm and fitted with a bumper bar.

Compression Grease Cup, Omer E. Risser and Peter E. McSweney, Springfield, Mo. A grease cup having an externally threaded plug screwing into the cup proper and a locking pin.

Gasoline Filter, Charles A. Port, John E. O'Neal and Dorace E. Motz, Pagosa Springs, Col. The combination of a fuel tank, water holder and a filter, the latter being so designed as to separate water from the gasoline and convey it to a discharge pipe as well as means for retaining the filtered fuel.

Motor Starter, Frederick G. S. Hewitt, Detroit. Fuel is taken from a supply chamber and forced to the combustion chamber by means of a pump. The mixture is ignited by a spark in the usual manner but a separate ignition system is provided, this being operated by dry cells.

Flexible Shafting, James D. Scovel, Detroit. A flexible shaft having in combination a series of interchangeable bars having hooked ends, a two-part guard for forming each bar into a loop at each end, a shell engaging over the meeting line of the two-part guard, and means for preventing longitudinal movement of the shell.

Fender, Adolph H. Luebke, Montello, Wis. Two front cross bars are utilized, spring members being interposed between them.

Locking Grease Cup, Thomas A. Walker, Evansville, Ind. A combination of a grease receptacle and plunger and having a screw threaded connection and an arc shaped spring and locking pin.

Latch Lever, William C. Azbill, North McAlester, Okla. The lever differs from those of the usual type in that the latch member is operated by rotating the handle, the movement engaging and releasing the tooth engaging the rack.

Buffer, Frederick C. Ferhman, Groffs Store, Penn. A pair of telescoping cylinders are employed, one carrying a coiled spring, and to the outer member is fitted the buffer bar.

Filter, Frederick H. Stubbe, New York City, assignor of one-half to John C. Klatzl. The filter is cylindrical in shape and is provided with a baffle plate to control the flow of the fluid, also screens and means for separating foreign elements from the gasoline.

Self-Heating Soldering Iron, Roy Merle Jett, Greenville, Ill. A soldering iron having a combined handle and fuel receptacle connected by a yoke, a hollow soldering point and jet and burner nozzles.

Nut Lock, William A. Moore, Gaithersburg, Md. The combination of threaded bolts and a nut, said threaded passages engaging and gripping each other.

Engine Starter, William S. Grigsby, Denver, Col. A starter in combination with the engine shaft of an explosive motor, two co-operating gears, means for rotating said gears and a spring device for compensating back firing of the motor.

Explosive Engine, George F. Dillon, Kansas City, Mo. An explosive engine having a hollow piston reciprocative in the cylinder and having a closed end, a bar supported by the body transversely to the longitudinal centre of cylinder, and an abutment slidably mounted and fitted in the piston.

To Drill Large Holes—To drill a large hole clean from the start without jumping or chattering in the least, take a small piece of old rag or waste about the size of the end of the drill; place it under the point of the drill, and then drill through the rag or waste. This idea may be used to a great advantage in countersinking work which requires a clean finish.

Brass Polish—Take three ounces of powdered rotten stone, two ounces of pumice stone, four ounces of oxalic acid, two quarts of rain water. Mix together and let stand several days, when it is ready for use. Shake well before using or applying. Polish with a dry woolen cloth or chamois skin.

Receipt for Case Hardening Iron—One ounce each of blue vitriol, borax, prussiate of potash and charcoal; two pints of common salt; one gallon of linseed oil; one quart of boiling water. Pulverize the solids and boil in the water, and then add the linseed oil. Heat the iron to a cherry red and immerse, stirring the mixture while it is cooling. By using this it is claimed edge tools can be made out of iron.

Drawing Temper From Brass—Brass is rendered hard by rolling or hammering. Temper may be drawn from brass by heating it to a cherry red and then simply plunging it into water, as though steel were to be tempered.

Rubber belts are liable to harden after considerable use. To render [illegible] soft and pliable, immerse in moderately warm water for about half an hour. It should then be put on the machine and run while in this condition. It will not return to its old hardness.

TIME CLOCK RECORDERS FOR GARAGES.

TWO or three problems stand out pre-eminently in the successful conduct of a public garage and service station. The proprietor who gives careful attention to business details realizes that there are many places in which leaks are liable to occur. It is not always so easy to determine just what is causing the leaks or to suggest a remedy, although it generally follows that the remedy is much more readily discovered than the leak.

The garage which is just starting in business in a small city or town is prone to count the cost, which sometimes means that conditions are overlooked in which it is possible to waste many times the money that would be expended in guarding against such situations. It is well enough to cut down expenses, but the successful business man is aware that there are ways of saving money by making wise expenditures.

Few garage proprietors will be disposed to criticise the statement that there is grave danger of losses which materially affect the profits of the business. It is only necessary to cite the instance of the customer who habitually "borrows" a little gasoline to clean his hands, or the man who persists in using the firm's tools to make minor adjustments on his car. Such small items, in the aggregate, make up a substantial total during the week, month or year.

But these are minor problems. Most garagemen find ways to overcome these difficulties, despite the fact that it may cost a trifle to secure locking devices which protect the gasoline tank and the tool box. They represent minor leaks, and while it is important to guard against them, it should not be forgotten that still other problems can be solved as easily.

Some garage proprietors lose sight of the fact that it is as important to retain customers as to secure them in the first place. Satisfactory workmanship is not the sole requisite. The job may be performed in the most careful manner, but if the owner once gains the impression that he is being overcharged, it is a difficult matter indeed to disabuse his mind. A better way is to convince him from the outset that he cannot be overcharged.

The desirability of adopting some method of recording the time at which work on a given job was begun and ended, has been commented upon freely in these columns. Without doubt the best scheme is that known as a time recording clock, and the truth of this assertion is borne out by the fact that the utility of the device does not end with its use in checking up given pieces of work.

The time recording clock is familiar enough to those who have had occasion to watch its operation in factory and department store service. By its use it is possible to record the time of arrival and departure of the employees, thereby simplifying the matter of bookkeeping in connection with the payroll. And it is only necessary to take a step further in its utilization in order to realize its full benefits to the garage business.

The cost is not excessive. Several makes are available. Herewith is presented the product of the Cincinnati Time Recorder Company, Cincinnati, O. It is known as the standard cost keeping machine, style 14, and has been designed especially for automobile garage use.

Contained within a polished solid oak case, the mechanism is operated by an eight-day Seth Thomas clock movement. It is constructed to last an ordinary business lifetime, and is built with a one-piece frame with well baked Japan finish, the small parts being with gun metal finish and polished nickel. The length is 34.75 inches, width 15.75, and depth eight. It is claimed to be entirely automatic in action, with no shifting device of any kind. It prints the day, A. M. or P. M., hour and minutes, and a decimal wheel can be furnished in place of the minute wheel, if desired. In short, it is a machine particularly adapted for accuracy in figuring cost.

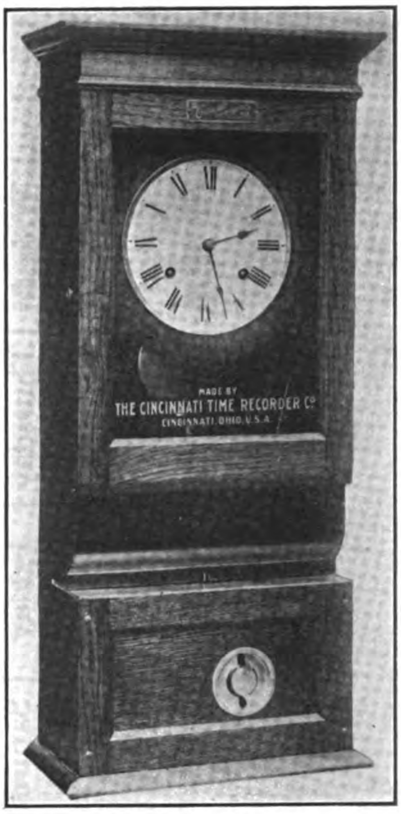


Fig. 1—The Cincinnati Time Clock Recorder.

Several blanks also are presented, indicating some of the uses to which the machine may be put in garage work. That at Fig. 3 A represents the employee's record card. On the obverse side it will be noted that provision is made for recording the time of arrival and departure of the workman for seven days. The "in" and "out" spaces on this side make it possible for the proprietor to know exactly at what hour the workman reported for work in the morning, went to lunch at noon, returned from lunch, and quit at night. On the reverse side are similar spaces, one portion of the card being reserved for overtime only, and the other for time out or lost time.

By means of this card it always is possible for the proprietor to tell at a glance whether or not his workmen are prompt and efficient. It will be noted that the machine is adapted to print upon any portion of the card, 8.25 by 3.375 inches.

Fig. 3 B presents the card utilized in keeping track of the work. As soon as the repairman begins work he runs the card through the clock, thereby securing an impression of the exact minute at which work was begun. If he is called off for any purpose, he first runs the card through the clock, then puts it in a case provided for that purpose, where it is readily accessible when he resumes work on this job, after again securing an impression of the time on the card.

Fig. 2—Showing Card Used to Check the Arrival and Departure of Each Machine—Copy of Record Is Sent to Owner.

At the bottom of the card will be noted a space for the noon hour registration. It will be seen that it would be possible to utilize this card for one job or any number of jobs, keeping an accurate account of the time expended on each. It might also be used in lieu of that at A, as a record of the workman, although in such cases it would necessitate rather more figuring to obtain the desired information. The best arrangement would be to utilize one card for each job.

On the reverse, provision is made for keeping track of the total time expended upon a given job or jobs, and where it is found desirable to utilize this card for an employee's record as well, sufficient information is available to assist the bookkeeper in making up the payroll. The size is the same as that at Fig. 3 A.

Probably no problem has caused the garage proprietor more concern than that of keeping watch of the cars in his care, so that none but those entitled to use them shall do so. Of course, it has been demonstrated that no owner can hold the garage liable for damages sustained in the so-called joy ride. No concern could remain long in business if such view of the matter were genererally taken.

When the garage proprietor has taken every precaution to deliver the machine to none but the authorized agent of the owner, his responsibility ends. Still, when it is considered that it is desirable to give a service which shall attract and retain custom, any proposition which will aid in solving this problem will be appreciated. And it is in this respect that the Cincinnati Time Recorder Company claims for its product a distinct advantage.

Without in any manner assuming the responsibility for the machine, the garage equipped with one of these clocks is in a position to render a valuable service to its customers. It may be added that several of these clocks are being utilized in this manner in the large garages of New York City, and that the results have been decidedly successful.

The card at Fig. 2 suggests the method. It will be noted that the card is divided into daily spaces, providing for the seven days of the week. Experience has indicated that six trips a day is about the largest number required for the ordinary garage. Each time the car is driven out of the garage the card is slipped into the clock, and a record is secured. As soon as it returns another record is obtained in the same manner.

Of course, it is necessary to assign some one to the duty of inserting the cards. It would not do to allow this duty to devolve upon the owner or chauffeur, so it must be an employee of the garage. In most cases some one in the establishment is assigned to look after cars when they go out or come in, but in the New York City garages mentioned the matter of securing the records is left to the young woman who cares for the telephone exchange, or to the bookkeeper.

This card is intended as a report. It may either be shown to the car owner at the end of each day or week, as desired, or it may be printed in copying ink, and after a press copy has been made for filing, the card itself is sent to the owner. The reverse side provides for the owner's name, make of car, storage report, garage advertisement and such remarks as may be necessary. The size is 9.125 inches long by 3.5 wide.

Let it be assumed that the owner has reason to suspect that his car is being used by the chauffeur without his consent. The garage equipped with one of these clocks and a set of cards is in a position to report to the owner at all times, just when his car left the garage, how long it was gone, and how many times a day it was being used. It is seldom indeed that the chauffeur ventures upon an extended joy ride at the first opportunity offered. If the report indicates that he is in the habit of taking more time to deliver the car to the garage than seems necessary, or any other lapse of duty, the owner is notified at once, and the possibility of a damaged machine is reduced thereby.

If the garage proprietor cannot afford to assume the responsibility for the improper use of a machine on storage, neither can he afford to relax his watchfulness over the cars in his charge. The possession of the clock does not eliminate the necessity for the other little means of checking against failure in this regard. But where it is possible to afford a service of this nature, in conjunction with the utilization of the clock as a time check on the employees and on the work of customers, it is easy to be seen that the recording device will pay for itself in a reasonably short time.

The loss of time on the part of employees is of moment. The possibility of losing a customer through inability to convince him that the entire time for which he has been charged was expended in work upon his car is decidedly important. The additional feature of providing a daily report of the car's movements, insofar as the garage itself is concerned, has a distinct value. Little attempt has been made herein to do more than suggest the possibilities. Numerous other ways of saving money can be cited by the garage owner himself. The need for system is imperative in the successful conduct of any business, and it is even more than ordinarily important in the garage and service station.

NEW ELECTRIC CAR.

Chicago Concern Places Its First Model in the Market and Begins Active Work.

The Chicago Electric Motor Car Company, Chicago, has presented its first Chicago electric car, designed by President Frederick J. Newman, who has been connected with a number of such makers in a similar capacity. It is understood that an effort will be made to produce these vehicles in such quantities as to compete directly with gasoline machines in every phase of the selling campaign. The company expects to have several cars ready for demonstration in the near future and to have the factory working at full capacity this fall.

According to President Newman, the body design is not unlike that of the Pierce-Arrow gasoline car. This and the chassis, motor and battery features are the result of long experimentation, and it is anticipated that the assembly will receive ready acceptance by a discriminating public.

PURCHASE ESTERLINE COMPANY.

Prest-O-Lite Owners Will Move Plant to Indianapolis and Enlarge Its Scope.

Announcement was made a few days ago that one-half of the capital stock of the Esterline Company, Lafayette, Ind., which totals $250,000, has been purchased by Carl Fisher and J. G. Allison, owners of the Prest-O-Lite Company of Indianapolis. The plant will be removed to Indianapolis, where it will be located at Speedway, the new "horseless city" recently established by the new owners. There is to be no change in the management of the company.

The Esterline Company is manufacturer of the Berdon system of electric lighting and has orders booked for more than $1,000,000 worth of this product. However, it is stated that the concern has been experimenting for the past year on a combined electric starting and lighting equipment.

The Esterline starter is to be unique in many respects, it is stated, and a rather radical departure from the electric starting devices already on the market. It goes without saying that it will incorporate those features of design making for convenience, simplicity and reliability, which have marked the success of the Berdon system.

Still another departure is the production of a new lamp, the reflecting surface of which is of a material which will not scratch or tarnish. A recent test of these lamps was made in Detroit, at which it was demonstrated that in a dense fog a 16 candlepower bulb in front of one of these new reflectors, projected its light six times as far as the rays from a 2000 candlepower arc lamp.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following concerns have been incorporated recently to manufacture and deal in motor cars, trucks, accessories, etc.:

Pioneer Motor Car Company, Troy, N. Y.; $10,000; directors, Henry J. Richardson, Troy; George N. Way, Hudson Falls, and others.

Hallett Vehicle Tire Company, Augusta, Me.; $500,000; to manufacture automobile tires; president, J. L. Coleman; treasurer, C. E. Beebe.

Park City Auto Company, Ashland, Ky.; $10,000; incorporators, Howard Elhoff, B. E. Tate and others.

Oconto Falls Motor Car Company, Oconto Falls, Wis.; $5000; incorporators, J. H. Delbridge, W. J. Munser and others.

Millbridge Motor Company, Millbridge, Me.; $10,000; president, Joseph Sawyer; treasurer, James S. Wyman.

Hill-Stage Company, Anderson, Ind.; $5000; to manufacture automobile repairing machinery; directors, Hugh, Forest J., and E. N. Hill and H. C. Stage.

Miller Auto Company, Jacksonville, Fla.; $10,000; to engage in automobile and garage business; president, F. C. Miller.

Kilbourne Thompson Company, Fort Wayne, Ind.; $50,000; to manufacture and sell automobiles; incorporators, Frank B. Thompson, Frank B. Dulin and others.

A. J. Meyer Motor Car Company, Cedarburg, Wis.; $25,000; incorporators, John Armbruster, Jacob Dietrich and others.

Sheboygan Auto & Supply Company, Sheboygan, Wis.; $25,000; to operate a garage.

Uneeda Tire & Sundry Company, Los Angeles, Cal.; $25,000; to sell automobiles, aeroplanes and accessories; incorporators, Hugh M. Webster, Walker D. Kidd, George H. Kidd.

C. U. Williams & Sons Company, Bloomington, Ill.; $100,000; to do a general automobile business; incorporators, C. U. Williams, Frances W. Williams and others.

Industrial Motor Company, Middletown, N. Y.; $350,000; to manuafcture automobiles; incorporators, W. A. Courtland, M. G. Crawford and others.

Des Moines Garage & Manufacturing Association, Des Moines, Ia.; $25,000; president, G. F. Knorr.

E. C. Andrews Company, Boston, Mass.; $40,000; to produce automobile furnishings; incorporators, Everett C. Andres, E. Russell Lynn and others.

Clinton Automobile Company, Hoboken, N. J.; $10,000; to manufacture and deal in automobiles, etc.; 132 Third street, Union Hill; incorporators, B. F. Krom, W. A. Schuette and others.

Franklin Auto Company, 120 Broad street, Elizabeth, N. J.; incorporators, William H. Reynolds, William H. Reynolds, Jr., Morris Gordon.

Southern Taxicab Company, Columbus, O.; $10,000; incorporators, James A. Allen, J. Keating and others.

Ideal Steel Wheel Company, Columbus, O.; $500,000; to make spring wheels for automobiles; incorporators, J. E. Streitelmeier, A. F. Parker and others.

South End Garage Company, Cleveland, O.; $5000; incorporators, A. Backin and others.

Model Garage, Charlotte, N. C.; $25,000; incorporators, R. F. Prince, E. J. Jones, R. B. Cochrane.

Mutual Oil & Auto Supply Company, Cleveland, O.; $10,000; to deal in oils, supplies and accessories; incorporators; M. L. Steuer, H. C. Killiman, Herbert Haase, C. F. Franke, A. S. Kraus.

Western Auto Sales & Manufacturing Company, Omaha, Neb.; $50,000; president, A. W. Gilman; secretary, M. M. Seales.

E. W. Johnson Company, Fresno, Cal.; $7000; directors, H. M. Johnson, E. W. Johnson and others.

Auto Air Rotar Company, Portland, Me.; $15,000; president, Albert F. Jones; secretary, James E. Manter.

Marrs-Lingo Motor Company, Dallas, Tex.; $7500; incorporators, A. A. Marrs, D. C. Lingo and others.

WITH THE MANUFACTURER

The Atlas Motor Car Company, Springfield, Mass., maker of Atlas cars, which has been in difficulty because of its inability to secure Knight engines according to the contract with the Atlas Engine Works, Indianapolis, Ind., which is now in the hands of a receiver and with which concern the Springfield company has no connection despite the similarity of names, is arranging for new capital, a recent meeting of the stockholders having provided a way for such action.

The Kissel Motor Car Company, Hartford, Wis., has appointed the following new agents for KisselKar pleasure and commercial lines: Lippart-Bishop Auto Company, Dubuque, Ia.; Zimmerman Steel Company, Lone Tree, Ia.; W. D. Sessum, Longview, Tex.; J. C. Bryant, Kaufman, Tex.; H. Lowenstein & Co., Marshall, Mo.; Brown Bros., West Point, Neb.; W. C. Evans, Sedalia, Mo.; Box Bros., La Crosse, Wis.; William C. Grace, Kalamazoo, Mich.; B. C. Kirkland, Battle Creek, Mich.; Ball-Washburne Motor Company, Rochester, N. Y.; Edward H. Bauer, Washington, D. C.; L. D. Collier, Salisbury, Md.; Howard Douglas, Nashville, Tenn.; D. L. Boureau, Regina, Sask., Can.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, recently opened a new factory branch in a new building at Van Ness avenue and Sutter street, San Francisco, Cal. An accompanying illustration presents the exterior of the building, which is believed to be adequate to take care of the Pacific Coast business of the company for some time to come.

The Oakland Motor Car Company is having a $50,000 salesroom, garage and repair shop erected in Atlanta, Ga.

The Locomobile Company of America, Bridgeport, Conn., is to erect a garage and showroom at Atlanta, Ga.

Tent Employed by Henderson Motor Car Company as Auxiliary to Main Plant During Construction of Factory Additions.

The Moon Motor Car Company, St. Louis, Mo., has completed the addition to its factory, shown in an accompanying illustration. This comprises the entire fourth floor, which will give the company much needed room for the production of Moon cars.

The Edwards Motor Car Company, 1734 Broadway, New York City, maker of Edwards cars, in which C. G. Stoddard and H. J. Edwards are the principal owners, has chosen Long Island City, N. Y., as the location for its new plant. The company has taken a factory under lease for a year, until it can make arrangements to build. The first models will be offered for sale in the near future.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the Henderson car, has been forced to utilize a tent, while awaiting the completion of its factory addition, beeause of the increase in producion made necessary in order to keep abreast of the orders. New agencies are announced as follows: J. F. Tentant & Co., Chicago, Ill.; F. D. Parker, Decatur, Ill.; Meade McClatchey, Canton, Ill.; Standard Motor Car Company, Ltd., Edmonton, Alta., Can.; Forest Park Garage, Springfield, Mass.; F. W. Davis & Sons, Fall River, Mass.; Charles Frederick, Bay Ridge, N. Y.; Harold C. Slater, East Orange, N. J.; L. E. Grider, Fresno, Cal.; Thesan & Gronewald, Golden, Ill.; Elmer S. Maine Company, Hubbard, Ia.; Automobile & Supply Company, Lancaster, Penn.; E. C. Graham, Lindsay, Cal.; D. & W. Lawson, Northport, N. Y.; J. J. Tanner, Petaluma, Cal.; Forbes Motor Car Company, Pittsburg, Penn.; Sacramento Motor Sales Company, Sacramento, Cal.; H. F. Hunter, Swedesboro, N. J.; Auto & Truck Sales Company, York, Penn.

The Federal Motor Truck Company, Detroit, announces the following new agencies for Federal trucks: W. S. Young, Larned, Kan.; Union Motor Car Company, Pittsburg, Penn.; Gibbes Machinery Company, Columbia, S. C.; Cole Motor Company of Georgia, Atlanta, Ga.; Fairchild Auto Company, New Orleans, La.; Mobile Auto Company, Mobile, Ala.; John F. Gubbins, Memphis, Tenn.; Eckenroth Sales Company, Cleveland, O.; Sanderson & Burghardt, Buffalo, N. Y.; Interstate Auto & Supply Company, Sioux City, Ia.; L. C. Hayden, Tecumseh, Mich.

The Nordyke & Marmon Company, Indianapolis, Ind., maker of Marmon cars, has added the following agents to its list: R. C. Bowman, Wheeling, W. Va.; Lion Auto Garage, Winnipeg, Man., Can.; Lougheed & Webster, Calgary, Alta., Can.

The Mercer Automobile Company, Trenton, N. J., announces the following additions to the list of Mercer agencies: Mercer Sales Company, Minneapolis, Minn.; Sitgreaves Auto Livery, Columbus, O.; R. L. Culbertson & Co., Youngstown, O.; C. J. McFarland, Wapakoneta, O.; Pine Bluff Motor Car Company, Pine Bluff, Ark.; Terminal City Motor Company, Vancouver, B. C.

The R-C-H Corporation, Detroit, maker of the R-C-H car, has added the following agents: Wallace & Tolar, Inverness, Miss.; H. A. Walton & C. W. Ellington, Roswell, Ga.; W. H. Ratcliffe, Alexandria, La.; S. H. Watts, Selma, Ala.; Automobile & Marine Motor Company, Charleston, S. C.; Albert C. Jones, Rockland, Me.; A. Elliott, Rochester, N. Y.; Robert L. Hiller, Batavia, N. Y.; F. Ebann, Chicago, Ill.; H. L. Webber, Wenona, Ill.; John E. Briggs, Williamsport, Ind.; May & McPheeters, Hardingsburg, Ind.; W. C. Sporleder, Chicago, Ill.; Karl B. Gast & A. A. Gast, Akron, Ind.; G. F. Wisegarver, Decatur, Ill.; Jackson Kline, Howard, Penn.; P. W. Pittman, Las Animas, Col.; E. L. Bradford, Albuquerque, N. M.; Carlsbad Auto Company, Carlsbad, N. M.; Crescent Garage, Deming, N. M.; Pecos Valley Auto Company, Roswell, N. M.; Frank Vegely, Santa Ana, Cal.; Alfred S. Donan Auto Company, Tucson, Ariz.; A. R. Riley, Riverside, Cal.: Boyce & Born, Green City, Mo.; G. R. Jones, Wichita, Kan.; John Nelson & Son, Ottawa, Kan.; Michael & Sappenfield Garage Company, Scranton, Kan.; P. C. Jonas, Le Roy, Kan.; Northrupp & Clark, Houston, Tex.; B. W. Carrington, Grand Salene, Tex.; Baker & Wilson, Nacogdoches, Tex.; Western Machine & Motor Company, Wessington Springs, S. D.; W. J. Baribeau, Enderlin, N. D.; L. L. Grier & L. S. Peters, Lake Wilson, Minn.; Wallace Donnelly Company, Jamestown, N. D.; E. Dieudonne & Son., Jamesville, Minn.; Walter H. Flessel, Huntington, N. Y.; I. R. Gardiner, Utica, N. Y.; W. H. Dykeman, Bayonne, N. J.; Cannon Electric Company, Bristol Landing, N. J.; Souderton Garage, Souderton, Penn.; Samuel F. Garrison, Bordenton, N. J.; Cortland L. The Knipper Kipp Company, which recently purchased the Kondolf garage at Monroe bridge, Rochester, N. Y., has moved into new quarters and is now ready for business.

Frank Brown, Chickasha, Okla., has purchased of A. L. Eagles, the garage on South Union avenue, Los Angeles, Cal. The purchase price is said to have been $25,000.

Fred H. McCulloch of the Minuet electric garage, Fort Wayne, Ind., has taken the agency in that city for the Cole Motor Company, Indianapolis, Ind., maker of the Cole car.

Charles Noel of the firm of Noel Bros., Goshen, Ind., has sold his interests therein to James Waltz, who will soon open a new garage to be conducted under the same firm name as the old establishment.

The East End Auto Company, Grand Rapids, Mich., has received a permit to erect a one-story addition to its garage in that city.

John J. Sullivan & Co., Cincinnati, O., has let the contract for a concrete and brick public garage on Michigan avenue. The garage will represent an investment of about $7000.

Edward Junck of Dallas, Tex., has rented the Cravens building at Fort Smith, Ark., and he will soon open a garage, repair and machine shop.

J. F. Wallace of Chicago has secured plans for a one-story brick garage to cost $17,000. The building will be located on South State street, Chicago.

The Motor Car & Supply Company, recently organized at Savannah, Ga., will do a general repair business and will carry a full line of automobile supplies.

The Potomac Motor Car Company has taken quarters on H street, Washington, D. C., until the completion of its new salesroom and service department on Connecticut avenue.

W. B. Herbst, one of the pioneer automobile dealers of Indianapolis, Ind., has found it necessary, because of increasing business, to secure more commodious quarters on West Michigan street.

William G. Faats has taken possession of the building known as Brown's garage, Binghamton, N. Y., and is conducting the automobile business formerly operated by Howard Brown.

H. F. Sundin, formerly with the National Motor Vehicle Company, Indianapolis, Ind., has opened an agency and service station for the National at Kansas City, Mo.

Samuel H. Rosenthal has purchased of Harvey T. Weeks, a two-story garage on Wabash avenue, Chicago, for $60,000, giving to the Chicago Title & Trust Company a trust deed to secure $25,000 for six months.

The Rainier & Lineberger Company, general eastern distributor of the Garford Company, Elyria, O., maker of Garford trucks and pleasure vehicles, has taken a lease of the Thomas building on Boylston street, Boston. P. C. Chrysler, a motor truck man of wide experience, will be in charge. His son, G. R. Chrysler, will direct the pleasure car end of the business.

The South Brooklyn Auto Livery & Sales Company, Brooklyn, N. Y., has just opened its large garage, which has 25,000 square feet of floor space. The establishment is not only for storage purposes for commercial and pleasure cars, but for repairs, painting, upholstering and supplies, with a rental department of taxicabs, touring cars and limousines. The company is agent for the R-C-H cars, made by the R-C-H Corporation, Detroit.

William R. Baker, Milford, Mass., has leased the salesroom formerly occupied by Leroy Leighton and will act as distributor for Oakland cars, made by the Oakland Motor Car Company, Pontiac, Mich., for Worcester county, Mass.

L. B. Clark has opened a first class repair shop at Hartford, Conn., and expects later to establish a garage in connection with it.

The Essenkay Company, Chicago, has purchased the City garage, Hagerstown, Md., of W. Kieffer Hull. J. B. Neville is manager and R. L. Mowen has charge of the mechanical department.

Charles Jacobson and Thomas B. Finlay, inventors and machinists, Hartford, Conn., have leased a large building on Main street, that city, and have opened an automobile repair shop. Their equipment includes all the latest appliances, making their establishment one of the best in the city.

The Poertner Automobile Company, New York, has opened fine new quarters at 1384 Bedford avenue, Brooklyn The concern is the eastern representative of the National and Herreshoff cars.

The Stafford Illuminated Auto Lamp & Number Company, Dallas, Tex., has filed an amendment increasing its capital stock from $25,000 to $50,000.

Kirk's Garage has opened for business on Crown street, New Haven, Conn. The establishment has a capacity of 250 cars and is fitted with the latest improvements and conveniences.

J. A. Bagwell and Cline Bagwell, formerly located at Macon, Ga., have transferred their business to Savannah, Ga., where they have secured headquarters with Broughton & Lamb, garage owners. They have the agency for the Overland and Little Four cars.

The Warren Motor Car Company, Detroit, maker of the Warren pleasure cars, has made the Warren agency house at San Francisco a distribution point of parts of the Warren machines, to the entire Pacific Coast trade. The agency, in charge of Edward Knauss, will have the handling of an immense stock of Warren parts, giving it the same advantages to take care of its owners as a branch house.

John S. Waterland and Charles Andrews, Chico, Cal., are erecting a large automobile garage in that city, to cost $10,000. The structure is to be in the mission style of architecture and will be one of the most modern automobile establishments north of Sacramento.

Hurlburt Motor Truck Company, New York City; $150,000; incorporators, J. P. Carroll, W. B. Carswell, F. D. Peale.

Punctureless Tire Company, Chipley, Fla.; $12,500; directors, L. W. Crow, J. S. McGeachy, C. B. Dunn.

Indianapolis Automobile Clearing House, Indianapolis, Ind.; $50,000; to manuacture and sell automobiles; incorporators, E. J. Kane, F. E. Barrett, T. E. Byrne.

North River Garage, New York City; $20,000; incorporators, W. C. Lockwood, Leonard E. Jelly, Robert C. Shaw.

Robertson Tire & Auto Company, Birmingham, Ala.; $2000; incorporators, J. E. Vandergriff, E. R. Minhinette, Jr., W. W. Robertson.

United Motor Equipment Company, Augusta, Me.; $1,000,000; directors, president and treasurer, E. M. Leavitt; clerk, Joseph Williamson.

Engle & Vincent Automobile Company, Columbus, O.; $15,000; to deal in automobiles; incorporators, Charles H. Engle, G. A. Marquardt, Frank L. Vincent, Charles W. Engle, John K. Henry.

Marathon Tire & Rubber Company, Akron, O.; $100,000; articles made of rubber; incorporators, Ellis R. Diehm, C. C. Owens, Sterling Newell, Donald McBride, H. J. Crawford.

Automatic Emergency Brake Company, Birmingham, Ala.; $60,000; incorporators, G. R. Godwin, J. R. Heaton, H. S. Stickle.

Grafton Motor Company, Grafton, W. Va.; $5000; to repair and store automobiles, deal in and hire same; incorporators, Henry J. Pracht, H. D. Comerford, J. Howard Reynolds, A. R. Kunst, D. C. Peck.

William E. Norris, Bridgeport, Conn., proprietor of the General Motors Service & Truck Company, has leased the garage formerly occupied by the Miller Motor Car Company. While the business of the General Motors Service & Truck Company has heretofore been confined to the sale of trucks, it will now maintain a thoroughly up-to-date garage with first class equipment for the care and repair of pleasure cars and commercial vehicles of both gasoline and electric types.

Green & Sibley, proprietor of Liberty garage, has purchased of Elmer E. Bray the latter's carriage and harness business at Lynn, Mass., which he has conducted for the past 19 years. Green & Sibley will maintain the Bray business as a selling plant in connection with its garage.

The Great Falls Automobile Company, Inc., has purchased the old Montana Motor Car Company, Great Falls, Mont., and is now equipped to do all kinds of automobile repair work. The company owns the only complete vulcanizing plant in the city, in which work of retreading and remaking tubes is accomplished.

The Texas Motor Company has purchased the Lattig garage at Corpus Christi, Tex., securing a lease of five years. S. C. Smith is vice president and general manager of the company.

S. E. Pope, Jeffersonville, Vt., has just opened a modern two-story garage equipped for every kind of automobile repair work. A vulcanizing machine, paint shop and elevator are among the conveniences installed.

Robert C. Hupp and Louis G. Hupp, Detroit, have certified to a partnership to conduct and transact business at San Francisco, where they will market gasoline and electric motor vehicles and parts thereof, in addition to conducting a garage for the care and repair of automobiles of all kinds. The company will be known by the name and style of R-C-H Company.

The Rex Garage and auto repair shop, Harrisburg, Penn., capable of housing 30 machines, will in future be known as the Rex Auto Garage under new management, E. C. Hawthorn and George Wolfe being the new proprietors.

Harry Hall ,has opened a garage at Seventh and McClure streets, Freemont, O., for the storage of all types of automobiles.

A. L. Gifford, for the past two years associated with the Boston branch of the Studebaker Corporation, is now a member of the sales force of the J. S. Harrington Company, Boston.

George C. Brinkman, St. Louis, Mo., has again taken the agency for the Nyberg cars, made by the Nyberg Automobile Works, Anderson, Ind., for the state of Missouri. Mr. Brinkman had the agency last year and met with gratifying success.

The Andersch Bros. Motor Company, Minneapolis, Minn., has been formed by the famous fur men of that city to enter the automobile business as distributor for the Abbott-Detroit motor cars, made by the Abbott Motor Company, Detroit, in Minnesota, North Dakota and South Dakota.

F. E. Richardson has withdrawn from the Richardson-Neighbors Motor Company, Cleveland, O., distributor for the Cole and Hupmobile lines. He has organized the Richardson Motor Car Company and will be located in a building adjoining the old company. Mr. Richardson will handle the Cole cars exclusively and Mr. Neighbors will look after the Hupmobile interests.

F. N. Phelps and A. F. Neale, Boston, representatives of the Baker Motor Vehicle Company, Cleveland, O., maker of the Baker electric wagons, have taken new quarters at 801 Boylston street. Mr. Neale is one of the Baker company's oldest pleasure car dealers. Mr. Phelps represents the truck department of the firm in a large part of New England.

Capt. Harry G. Chase, Boston, acting chief signal officer of the Massachusetts militia, has joined the sales force of the New England branch of the White Company, Cleveland, O., manufacturer of White pleasure and commercial vehicles. Mr. Chase will devote the major part of his time to the commercial side of the business.

J. Weeder, formerly with the Packard Motor Company, Boston, is among the recent recruits to the Buick Boston Company's sales force.

The Grant Bros. Auto Company, Detroit, which for years has conducted one of the most exclusive and up-to-date garages at Detroit, has become distributor for the Lozier, made by the Lozier Motor Company, Detroit, in that district.

The R. S. Mattoon Motor Company, 2015 Michigan avenue, Chicago, an old established concern, has taken the Ohio line of cars, made by the Ohio Motor Car Company, Cincinnati, O., which it will handle exclusively.

MILLER'S ATLANTA STORE.

The business conducted by Chas. E. Miller, 97-103 Reade street, New York City, in Atlanta, Ga., has grown to such proportions that it has been found necessary to secure more commodious quarters. To this end a store in a new building, nearing completion, at the corner of Harris and Peachtree streets, has been acquired and the southern branch will be located at 259 Peachtree street in the near future. As is well known this pioneer accessory manufacturer, jobber, exporter and importer has 14 branches in 13 cities and in nine different states. The business conducted at each of these is growing rapidly, and the result in Atlanta is quite in keeping with the Miller policy.

NEW R-C-H ROADSTER ANNOUNCED.

Announcement is made of a new long wheelbase roadster by the R-C-H Corporation, Detroit, in response to a demand for a car of this type along the lines of previous models. The new car will embody the features of the touring car and will have a wheelbase of 110 inches, fitted with an English roadster body the seats of which will be much lower than the regular models and will be provided with extra deep cushions. The fuel tank is mounted on the rear deck and will contain 26 gallons, and a trunk large enough to carry two suit cases is also provided.

The equipment is very complete, including as it does five electric lights with an 100 ampere-hour capacity storage battery, non-skid tires, Warner Auto-Meter, top with Jiffy curtains and slip cover, demountable rims, horn, rear vision mirror, tools, jack, etc. In addition one extra non-skid tire is mounted on an extra demountable rim in a self-locking tire carrier located on the right running board. A slip cover is also furnished for the trunk.

The new model is especially appropriate as a business man's machine as it is easily handled and its long rear deck provides ample space for carrying sample cases, etc.

COLE EXPERTS NAMED.

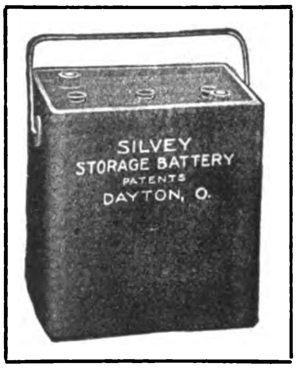
In line with the policy of the Cole Motor Car Company to maintain the highest possible service for Cole owners, four valuable additions have been made to its travelling field force, which will add much strength to the service organization. C. J. Corkhill, an automobile man of much experience, has been appointed assistant sales manager with headquarters at Omaha, Neb. His territory, over which he will have complete control, is bounded on the east by the Missisippi river, on the south by the Gulf of Mexico, on the west by the Rockies and on the north by Canada. J. R. Moler is to hold a similar position in the territory west of the Rockies, and will continually travel among the Cole agents.

J. R. Hamilton, a thorough mechanic, will be associated with Mr. Moler. W. B. Lacer, who has had considerable experience in automobile manufacturing, is also a Cole service expert. In adding these men to the field service department, President Cole of the company continues his staff of experts at the factory, whose duty will be to travel from place to place, as required.

SILVEY LAMPS AND BATTERY.

The growing tendency of motor car owners to replace the oil and acetylene lamps with electrical units has resulted in electrical concerns developing this branch of the industry. Among those who have been manufacturing and marketing lamps and batteries is the Silvey Electric Company, 10-16 Canal street, Dayton, O.

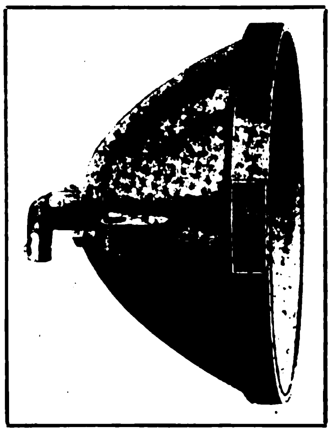
The electric searchlight presented in the accompanying illustration is a casting of pure silver, aluminum and another metal, the construction making for durability as well as extreme lightness. The body, rear stem and carrying parts are integral and the front ring is of the same material as the lamp. The true parabola mirror is highly burnished and being air tight cannot tarnish or become dirty. The lamp is made in three sizes, black enameled or polished and the front or glass holder is furnished in brass, bronze or enamel as desired, without extra charge.



Silvey Battery.

The company also manufactures a torpedo type of reflector designed for converting the gas lamp into an electrical unit. These reflectors are of spun metal, vary in sizes from five to 11 inches, and each has a flexible cord for connecting to the source of current.

The Silvey storage battery has been on the market for a number of years and is made in three sizes and amperages, these being six-volt members and their capacities are 45, 90 and 135 amperes, respectively. They are constructed on the interchangeable plan and the jars are of hard rubber with high ribs, providing ample space for the electrolyte. The vents are set in a recess so that if any electrolyte escapes it will return to the cell. The connectors are of acid proof material and marked to prevent errors in connecting. The battery is made portable by means of a steel carrying bail, attached to hard rubber bosses at each end of the jar. The bail may be detached if desired. The company also markets lamps, sockets, switches, wire, battery boxes, etc.



Silvey Electric Lamp.

TRADE DIRECTORY WITH 1,000,000 CIRCULATION.

A Record of Known and Reliable Business Houses, Revised 48 Times the Year, Contrasted with the Indiscriminate Listings of General Directories.

A trade directory is distinctly a reference. Its value to the buyer is in the accuracy of its information. Its worth to the concern listed is gauged by the care in compilation and the frequency of revision. Commercial data as ordinarily compiled is with each enterprise of record grouped under its appropriate classification. These lists are published four times a year at the most and are circulated to those who are sufficiently interested to purchase them. Naturally the distribution is limited and the expense is considerable. Aside from active manufacturing interests few are purchased. These directories are general and are not as a rule devoted to any particular industry. Neither are they confined to any special group of industries. They are not public conveniences and are serviceable only to the subscriber.

In these lists all trade interests are given like prominence. The firms that have the highest business reputation and standing are rated at parity with others that may be little known and of doubtful repute. The buyer may be brought into relations with the unreliable concern solely through the fact that he assumed reliability through its apparent equal rating with others in the industry. In this respect the trade directory is a vehicle for those who are unscrupulous to pirate upon the businesses that have been long established and are deserving of confidence and patronage.

The guide for the buyer must be dependable, first of all. It must be accurate and it must be composed of firms of unquestioned reputation. It ought to specify so far as possible to differing products of each concern. Buying at long range is becoming the more and more necessary and time is a potent factor.

The Buyers' Guide published in The Automobile Journal, the Motor Truck and the Accessory and Garage Journal specifies the firms that are actual and legitimate business competitors. The classification is select from the viewpoint of the buyer and the seller. The list is complete in every sense. It directs attention to reliable business houses and inspires confidence in them because they are well and favorably known. Both the buying and the selling interests are benefited.

The Buyers' Guide appears in each issue of these three magazines. It is revised for each edition, and there are 48 distinct publications annually, which insures to those making use of it that it is correct to the day of publication. The compilation is first brought directly to the attention of the subscribers. The magazines are then preserved for reference. The trade directory may have a circulation of 5000 each edition, and four editions annually at the most. The average business guide goes to practically the same persons each issue. The Buyers' Guide is published in The Automobile Journal and reaches its 13,000 subscribers 24 issues the year, and once each month it is received by the 9000 readers of the Motor Truck, and by the nearly 12,000 who subscribe to the Accessory and Garage Journal. This totals approximately 34,000 different interests who receive the Buyers' Guide in the magazines either 12 or 24 times a year. This is from three to six times the number of editions of the best and most progressive general directory and the distribution is about 580 per cent. more.

The value of the Buyers' Guide is alike to all who receive it. The Automobile Journal is published for the benefit of the owners of automobile vehicles. More than 90 per cent. of its circulation is to this class of readers. The Motor Truck is devoted to the promotion of the mechanical wagon for highway transportation and it is read by those who are using such service or are studying haulage subjects with a view to utilization of power conveyances. The Accessory and Garage Journal is given over to the industry producing the pleasure car and the commercial transport, to those distributing them, to those selling them, to those manufacturing equipment, accessories and supplies, to the garage and public service station owners and managers, and the repairers and those who specialize maintenance work.

The Buyers' Guide is a systematically arranged classification of select firms. It is a list of reliable and dependable concerns, known through merit of production and worthy of confidence because of established reputation. It is composed of enterprises producing practically everything that may be desired in connection with the use of the automobile. The Buyers' Guide is revised for each edition and it is more complete than any other in this respect. No less than 48 revisions each year insures the most authentic information.

The Buyers' Guide is a reference instantly at the command of those desiring its facts and specific detail. It contains the precise knowledge wanted and everything not essential is eliminated. It is complete and thorough in all requirements.

Besides the qualities emphasized the Buyers' Guide is published in the editions of Standard Automobile Mechanical Handbooks. The works are the most comprehensive of their kind and are recognized authorities. They are adopted as text books in many of the largest and best known technical and mechanical schools. They go into the hands of those who use them constantly as references. As a complete library of practical worth they are preserved and the lists are always available. The distribution of these volumes will aggregate approximately a half million the present year. This places in the hands of the purchasers of these works the latest and most desirable buying information.

The combined circulation of the Buyers' Guide in the magazines, based on the distribution of April 1, is 564,000 annually, and in the handbooks the most conservative estimate of sales is a half million the present year, so that there will be approximately a million copies distributed during 1912. There is no question as to the figures stated. There is the natural increase that is not considered in the statement made.

The service of the Buyers' Guide is free to all advertisers who have yearly contract with any one of the magazines. Each firm is listed under one or more appropriate classifications. Any new production may be designated, a condition that is especially desirable with any established firm.

STOCKHOLDERS ASSESSED $24 A SHARE.

Details of Latest Plans for Reorganizing United States Motor Company Said to Meet with Favor of All Interested Parties—New Sales Manager for Grinnell Electric—Lamp Men Buy Peerless Stock—Will Make Knight Engines.

Although several plans for reorganizing the United States Motor Company, New York City, which went into the hands of receivers Sept. 11, have been published during the past month, it is understood that none of them met with unqualified indorsement by all interested parties. The latest announcement respecting the situation is that an assessment of $24 a share is to be made upon the preferred and common stock of the parent organization, and on the preferred and common stock of the Columbia Motor Car Company, Hartford, Conn., one of its subsidiaries. It is understood now that the total capitalization will be scaled down as follows:

For and in consideration of the $24 assessment, the new company will issue in exchange for the preferred certificates 24 per cent. of new first preferred, 25 per cent. of the second preferred and 30 per cent. of common. For the common certificates outstanding, on payment of an assessment of $24 a share, the new company will issue 24 per cent. of first preferred, 17.5 per cent. of second preferred and 30 per cent. of common. This assessment means that the new company will start out with a clear capital for working operations of about $3,000,000. It is proposed to raise by this method the sum of $5,720,000. The remainder will be used for funding the matured obligations.

At this time there is still remaining in the treasury of the company the sum of $1,000,000. The distribution of this fund was one of the chief matters of contention in the deliberations of the merchandise creditors. It is understood that a compromise has been reached, whereby these creditors will receive 25 per cent. of their claims in cash, 25 per cent. in first preferred, 25 per cent. in second preferred, and 15 per cent. in common, thus making a settlement of approximately 90 cents on a dollar.

All first and second preferred stock of the new company and all common stock other than shares reserved to qualify directors is to be vested for a term of not exceeding five years in Charles H. Sabin, Harry Bronner and James C. Brady, and their successors as voting trustees, and voting trust certificates in such form as may be determined by the committee will be distributed in lieu of stock. Voting trust certificates are intended to be distributed to creditors and stockholders participating in this plan substantially as follows:

First Preferred Stock.

To depositing holders of debenture bonds and bond scrip (50%)	$3,080,755
To depositing holders of claims against the Motor company only (25%)	475,906
To depositing stockholders of the Motor company and of the Columbia company duly paying the assessments hereinafter provided for:	
Preferred stockholders (24%)	2,763,152
Common stockholders (24%)	2,957,844
Total	$9,277,657

Second Preferred Stock.

To depositing holders of debenture bonds and bond scrip (50%)	$3,080,755
To depositing holders of claims against Motor company only (25%)	475,906
To depositing stockholders of the Motor company and of the Columbia company duly paying the assessments hereinafter provided for:	
Preferred stockholders (25%)	2,878,283
Common stockholders (17½%)	2,156,761
Total	$8,591,705

Common Stock.

To depositing holders of debenture bonds and bond scrip (40%)	$2,464,604
To depositing holders of claims against Motor company only (15%)	285,543
To depositing stockholders of the Motor company and of the Columbia company duly paying the assessments hereinafter provided for:	
Preferred stockholders (30%)	3,453,940
Common stockholders (30%)	3,697,305
Total	$9,901,392

In connection with this situation, it is announced that Benjamin Briscoe has resigned as president of the company, although he will remain in office until the middle of November. He retains his interest in the concern, however.

REID WITH GRINNELL ELECTRIC.

Well Known Selling Agent Becomes Sales Manager of Prominent Detroit Concern.

The many friends of Theodore C. Reid of Jackson, Mich., will be glad to learn of his appointment as manager of the sales division of the Grinnell Electric Car Company, Detroit, maker of Grinnell electric vehicles. Mr. Reid brings to his new position a wealth of information concerning modern methods of salesmanship, and as he is thoroughly convinced of the practicability of the electric car, there is little doubt that his new connection will prove as successful as his past record would seem to warrant.

For the past few years Mr. Reid has been identified with one of the most enterprising and systematic selling organizations in Chicago. His insight into selling methods was obtained through a very broad and thorough experience in several lines, and this led the Grinnell company to select him from a large number of prospective sales managers. There is every reason for believing that he will add material strength to the Grinnell organization.

T. C. Reid, Sales Manager Grinnell Electric Car Company.

BUY PEERLESS STOCK.

National Electric Lamp Men Now Powerful Factors in Affairs of the Concern.

Five of the men most influential in the National Electric Lamp Company, Cleveland, O., a branch of the General Electric Company, have purchased substantial blocks of stock,in the Peerless Motor Car Company, Cleveland, O., maker of Peerless pleasure and commercial cars. They are H. A. Tremaine, B. G. Tremaine, J. B. Crouse, J. R. Crouse and F. S. Terry and they now form a powerful factor in the affairs of the automobile manufacturing concern.

Between the corporations as such there will be no alliance, but the experience and connections of the lamp men will furnish important impetus to development of the Peerless company's business. The latter concern owns 20 acres of property in Cleveland and the ground and nine-story building on Broadway, New York City, besides its allied distributing companies in a number of states.

The concern within the year has sold $1,100,000 in 6 per cent. bonds and $300,000 in stock and is about to issue $1,100,000 additional stock, it is said, making its total stock capitalization $3,000,000. The officers are: President, L. H. Kittredge; vice president, E. H. Parkhurst; treasurer, F. I. Harding; secretary, George B. Siddall. W. H. Staring, L. H. Treadway, A. B. McNairy, Samuel Scovil and C. E. Sullivan constitute the board of directors and it is believed that representatives of the National Electric Lamp Company will shortly be elected to the board.

ATLAS ENGINE WORKS SOLD.

Lyons-Atlas Company Is Purchaser and Plant Will Resume Work on Large Scale.

The Atlas Engine Works of Indianapolis, has been purchased by the Lyons-Atlas Company, which has been incorporated with a capital stock of $500,000, all paid in. The concern will take possession of the plant, which covers 67 acres, at once and will begin the manufacture of Knight engines for the trade. The Atlas Engine Works was ordered sold by Judge Weir of the superior court and was in the hands of a receiver for 3.5 months. The Lyons-Atlas Company, which made the successful bid, is composed of experienced Chicago men who have been engaged in the manufacturing business. The president, James W. Lyons, and the vice president, William F. Lyons, were connected with the Atlas Engine Works about 20 years ago. George W. Lyons is secretary and treasurer.

Under the provisions of the bid the new company will pay $441,000, the interest on the $1,050,000 in bonds, secured by a mortgage deed of trust held by the Indiana Trust Company; $105,000, a certain indebtedness secured by $150,000 in bonds; $48,187.04, a debt which is secured by $63,000 in bills and accounts receivable, and $80,000 in cash. Two judgments against the Atlas Engine Works, aggregating $6700 will also be paid. The company will take over the real estate and buildings subject to the mortgage deed of trust, but the personal property must be paid for in cash. In addition to the manufacture of Knight engines it will continue the production of the Diesel engine and will employ from 2000 to 3000 men.

President A. V. Myer of the National Motor Supply Company, Cleveland, O., will sail Nov. 1 to look after the European business of his concern which makes the National vulcanizer.

ACCESSORY EXHIBITORS AT COMING SHOWS.

EIGHTEEN new members were elected at the recent meeting of the Motor & Accessory Manufacturers in New York City, at which time allotment of spaces for the New York, Chicago and Boston shows also was made. The new members follow:

Bijur Motor Lighting Company, New York City; Endurance Tire & Rubber Company, New York City; Edward G. Budd Manufacturing Company, Philadelphia; Brown & Sharpe Manufacturing Company, Providence, R. I.; Hartford Machine Screw Company, Hartford, Conn.; Simms Magneto Company, New York City; Ignition Starter Company, Detroit; Walpole Rubber Company, Boston, Mass.; New Jersey Car Spring & Rubber Company, Jersey City, N. J.; Hess Steel Castings Company, Bridgeton, N. J.; Schoen-Jackson Company, Medina, Penn.; Gould Storage Battery Company, New York City; New Miller Carburetor Company, Indianapolis, Ind.; Marathon Tire & Rubber Company, Cuyahoga Falls, N. Y.; Electric Auto-Lite Company, Toledo, O.; Baldwin Steel Company, New York City; Pittsburg Model Engine Company, Pittsburg, Penn.; Garage Equipment Company, Milwaukee, Wis.

The allotment of spaces shows that members will exhibit during the following weeks:

TWO BUILDINGS FOR MONTREAL.

Demand for Exhibition Space Much Larger Than for Any Previous Canadian Show.

There has been such an unprecedented demand for space at the Montreal motor show, the representative automobile exhibition of eastern Canada, that the management has been obliged to secure a second building for overflow exhibitors. The 65th Armouries has been engaged in addition to the large Drill Hall on Craig street. The show will be held Jan. 4-11, under the direction of the Automobile Club of Canada.

The exhibition will be devoted to pleasure cars and motor trucks exclusively and American vehicles will probably comprise 50 per cent. of the exhibits, the balance being made up by cars of Canadian and European manufacture.

EXHIBITORS AT CHICAGO.

Space Allotted to Eighty-Two Concerns for February Display, with Electrics Unplaced.

Manufacturers who will exhibit at the Chicago show of pleasure and commercial vehicles in February have drawn positions. Eighty-two motor car concerns have received allotments and three-quarters of the centre space of the First Regiment Armory has been reserved for electric vehicles, which have not drawn. As usual, the show will be held in the Coliseum, Coliseum annex, and the First Regiment Armory. On the main floor of the Coliseum are to be 39 exhibitors; Coliseum annex, 8; Coliseum annex basement, 17; Armory, 18. The following makes will be represented:

PLEASURE CARS.

Coliseum Centre—Peerless, Flanders, Pierce-Arrow, Haynes, Glide, Buick, Cadillac, Maxwell, Stevens-Duryea, Stearns. Winton, Stoddard-Dayton, National, Hudson, Packard, Premier, Reo, Franklin, Locomobile, Studebaker, Oldsmobile, Pope-Hartford, Chalmers, Overland.

Coliseum, Along the Walls—Selden, Columbia, Auburn, Rambler, Fiat, Marmon, Alco, White, Cole, Case, Imperial, Mitchell, Moon, Oakland, Lozier.

Coliseum Annex—American, KisselKar, Cartercar. Knox, Velie, Inter-State, Hupmobile, Garford.

Coliseum Annex Basement—Colby, Paterson, Halladay, Lexington, Cino, Midland, Ohio, Crow, McIntyre, Davis, Elkhart, Mercer.

First Regiment Armory—Jackson, Austin, Matheson, Abbott, Michigan, Regal, Cutting, Kline-Kar, Pathfinder, Staver, Pullman, K-R-I-T, Westcott, McFarlan, Great Western, Stutz, Speedwell.

COMMERCIAL VEHICLES.

Coliseum Centre—Buffalo electric, Jeffery, Studebaker, Reo, Selden, Autocar, Waverley, Adams, KisselKar, Speedwell, International, Gramm, Pope-Hartford, Locomobile, Pierce-Arrow, Velie, Buick, Peerless, Federal, Hupmobile, Kelly.

Coliseum, Along the Walls—Sternberg, Durable Dayton, Alco, Walker, U. S. Motor Truck, Garford, Rapid, Reliance, Knox, Krebs, Old Reliable, Clark, McIntyre.

Coliseum Annex—Universal, Service, Bowling Green, Standard, Transit, Dart, M. & P. electric, Lippard-Stewart.

First Regiment Armory—Chicago Pneumatic, International Harvester, National, Sanford, Commerce, Four-Wheel Drive, Gramm-Bernstein, Poyer, Bessemer, Harwood-Barley, G. V., Avery, Packard, White, Sampson, A. L. Smith, Lauth-Juergens.

REMOVES TO DETROIT.

Well Known Manufacturer's Agent Transfers Boston Headquarters to Industry's Centre.

Smalley Daniels, operating as manufacturer's sales representative with headquarters in Boston for several years, has removed his main office to Detroit. He already has branch offices in five principal centres throughout the country, and the former Boston quarters will become a branch.

The operations conducted by Mr. Daniels outside of the state of Michigan are entirely distinct from the Smalley Daniels Company of Michigan, which has just succeeded the Snyder & Harbridge Selling Company of Detroit. Associated with him in Michigan is J. C. Schmadebeck, who has been connected with H. M. Snyder in the above company for a number of years.

HENDERSON SUCCEEDS CARTER.

Head of Cole Sales Force Retires to Become President of Henderson Company.

When it became known last May that the Henderson Motor Sales Company, which had been in charge of the distribution of the product of the Cole Motor Car Company, Indianapolis, since the organization of that concern, was to be absorbed by the Cole company and that the men connected with the old sales organization were to form the new Henderson Motor Car Company, R. P. Henderson became sales manager of the Cole Motor Car Company. At the same time he was financially interested in the production of the new Henderson car, and it does not come as a complete surprise to the industry that he has now resigned from the Cole company to become president of the new Henderson concern.

The Henderson Brothers of Indianapolis: C. P. at the Left and R. P. at the Right.

Mr. Henderson succeeds L. Carter, a Georgian banker, who always has been closely associated with the Hendersons, of whom there are two brothers, R. P. and C. P., and who now becomes chairman of the board of directors. In addition to being interested in the Henderson company, Mr. Carter also is one of the largest stockholders in the Cole company.

Under the new arrangement every share of stock in the Henderson Motor Car Company is owned by those actively directing its progress. R. P. Henderson continues as vice president and general manager, and L. S. French is secretary. The Henderson brothers are known in the trade as the Hendersons of Indianapolis, and R. P. will devote his time exclusively to directing the manufacturing end, while C. P. will supervise the sales and control the administration of the company's affairs.

HALL WINS PROMOTION.

Work in Illinois Leads to Appointment as Sales Manager of Olds Motor Works.

J. V. Hall, formerly manager of the Oldsmobile Company of Illinois, has been appointed general sales manager of the Olds Motor Works, Lansing, Mich., maker of the Oldsmobile, by General Manager O. C. Hutchinson. Mr. Hall's ability in his Illinois territory was marked and was responsible for his selection by Mr. Hutchinson to succeed Rupert E. Paris, resigned.

The success of Mr. Hall in his new position is assured, as the qualifications displayed by him in bringing about the efficient organization of the company in Illinois are such as indicate that he is capable of extending Oldsmobile sales in a satisfactory manner.

SHOW SPACE ALLOTTED.

Eighty-Seven Manufacturers Will Exhibit Products in Two Buildings at New York City.

Allotment of floor space for the annual pleasure car show which is to be held Jan. 11-18 in the Grand Central Palace and Madison Square Garden, New York City, running simultaneously for two weeks, has been made at the headquarters of the Automobile Board of Trade. It was evident that the interest of the manufacturers has not abated as the applications for space greatly exceeded all expectations, there being 87 requests from car makers and more than 400 from accessory producers. The figures indicate that the double show will surpass any previous exhibition ever held.

When the drawings for space were held at the quarterly meeting of the Automobile Board of Trade, a representative of each of the 61 members in the organization was present. Pleasure cars are to be shown during the first week of the exhibition and commercial vehicles will be on display in both buildings during the second week. The plan is to charge one admission, which will provide admittance to both buildings. The exhibitors of pleasure cars to make display in the Palace and Garden include the following:

Willys-Overland Company, Toledo, O., Overland.
Pierce-Arrow Motor Car Company, Buffalo, N. Y., Pierce-Arrow.
Garford Company, Elyria, O., Garford.
Knox Automobile Company, Springfield, Mass., Knox.
Moon Motor Car Company, St. Louis, Mo., Moon.
Matheson Automobile Company, Wilkesbarre, Penn., Matheson.
National Motor Vehicle Company, Indianapolis, Ind., National.
Velie Motor Vehicle Company, Moline, Ill., Velie.
Cole Motor Car Company, Indianapolis, Ind., Cole.
Kissel Motor Car Company, Hartford, Wis., KisselKar.
Studebaker Corporation, Detroit, Mich., Studebaker.
K-R-I-T Motor Car Company, Detroit, Mich., K-R-I-T.
Cutting Automobile Company, Jackson, Mich., Cutting.
Paige-Detroit Motor Car Company, Detroit, Paige-Detroit.
Motor Car Manufacturing Company, Indianapolis, Ind., Pathfinder.
Flanders Manufacturing Company, Pontiac, Mich., Flanders electric.
Fiat Automobile Company, New York City, Fiat.
Hupp Motor Car Company, Detroit, Hupmobile.
Ideal Motor Car Company, Indianapolis, Ind., Stutz.
Olds Motor Works, Lansing, Mich., Oldsmobile.
R-C-H Corporation, Detroit, Mich., R-C-H.
Lozier Motor Company, Detroit, Mich., Lozier.
Flanders Motor Car Company, Detroit, Mich., Flanders.
Oakland Motor Car Company, Pontiac, Mich., Oakland.
Pope Manufacturing Company, Hartford, Conn., Pope-Hartford.
F. B. Stearns Company, Cleveland, O., Stearns.
Dayton Motor Car Company, Dayton, O., Stoddard-Dayton.
Franklin Automobile Company, Syracuse, N. Y., Franklin.
Stevens-Duryea Company, Chicopee Falls, Mass., Stevens-Duryea.
Peerless Motor Car Company, Cleveland, O., Peerless.

NEW ACCESSORY MAKER.

Concern Organized in Indianapolis for Production of Tops, Seat Covers, Etc.

Frank L. Glover has been elected president and general manager of the Glover Equipment Company, Indianapolis, which has been incorporated under the laws of Indiana with a capital stock of $20,000. The concern will manufacture automobile tops, seat covers and similar goods. Temporary quarters have been secured at 142 West Market street, Indianapolis.

Mr. Glover was formerly identified with the R. J. Irwin Company and the Gates Manufacturing Company of Indianapolis and has a wide experience in the automobile accessory business. The other officers of the new company are: Vice President, Leonard Geiger; treasurer, William Umphrey; secretary, Louis Libking.

WILL DEAL IN USED CARS.

Boston Men Unite to Handle Machines Taken in Trade by Reputable Agents.

A new organization to handle high grade used cars has been formed at Boston and is known as the Massachusetts Auto Clearance House, with headquarters in the old Boston Cab Company's building at 108-110 Massachusetts avenue. George W. Tolman, for some time in charge of the used car department of the Whitten-Gilmore Company, and Edward H. Houtz, who was manager of the used car department of the Thomas Motor Car Company, will direct the affairs of the new company.

Both men have in their long experience become experts in their particular line and will endeavor to make their concern all that its name implies, a clearing house for used cars taken in trade by a number of reputable dealers.

NEW COLE SALES POLICY.

Country Divided and Placed in Charge of Experienced Men as Sales Managers.

President J. J. Cole of the Cole Motor Car Company, Indianapolis, Ind., maker of the Cole cars, has devised a system of conducting the sales department of the company so that he anticipates it will give the greatest possible efficiency. The country has been divided into territories with district sales managers in charge of certain allotted districts. The plan is to give Cole agents and owners stimulated co-operation by the sales managers keeping in direct personal touch with them. The sales force thus created will work in harmony with President Cole and his sales force at Indianapolis.

J. R. Moler has been allotted the territory west of the Rockies and in the Dominion of Canada. He has for 18 years been connected with the promotion of sales and agency work. C. J. Corkhill, a pioneer automobile man, who entered the field with the Olds Motor Works and more recently was with the Apperson company in Nebraska, takes the district bounded by the Mississippi river on the east and the Rockies on the west. George H. Strout, a graduate from the bicycle business, formerly sales manager for the Columbus electric, and later sales manager for the Apperson, is given jurisdiction over the Southwest and part of the Middle West; E. C. Frady, head of the Cole Motor Company of Chicago, takes the North Central states, while William L. Colt, president of the Colt-Stratton Company, Boston, Cole eastern distributor, takes charge of a territory east of a line drawn north from Washington, D. C., to Syracuse, N. Y.

OPENS NEW FIELD.

Detroit Concern Will Produce Chassis for Those Who Desire to Fit Bodies Thereto.

The Detroit Motor Chassis Company, Detroit, has been organized with capital stock of $25,000 to manufacture complete chassis for carriage builders and other concerns which desire to supply bodies and equipment to market complete cars under their own names. The company claims to have discovered an insistent demand for this class of work. A plant has been secured at 960 Champlain street, Detroit, and deliveries are expected to begin about Nov. 1.

The officers are all men who have been identified with the motor industry for several years and are as follows: President, A. J. Kinucan, formerly connected with several Detroit automobile factories; vice president, M. C. Dewitt of the Jeffery-Dewitt Company; secretary, L. J. Stringer, formerly with the Hudson Motor Car Company; treasurer, William P. Culver of the Culver-Taylor Chain Company.

MACK IN LANSDEN COMPANY.

Heads Executive Board, Confirming Rumor of His Connection with That Concern.

J. M. Mack of Allentown, Penn., has been elected chairman of the executive board of the Lansden Company, Newark, N. J., maker of electric trucks. At the time of the reorganization of the company about a year ago it was reported that Mr. Mack, who was then vice president of the International Motors Company, New York City, maker of Mack, Saurer and Hewitt trucks, had acquired an interest, but the report could not be confirmed.

Mr. Mack has since retired from the International corporation and now is devoting himself chiefly to the new Webb company, which will manufacture motor fire apparatus at Allentown. His election as chairman of the Lansden executive board is said to relieve R. S. Hotz, president of the company, who resides in Chicago.

PROMOTION FOR WILLMAN.

Succeeds Wilson as Sales Manager for Warren Motor Car Company at Detroit.

G. L. Willman has been appointed to the office of sales manager of the Warren Motor Car Company, Detroit, maker of the Warren cars, to succeed George D. Wilson, who has become the eastern representative of the Warren company, with headquarters at New York. Mr. Willman, although a comparatively young man, possesses a varied experience.

He is a graduate of Harvard University, an expert in technical telephony, has been an instructor in salesmanship, is a fluent writer and has been an irregular contributor to several national magazines. He was connected with the Detroit Chamber of Commerce during the time that Lucius E. Wilson, vice president and general manager of the Warren company, was secretary of that organization. His many friends will be glad to learn of his promotion.

WARD BUYS KING BUSINESS.

Bid of $40,000 Accepted and He Will Continue Manufacturing Plant in Detroit.

The assets of the King Motor Car Company, Detroit, have been purchased by Artemas Ward of the advertising firm of Ward & Gow, New York City, who intends to continue the factory indefinitely. Mr. Ward's bid of $40,000 was accepted by the United States district court receiver, the Union Trust Company of Detroit.

Mr. Ward was the heaviest creditor of the company, having loaned it $100,000 in cash and also having an unsettled advertising claim against the concern amounting to about $29,000. It was found that in order to continue the manufacturing as he contemplated, material, parts and money to a large amount would be needed. The accessory men who had appealed to the courts did not care to follow this plan and left the field clear for Mr. Ward to acquire the plant.

JOINS PACKARD COMPANY.

Frank H. Trego Will Take Charge of Research Engineering Department in Detroit.

Frank H. Trego, who was until recently chief engineer of the E. R. Thomas Motor Car Company, Buffalo, N. Y., maker of Thomas pleasure cars, has returned to Detroit to take charge of the department of research engineering for the Packard Motor Car Company, manufacturer of the Packard machines. Mr. Trego is widely known in automobile circles through his connection with the technical side of the American Automobile Association's contests, having drawn up the original contest rules for 1910 and officiated at international races.

He has played an important part in the development of numerous improvements in motor construction. As one of the organizers of the Chicago Motor Club he was for two years its secretary. He was also one of the six founders of the Wolverine Automobile Club, Detroit. Mr. Trego was formerly one of the managers of the technical department of the Hudson Motor Car Company, Detroit, manufacturer of Hudson cars, and for a number of years he has been an extensive contributor to technical journals.

THOMAS OFFICIALS RESIGN.

Announcement Follows That of Placing the Concern in the Hands of a Receiver.

Judge Hazel of the federal court in Buffalo, N. Y., appointed George C. Finley and Adolph Redabow, receivers for the E. R. Thomas Motor Car Company of that city, Aug. 29. Following this action, announcement was made of the resignation of President Humpage, Vice President Gleason and Treasurer Ramsey, to take effect Sept. 1.

The stock exchange firm of Eugene Meyer, Jr., & Co., New York City, took hold of the E. R. Thomas Motor Company in February, 1911, and the concern was reorganized. According to information filed with the court, it appears that the company now has assets of $1,700,000 and liabilities of $960,000. A short time ago, it was announced that a substantial portion of the stock had been purchased by those connected with the United States Motor Company. It is understood that the receivers will continue the production of Thomas cars.

GOODYEAR SUCCESS RAPID.

Factory to Operate Day and Night to Fill Orders.

C. W. Seiberling, vice president of the Goodyear Tire & Rubber Company, states that it will be necessary to keep the Goodyear factory in operation 24 hours a day the entire year, except for two weeks in October to overhaul machinery and make repairs. This activity is necessary to meet demand for Goodyear no-rim-cut tires. The growth of the company's business the past 12 months has been phenomenal. "In all," says Mr. Seiberling, "the company has now 67 branches, 11 of which are in Canada, 55 in the United States and one in Mexico, with a new field being opened in England, Australia, South Africa and European countries.

Commenting upon the increased business of the Goodyear company, he intimates that during the past year it has been found necessary to extend its distribution system, and from September, 1911, to September, 1912, direct factory branches have been opened at Albany, N. Y.; Dayton, O.; Kansas City, Mo.; Denver, Col.; Newark, N. J.; Oakland, Cal.; Omaha, Neb.; Portland, Me.; Rochester, N. Y.; St. Paul, Minn.; Spokane, Wash.; Salt Lake City, Utah; Syracuse, N. Y.; Worcester, Mass., and Mexico City, making a total of 16 new branches in the past 12 months. New Goodyear buildings have been erected the past year at Grand Rapids, Wis.; New York City; Baltimore, Md.; Buffalo, N. Y.; Columbus, O.; Birmingham, Ala.; Kansas City, Mo.; Louisville, Ky.; Minneapolis, Minn.; Memphis, Tenn.; Newark, N. J., and Philadelphia.

AMES COMPANY REORGANIZED.

New Men Become Interested in Kentucky Corporation.

The Ames Motor Car Company, Owensboro, Ky., has been reorganized with capital of $100,000. Among the new men interested in the concern are George W. Yeoman of Muskegon, Mich., formerly sales manager of the Continental Motor Manufacturing Company, and H. M. Robins of the same city, formerly of the American Electric Fuse Company. The other stockholders include F. A. Ames and Charles T. Smith, both of Owensboro.

CADILLAC TO INCREASE OUTPUT.

Next Season's Production Will Eclipse All Past Records.

According to E. C. Howard, sales manager of the Cadillac Motor Car Company, Detroit, the 1913 season will eclipse all the company's past records for number of machines manufactured. The record for 1912 was 12,000 and this figure will be exceeded by 3000 and every one of the 15,000 cars has been contracted for by dealers. Features of the new model include a larger motor, combined electric lighting, cranking and ignition system, and many notable refinements contributing to the comfort of the passengers.

FRANK BRISCOE RESIGNS.

United States Motor's Vice President to Study Abroad.

Announcement is made that Frank Briscoe, one of the vice presidents of the United States Motor Company, New York City, has resigned. He will sail for Europe later in the month, his object being to study motor car engineering abroad. He contemplates remaining in England and on the Continent about a year. Mr. Briscoe will continue as president of the Briscoe Manufacturing Company, Detroit, one of the subsidiaries of the United States Motor Company.

HUPMOBILE WINS FIRST PRIZE.

American Car Honored at International Motor Exposition.

At the recent first international motor exposition held at Turin, Italy, at which were represented a great portion of the world's most famous motor cars, ranging in price from $500 to $10,000, the Hupmobile runabout, made by the Hupp Motor Car Company, Detroit, won first prize for automobiles of less than 110 cubic inches displacement. In this contest all points of the car were taken into consideration, even to the examination of the general efficiency of all bolts, their strength against road shocks, spring resiliency, maximum amount of weight, hardness of metals used in the different parts, etc. After this severe test, the Hupmobile stood perfect and was given first prize, a beautiful hand-worked gold medal.

NEW CAPITAL FOR ATLAS.

Springfield, Mass., Concern to Issue Additional Stock.

According to information from Springfield, Mass., the Atlas Motor Car Company of that city anticipates that business men of Springfield, New York City and Dayton, O., are to subscribe $100,000 additional stock, and the concern is to increase its capital to $250,000. The plan is said to include an issue of $100,000 in preferred stock and $50,000 in common. The company has been handicapped somewhat of late because of its inability to secure Knight engines from the maker, and active operations are said to have been held in abeyance until fall, at which time it is expected that the new proposition will be carried out.

STRONG GOES TO INDIANAPOLIS.

Buick Motor Company to Have New Branch Manager.

E. T. Strong, new manager of the Indianapolis branch of the Buick Motor Company, succeeding R. H. Losey, recently resigned, has assumed full charge of his new positon. For the past few weeks he has been in charge of the branches in Indianapolis and Buffalo, N. Y., he having been manager of the latter before being transferred to Indianapolis. Mr. Strong has been one of the main factors in the Buick organization for several years and his promotion to the Indianapolis field is in line with the company's policy to advance the men whose work has been found to be the most meritorious.

ANNUAL IMPORTERS' SALON.

New York Automobile Show Season to Be Inaugurated at Hotel Astor.

Following the custom of several years past, the 1913 American automobile show season will be inaugurated by the annual Importers' Salon in the Hotel Astor, New York City, Jan. 2-11. With one or two exceptions all of the foreign makes represented in this country will participate in this season's Salon. Among those which will be displayed by Paris exhibitors are: De

Dion-Bouton, Isotta-Fraschini, Lancia, Mercedes, Metallurgique, Minerva, Panhard and Renault. This list represents five nations: France, Germany, England, Italy and Belgium.

HANDLEY REORGANIZES COMPANY.

Head of Marion Car Concern Completes Executive Staff.

Announcement was made at Indianapolis recently by President J. I. Handley of the Marion Motor Car Company of the completion of his new organization. Under his direction an executive staff composed of men of national prominence in the automobile industry has been secured and they have reorganized the Marion Company.

The list of men who will work with Mr. Handley in carrying out the new and extensive policies he has inaugurated includes J. B. Myers, vice president, in charge of production; J. M. Edsall, treasurer; F. G. W. Sudrow, sales manager; M. B. Morgan, chief engineer; W. McK. White, advertising manager.

MORGAN OUT OF COMPANY.

Well Known Automobile Man Severs Connection with Truck Interests.

Ralph L. Morgan, formerly with the Morgan Motor Truck Company, Worcester, which has just been incorporated for $300,000, has severed his connection with the company. He has taken a suite of offices in the People's Saving Bank building on Main street, where he will in future be at home to his friends in the automobile trade.

CARROLL, GOODYEAR MANAGER.

Promotions in Order in Rubber Business on Pacific Coast.

Frank E. Carroll, for many years prominent in automobile trade circles on the Pacific Coast, has been appointed manager of the new branch of the Goodyear Tire & Rubber Company at San Francisco. W. T. Powell of the Portland, Ore., branch, has been promoted to be Pacific Coast manager of the Goodyear Company.

MAYOR FAVORS INDUSTRY.

Boston's Executive Advises Co-Operation with Motor Car Builders.

Mayor Fitzgerald of Boston has called the attention of the Boston chamber of commerce to the advisability of co-operating with manufacturers of motor cars who are seeking locations in the East, especially the makers having a large export trade. The mayor advocates that the chamber of commerce take special efforts to attract makers to the Hub, holding that they would be of great benefit to the city. The letter is the result of a published interview with John M. Willys, president of the Willys-Overland Company, Toledo, O., in which the official pointed out the shipping advantages of eastern cities.

TRADE INFORMATION EXCHANGE

BUSINESS PROPOSITIONS.

Opportunities Are Offered Below for Agents to Secure New Lines, for Manufacturers to Extend Their Representation, and for Producers to Get in Touch with Those Who Are in the Market for Equipment and Supplies. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without Names, Those Interested Desiring the Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding.

CAR AGENCIES DESIRED.

2015—Connecticut Concern desires the agency for pleasure cars listing at $900 to $1500.

2017—Indiana Garage, under new management, with well established business, would like the agency for pleasure cars selling at $700 to $2000 and commercial vehicles at $500 to $1500.

Notary Public,

My commission expires June 30, 1914.

REGISTRATION AND RECIPROCITY.

Fifteen out of 35 states which have passed motoring laws covering the subject, permit full reciprocity to non-residents. Some of the commonwealths, the residents of which strongly advised New Jersey to repeal its obnoxious clause against visiting motorists, while nominally in the reciprocity column, really grant no reciprocity, insofar as residents on border states are concerned.

Special reference may be had to Massachusetts, which grants an exemption for 10 days in one calendar year. The same thing may be held to apply to New Hampshire and Pennsylvania, and in a similar measure to Rhode Island. This exemption is of benefit to the tourist, but even North Carolina, which requires all non-residents to register, makes an exception of those who are crossing the state.

The original idea appears to have been that of compelling residents of border states to contribute their proportionate share for the maintenance of roads which they helped to destroy. It may be remembered that this was the argument advanced by New Jersey for not granting reciprocity in any form. The special reference to Massachusetts is made because merchants in Springfield, Pittsfield, North Adams, Fitchburg, Haverhill, Newburyport and other cities near the border have found that residents of Connecticut, Rhode Island, New Hampshire, Vermont and New York fail to visit their stores as regularly as they might be expected, for fear of being arrested or compelled to take out a special automobile license. Naturally, a movement is on foot looking toward an amendment in the law, permitting full reciprocity, such as is granted by Connecticut, Vermont and New York.

An accompanying table sets forth the exemption granted to non-resident motorists in the several states, and it also presents the registration provisions. For instance, the registration in Alabama expires annually on Oct. 1, and the fee is $7.50 to $20, according to the horsepower. This table, as well as others which have appeared in these columns from time to time, shows the desirability of uniform laws covering these matters.

	Expires	Fee	Exemption
Alabama	Oct. 1	$7.50-20	reciprocity
Arkansas	Dec. 31	$5	reciprocity
California	perpetual	$2	temporarily
Connecticut	Dec. 31	50c hp.	reciprocity
Delaware	Dec. 31	$5	reciprocity
Florida	perpetual	$2	30 days
Georgia	perpetual	$2	30 days
Illinois	Dec. 31	$4-10	60 days
Indiana	perpetual	$1	reciprocity
Iowa	Jan. 1	*40c hp.	reciprocity
Kentucky	annually	$5-20	reciprocity
Maine	Dec. 31	$5-15	30 days
Maryland	Jan. 1	$5-25	†§14 days
Massachusetts	Dec. 31	$5-25	10 days
Michigan	Dec. 31	$3	reciprocity
Minnesota	triennially	$1.50	30 days
Mississippi	annually	$5-25	30 days
Missouri	Jan. 31	$2-10	20 days
New Hampshire	Dec. 31	$10-40	10 days
New Jersey	Dec. 31	$3-10	15 days
New Mexico	Sept. 30	$11	60 days
New York	Jan. 31	$5-25	reciprocity
North Carolina	July 1	$5	‡
North Dakota	Jan. 1	$2	temporarily
Ohio	Jan. 1	$5	reciprocity
Oregon	Dec. 31	$5-10	30 days
Pennsylania	Dec. 31	$5-15	10 days
Rhode Island	annually	$5-25	20 days
South Dakota	perpetual	$1	reciprocity
Utah	perpetual	$2	temporarily
Vermont	Dec. 31	$1 hp.	reciprocity
Virginia	Jan. 1	$5-20	†14 days
Washington	June 1	$2	reciprocity
West Virginia	perpetual	$1	reciprocity
Wisconsin	Dec. 31	$5	reciprocity

*Less than 20 horsepower, $8; †two periods of seven days each; §reciprocity with certain states by governor's proclamation; ‡only cars passing through the state are exempt.

Mechanical Pointers for Garagemen and Repairmen

THE HANDY TAPE.

An operator whose car was fitted with a pinned steering wheel was annoyed by the pin working loose and jamming while on the road. Not having the necessary tools to pein the part over and not wishing to damage the metal of the wheel, he effected a temporary repair by winding the troublesome member with friction tape. This prevented the pin from working in either direction.

REPAIRING BROKEN SPRING PADS.

Spring pads or seats rarely break, but when they do to effect a repair by the usual method of welding, it is necessary to remove the axle, springs, etc., a considerable job. At Fig. 1 is illustrated a method which can be utilized by simply jacking up the side of the car high enough to permit the removal of the spring from its seat.

At A is shown an I section axle, the front spring pad of which was broken in a collision. The damaged member was removed and the axle smoothed off, as shown at C. A seat, forged to the shape outlined at B, was fitted over this. A hole was then drilled through both members and a bolt used to hold them firmly, as depicted at D. The spring and clips were replaced and the latter tightened in the usual manner.

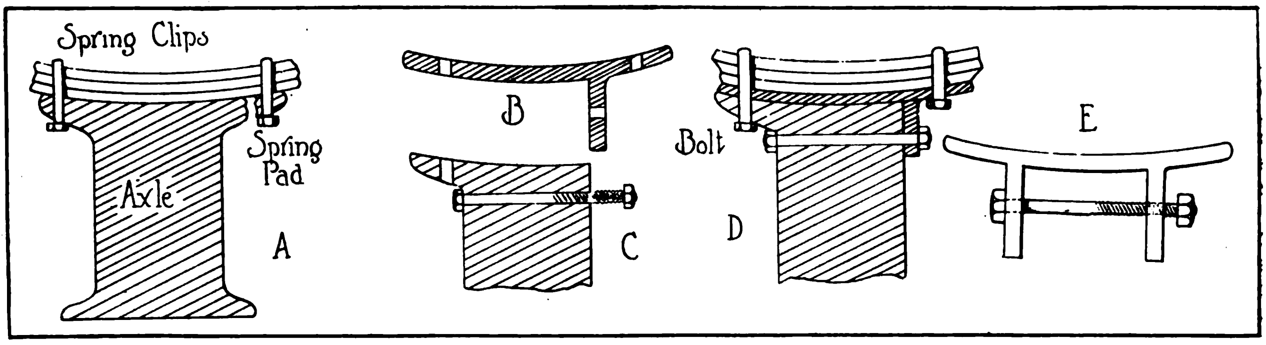

Fig. 1—Repairing Broken Spring Pads: A, Showing Broken Section of Axle; B, Forged Part, Which Is Fitted and Bolted as Outlined at C; D, Parts Re-assembled; E, Repair Applied to a Dead Axle.

The repair was effective and gave no trouble.

Broken members on rear axles of the dead type can be remedied by using the spring seat at E. The method of application is the same as before. This would not be possible, however, except on those utilizing the side chain drive.

COMMUTATOR HINTS.

It is seldom that a car is held up on the road through commutator troubles as this device will give warning in an erratic running engine, and the well posted driver will heed the notice and overhaul the timer before venturing out again. It is rare that the tension spring of the roller breaks, but when such is the case a repair can be made by bending a new hook. To do this it is necessary to remove the part. Care should be taken to mark the position of the roller and this can be done with a lead pencil on the fibre. Sometimes the timer is worn badly and the engine skips. This condition may be improved by increasing the tension of the spring. If the latter cannot be repaired a stout elastic band can be utilized temporarily.

AUTOMATIC VALVE HINT.

Motors fitted with automatic intake valves depend upon the suction of the piston to open these. Where the piston is cracked or broken serious difficulty in carburetion is experienced. A motorist, whose car was equipped with a two-cylinder engine of this type, was unfortunate in having the stem break and drop into the combustion chamber where the up-stroke drove it through the top of the piston, the combustion chamber walls being thicker and well ribbed. The owner spent many unpleasant minutes in cranking and while he could start the engine it would stall when he let in the clutch.

Finally he disconnected the intake manifold and placed a piece of cardboard between it and the cylinder thus preventing vapor from passing to the latter. The spark plug and intake valve cage were removed from the damaged member, the motor cranked and the journey resumed.

RESTORING DEAD DRY CELLS.

There are several methods of reviving dead dry cells so as to enable a stranded automobilist to reach home. The writer cannot vouch for the practicability of the following suggestion, but the tip was given by an agent for a battery concern: The depolarizer is compacted or driven downward, using a piece of wood in the operation. It is said that amperage will be increased considerably by this action. Another suggestion is the addition of a small quantity of weak acid, as for instance, vinegar.

HOME MADE RATCHET DRILL.

A motorist who planned several alterations to his car, necessitating considerable drilling of fairly large sized holes, devised a ratchet drill, a sketch of which is presented at Fig. 2. This was practically home made, inexpensive and did the work required in an efficient manner.

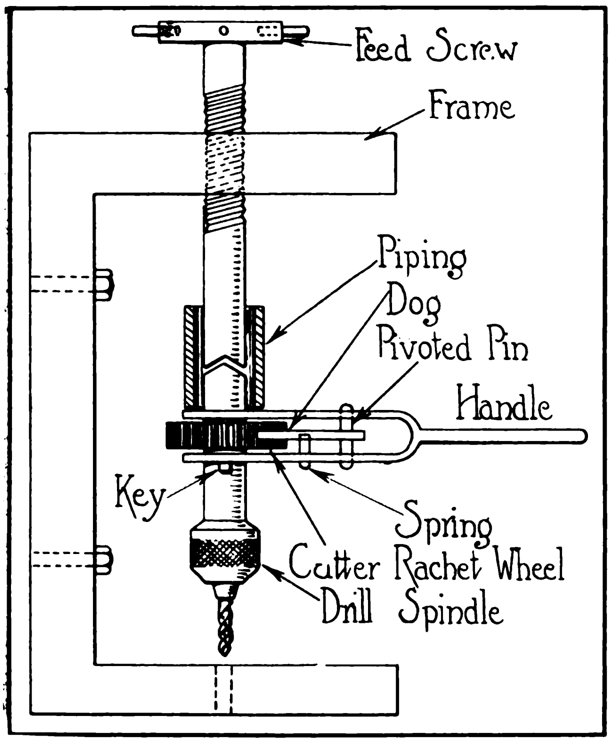

Fig. 2—Home Made and Easily Constructed Ratchet Drill.

The frame was made at a blacksmith shop, the shape being shown in the illustration, and this was bored to take two large coach screws which were utilized to fasten the metal to the wall. An old milling cutter was annealed for the ratchet and keyed on the drill spindle. A piece of strap iron was next bent U shaped and one end drilled and tapped to take the handle.

A dog was fitted with pivoted pin and controlled by a spring one end of which was secured. The feed screw member was made of round stock, threaded to pass through the frame, and the lower end recessed to fit the top of drill spindle. A piece of piping was utilized, as indicated, to prevent any possible slipping. The arrangement of the hand feed is obvious. As the ratchet is moved clockwise the tension of the drill is tightened by the feed screw which is turning in the same direction.

The device could be improved by welding a Y to the lower part of the frame which not only would strengthen the member but permit the easy handling of large pieces of work. The tool should be superior to the breast drill and save considerable time and labor.

GEAR CHANGING TROUBLES AND CAUSES.

Some drivers experience more or less trouble in changing gears and the writer knows more than one instance in which owners of cars fitted with the sliding gear transmission replaced them with the simpler planetary type because of inability to operate the former successfully. Undoubtedly there is a lack of skill in this respect, evidence of it being noted every day. It is safe to assert, however, that in the majority of machines this may be effected with little if any noise, but to accomplish this it is necessary that the operator have a knowledge of what occurs within the gearbox as well as without. There are some automobiles in which the inertia of the flywheel is not overcome, making gear changing difficult, but these can be handled easily by means of a braking device which can be fitted to either the cone or multiple disc type of clutch.

Many are able to shift from low to high without trouble but are bothered in changing down. Before discussing the subject, however, a study of the diagram, Fig. 3 is suggested. Here are presented the components of a three-speed gearbox, the clutch engaged in the flywheel, and the coupling shaft. With the motor running, the following conditions exist: First, the clutch and intermediate shaft are revolving at the same speed as the engine, while the secondary shaft and its attached gears are rotating in accordance with the ratio of the constant mesh gearing. Second, the main shaft and its gears are stationary.

Under these conditions a noise will follow if the lever be moved for an engagement of the low speed immediately upon the clutch pedal being depressed, owing to the former revolving when pressed against the stationary pinion. To bring about silent meshing both gears must be stationary, and this will not take place until the clutch, intermediate shaft and secondary member have stopped turning. This occurs a few seconds after the clutch has been thrown out fully, and then the first speed may be engaged without trouble. Instead of waiting for these conditions, however, many drivers jam the gear lever into its first speed position simultaneously with throwing out the clutch, thereby causing a grinding of the teeth and sometimes jumping the car. To determine the minimum pause in any given instance should not be a difficult matter.

Some operators will take exceptions to the above statement, saying that if they allow the clutch to come to a stop they cannot engage the first speed. This is true in some instances and is brought about by the faces of the gears being worn badly; that is, the chamfered edges have so deteriorated that unless the members come to rest with the teeth to be meshed exactly in line, the pressure of one against the other has little if any effect. The purpose of the chamfer is to facilitate meshing.

Sometimes difficulty is experienced in changing from neutral to the first speed even when a pause is made before using the lever and when the clutch pedal has been fully depressed. This is due usually to abnormal pressure being brought to bear upon the pedal, so that when a clutch stop is in position the shafts are practically locked. Even with the edges of pinions in perfect condition under such circumstances a shift cannot be made.

If difficulty be experienced, less energy expended upon the pedal probably will eliminate the trouble, but if not it may be taken for granted that the teeth are worn, as described. However, engagement may be effected by letting the clutch in a little way, thus imparting motion to the clutch shaft which in turn will move the constant mesh gears and rotate the secondary shaft, permitting the meshing of the pinion in question.

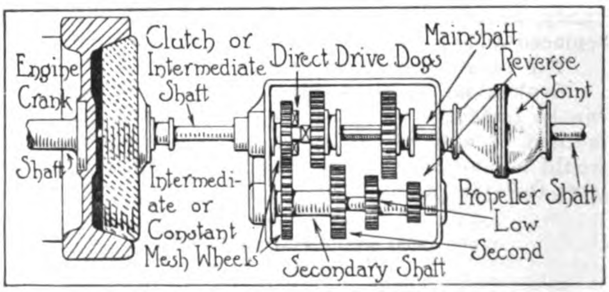

Fig. 3—Components of Three-Speed Gearbox.

In changing from first to second, the following conditions exist before the movement: First, motor, clutch shaft, and secondary member with its gears running at a comparatively high number of revolutions a minute. Second, the main shaft is turning slowly. The difference between the ratios of these two speeds requires that either the motion of the main shaft shall be increased or that of secondary reduced. The former cannot be accelerated because it is connected with the driving wheels, therefore the speed of the secondary must be cut down.

Some drivers bring this about by crowding the second speed gears against each other immediately upon disengaging the clutch. Noise results as well as considerable wear. The suggestion regarding the first change should be followed; that is, the clutch pedal should be depressed to its fullest extent and the lever moved slowly but firmly from first to second. It should be understood that the slowing of the clutch shaft cannot begin until the low speed gears are out of mesh, consequently the period during which the clutch brake is enabled to effect its purpose is very short, and if it be inefficient or none is provided, it is well to make a distinct pause when the lever is in neutral.

In making any upward change which requires the crossing of the gate this pause is automatically brought about by the time occupied in the lateral movement of the lever, but where a backward or forward movement only is made, there should be a delay and the habit cultivated. It need be very small, and on some cars would amount to no more than a slight hesitancy in the operation.

In shifting from indirect gears to the direct drive, where the latter is by dog clutches, a little more energy is required in the handling of the lever, although the conditions before and during the change are the same as in any other upward movement. This is due to the square shape of the dogs, their number and small engaging surface, as compared with gears. A pair of the former rotating at very slightly divergent speeds—conditions under which a pair of chamfered pinions would almost engage of their own accord, or, at least with no more pressure on the lever than that of a finger—will sometimes move away from one another unless the lever be held firmly. Where they have moved apart and before the operator has brought them together for engagement, the relative speeds may have changed so that the faster may have become the slower, and it will be necessary to let the clutch in again and speed up the clutch shaft before the dogs can be meshed.

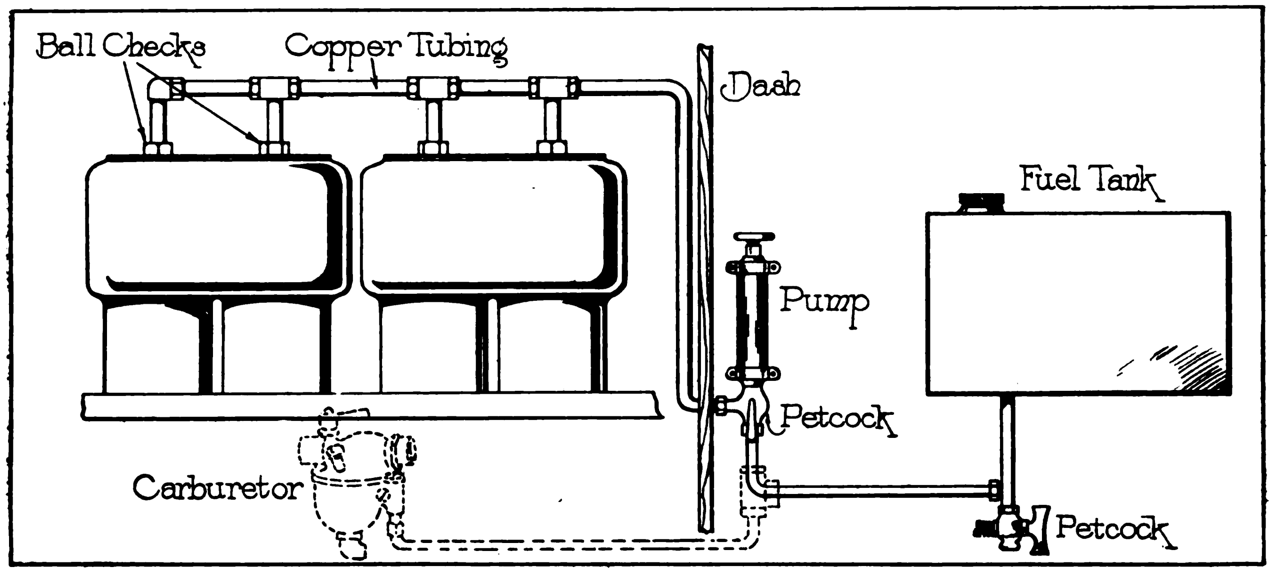

Fig. 4—Showing How a Priming Device Operated by a Hand Pump May Be Installed in the Fuel System of a Motor Car.

It may be said as a general rule having but few exceptions, that in changing up, the greater the difference in the ratio of any two gears the slower should be the movement of the lever or the longer the pause between the two positions. Some owners complain that their cars are noisy only when changing from first to second. This is due to the fact that the ratios of these gears are usually the most divergent.

PRIMING MOTOR FROM SEAT.

When motors have been exposed to the cold for any length of time some are difficult to start. They will not respond to repeated crankings even though the carburetor be flooded and the air intake closed. This state of affairs may exist even with a strong spark, at the points of the igniting member. The usual method is to raise the hood, open the priming cocks, and inject gasoline.

This operation involves unstrapping the hood and raising it, opening the tool box and securing the priming can. Sometimes the latter will be found empty, the operator either having neglected to replenish the supply or the liquid has been spilled by the can overturning. In such event priming material will have to be obtained by syphoning from the fuel tank or a connection thereof, a disagreeable task on a cold day.

At Fig. 4 is presented a priming device which may be operated from the seat. It is fitted easily and is not very expensive, the material required being a hand pump, copper tubing, four ball checks, three unions and an elbow. The tubing may be of other material than copper although the latter is preferable as when annealed it is easier to handle in making bends and turns.

The device illustrated was installed by a repairman who possessed a hand pump with a petcock attached, and the tubing. The ball checks and connections were purchased. The motor had core openings in the centre of the cylinder head and over the combustion chamber. These were removed, drilled and tapped to take four leads from the main line of piping.

Ball checks were installed in these members the former allowing fluid to flow into the cylinder but not out of the chamber. Short pieces of piping were utilized with unions to connect the main line being brought back to the dash, thence through this and attached to the petcock of the pump. Another tube was led from the shut-off valve and carried below the floorboards to the pipe leading from the fuel tank.

The operation is obvious. When the motor requires priming the petcock of the hand pump is opened and gasoline flows by gravity to the latter, the handle of which is raised, which action sucks in the fluid. The petcock is then closed and the handle depressed which movement forces the fuel through the pipe and check valves into the cylinders. In addition to priming, the appliance may be employed for flushing the motor with kerosene by disconnecting the pipe at the lower end of the pump and drawing in the fluid through the petcock.

REGARDING ELECTRIC LIGHTING.

Many owners whose cars are not equipped with electric lighting outfits desire to install some system that is inexpensive and requires but an elementary knowledge of electricity. If the car be fitted with a current generator which will permit the use of electric lamps in connection with the ignition system, the voltage of the device should be ascertained before fitting lamps in the circuit. If the speed of the magneto be variable; that is, not fitted with some form of a governor or regulating member, it should be taken into consideration in figuring the voltage of the lamp to be used. This will save expense in replacing burned-out members.

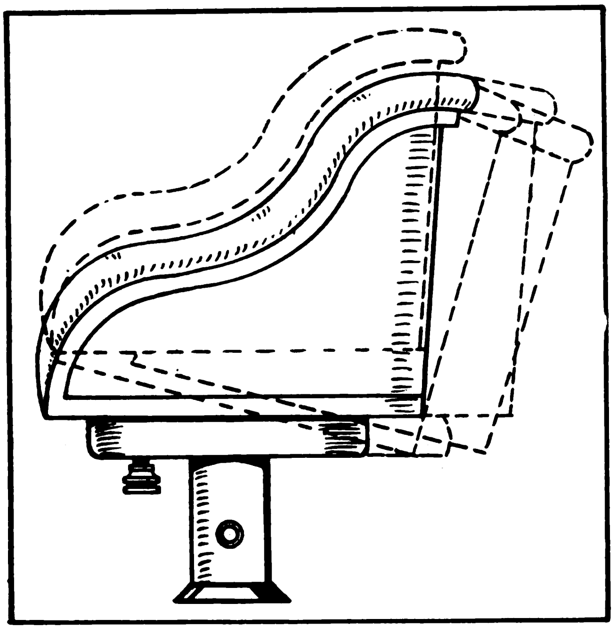

Fig. 5—Adjustable Driver's Seat Recently Brought Out Abroad.

The writer is in receipt of queries regarding a certain popular priced machine which is equipped with a current generator having rotary field magnets that revolve with and as a part of the flywheel. This device develops an alternating electromotive force from a few volts to as high as 30 in an open circuit, the amount necessarily depending upon the number of revolutions of the wheel.

This electricity can be employed for lighting; in fact, the K-W Ignition Company markets an outfit which is practical and complete. Some owners consider that the current may be used also for charging a storage battery by floating it on the line, but this is not correct as a direct current is required for that purpose. It may be done, however, by utilizing a rectifier, but the latter is expensive and would take up more or less room.

The storage battery may be employed as a reserve when the motor is not running, and the auxiliary member may be wired so that it may be used for starting purposes as well. Unless one is familiar with electricity it perhaps would be best to install a system that has been thoroughly tested.

AN ADJUSTABLE SEAT.

An English concern has brought out an adjustable drivers' seat which is illustrated at Fig. 5. By means of attaching this to a centre column the positions may be changed without the operator leaving his seat. It can be raised three inches and moved backward or forward five inches.

The mechanism provides for tilting at any angle, as indicated by the dotted lines in the drawing, and the seat also may be revolved. The advantage of a device of this kind is that in the case of a very tall or short man the seating accommodation may be fixed without altering the steering column, clutch or brake pedals. It also affords an opportunity for a change of drivers irrespective of their size and positions assumed while operating. The controlling mechanism is simple and is operated easily.

PECULIAR CAUSE OF OVERHEATING.

Upon first thought the average experienced operator of a car would not expect that an insufficient supply of gasoline at the carburetor would be a cause of overheating of the motor, but an instance in which this was primarily the cause was noted recently. The engine was a two-cylinder, and had never run well from the day it was new. It was rather hard to start and ran hot. The valves pitted so badly they required turning true in a lathe, and the exhaust valve spring lost its temper within 100 miles, etc.

The motor was more or less responsive to both throttle and air levers; started with the extra air shut off, and took almost the whole of the auxiliary atmosphere when running fast. If either the throttle or air lever were moved carelessly; that is to say, with a swift movement over a large portion of the quadrant, the engine promptly stopped firing, and had to be restarted. A cure of these difficulties was effected finally by simply adjusting the float so that when the car was standing still and the engine inoperative, the fuel stood on a level with the top of the jet.

The existing conditions were that the motor had two functions to perform under the original adjustment of the carburetor. One was the normal function of taking gasoline from the tip of the jet and atomizing it, added to sucking in air through the orifices provided in suitable proportions. The other was the abnormal function of sucking up fuel through a very fine tube. The second operation demanded more suction, and owing to the fact that most of that obtainable was wasted on the air openings, the remainder could not be relied upon to bring up the gasoline in the jet, and so the motor was difficult to start. As soon as this was accomplished, a second trouble arose. After cranking, the driver naturally leaned over to the levers to provide a little extra air. This increased the air openings upon which the scant supply of suction promptly wasted itself. As a result there was a dearth of gasoline at the jet, and consequently the motor stopped.

The operator upon restarting, imagining he had been too free with air, fell into the habit of running on too rich a mixture, causing overheating. This demonstrates the necessity of having the fuel level with the top of the jet in some carburetors and of verifying this point when the float needle has been ground in after long use. The test should be made with the vaporizer on the car, if possible, as few are set dead level on the machine.

CARE OF INNER TUBES.

Sometimes an inner tube leaks and upon examination small holes are noted and usually the motorist blames the maker for employing poor material. This is not the cause, says an experienced tire man, as the apertures are due to carelessness of the operator who allows small particles of dirt or mud to enter the envelope when fitting a new tube. The air pressure from without and within combine to grind the foreign elements into the rubber. In fitting the device care should be taken to clean both the shoe and tube. The tools utilized in removing the former should not be left lying around on the ground where they will collect dirt.

SOLDER IN VALVE CAP.

Occasionally the little piece of rubber located in the tire tube valve cap sticks and tears when changing tires and sometimes it affects the plunger. A small amount of soft solder dropped into the cap makes an excellent substitute the metal being sufficiently soft to bed itself against the end of the valve, and make a perfectly air tight joint. It will not adhere to the other metal and as it is not affected by oil or foreign elements it may be used for an indefinite time.

GRINDING DISCS OF CLUTCH.

Multiple disc clutches when used properly and given attention present little if any trouble and may be operated thousands of miles. On the other hand, if they were wrongly adjusted in the first place, the chances are that they will start slipping which movement very soon rubs away the lubricant between the rings, and the result is a continual grating until the clutch locks and takes up the drive solidly. When plates get to this stage there is only one remedy and that is to replace them with new members or have the old ones ground, which sometimes does not give entirely satisfactory results.

In connection with this operation it is noted that a new method of smoothing the plates has been brought out by an English concern, which uses a magnetic chuck on the grinding machine. These tools are admirably adapted for this work. Each of the thin rings is simply laid against the chuck and the electricity turned on, whereupon it is held firmly against the face of the plate, and there is not the least fear of its being in any way distorted. By this method the metal may be ground smooth on one side then reversed for similar treatment on the opposite side.

WHY PEDALS WEAR SHOES.

Those who do considerable driving in crowded traffic of the cities operate the clutch and brake pedals considerably more than the average driver, and in the continual contact and rubbing between the metal and the leather the latter suffers most; in fact, a pair of light soled shoes are soon reduced to a state where repairs are necessary. Obviously the remedy would be to employ heavy soles, but many object to these, as they claim they cannot "feel" the pedals. A driver whose work is mostly in the city treats the soles of his foot apparel in the same manner as the leather of the clutch by dressing them with castor oil, applying several coats and allowing the lubricant to soak in. This not only softens the leather but adds to its wearing qualities. The soles of new shoes may be similarly treated.

Preservation of Calcium Carbide—Calcium carbide is readily attacked by the air and the moisture contained in the generators and consequently decomposes during the storing, with the formation of acetylene gas. Aside from the loss, this decomposition is also attended with dangers. One of the oldest methods of preservation is the saturation of the carbide with petroleum. In using such carbide a layer of petroleum forms on the surface of the water in the generator, which effectually prevents the water from evaporating.

A VALVE LIFTING KINK.

The amateur in attempting his first removal of a valve in preparation for grinding, is often bothered in lifting it high enough to be grasped by the fingers. It may be operated easily by inserting the tang of a file in the slot of the valve stem and moving it upward as far as it will go, then holding the stem with the point of a screw driver while another lift is made with the other tool.

STEERING WHEEL WARMING DEVICE.

Many drivers complain of cold hands during the winter, although different forms of gloves are worn. One of the reasons for this is that in gripping the wheel the circulation of the blood is more or less impeded by the pressure exerted in holding the member. Some operators find that the old-fashioned woolen mitten is the warmest covering for the hands, but more or less difficulty is experienced in gripping the wheel because of the smoothness of this member.

At Fig. 6 is shown a method of wrapping the circle with felt which will exclude the cold and provide a good surface for the woolen mittens. To prevent the material from slipping, friction tape is sewed to one side, as depicted in the drawing. It should be less in width than the felt.

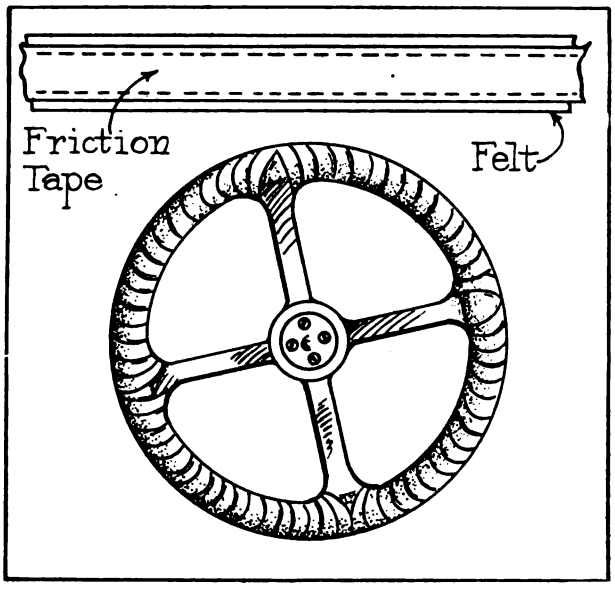

Fig. 6—Illustrating How a Wheel May Be Wrapped with Felt Sewed to Friction Tape.

The first step is to cut the felt into strips about .75 inch and sew as many together as will be needed. The tape is then stitched on and the rim of the wheel covered as outlined. The edges of the felt should be wrapped close together to provide smoothness. When the wheel is covered the two ends of the material are sewed together. The tape will grip the wood firmly and the felt will not be as cold as would the original material. Another advantage will be that the covering will absorb vibration and driving will not be so tiresome.

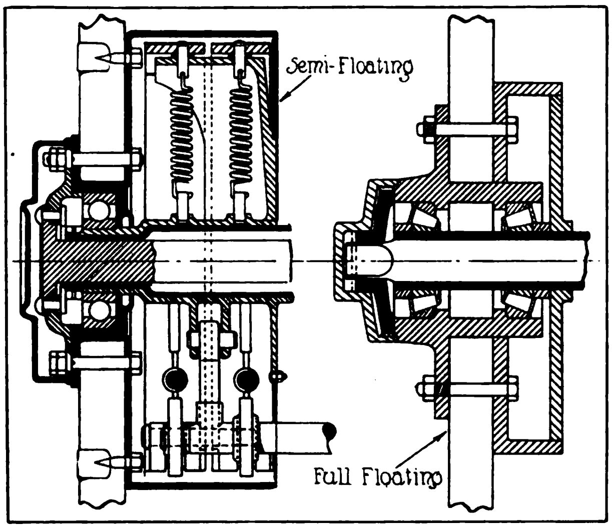
Cleaning of Colored Leather—Stained leather shoe covers can be cleaned and be made to look as good as new by applying the following mixture: Pour carbon bisulphide on non-vulcanized gutta-percha, and allow it to stand about 24 hours. After shaking well add more gutta-percha gradually until the solution becomes of a gelatinous consistency. Apply to leather and allow to dry about three hours. To remove gutta-percha, rub with fingers and roll off. The color is not injured the least. Only those leathers on which a dressing containing starch has been used look a little lighter in color. The dry gutta-percha can be dissolved in sulphuret of carbon and used over again.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Semi and Full Floating Axles.

(110)—I am greatly interested in your "Correspondence with the Reader," and believe you will cheerfully answer these questions for me: What is the difference between a semi-floating and full floating rear axle? What advantage or disadvantage has the four-cylinder upright motor with cylinders cast en bloc over one with cylinders cast separately or in pairs? Is it true that a two bearing crankshaft of an en bloc motor has an advantage over the three or five bearing crankshaft of the motor with cylinders separate, or in pairs? A. J. RIKER.
Moundsville, W. Va., Oct. 8.

In the full floating type rear axle the housing is constructed substantially in order to support the weight of the car. Each outer end of the tubing surrounding the axle is provided with a hardened steel bushing or cup upon which the balls or rollers of one of the driving wheel bearings are adapted to run, so that the wheels are entirely supported by the ends of the housings. The differential gears have their bearings within the central expanded portion of the housing. Each end of the two axle shafts is squared and fits similar recesses in the hubs of the gears of the differential. The outer ends of the shafts enter corresponding squared out cavities in the hubs of the driving wheels. This makes for a form of jaw clutch and a certain flexibility is given to the power transmitting portion of the axle and any slight deflection of the casing results in no binding of the moving parts. This construction is varied in several ways but the principles are similar.



Depicting Types of Semi and Full Floating Rear Axles.

In the semi-floating type the wheels are mounted directly upon the axles, which carry the weight of the car as well as transmit the power. The axles revolve in bearings mounted in the axle housing. The difference in construction will be noted in the accompanying drawing which depicts full floating and semi-floating types of rear axles.

The advantages claimed by the advocates of four or six-cylinder motor cast en bloc is a shorter and more compact power plant, and there is a growing tendency among the automobile manufacturers to adopt this design. The twin and single-cylinder castings are favored by many makers, however.

Regarding the two bearing crankshaft of an en bloc motor and the type fitted with three or five bearings with cylinders cast in pairs or singly, the designers strive to achieve the same results, that of strength and durability. It is obvious that where two bearings are employed these must be larger and stronger than where five are utilized and these points are considered in the design of the crankshaft and crankcase, which are shorter with the en bloc type of engine.

Acetylene for Starting Motor

(111)—If one should install a motor starter of the acetylene type and if a large quantity of gas should be permitted to go into the cylinders, would there be any danger in exploding the charge? What I wish to know is would there be any danger with a large amount of acetylene and if it would be injurious to the engine. Suppose the device to be so arranged that there would be small brass tubes leading from the distributor to the cylinders. Would there not be enough gas left in these tubes after the motor started? If so would there be any danger of these tubes becoming hot enough to cause the gas to explode? UTTUS WHEAT.
Holland, Texas, Sept. 15.

Various methods are utilized in self-starters employing acetylene, but the basic principles are similar, that of mixing a stated quantity of air with the gas, conveying it to the combustion chamber of the motor and exploding the mixture by a spark. As with gasoline, it is essential to know the proper amount of air to combine with a given quantity of acetylene to obtain the correct efficiency. Too little or too much in proportion to the fuel will result in a poor mixture and starting conditions will be affected thereby.

An explosive point is reached when only 3.35 per cent. is acetylene and the balance air. Regarding the correct proportion of acetylene to air to ensure proper combustion and maximum force, the experiments of Berthelot and Vielle show that with a 10 per cent. acetylene and 90 per cent. air mixture an explosive force of 11 atmospheres is derived. With an increase in proportion of gas up to 50 per cent., at which point it is 22 atmospheres, the maximum is reached and beyond equal parts, it decreases.

Supt. O. H. Skinner of the Prest-O-Lite Company, Indianapolis, Ind., states that the best results are obtained by using one part acetylene and 10 of air, approximately, and that when this is ignited it will burn explosively and produce a force considerably greater than if gasoline were used, provided, however, some means of obtaining air is installed other than taking it through the intake manifold.

In considering the application of acetylene in a form of self-starter, some form of regulating valve should be incorporated and when the member is of the automatic type the sizes of ports or valves open from the line would accurately gauge the amount of gas being used. The pressure of the latter when brought from a tank should be reduced, as acetylene should not be piped about the car at a pressure greater than two atmospheres, or about 30 pounds. The pressure may be reduced by fitting a two-way valve to the tank when the latter is utilized both for starting and lighting.

Regarding the effect of acetylene upon the cylinders, a well known authority states that it will not injure them provided the mixture is correct and that the explosions brought about are not unduly high. The tubes carrying the mixture to the cylinders would not become heated enough to explode any gas left in them if there were any. If the device should be so constructed as to leave any mixture in the tubes it would be drawn into the combustion chamber by the instroke of the piston, and as the amount would be small, it would not affect the gasoline mixture operating the motor. It is obvious that the acetylene from the tank would be prevented from flowing except when the self-starter was being employed.

Regarding Disco Self-Starter.

(112)—I am considering a self-starter and regarding the Disco system desire to obtain the following information: When the engine has stopped at dead centre and does not start the first time, what becomes of the explosion, also on a cold day when it fails to start? Has there ever been such a thing as blowing off the cylinder head with this starter? Will the explosions injure the motor in any way when it fails to start?

Red Hook, N. Y., Oct. 11.

JOHN R. FINGAR.

Regarding the motor stopping at dead centre, the maker of the Disco device states: "Should the Disco fail to start the motor, owing to the latter being on dead centre, it is only necessary to make a quarter turn with the crank and then start on the spark." Stopping on dead centre rarely occurs, however.

As to an explosion taking place and not enough energy being developed to start the motor, or in other words, if the pressure be not strong enough to force the piston down far enough to bring up to dead centre the piston of the next cylinder to fire, the burnt gases will remain and be forced out through the exhaust valve when the motor is cranked a quarter turn or the cylinder in question charged and exploded properly.

Regarding blowing off of a cylinder head with the Disco system, the writer does not see how this could take place, owing to the fact that the gas and air is mixed in proper proportions by the distributor of the system. As to the proper proportions and danger of injury to the cylinders, these questions are answered in the previous communication.

Locating Poles of Battery.

(113)—I acquired a second hand storage battery recently and wish to do my own charging. The pole marks are not shown on the battery. Will you please tell me how to locate them? WILLIAM E. NEVINS.

Richmond, Va., Sept. 12.

Attach a wire to each terminal and place the ends in a glass of water taking care that they do not touch. The negative wire will give off bubbles and this terminal of the battery should be marked thus —. The other will be the positive and should be marked thus +. In charging, the leads from the charging apparatus should be similarly connected.

Driving Out Ball Races.

(114)—I have a model ——— car and the large ball races in the front wheels are worn out. Have secured new members from the factory but cannot get the old members out. Have tried the suggestions contained in instruction books, but without success. Have been told that I will have to apply heat to draw the temper and then break up the races with a cold chisel. Is there any method you can suggest? C. B. FORDHAM.

Portland, Ore., Oct. 7.

The easiest and quickest way to remove the races is to dismantle the wheel. The hubs and flanges may be taken apart easily by removing the nuts and driving out the bolts. The hub and flange will come apart and it will be noted that the flange member in which the ball race is located has three holes. These were incorporated by the manufacturer for the purpose of removing the races when other means fail. By utilizing a punch and hammer the race may be removed. The dust ring will come out with the race so it will not be necessary to remove the former separately. In using the punch, it should be employed alternately in each opening of the flange to equalize the driving strains. In fitting the new member, it should be driven in with a lead mallet or with a block of hard wood inserted between the hammer and race, as these members are hardened and break easily.

Adjusting Babbitt Connecting Rods.

(115)—The connecting rods in my model T Ford need adjusting instructions for which are given in the book. I notice it is stated that they should not be taken up too tight. How is one to determine this? The book says the connecting rod should barely turn of its own weight when inclined in a horizontal position. This would be possible if the cylinders were removed, but I wish to adjust the bearings without going to this trouble.

W. D. M.

Pepperell, Mass., Sept. 19.

It is an excellent plan to follow the instructions of the maker in the matter of operating and adjustment. The rods may be taken up as stated by thinning down the shims a trifle at a time, and replacing and tightening up the connecting rod and bolt, trying the snugness before replacing the cotter pin. The rod should move to and fro fairly easily on the crankpin when a little pressure is applied. Some repairmen make it a practise to take up the bearings very snugly, but if one is not familiar with the work it is best to have them a little loose rather than too tight. If the shims have to be filed care should be exercised in making the surfaces even. Set up each bolt and nut as hard as possible and fit the cotter pin.

Ice Boat Design and Construction.

(116)—Will you please give me some information on the subject of ice boat construction? I wish to build one, a power driven one, and wish to use the engine from an old automobile. This is a single-cylinder motor of 3.5 inch bore and four-inch stroke. I have planned to have two runners ahead and one spiked wheel behind. Will it be a good scheme to steer by the two forward runners, using the steering knuckles of the old auto? I would like to use some kind of friction drive. Could you give me any advise in the practical design of a wheel of moderate cost? Is there any way of using one of the old auto wheels, which has a steel rim and 28 inch diameter tire? In using this, would it be feasible to use the brake and a chain drive to the sprocket now on it? Is there power enough in this little engine to drive the machine over hard snow? I would like to have you give me a number of hints about ice boat design and construction, if it is not asking too much. L. R. G.

Clifford, Mass., Sept. 23.

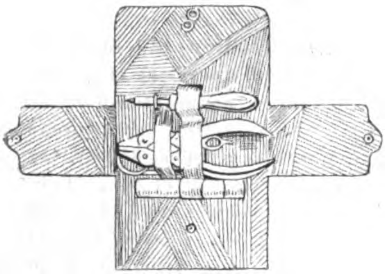
The engine you have will be suitable, although its power which will not exceed five horsepower, would not allow running the ice boat over snow, even hard packed snow. The two runners ahead, hung on the steering knuckles of the automobile, and used to steer the boat, will work all right as will also the single driving wheel behind. In preparing the wheel, you can use the sprocket and brake drum now on it, although it is doubtful if the brakes will do much good.

On the driving wheel, it would probably be advisable to have a form of leather outer shoe made for the tire, this being studded with spikes to take hold of the surface of the ice. If this cannot be done, remove the tire and use in its place a regular leather tread tire. Or, if the tires on the automobile are old, and you do not care to keep them, use them with tire chains on the driving wheels, using the various tires alternately. The driving wheel must be made so as to adjust itself to the surface it is passing over, that is, it should be spring suspended, while in addition, it would be well to make such a suspension that the driver of the boat can lift it off of the surface of the ice and shut off the power, when he does not want to use it.

A number of hints on ice boat design and construction will be found in an article published in the Automobile Journal of a recent date on this very interesting subject.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.



Cinch Repair Kit

The Cinch Tire Repair Kit, marketed by the Hailstone & Winmore Company, Northampton, Mass., is a device with which it is claimed an inner tube may be repaired when punctured in a very short time without removing the member from the wheel. The outfit comprises a number of rubber plugs, a cutting tool, a wire spreader and a pair of patented pliers. The patching plug is made in two parts, having a space between the sections, and so devised that these may be compressed, thus sealing the aperture in the inner tube. The wire spreaders are utilized for temporarily enlarging the puncture and for making easy the insertion of the plug which is of rubber and metal. It is stated that an inner tube may be repaired in less than a minute, that it will not leak and that the repair is permanent.

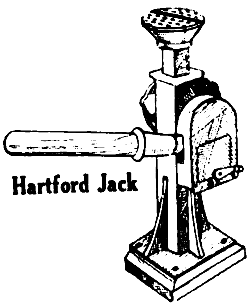
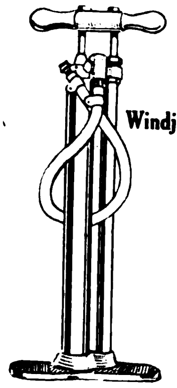
The Hartford Auto-Jack, manufactured by the Hartford Suspension Company, Jersey City, N. J., maker of the Truffault-Hartford shock absorbers, will appeal to motorists who desire a jack which will lift a heavy car without undue effort. The working parts are constructed of solid chrome nickel steel fitted in a casing of tough malleable iron and it is pointed out that the tool will survive the roughest treatment. It operates up or down, these movements being possible by the moving of a small lever, and as the positions are indicated there is no guesswork when utilizing the device.



Hartford Jack

—— ★ ——

The Windjammer Automobile Tire Pump, manufactured by the Bridgeport Brass Company, Bridgeport, Conn., is said to differ from those of usual construction as to disassemble the device it is only necessary to unscrew one nut. The cylinders are constructed of heavy gauge seamless brass tubing and these are fastened into the foot base in such manner as to be absolutely air tight. This operation is performed by a special process. The top is made of malleable iron and is said to be practically unbreakable. The Bridgeport product is provided with a heavy coil spring on the piston rod, this preventing any violent upward movement from damaging the top.



Windjammer Pump

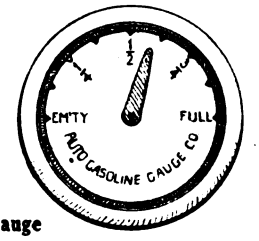
The Auto Gasoline Gauge is being placed upon the market by the Specialty Sales Company, Racine, Wis., and is designed for attaching to the fuel tank to denote the amount of gasoline in the container. It is very compact and it is claimed that it may be installed in 15 minutes by the utilization of the special tool which accompanies each device. It comprises a metal tube which extends from the top to the bottom of the fuel tank, a float and a gauge. The casing has a spiral slot extending from top to bottom, half way around its circumference. This slot engages with arms on the float which slide freely on a straight staff. The latter is pivoted at either end of the casing, and at the upper end is an indicating hand which records the movement of the float below. The casing also serves to prevent the slopping of the fluid and disturbing the operation of the float. When the gauge is installed in the tank the dial lies in a horizontal position close to the surface and it is said that a perfectly steady reading is given by the indicator. The dial is calibrated, denoting empty, full and intermediate positions.



Auto Fuel Gauge

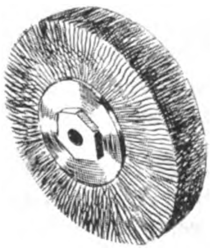
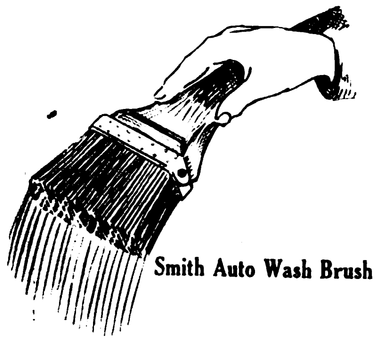
The Economy Wire Brush, produced and marketed by the Williams Foundry & Machine Company, Akron, O., maker of automobile tire repair equipment, is designed to be utilized with a buffing stand, but it may be operated on an ordinary emery grinder. Where there is much work to be done, it is claimed that the brush will save considerable time in preparing casings and tubes for cement and new material. The device is constructed of steel wires in suitable lengths and it is claimed that the material will not break. It is made with different diameters as well as width of faces.

Economy Wire Brush



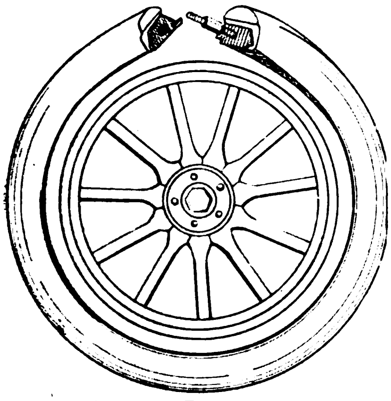
The Auto Wash Brush, marketed by the I. J. Smith Manufacturing Company, 4241 Park avenue, New York City, is designed more especially for owners who take care of their own cars, although it is constructed for garage service as well. The brush is made of a high grade soft hair through which the water passes, keeping it clean, as well as insuring a constant flow of fluid upon the part being washed. It is fitted with a special coupling to which the hose is attached and the connection also forms the handle. Extra brushes may be purchased.



Smith Auto Wash Brush

★

The American Emergency Tire, marketed by the American Automobile Specialty Company, 510 Ashland boulevard, Chicago, is as its name implies, an emergency shoe for replacing a blown-out or badly damaged pneumatic tire while on the road. It consists of a length or strip of solid rubber tire material perfectly conformed to the shape and size of the channel of any given wheel. It is reinforced internally, with high carbon steel wires and these are welded at their ends to two steel plates which form parts of a turnbuckle. The tire is made tight and secure in the channel, between the rims of the wheel, through the action of the right and left hand threads of a double screw engaging in each end plate. The lateral strain is on the rims of the wheel. The turnbuckle is hidden from view and its arrangement permits of the two ends of the tire being joined closely and without a projection.

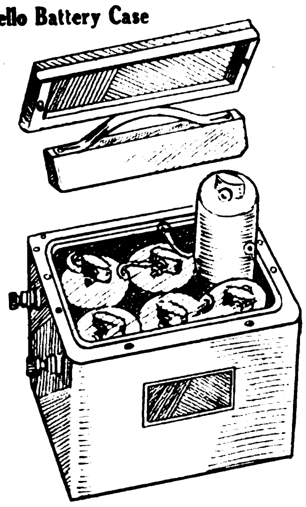


American Emergency Tire

★

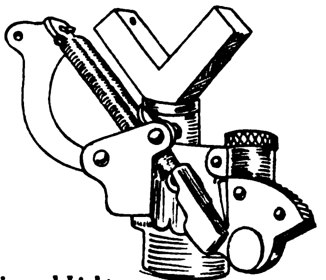
The Cello Battery Case is produced and marketed by the A. S. Campbell Company, 284 Commercial street, Boston, and is specially designed for automobile or marine service, as the hermetic case protects the dry cells from all moisture. The walls of the holder are .5 inch thick and the interior of the container is sealed with a water proof compound. The lower section is fitted with a bronze rim equipped with a substantial rubber gasket, which is compressed when the cover is fitted, inasmuch as this also has a gasket which presses against the rubber. The cells are held securely by a block on which is mounted a spring. Two binding posts or terminals are fitted to the exterior of the holder. The case is adaptable to any make of dry cells and is constructed to hold six batteries. It is neat and compact and the exterior well finished.

Cello Battery Case



★

The Universal Lighter differs from those of usual construction, as by it the acetylene headlights may be lighted by a simple movement of the finger. It does not require any wiring or batteries, the spark being generated by a friction file passing over a sparking alloy, the movement throwing a shower of sparks directly into the path of the flame. It is claimed that the sparking alloy will endure over six months and it is enclosed in a small thumb nut with spring tension to keep it automatically in proper adjustment until worn out. The sparking attachment is sold separately, and costs but a few cents by the dozen. The lighter is clamped around the base of the burner and is so constructed that it will fit any type of burner. It is marketed by the Waite Auto Supply Company, Providence, R. I.



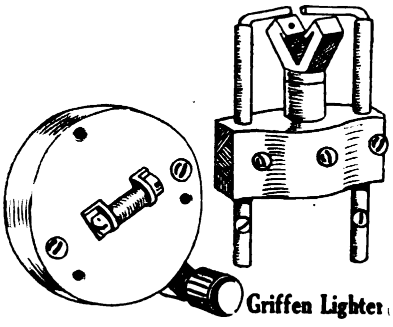
Universal Lighter

★

The Griffen Lighter is the invention of Stephen J. Griffen, 306 Linwood avenue, Bridgeport, Conn., who devised it for application to his single-cylinder car. It comprises a switch having a spark gap and a bracket for attachment to the acetylene burner. The burner device has two points in proximity to the path of the flame. When the switch lever is moved, the direction of the secondary current is changed so that it makes the circuit of the spark gaps at the burners, returning to the spark gap on the switch, and thence to the plugs as usual. The current to the plugs is interrupted but for the fraction of a second and the maker claims it does not interfere with the operation of the motor, also that the lighter is adaptable to any type of internal combustion engine.

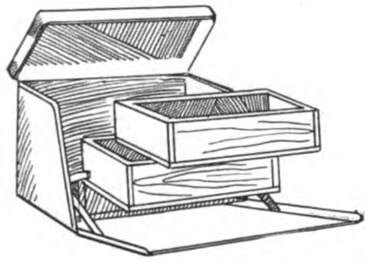
★

The Gray Telescoping Tool Box, manufactured and marketed by the Gray Specialty Company, 148 Avon avenue, Newark, N. J., is a practical device for the automobile as its construction is such that any tool may be secured easily without disarranging the



Griffen Lighter

other members. This is of value on the road as considerable time is saved, and another advantage is that the tools are always in sight. The front and top of the box are hinged and the drawers swing outward, permitting easy access to the contents. The container is constructed of heavy gauge steel, and is 16 inches long, 10.5 high and eight wide. The compartments are of wood, preventing rattling of the tools. The device is equipped with a substantial brass trunk lock and the exterior is highly finished.

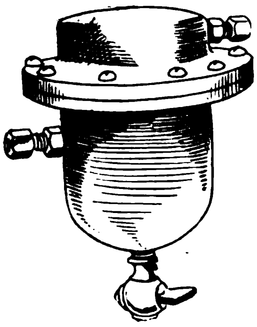


Gray's Telescoping Tool Box

*

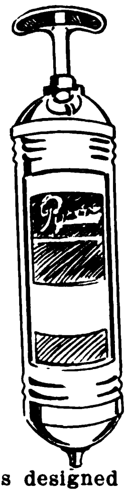
The Peerless Gasoline Separator is a practical accessory as when incorporated in the main fuel line it catches all moisture and foreign elements that may be present in the gasoline. The device is constructed of brass or aluminum, the former being designed for service on motor boats operating in salt water. The separator is in two sections, the fuel entering the lower and passing up through a chamois strainer into the upper chamber from whence it flows to the carburetor in the usual manner. All water or dirt being heavier than the fuel drops down to the bottom of the lower compartment whence it is removed easily by opening a petcock with which the filter is equipped. A special grade chamois is utilized and the maker points out that it will not harden or become dirty as it is maintained in a moistened condition by the flow of the gasoline. The device is made in two sizes by the Stott-Crowley Manufacturing Company, Detroit.

PEERLESS GASOLINE SEPARATOR



*

The Pyrene Fire Extinguisher is a compact device designed for attachment to the automobile, being 14 inches long and but three in diameter, and weighing only five pounds. The contents are impervious to heat or cold and it is claimed will not freeze at 60 degrees below zero, Fahrenheit. The liquid is not maintained under pressure, is proof against explosion, and will not deteriorate with age. Containing neither acids, alkalis or salts it will not injure any material with which it is brought in contact. The Pyrene Manufacturing Company, New York City, has designed a holder for attachment to the dash. The device itself is finished in enamel, brass or nickel.

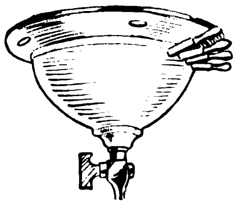


Pyrene Extinguisher

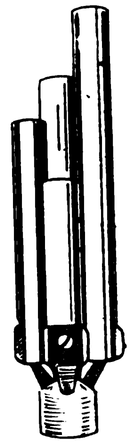
*

The E. & J. Condensation Cup is a device produced by the Edmund & Jones Manufacturing Company, Detroit, for attachment with the generator or gas tank, and by it all moisture is collected before it has an opportunity of reaching the acetylene burners. It is compact and easily installed, and is provided with two intake connections and a like number of outlets. It is placed below the generator or tank and any fluid that may collect is drained easily by the opening of a petcock with which the cup is provided. It is constructed of high grade material and is inexpensive.

E. & T. Condensation Cup



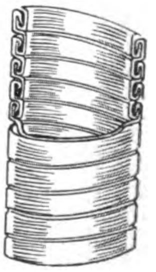
The Aermore Exhaust Horn is manufactured by the Aermore Manufacturing Company, Chicago, and it is claimed that its construction is such that it will not become clogged with soot and that it will clean itself automatically. It comprises four brass tubes having apertures and constructed on the principle of an organ. It is operated by the exhaust of the motor and may be attached to any convenient point of the exhaust pipe. A special tail-end valve is supplied if desired. The signal is operated by pedal and it is claimed that the horn produces the four major notes of the scale simultaneously and that the volume of sound is controlled easily.



Aermore Horn

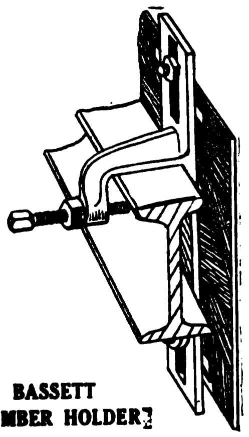
*

A Flexible Brass Conduit for covering the exposed wiring on motor cars or protecting gas tubing, etc., is manufactured by the American Metal Hose Company, Waterbury, Conn. It is made either of brass or steel and the metal strips are interlocked by a special process. The tubing may be bent to a considerable angle without affecting the joints. It is made plain or lined with asbestos, in different finishes, and is produced in various sizes to meet the requirements of the purchaser.



Flexible Brass Conduit

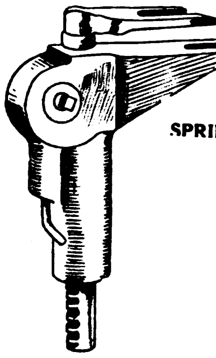
Bassett Number Plate Holder is one of many practical and useful accessories brought out by Charles A. Bassett, Providence, R. I., and is made in two styles for attachment to the front axle and rear of the automobile. The front device comprises a clamp with screw and locking nut and is so designed that it may be slipped over the I beam section axle and adjusted and locked easily. The number plate is attached to the holder by wing nuts and means are provided for adjusting the position of the plate.



BASSETT NUMBER HOLDER

★

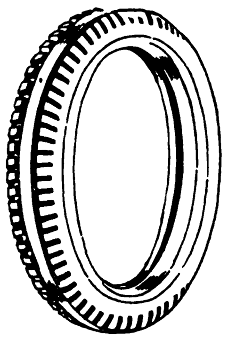
The Bryant Spring Remover, marketed by Stevens & Co., New York City, is compactly designed little tool for removing or replacing valve springs and is made in three sizes to fit any diameter springs. It differs from the usual valve tool as the spring is compressed or released by a rack and gear arrangement. Means are provided for locking the device in any desired position. The steel engaging device on the end of the lifting rack is a feature, as it will pass easily between the coils of the valve spring and may be twisted slightly if desired. The rack is of cold rolled steel, accurately cut to mesh with the cut gear, and the catch pin is of steel and will hold equally well in either direction. The engaging device is of high grade material, fitted and pinned securely to the rack, and the tool is nicely finished, comes in a box, and is inexpensive.



BRYANT SPRING REMOVER

★

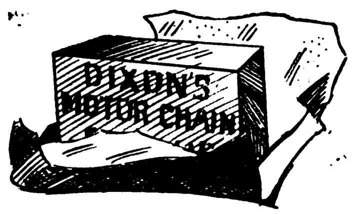
The Tyrian Anti-Skid Tire is the product of the Tyer Rubber Company, Andover, Mass., and it is claimed by the maker that its design is such chains are not necessary, as the shoe will grip the road. The tread has a number of block like corrugations running transversely and between these is a strip extending in an opposite direction. It is pointed out by the maker that the two evenly moulded channels running around the tire allow the shoulder in the middle to grip the road, preventing skidding. The cross channels eliminate forward slip and make easy the starting of the machine.



TYRIAN ANTI-SKID TIRE

★

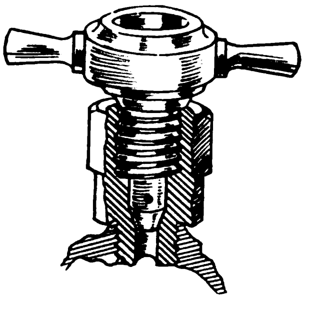
Dixon's Motor Chain Compound, manufactured by the Joseph Dixon Crucible Company, Jersey City, N. J., is a composition of graphite and a lubricant especially adaptable to motor chains, and comes in solid form, neatly and compactly wrapped. It is well known that the best treatment for driving chains is to cleanse them thoroughly and immerse them in a bath of graphite and tallow or similar material. This involves melting the tallow and mixing in the graphite. The Dixon preparation not only saves this work but insures the proper proportion of the lubricants and the right grade of graphite. A quantity of the compound, sufficient to cover the chains, is cut from the block and melted at a temperature of 180 degrees Fahrenheit, after which the members are plunged in cold water to harden the lubricant.



DIXON'S CHAIN COMPOUND

★

The Morgan Priming Cup, is the product of B. Morgan, Newport, R. I., and possesses many advantages over the usual construction as it is claimed by the maker that leaking, sticking or the possibility of broken handles are prevented. It comprises two parts, one of which is screwed into the cylinder head, while the other is screwed into the bushing member and when rotated provides a suitable opening for the priming fluid. Another feature of the device is that it gives a large opening into the cylinder, facilitating valve or ignition timing by the piston. The Morgan priming cup is made in standard sizes, either male or female, and is constructed of high grade material.

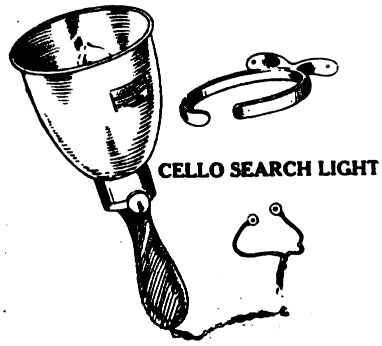


MORGAN PRIMING CUP

★

U-Vulk is a liquid preparation by the utilization of which tires and inner tubes may be vulcanized without employing heat. It is marketed by J. E. Gimperling & Son, Dayton, O.. and it is stated by the maker that containing no acid it will not injure a tube or casing. It is also claimed that cuts and tears in casings may be repaired easily and quickly in a few minutes and that the operation is so simple that it may be performed by those not familiar with tire construction. It will appeal to those who maintain their own machines, and in addition to being of service for tires, may be employed to repair rubber wearing apparel and appliances such as the horn bulb. The U-Vulk outfit is very complete and inexpensive.

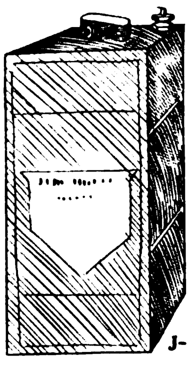
The Cello Searchlight, manufactured by the A. S. Campbell Company, Boston, is designed especially for service in locating street signs, guide boards, door numbers, etc., and differs from those of usual construction inasmuch as it is equipped with a hanging bracket for attachment to the car. The latter arrangement makes for convenience, as the lamp is always accessible. The diameter of the reflector is three inches and the bulb is a tungsten, eight candlepower requiring a six-volt current. The lamp is nickel plated and it is claimed by the maker that it will throw a powerful beam of light.



CELLO SEARCH LIGHT

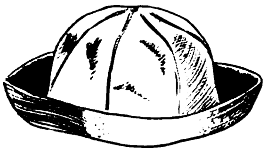
*

The J-M Dry Cells, made by the H. W. Johns-Manville Company, New York City, are in two types, round or square, and are manufactured especially for ignition work in motor cars, gasoline motors, signal horns, small lights, bells, etc. They register 1.5 volts a cell and are made in 20, 30 or 35 amperes capacity. It is pointed out that two series of J-M cells connected in compound series multiple, instead of series or multiple, will afford about three times the life of a single series on current, on account of the reduced rate of discharge. The J-M batteries are guaranteed to give entire satisfaction.



J-M BATTERY

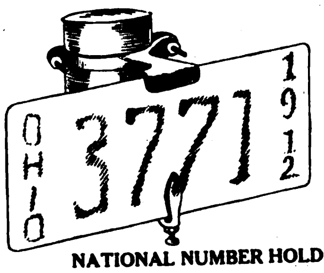
States Folding Hats have been brought out by the States Manufacturing Company, Chicago, and will interest a large class of motorists who employ their machines for travelling to and from the house and office, and who desire a hat that may be folded and placed in the pocket when not in use. The member is very light, made of silk and wool and in nine different shades. Its design is such that it may be adjusted easily to any position and is adaptable to both sexes.



STATES FOLDING HAT

*

The National Number Holders, produced by the National Motor Supply Company, Cleveland, O., are made for attachment to the radiator cap, also to be fitted to the rear lamp bracket. The former are adjustable and will fit any car and carry any size of license plate. The device is attached easily to the filler cap being constructed in two parts and provided with retaining bolts and locking nuts. The holders are made of high grade material and are finished carefully in black japan.



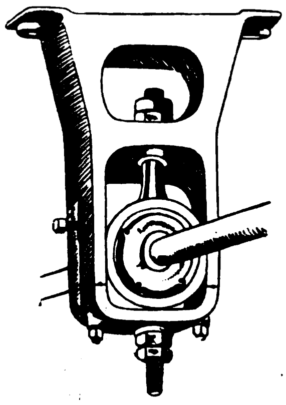
NATIONAL NUMBER HOLDER

*

The Dayton Tire Bandage, manufactured by the Dayton Inner-Tire Company, Dayton, O., is an adhesive bandage, nine feet long, three inches wide, of two-ply, 16-ounce tire fabric and designed for emergency use in the event of a blow-out or bad cut to the casing. The ends of the bandage are equipped with large brass eyelets and means for fastening. It is stated that the bandage cannot slip and that dirt or water is eliminated by the adhesive qualities which are incorporated in it.

*

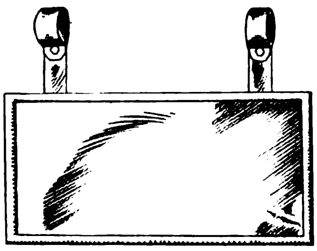
The Hess-Bright Hanger, made by the Hess-Bright Manufacturing Company, Philadelphia, well known maker of bearings, possesses many advantages over the ordinary form of hangers as by the utilization of ball bearings instead of plain members, friction is reduced to a minimum, power cost reduced, and economy effected in operation, as well as in space in shafting. Careful experiments conducted by the company developed the fact that with ordinary babbitt bearings there is a considerable loss due to friction and that with Hess-Bright ball bearings the coefficient of friction is but one-sixth of one per cent. Another feature emphasized of the ball bearing hanger is that it rolls true in contact regardless of shaft deflection, does not heat and requires but little lubricant for proper operation.



HESS-BRIGHT HANGER

*

The Holt & Beebee Mirror is manufactured by Holt & Beebee, Boston, and is a practical and useful accessory for the automobile, especially where operated in heavy traffic. It comprises a mirror in a suitable frame and includes means for attaching to the windshield or the latter's frame. It allows the driver to note at a glance the movements of all vehicles behind, thereby preventing the possibility of accidents. It is also of service when on the road as the movement of a machine approaching from the rear may be discerned easily.



HOLT & BEEBEE'S MIRROR

Recent Patents of Interest

Dow Ignition System.

Willard A. Dow, Braintree, Mass., has patented an ignition system for internal combustion engines. It is very compact, comprising as it does, magneto and battery circuits, also an induction coil and switch. Provision is made for attaching the various primary, secondary and ground wires and for cutting in the coil or magneto circuits as desired. Being in cartridge form it is installed easily on the dash of an automobile.

Swearingen Muffler.

The prohibiting of the use of cut-outs on mufflers has stimulated the efforts of inventors to produce a muffler which will not only reduce the noise of the exhaust to a minimum but back pressure as well. Zachariah Swearingen, Oscealo, Ia., has been granted a patent for a silencer which is fitted with removable heads, the latter being provided with suitable openings for the admission and egress of the burnt gases. The interior of the device is equipped with a deflector of concavo-convex design, also conical and other similar member. The components are held together by means of tierods and it is claimed by the inventor that the muffler may be disassembled and cleaned easily.

Pennock Horn.

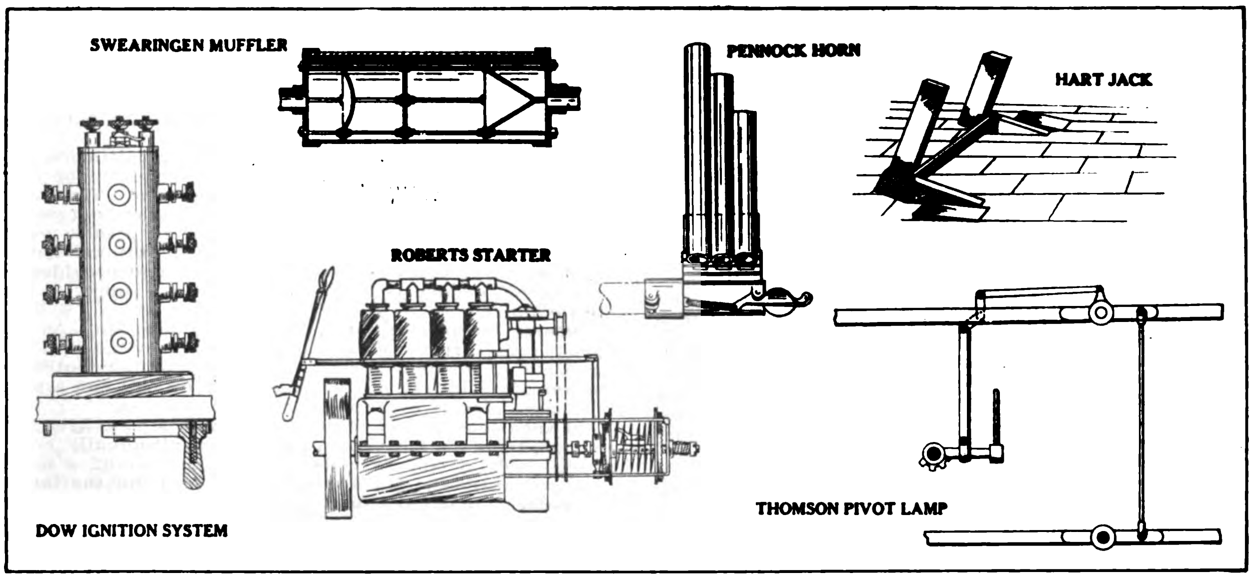
Willard Pennock, Minerva, O., has been granted a patent for a motor car horn operated by the exhaust from the engine. The three tubes are similar in construction to the usual tube horn but the passages for the gases are slotted and means are provided for registering these spaces, as well as for directing the flow of the exhaust through the signal and for interrupting the same.

Roberts Self-Starter.

A large number of patents has been granted of late for self-starting devices for automobiles. Judson O. Roberts, Cripple Creek, Col., has patented a mechanical starter for gas engines, which comprises a reciprocating starter shaft, a coupling adapted to engage said shaft with that of the motor, also a coil spring centred around the starter shaft. The spring is supported by a pair of wheels having guide engagements, a number of pawls and a dog controlling their movements. An auxiliary spring is provided to maintain the connecting coupling from engagement when the device is not in service. Pivotally connected to the starting mechanism is a lever in turn secured to a rod which is actuated by a lever conveniently placed to the driver or operator. Means are also provided for rewinding the spring by the power of the motor.

Thomson Pivot Lamp Device.

Among the latest devices for mounting the headlights of the motor car so that the members will be turned simultaneously with the front wheels, is the the invention of Arthur Gale Thomson, San Francisco, Cal., to whom a patent has been granted. The rotating means are obtained by mounting the lamps on a turntable device and the lights are operated together by means of a connecting tierod, which actuates the bell cranks secured to each lamp. Motion is imparted to the device by the steering mechanism which operates a series of pivotally mounted levers.



Depicting Some of the Recent Ideas of Inventors Relative to Devices Applicable to the Motor Car and Its Allied Industries.

Hart Automobile Jack.

Charles A. Hart, Findlay, O., has been granted a patent for a novel form of automobile jack by means of which a motor car may be run onto the member and jacked up by a tilting movement. The jack comprises a tiltable frame, including standards, the latter being provided with base fulcrum members. Each standard has on its underside main and auxiliary bearing surfaces extending at an angle to one another to support the frame in a tilted or vertical position. Runners are fitted, these being for the purpose of receiving the wheels of the vehicle and pivotal means also are provided.

OTHER PATENTS GONE TO ISSUE.

Spring Wheel, Alvin R. McEntire, Folsom, Ga. A vehicle wheel comprising a hub, a number of spokes slidingly mounted and coil springs arranged between the hub casing and retaining nuts.

Lathe Attachment, John M. Palmer, Chicago, assignor to the Universal Tool Company of that city. A lathe attachment, a turret head for carrying a plurality of lathe tools, and a substantially concentric shank extending therefrom, said head and shank having a tool receiving socket therein.

Carburetor, Nathaniel C. Stamps, Ocean Park, Cal. A carburetor having the usual mixing chamber and outer air passages but provided with a movable thimble device having a central air passage and means for controlling the air passing through the inner and outer passages.

Clutch Mechanism, Frank B. Allen, Salt Lake City, Utah. A clutch mechanism including in combination a transmission ring, a split gripping ring located within the same, a hub, sleeve and means for forcing the gripping ring into contact with the transmission and operating toggle levers.

Motive Fluid Mixer, William G. Cross, Seneca Falls, N. Y. A motive fluid mixer for internal combustion engines having a transfer passage for the fluid to be mixed with gas to provide a charge of motive fluid to the motor.

Roller Bearing, Chester Arthur Heinzelman, Belleville, Ill. A roller bearing comprising an inner member mounted on the spindle of the bearing and provided at one end with an undercut recess; a beveled surface which tapers oppositely to the sides of said recess, and a roller retaining ring fitted with yielding fingers which have lugs that project into said undercut recess.

Lock Nut, George O. Douthit, Summers, Ark., assignor to M. M. McCoy, Westville, Okla. The recessed or threaded portion of the nut is provided with teeth which grip the bolt and the device is secured by means of a locking pawl.

Sash Lock and Anti-Rattler, Joseph De Mars, San Francisco, Cal., assignor in part to Frank Minitree Johnson, Cheyenne, Wyo.; Anthony J. Walker, Niagara Falls, N. Y., and Arthur J. De Mars, San Francisco. A sash lock having a flanged casing with rock shaft journaled in the flanges, bent into two loops and provided with a stop projection adapted to engage the back of casing, and two flat spring indents. The free ends of the springs project in opposite directions and engage the edge of the sash.

Spark Plug, Joseph J. Lombardi, New York City. An electric ignition device comprising a hollow base portion and an insulating block fitted therein through which extends the electrode. The lower part of the shell has a circular opening and means are provided for raising or lowering the electrode to obtain the desired gap.

Vehicle Tire, Lewis Quintal, Cleveland, O. The device comprises two rims between which are interposed coiled springs resting in cup shaped members and means are provided for their retention and operation by adjustable bolts.

Lubricator, Ivert Larsen, Chicago. A lubricating device comprising a reservoir having a number of outlets, a rotary member for registering said outlets and a pump having a valve equipped piston for actuating the lubricant.

Spring Wheel, Herman M. Strawn, Marysville, Cal. A spring vehicle wheel having outer and inner rim members between which are fitted semi-circular springs which are retained by a device secured to the inner rim.

Motorcycle Handle, William F. Boast, Sterling, Col. A handle comprising a hollow grip of resilient material, having a coiled spring imbedded therein, and a block located in the outer end and engaging the springs.

Resilient Tire, Oscar H. Duckworth, Summerfield, Kan. A tire having a coiled spring formed into a series of convolutions and means for retaining spring and to provide for contraction and expansion.

Windshield, George F. Murphy, New Haven, Conn. A windshield for motor car service having curved forward members upon which the member is attached and operated, providing for different positions of the shield.

Wrench, Thomas J. Kennel, Middletown, O. A wrench having serrated jaws, also those of the usual construction. Means are provided for adjusting either set.

Spring Wheel, Robert Stock, Silver Creek, N. Y. A spring wheel having hollow spokes connecting the hub and rim, and main guide rods passing through openings in the rim and their inner ends within the spokes. Coiled springs are fitted inside the hollow spokes and auxiliary guide rods are incorporated between the ends of the springs and the outer rim. Other coiled springs are provided between the outer and inner rims.

Multi-Cylinder Engine, Samuel James McFarren, Pittsburg, Penn. A four-cycle gas engine having an uneven number of cylinders in two parallel groups, a shaft having oppositly set cranks, each of two said groups of cylinders being above a horizontal plane passed through the axis of said shaft. The pistons of the cylinders of one group are connected with one crank while those of the other group are attached to another shaft.

Spray Carburetor, Gottfried Plumm, Berlin, Germany. A carburetor having a revolving conical top with mixing mechanism and a porous nozzle pipe.

Expansible Piston, Edmond Van Bever, Watertown, Mass. A hollow shell piston, having inwardly extending bosses with wristpin fitted therein, and a shell portion integral with the piston body extending inwardly from said wristpin, said integral shell portion having a lengthwise extending slot and an external expander designed to expand inwardly extending shell portion.

Tire Tool, John H. Blake, Portland, Ore. A device for removing tires from rims, comprising a lever having teeth, a hook like lever carrying a pawl for engaging with said teeth and means for actuating same.

Induction Coil, John F. Cavanagh, assignor of three-fourths to the Lindsley & Allen Electric Company, Providence, R. I. An induction coil comprising a primary and secondary coil with condenser, and an interrupter constructed of a thin sheet metal disc having a continuous outer portion and provided with a spirally formed aperture through it whereby a flexible vibratory member is formed integral with the outer portion of said disc.

Motor Car Extricator, a device for extricating automobiles when stalled in mud, sand, etc. It comprises a windlass arrangement and means for securing same.

Calipers, Nicholas Helwig, Middletown, O. A caliper having a graduated beam on a screw threaded portion. One leg is mounted on the threaded portion and is moved and retained by a nut.

Headlight, William Churchill, Corning, N. Y. A headlight provided with a yellow glass screen adapted to be placed in or out of the path of the rays of light. Its object is to absorb all the blue and violet waves as well as those of the green of relatively shorter wave length.

Valve Lifter, George F. Clark, Daytona, Fla. The upper part of the device is hook shaped for holding valve head in place and attached to it is a chain. The lever member is provided with an L shaped part which hooks into the chain and is also fitted with a U shaped head for engaging the valve spring.

Tire Holder, John Clarence Cole, Chicopee Falls, Mass., assignor to the Fisk Rubber Company of the same place. A tire holder having three supports with adjustable jaws for gripping the inner periphery of the shoe and a locking device to tighten the grip of the members.

Cable Holder, James P. Holloway, Washington, D. C. A device for holding flexible cables, comprising a pair of rigid fingers and a clamp for securing holder.

Explosive Motor, William S. Lee, Detroit. The cylinder is provided with two bores and has a slidable valve sleeve with corresponding external diameters and a bore of a like number of diameters, and means for actuating sleeve.

Brazing Burner, William H. Van Horn, Baltimore, Md. The device includes a fuel chamber and means for conveying same to a jet nozzle and pilot burner. The latter is connected to the jet member by a separate passage and is provided with a number of outlets adapted to maintain the flame of the jet nozzle against extinguishment by the pressure of the gas. Means are also provided to regulate the flame as well as to shut off the supply of fuel to the burner.

Motor Starter, Myron T. Baird, St. Louis, Mo. An explosive mixture is led by tubing to each cylinder of the internal combustion engine. The vapor is distributed by means of a rotating mechanism driven by belt and a push rod is utilized to actuate the rotative member.

Expansion Reamer, Delano H. Dugar, Milwaukee, Wis. An expansion reamer comprising a longitudinally channelled body, a bolt swivelled to one end thereof, a set of blades and means for adjusting and securing the latter.

Battery Cell Container, Thomas A. Edison, Llewellyn Park, N. J., assignor to the Edison Storage Battery Company, Orange, N. J. A container for battery cells, comprising a frame adapted to stand upon a supporting surface, and means for supporting a plurality of cells out of contact with each other, and for preventing lateral movement of same relative to the frame.

DEVICES THAT DETECT INEFFICIENCY.

Additional Information Relative to Revealing Misuse of Pleasure and Commercial Vehicles---Outlining Particularly the Protection Afforded the Owner.

PREVIOUS consideration of the subject of recording devices for watching the movement of the motor vehicle when not accompanied by the owner, took up certain phases of the situation, and the illustrations were such as would tend to bring out the application of this factor to the commercial vehicle side. Mention was made of the fact that these instruments were designed for use with the so-called pleasure car, but it so happened that the charts presented laid rather more stress upon the possibility of their use for strictly business purposes.

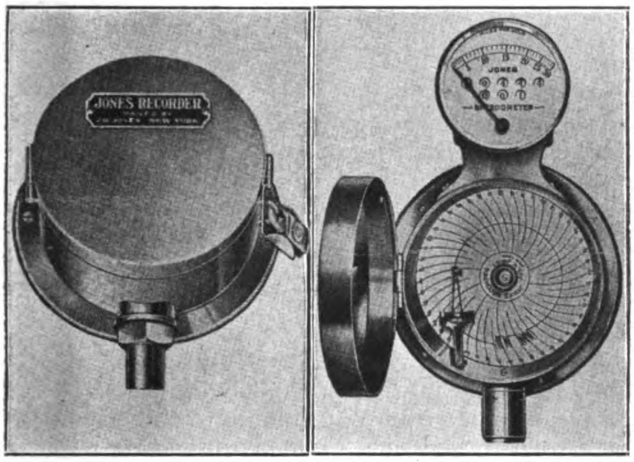


Fig. 5—Front and Rear of Jones Recorder, with and Without Speedometer.

An effort will be made herein to discuss still other phases of the problem, and if the illustrations and the arguments appear to indicate that the devices selected for description are particularly applicable to the pleasure vehicle side it should not be taken to mean that they are not also of special advantage to the owner of a motor truck. The point which the writer desires to make is that all the instruments illustrated and described during the consideration of this subject are equally applicable to all types of automobiles. It has been deemed best, however, to indicate certain needs of the business man, pleasure car owner and garage man, and the efforts that have been made to solve the difficulties presented.

There is at least one problem in which the garage proprietor is deeply interested. It was touched upon in a previous installment. While it is true that no garage can be held responsible for the improper use of the car, there is bound to be more or less unpleasantness if it so happens that the machine is turned over to the chauffeur without the owner's knowledge, particularly when the result is what has come to be termed a "joy ride." Any device or any method which will tend to eliminate this possibility is bound to receive careful attention from the garage man.

It is not claimed that the recording device will entirely solve this problem, but it may be indicated that by its use the owner is enabled to keep a strict watch upon his chauffeur and his property. If at any time he discovers any suspicious circumstance he is in a position to determine for himself whether or not there is danger of more serious consequences and to take such steps as good judgment would dictate.

The garage proprietor cannot be expected to assume the responsibility for any or all of the machines in his care. He is selling service, not conducting a detective bureau. He tries to protect the owner by arranging to deliver the car only upon order, but further than that he cannot go with reason. It remains for the owner to protect himself, particularly when it is possible to do so by the installation of simple and inexpensive precautions.

To illustrate this point, reference may be had to Fig. 5, which presents the Jones recorder, manufactured by the Jones Speedometer Company, New York City. This is shown both with and without the speedometer attachment and in both front and rear views. The company also produces a hub odometer, which registers the mileage, either forward or backward. The recorder, however, is designed to supply a complete and accurate history of the vehicle's performance every minute of the 24 hours and is equally applicable to pleasure and commercial cars.

The instrument is enclosed in a heavy brass case and may be attached to the dash or any other convenient part of the car. It is connected by a flexible shaft and gears to the front wheel, in exactly the same manner as the Jones speedometer is fitted. A marking stylus travels over a chart of sensitized paper, which cannot be tampered with and which gives a permanent record of the vehicle's movements at all times.

One of these charts is shown at Fig. 7, and in explanation it may be said that when the car is standing this chart is constantly travelling under the marking stylus, the record of the stop being shown by the continuous line. The length of this line indicates the duration of the stop. The running time is recorded by cross or zigzag lines, each one of which denotes a half-mile of travel. The speed of the run is calculated by counting the number of zigzag lines in a given period of time.

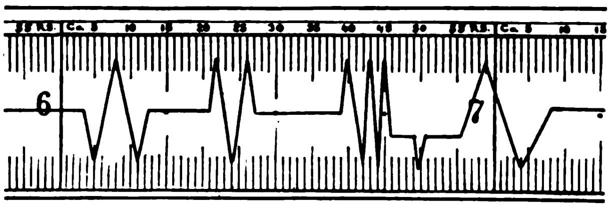

Fig. 6—Portion of Sample Speedograph Chart.

With one of these recorders attached to the car, the owner always is in a position to tell the start, stops and duration, mileage between stops, speed at all times, and the time of returning to the garage. Inasmuch as the case is locked, and no one can have access to the record except the party who holds the key, the company maintains that the owner is in possession of even more accurate information than would be possible if the car were accompanied by a private detective.

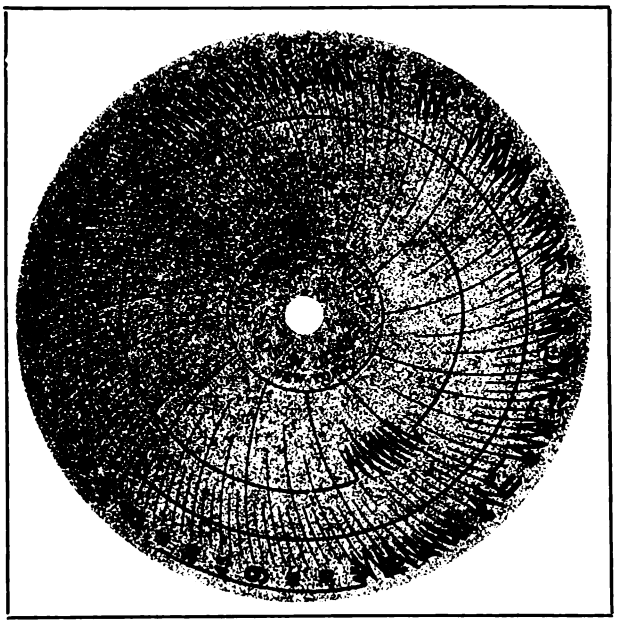

Fig. 7—Sample Jones Recorder Chart, Indicating Characacter of Permanent Record.

If it should transpire, for instance, that the chauffeur was in the habit of utilizing the machine for his own pleasure without authorization, this fact would be made apparent from study of the chart at the end the day. The owner, therefore, must have knowledge of any lapse of duty, and is able to forestall the possibility of the more serious "joy ride."

This is but one of the many ways in which the recorder may be utilized to advantage. In fact, it may be stated that the objects of this device are the same as may be applied to all of those described heretofore, and any of those may be employed as indicated of the Jones.

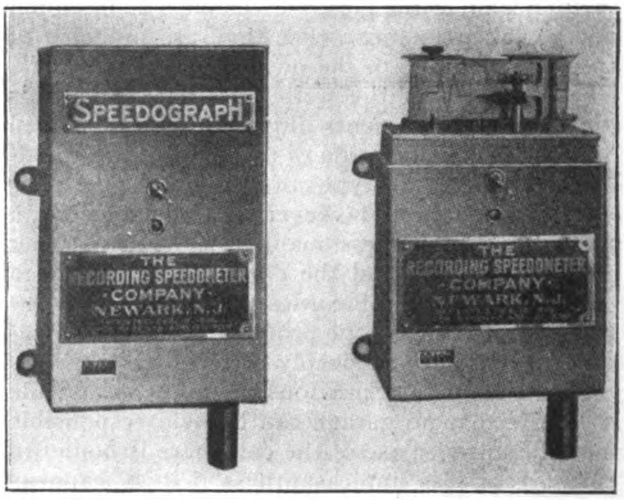
Referring again to Fig. 7, this chart was put on at 8:15 and the vehicle was running as follows: 9:45 to 10:37, 9.5 miles; 10:45 to 11, three miles; 11:15 to 11:37, four miles; 11:45 to 12:05, 2.75 miles; 12:15 to 12:35, 4.25 miles; 12:47 to 1:15, five miles; 1:20 to 2, 7.25 miles; 2:15 to 2:35, three miles; 2:45 to 2:55, two miles; 3:05 to 3:22, 3.5 miles; 3:33 to 4:50, 14.5 miles; 5:30 to 5:35, 3.25 miles. There were 12 stops. The car was out of service for 16.5 hours and then ran again from 10:15 to 11:08, 9.25 miles. The chart was removed at 2 with a total run of 71.25 miles. The average speed was 11 miles an hour. The running time was six hours and 25 minutes.

Still another device of this character is the Speedograph, made by the Recording Speedometer Company, 54 Clinton street, Newark, N. J., and illustrated, both opened and closed, at Fig. 8. It will be noted that this is a combination speedometer and service recorder, the former being located in the bottom portion of the case and connected by a set of gears with the actuating mechanism at the top.

When closed all parts of the Speedograph are securely locked against anyone not in possession of the key. It is maintained by the maker that there is absolutely no way in which the actuating needle can be tampered with or the gear be thrown out of engagement. In this manner the owner always is assured of an accurate record of the vehicle's movements. It is designed to check the time the car leaves the garage or any given point, as well as of the return, every stop made and its duration, the total number of miles travelled, the speed and variations in speed during the trip, etc. It readily will be seen that it may be employed in the same manner as the other devices presented.

Fig. 6 depicts a portion of one day's record, and in explanation it should be stated that the vertical lines indicate the vehicle was moving, while horizontal lines show that it was idle. The tape is divided into minutes, and is moved past the pencil point from one spindle to the other at the rate of three inches an hour, this being timed accurately by clock work. The pencil point travels up and down three-quarters of an inch for each half-mile, and is operated by the wheel of the vehicle.

The above record shows that the car started at 6:03 and was run 1.5 miles at the rate of 10 miles an hour, or one mile in six minutes. From 6:12 until 6:21 the vehicle was standing. From 6:21 to 6:27 it ran 1.5 miles at the rate of 15 miles an hour, or one mile in four minutes. From 6:27 to 6:39 it was standing. From 6:39 to 6:42 it moved at the rate of 15 miles an hour for three-quarters of a mile, then at the rate of 30 miles an hour for 1.675 miles. At 6:46 it stopped three minutes, then ran one-quarter of a mile at a 10-mile rate; stopped five minutes; ran 1.75 miles at the rate of six miles an hour, or one mile in 10 minutes, and stopped again at 7:08. Thus the



SPEEDOGRAPH
THE RECORDING SPEEDOMETER COMPANY NEWARK, N.J.
THE RECORDING SPEEDOMETER COMPANY NEWARK, N.J.

Fig. 8—Speedograph Opened and Closed, Showing Recording Pencil Making Record on Chart.

record might go on for the entire day, giving the owner opportunity to follow its movements all of the time.

Another maker of hub odometers is the Veeder Manufacturing Company, Hartford, Conn. These differ from the recorders, in that there is no chart, the main object being to disclose the mileage obtained from the car under all conditions. Additional details are possible of computation, however, and the maker states that a reading of the register will give the owner all the essential information of this nature.

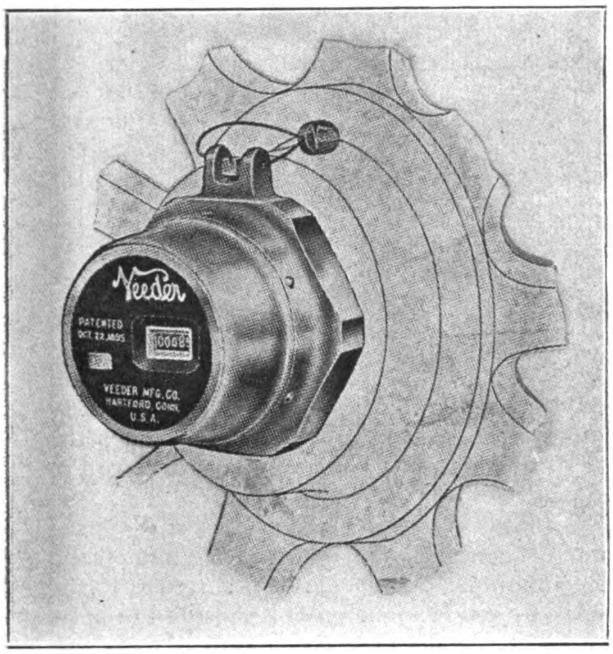


Fig. 9—Veeder Hub Odometer Sealed in Place on Hub.

The Veeder hub odometer, which is illustrated at Figs. 9 and 10, the former showing the instrument in place on the hub and the latter the internal mechanism, is of exceptional value to taxicab owners, although, as indicated above, it is equally applicable to all forms of vehicles. It is obvious that with an exact record of the mileage available at all times, the owner is in possession of data which will aid materially in computing costs of motor haulage, for instance.

A small spur gear is used to drive the odometer. A shank on the side of this gear is inserted in a hole in the end of the axle. The cotter pin which locks the nut passes through this shank and prevents the gear from turning or becoming loose. This gear meshes with a second gear inside the cap as seen in Fig. 10, and suitable mechanism drives the register always in the same direction, so that the entire distance travelled by the car, whether forward or backward, is recorded.

It is maintained that there is no way to take the instrument off except by unscrewing it from the hub. This can be done only after the set screw, shown in Fig. 9, has been withdrawn sufficiently to permit the cap to be turned, an operation that cannot be accomplished without first breaking the seal. This seal is the same in form as that which has been used for many years by railroad people and is held absolutely to prevent tampering with the odometer without being detected.

As has been explained the odometer is designed so as to record the distance travelled, no matter whether the car is going forward or backward, so that it is impossible for the driver to subtract mileage by jacking up the wheel and running it backward. It is held that there is no way to disconnect the mechanism by slipping the gears out of mesh.

FUTURE OF RUBBER MARKET.

The United States Rubber Company now has 80,000 acres of land in Sumatra planted in rubber trees, some 2,500,000 trees being set out, and already the prospects of the investment are held to be extremely promising. It is predicted that in time the company will be rendered independent of the open market, except for the finest Para. The oldest of the trees planted are now between two and three years old and as best results are obtained only by tapping trees not less than five years old, it will be two or three years before rubber from that source is expected.

It has been figured by some that when the trees begin to yield fully, there will be a saving equal to 4 per cent. on the common stock, basing this figure on an estimated output of 5,000,000 pounds from the plantations. Even the production of 1,000,000 pounds would mean an addition of a full 1 per cent. on the $25,000,000 United States rubber common, taking the value of crude rubber at $1 a pound, and estimating that it will cost the company 50 cents a pound to produce it in the plantation

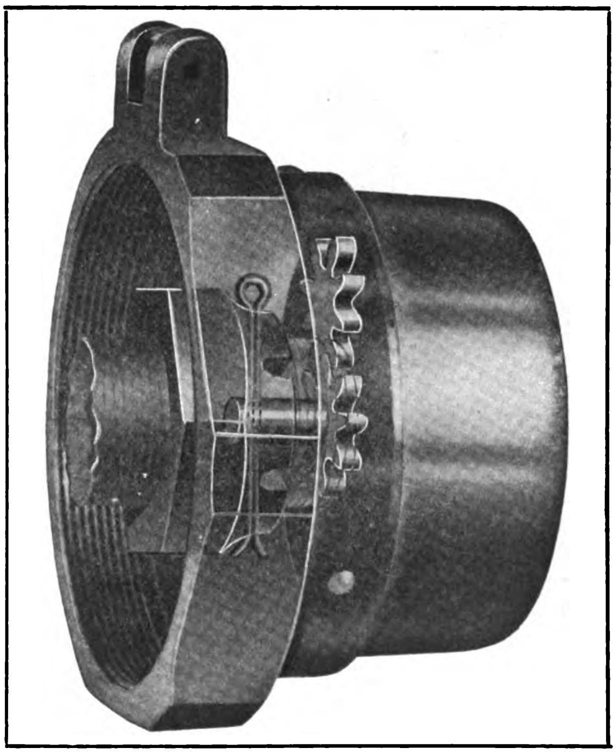

Fig. 10—Shadow View of Hub Odometer, Showing Operating Mechanism.

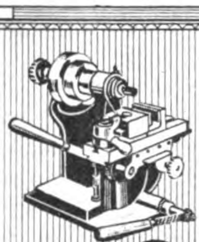
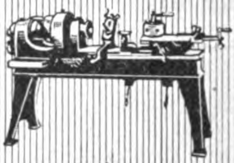


Up-To-Date Shop & Garage Equipment



WAYNE SIDEWALK FUEL PUMP.

Proprietors of some garages complain that there is no money in selling gasoline, stating that the profits are consumed by the cost of service and shrinkage. This does not apply to the concerns which are equipped with modern appliances. The small garage that makes it a practise to draw five gallons at a time from a tank and carry it as well as the funnel to the car, is losing the services of an employee. With the modern facilities for handling gasoline there is no reason why good money should not be made by selling fuel.

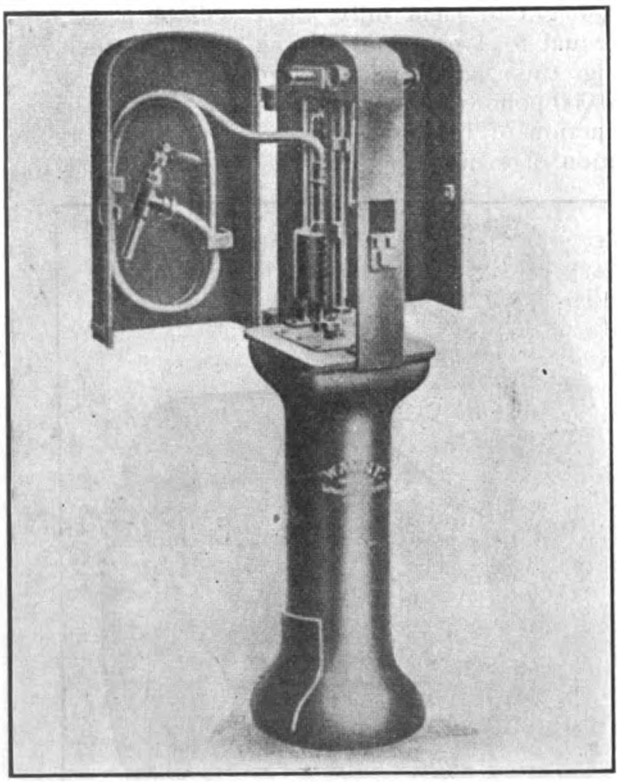


Fig. 1—The Wayne Sidewalk Gasoline Pump, an Equipment Making for Convenience.

Considerable improvement is noted in labor as well as time saving appliances for handling gasoline, and at Fig. 1 is shown the Wayne sidewalk pump, manufactured by the Wayne Oil Tank & Pump Company, Fort Wayne, Ind. It will appeal to the retailer in that it may be installed at the edge of the sidewalk, as well as in the garage, and in addition to being a practical equipment presents an attractive appearance to the passing motorist. Among its qualities is that its components are completely enclosed and locked by a spring lock, preventing its use by persons not possessing a key. This enables the owner of the garage to keep an accurate record of all gasoline sold or utilized.

The pump consists of a substantially made cabinet of cast iron finished in red enamel and black trimmings. The pedestal is fastened to the sidewalk by four expansion bolts inside the base. The cabinet is 4.5 feet high, overall dimensions, and occupies a ground space of about 18 inches square. Doors are provided on either side. The handle for pumping is located on one side and the hose and portable nozzle on the other. The pump is a specially designed one-gallon measuring member and is adjustable to measure a half-gallon or a quart at one stroke. The measuring device is enclosed in the housing at the top and cannot be tampered with. The pump is equipped with a 10-gallon discharge register and a 10,000-gallon worm gear meter which registers a cumulative record of all fuel drawn. There is also a dial to measure the fuel by quarts, if desired.

The outfit is equipped with a seven-foot length of special gasoline hose and a portable filling nozzle. When desired the pump may also be equipped with a special filter for removing water. The equipment may be utilized with any sized tank and may be employed with another pump located inside the garage. Economy of time is effected as the automobile is stopped beside the pump and the nozzle inserted in the tank. It also saves registering the car upon the garage record, which is required in some states.

ADJUSTABLE DIES AND HOLDERS.

Screw cutting dies form a valuable addition to the equipment of the repair shop and modern shop practise demands of all tools that they do their work quickly and well, that their form be such that they can be sharpened easily and that they cut as true at the end of a year's use as at its beginning.

The Remington Tool & Machine Company, Boston, is manufacturing a screw cutting die which is adjustable and possesses the quality of being easily accessible for sharpening or repair. The tool, which is shown at Fig. 2B, is constructed in two parts with a heavy rigid hinge formed integral with one side.

It is claimed by the maker that the die may be resharpened so long as any appreciable portion of the teeth remains, and that its life is from five to 10 times that of ordinary members. The taper hole at the top provides for the reception of the tapered point of the adjusting screw on the elastic die holder shown at D. Adjustment for expanding or contracting the die is accomplished without its removal from the holder. It is also pointed out that the hinge and taper point practically make a solid die when placed in the holder.

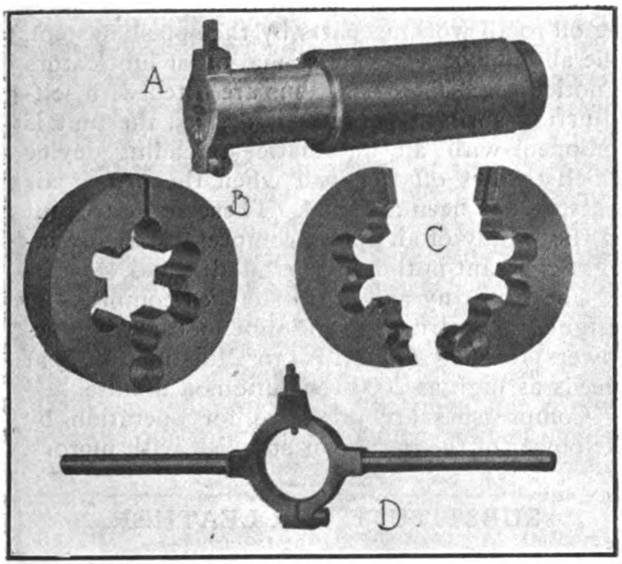

Fig. 2—Useful Tools for the Shop Equipment: A, Remington Screw Holder Adapted to Lathe Work; B, Adjustable Screw Cutting Die; C, Showing Assembly of Member; D, Elastic Die Holder.

The die is ground to a perfect cutting edge after tempering and is so designed that there is ample clearance for an emery wheel or lapping with diamond powder. It is also stated that particles of metal lodging between the teeth of the die are removed easily and that alignment is secured by reason of the sharp cutting teeth. The screw lead is properly maintained and a single cut is stated to make a perfect thread.

For bench work the die is utilized with the elastic or ordinary holders, but for machine work the member shown at A is recommended by the maker. The dies are constructed to cut U. S., V, Whitworth or Acme standard thread. They are made in diameters varying from .25 to four inches, and pitches from 20 to four, according to the style of thread. The best of material and workmanship are incorporated. Edgar T. Ward & Sons, Boston, is selling agent.

QUICK OPENING TIRE KETTLE.

The tire repair shop which averages two retreaded casings a day is the exception rather than the rule. It is now unnecessary for a concern doing this amount of retreading to install a large vulcanizer and kettle which require valuable space and increase the investment. With a large kettle the repairman is apt to allow tires to accumulate until enough to fill the kettle are ready to cure. This often inconveniences the customer.

The Williams Foundry & Machine Company, Akron, O., maker of tire repair equipment, is marketing a new quick opening steel tire kettle which is shown at Fig. 3 and with it a retread can be cured with as little trouble as a sectional repair. The tires after being wrapped are placed in the kettle and the lid lowered by means of the hand wheel working the double acting screw. A bar is placed on one of the sockets on the lid and given a part turn so that the lugs on the cover extend under the projecting lugs cast on the body of the kettle. Steam is then turned on and this brings the special wedge shaped packing into play, effectually sealing the joint.

When the cure is completed the inlet valve is closed and the steam blown off. The lid is given a part turn as before so as to free its lugs from those on the body of the kettle, and raised about four inches by means of the hand wheel. The crane and lid are then swung to one side, leaving the opening of the kettle entirely unobstructed. There is no overhead rigging and no possibility of the lid catching and injuring the operator.

The member is boltless and has sufficient capacity for all except the very largest shops. It measures 43.5 inches inside diameter in the clear and the curing space is 16 inches high above the bottom grating, making a capacity for about four tires, 42 inches or smaller. The kettle and lid are constructed of open hearth steel, tested with 200 pounds steam pressure, making it perfectly safe for any condition of service. The crane head handling device and bottom grating, which keeps the tires out of the water and permits steam to circulate all around the casings, are an improvement over the vertical kettle.

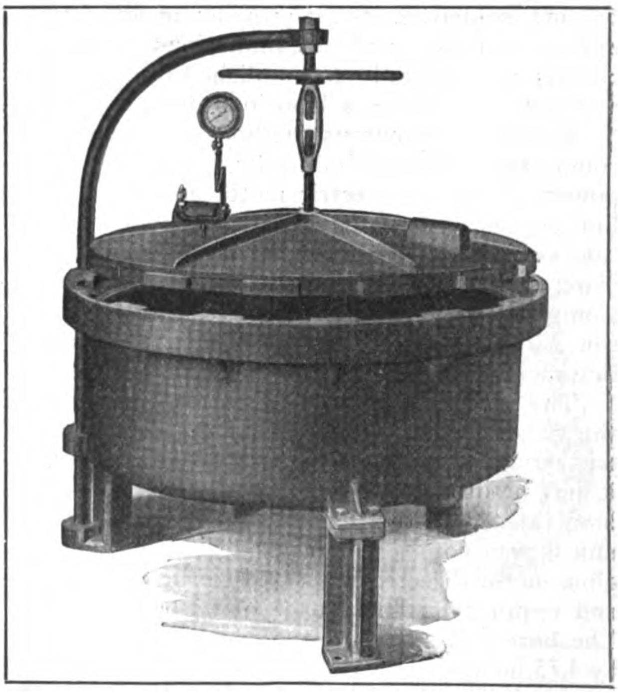

Fig. 3—The Williams Quick Opening Steel Tire Kettle.

The same concern is also manufacturing a tread rolling machine which is depicted at Fig. 4

and which is designed to replace the work of uniting the rubber and fabric by hand when tires are to be retreaded or new sections inserted. The maker also points out that the machine not only rolls the work properly, but it prevents air pockets and consequent blistering.

In operation the upper or concave roll is raised by means of a large hand wheel and the tire inserted between the rollers. The desired pressure is applied by screwing down the hand wheel. A heavy oil tempered steel spring below the lower convex roller insures even tension regardless of inequalities in the thickness of the casing. Turning the crank causes the tire to travel between the rollers which will work from one bead clear around the tread to the other. The rolling machine is constructed of high grade material.

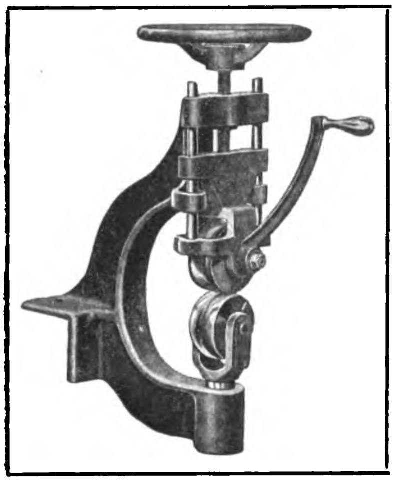

Fig. 4—The Williams Tread Rolling Machine.

THE CLAYTON AIR COMPRESSOR.

The air compressor has a wide range of utility, for in addition to being of service for inflating tires, cleaning upholstery, supplying air blast for brazing, soldering, etc., it provides means for removing grease and accumulations from the chassis, work usually accomplished by the brush and can of gasoline, a laborious operation.

There are numerous methods of driving the compressor, these including by belt off the main power line, by an electric motor and by a gasoline engine, the design depending upon the garage equipment. In order to comply with the varying conditions the International Steam Pump Company, New York City, successor to the Clayton Air Compressor Works, is manufacturing a line including the types outlined above.

The unit illustrated at Fig. 5 is designed for the garage outside the zone of the central electric service station and one of its qualities is that it may be utilized when the power of the shop is inoperative and the tank requires refilling. The unit is very compact, comprising as it does a gasoline motor directly connected to the compressor and requiring a floor space of 22 by 27 inches. The bore and stroke of the compressor are 4.75 by 4.75 inches and it is designed to operate at 125 pounds pressure, the company maintaining that an excess of this amount is not adaptable for garage service owing to the danger of bursting of tires when utilized by the inexperienced or careless workman.

The compressor is driven at a speed of 240 revolutions a minute by a three horsepower standard motor and is of the water-cooled type, although the company makes a wide variety of both air and water-cooled members. The machine is constructed of high grade material and accessibility is a feature. It is self-lubricating, an oil reservoir in the bottom of frame base supplying oil to all working parts by the splash system. The absence of grease cups and other lubricators is noticeable. The air pistons are fitted with self-adjusting spring rings and if desired the unit is equipped with an automatic unloading device which throws off the load when the proper air pressure has been attained. These serve to shut off the supply of air to the compressor, maintaining it constant in the receiver at all times.

The company also manufactures compressors designed to be driven by gasoline motors of horsepowers ranging from 1.75 to 21.5 operating at speeds as high as 2000 revolutions a minute.

Compressors are produced for operation by the power of the garage or supplied with motors.

SUBSTITUTE FOR LEATHER.

According to Consul-General John L. Griffiths, London, England, a new material, Seagumite, has been discovered which may be employed as a substitute for rubber and leather belting. It is obtained by treating seaweed by a secret process which, it is stated, results in a totally non-inflammable, impervious, leather like, damp proof composition, unaffected by heat, cold, oils or exposure to the weather.

Its inventor expects it to be used as a substitute for rubber and leather in all climates, and its cost of production is very low. It possesses an unusual power of resistance to an electric current and trials made under severe conditions by electrical experts show that it withstood a test of 32,000 volts and that its insulating properties are greatly enhanced after immersion in water.

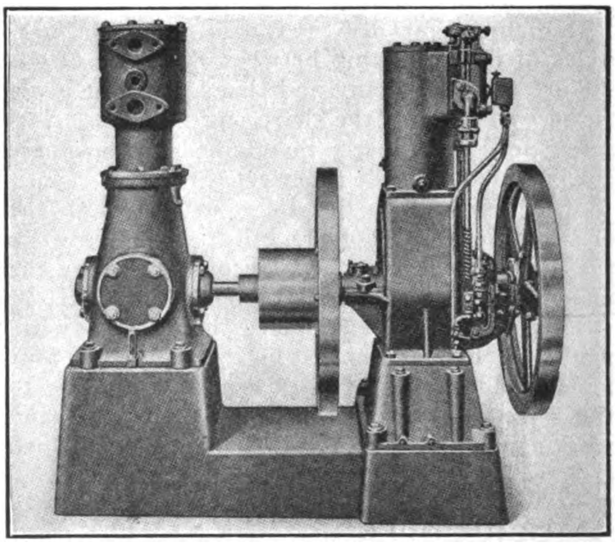

Fig. 5—The Clayton Air Compressor Operated by Gasoline Motor and Designed for Garages Beyond Zone of Central Electric Service Station.

FEATURES OF THE NEW STANWELD RIMS.

ANNOUNCEMENT is made by the Standard Welding Company of Cleveland, O., of its new line of automobile rims which will be marketed under the name of Stanweld. The new types are the result of much study and experimentation and are designed to meet the requirements of the motorist who desires to change the make of shoes and who wishes the quick detachable and quick demountable features incorporated. The rims are universal in that they will accept either a straight side or clincher casing.

To meet the demand for a quick detachable rim without the demountable feature, the company has designed three types of rims the only variation being the type of tire they will accept, these being known as Stanweld rim types 50, 51 and 52. The first named is a universal rim in that it has two removable side rings, one continuous and one split, both of which can be reversed and the rim utilized for a straight side or clincher tire. On the types 51 and 52, one straight or clincher side is made integral with the rim base, making for durability as well as minimum weight. Type 51 is for straight side tires only, while 52 is for clincher, although by using a rim filler on one side, and reversing the detachable ring, this type may be employed with straight side casings.

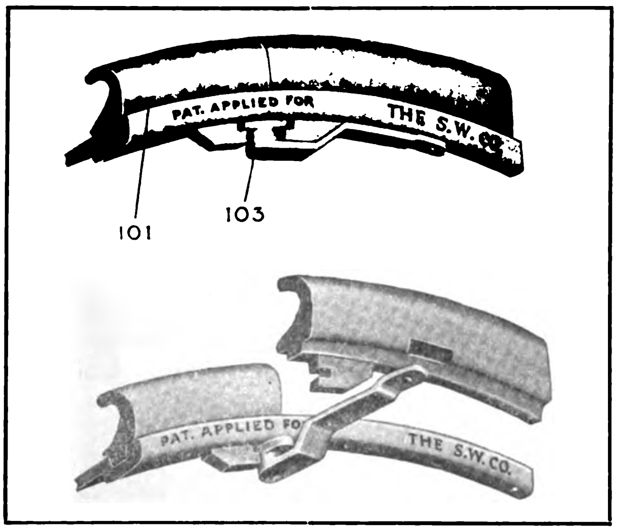

Fig. 4—The Stanweld Detaching Mechanism, a Positive Locking Device—The Upper View Shows Latch and Ring Locked.

A quality of the design is the detaching mechanism shown at Fig. 1. This side ring is split transversely and has slotted lugs on either end which protrude through slots in the rim base when the ring is in position. The latch is easily operated, being securely attached to the rim, and in normal position absolutely locks the ring to the base as depicted in the sketch. The ease of operation is shown at Fig. 2, the only tool required being a screw driver, which is inserted in a recess and given a slight upward pull, releasing a projection, after which it is a simple matter to swing out the latch and remove the split ring.

The demountable rims are known as types 30, 40, 41 and 42, and have the quick changing qualities of the rims just mentioned, but demountable features also are incorporated. These are simple and effective, comprising practically four parts, the rim base, adjusting ring, felloe band and clamping devices. The adjusting ring, which is depicted at Fig. 4, is a new feature, as it is split transversely, making for accurate centring and continuous bearing of the rim base on the felloe band. Its outer circumference is designed to fit the ledges on the rim base flanges in such manner that the rim base cannot move in a lateral direction, as the bevels of the rim base flanges and adjusting rings fit each other so that the weight of the car tends to force the rim in a direction towards the retaining flange of the felloe band. The continuous bearing of the retaining flange against the rear of the rim base prevents lateral movement in that direction. The maker points out that the construction relieves the clamping devices of all direct strain, as the pressure on the rim base transmits its greatest displacing force to the adjusting ring and towards the felloe band flange, the bolts assuming but a slight strain.

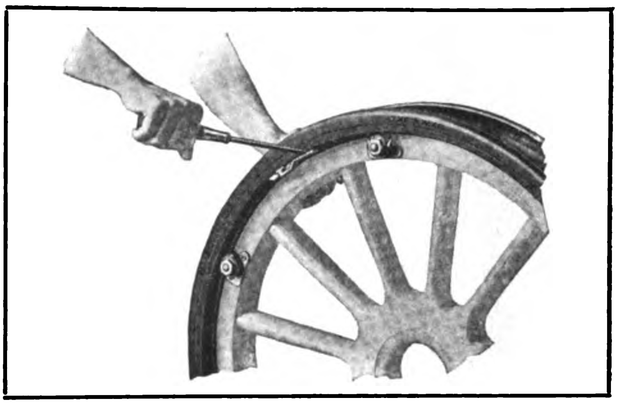

Fig. 2—Depicting Simple Operation of Releasing Latch from Lock—The Only Tool Required Is a Screw Driver.

The design is noticeable for simplicity and it is impossible for the wheelmaker to attach the felloe band in other than the proper location and the rim will run true with the wheel. A quality claimed of the adjusting ring is that it gives a contemporaneous radial expansion to the rim base at all points of its front and rear circumference, preventing wabbling and consequent tire expense. It is not necessary to carry a spare adjusting ring with each spare rim as the adjusting ring can be removed easily and quickly placed in the spare rim that is to be fitted.

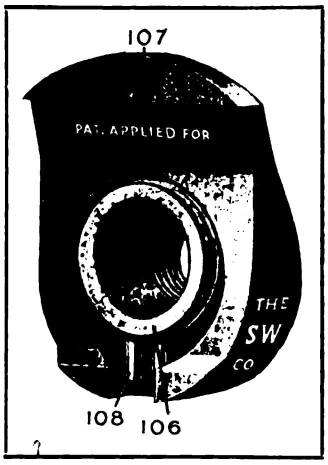

Fig. 3—Outlining Construction of Clamp Utilized with Demountable Rim.

To positively lock the rim base it is only necessary to hold the adjusting ring in a position between the rim base and felloe band. This is quickly and easily done by the utilization of six clamping bolts, placed equidistant.

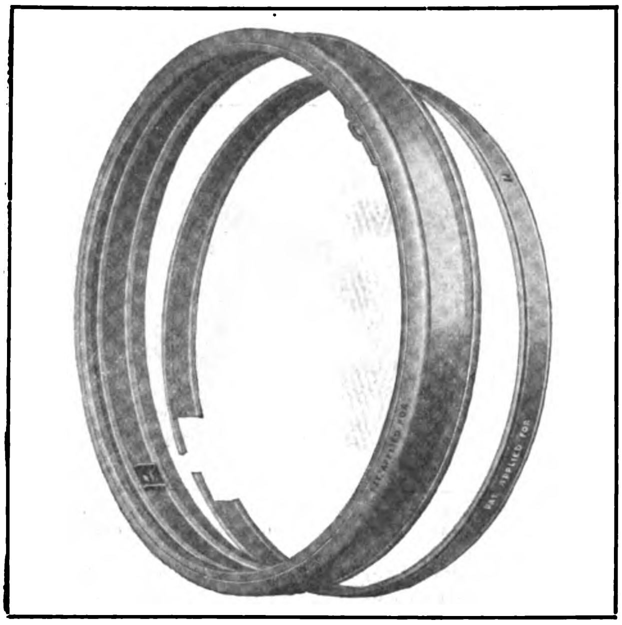

Fig. 4—The New Stanweld Adjusting Ring, Making for Accurate Centring and Continuous Bearing of Rim Base on Felloe Band.

The locking bolt is depicted at the right at Fig. 5 and comprises a bolt 105, which has a head made integral with it and which provides a support for the back flange of the felloe band; the clamp washer 109, which is secured to the front of the felloe with screws and the clamping device, which is an assembled piece consisting of a concave clamp 107, a conical clamp 106, and a friction spring. These parts are inseparable after being assembled and are designed to withstand severe usage.

The clamp when locked, bears upon both the adjusting ring and clamp washer. It has a universal movement on the conical clamp nut which provides for considerable variation in the position of the clamp, as well as prevents possible bending of the bolt through misalignment. Only a few turns of the conical clamp nut are necessary to release or tighten the clamp and during the operation the clamp turns with the nut, but only until the desired position is reached. The clamp washer has a projection which prevents the clamp from turning further. When the clamps are unlocked the rim base with its adjusting ring can be removed easily from the wheel. The clamps do not have to be tightened in a released position in removing the rim as the clamp nuts perform this work.

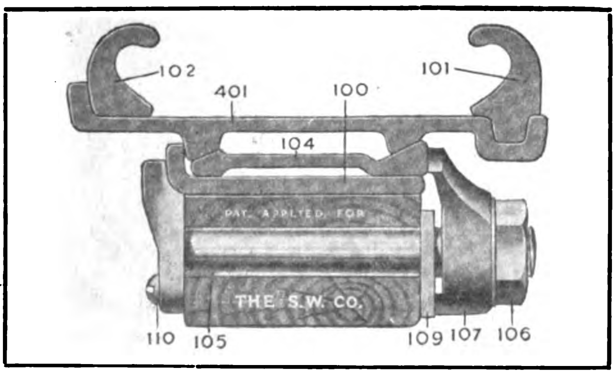

Fig. 5—Cross Sectional View of Demountable Rim Type 40, Showing Locking Bolt and Clamp.

All Stanweld demountable rims embody the quick detachable feature and are very light in weight as well as water tight, qualities making for efficient service. The demounting device comprises several wedges operating on bolts extending through the felloe. These wedges form a simple yet efficient method of retaining the rim base with its tire on the wheel. The rim is produced in both the straight side and clincher types and its simplicity and light weight may be cited among its more noticeable features.

All the demountable rims embody a quick detachable feature which is independent of the demountable design. In the event of a second or third puncture or blow-out it is not necessary to remove the entire rim to detach the tire, as this may be performed independently and without disturbing the demounting mechanism.

Type No. 30 differs considerably from the rims mentioned and is designed for those who desire a demountable rim of extremely light weight, yet sufficiently strong to withstand severe strains. It has a circumferentially locking rim, both sections of its base having tire gripping flanges integral with them. The abutting edges of these sections have inwardly projecting lugs which, when the rim is locked, are held securely together by means of rings of pressed steel slotted to accept the protruding lugs. The spring rims, of which there are only two, are riveted to one section of the rim base.

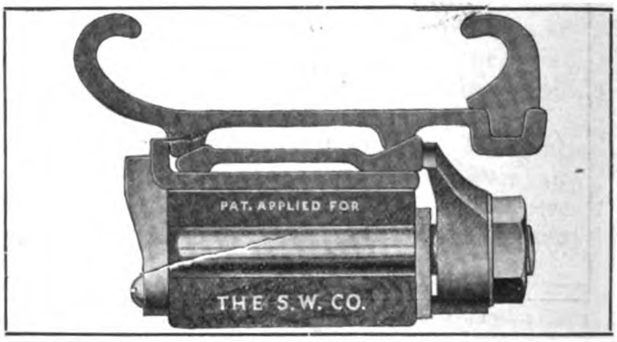

Fig. 6—Depicting Sectional View of Demountable Type.

To detach a tire it is only necessary to loosen a retaining catch and pry up the ends of the spring rings. The two sections of the rim base are then separable. It is pointed out by the maker that there is absolutely no friction of parts to overcome in locking or unlocking the two sections as no circumferential movement of either is necessary.

The demounting device consists of several wedges operating on bolts extending through the felloe. These wedges form a simple yet efficient method of holding the rim base with its tire upon the wheel. The rim is produced in both the straight side and clincher types, and its simplicity and light weight may be cited as among its more noticeable features.

Brown, Temple, Tex.; O. L. Cottingham, Pekin, Ill.; Lambert Morin Motor Vehicle Company, Lawrence, Mass.; Frank Johnson, Coatsville, Ind.; L. S. Rudy, Cheyenne, N. D.; B. C. Barry, Santa Barbara, Cal.; O. C. Drew, Jr., Atlanta, Ga.; Edward F. Cushion, Claremont, N. H.; H. E. Shaw, Greenfield, Mass.; William V. Little, Miami, Fla.; E. W. K'Burg, Toledo, O.; Carmine Coccari, Monessen, Penn.; E. F. Walker, San Marcos, Tex.; J. W. Paulen, Fredonia, Kan.; Palmer Auto & Supply Company, Maquoketa, Ia.; William Konow, Chicago Heights, Ill.; A. D. Barton, Cythiana, Ind.; Woodworth Bros., Newton Highlands, Mass.

The Hudson Motor Car Company, Detroit, maker of the Hudson cars, has greatly increased its factory space to conform with the growing demand for its product. Two new factories have been added, instead of one, as was originally contracted for by the company. A year ago the Hudson factories' floor space was 172,811 square feet. The plant has since been doubled in size, the new additions bringing the total to 363,311 square feet.

Frank and Perry Remy, formerly owners of the Remy Electric Company, Anderson, Ind., who sold their interests in the concern two years ago, are preparing to enter the field again and develop several patents which it is said have recently been granted to them.

The Lozier Motor Company, Detroit, manufacturer of the Lozier cars, has leased from the B. F. Goodrich Company, New York, the eight-story building at 227 West 57th street, New York. The Lozier company also reports that the five-story building which it now occupies at the northwest corner of Broadway and 56th street, has been leased for a long term of years to the Overland Sales Company, New York.

John H. Ashton, Trenton, N. J., has started the 1913 season in a newly equipped garage and salesroom.

Illinois Automobile Company, with headquarters at Chicago, is a new company surrounded by familiar faces in the automobile industry of the Windy City. The officers are: President, W. G. Benner; vice president, R. B. Holt; secretary and treasurer, E. H. Marhoefer; sales manager, D. E. Northam.

The Prest-O-Lite Company, Indianapolis, has moved its Detroit branch into a spacious new service station, with ample room for the storage of a large number of tanks as well as a department for adjusting Prest-O-Lite starters and lighters.

The Baker Bros. Motor Company, Buffalo, N. Y., distributor in western New York for the Cole car, made by the Cole Motor Car Company, Indianapolis, Ind., has opened new salesrooms at 1227-1229 Main street. The firm will in future be known as the Cole Motor Company.

Carroll A. Haines & Co., Baker electric distributor in Philadelphia, has moved into new and larger salesrooms at 1927 Market street.

William Wenkenbach Sons, Philadelphia, is erecting two buildings, in which it will manufacture bodies for motor trucks. H. Albert Wenkenbach is president and F. D. Klein is superintendent of the company.

The Ohio Motor Sales Company, Pittsburg, Penn., will in future represent the Ohio car, manufactured by the Ohio Motor Car Company, Cincinnati, O., in that territory. Temporary quarters have been obtained at 5712 Penn avenue pending the completion of the company's new salesroom and service station. The Ohio's new Pittsburg dealer succeeds the Federal Motor Car Company, which formerly represented that line.

John W. Hayden, Chicago, will act as special agent in Chicago and vicinity for the Nyberg cars, made by the Nyberg Automobile Works, Anderson, Ind. Until recently Mr. Hayden had been manager of the United Motors Indianapolis branch for three years, previous to which he had been for six years manager of the Chicago branch of the National Motor Vehicle Company, Indianapolis, being the first agent in the employ of that concern.

W. L. Hunsucker, for two years an aggressive and successful automobile salesman of Oakland, Cal., and for the past year connected with the sales force of the Pioneer Automobile Company, has been appointed manager of the Oakland branch of the American Motors Company of California and also of the Marion Motor Car Company. Mr. Hunsucker had been temporarily in charge of the interests of both firms and his appointment makes his office permanent.

Alfred Measure of the Cadillac Automobile Company, Boston, in preparation for the marketing of the 1913 Cadillac made by the Cadillac Motor Car Company, Detroit, has reorganized his sales staff, adding Fred H. Lucas, for many years prominent in the carriage trade; Theodore A. Earle, Edward Becker, C. J. Bailey and C. W. Cole.

J. A. Strelinger, a Detroit boy, who has been working for a number of years on a magneto dynamotor for lighting and starting, is attempting to interest the automobile manufacturers of that city in his perfected device.

The Vanguard Manufacturing Company, Joliet, Ill., is soon to remove its office and factory force to Detroit, where the new plant will be completed in the near future.

N. Bates Ackley, assistant auditor and for 27 years in the employ of the Michigan Central Railroad Company, has joined the Studebaker Corporation's automobile division as assistant treasurer and will be in charge of the finances of the big Studebaker plants at Detroit.

C. E. Havens has resigned as manager of the technical and service departments of the Abbott Motor Company, Detroit, maker of the Abbott-Detroit cars, and is taking an extended vacation in the northern Michigan woods for his health. Mr. Havens was for many years technical manager of the Hudson Motor Car Company, Detroit, maker of the Hudson cars, before joining the Abbott company. He expects to join a new concern in the course of a few months.

The Dominion Stamping Company, Ltd., has erected a large forge shop at Walkerville, Ont., and is installing machinery. The company is capitalized at $250,000 and the new plant will be in operation in the near future. The factory will be one of the largest in Canada and contracts have been closed with a number of automobile manufacturing concerns in the United States and Canada, covering their 1913 requirements.

The New York Lubricating Oil Company has found it necessary to open new and larger quarters in San Francisco owing to the immense increase in the sales of Monogram oil on the Pacific Coast In addition the company has opened an office at Spokane, Wash., at Lincoln and Railroad avenues.

The Chalmers Motor Company, Detroit, has voted to increase the capital stock from $3,000,000 to $5,000,000. Of this amount $1,000,000 was paid in stock dividends to the stockholders and the other $1,000,000 was placed in the treasury for future use.

The Stuyvesant Motor Car Company, Sandusky, O., is to erect a new factory at Benton, Mo. The contract for a large building already has been let.

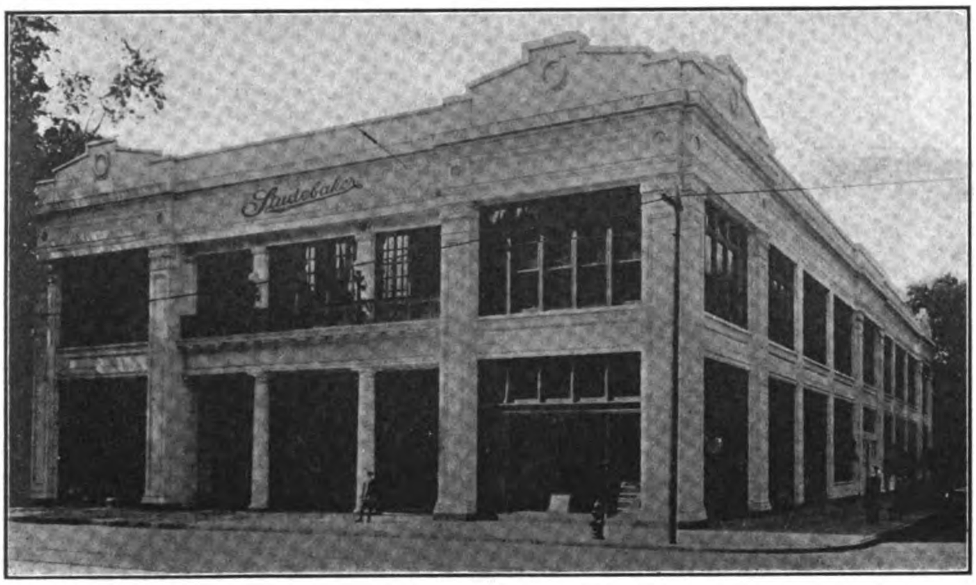
The Oakland Motor Car Company, Pontiac, Mich., has established a factory branch at 1905 Euclid avenue, Cleveland, O., of which Fred C. Wood is manager.

C. M. Dow has joined the sales force of the Tanner Motor Car Company, Brooklyn and Long Island distributor of the Flanders-Everitt line. Mr. Dow has had many years experience in the automobile field and goes to Brooklyn direct from the Everitt organization at Detroit.

The E. C. Andrews Company, Boston, has located in its new fireproof building at 67 Church street, near Park square and now has increased facilities and improved equipment for handling promptly all orders for automobile tops, slip linings, envelopes, storm fronts, etc.

The Willys-Overland Company, Toledo, O., maker of Overland cars, has leased for a long term the entire building at 915-921 Boylston street, Boston. Improvements will be made after which the building will be occupied. There is 6000 square feet of land, with a six-story fireproof structure, especially built for the automobile business and formerly occupied by the E. R. Thomas Motor Car Company's branch.

The Atlanta Tapto Top & Trimming Company, Atlanta, Ga., which was incorporated one year ago, expects to move into new and larger quarters in the near future. The new factory will be fully equipped and will carry an up-to-date line of automobile accessories. The officers are: President, J. Richardson; vice president, G. W. Anderson; secretary and treasurer, W. H. Spratlin.



Model Garage Erected by Studebaker Corporation, Detroit, Mich.

The Federal Rubber Manufacturing Company has secured quarters on North Broad street, Philadelphia, in which are located ideal sales and service rooms for the Federal line. Henry Benner is manager.

The Nordyke & Marmon Company, Indianapolis, Ind., maker of the Marmon automobiles, has established a factory branch at Kansas City, which is under the management of Fred D. Clinton.

S. H. Humphrey, for many years prominently identified with the automobile industry, has been appointed factory manager of the Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars. He will have charge of the 1913 output.

The Locomobile Company of America, Bridgeport, Conn., maker of Locomobile cars, has opened a factory branch at 3033 Locust street, St. Louis, Mo., with A. L. Ellwood, formerly of the Chicago branch, as manager.

The Moline Automobile Company, East Moline, Ill., maker of the Moline cars, has established a branch on East Washington street, Los Angeles, Cal., and the 1913 models are being shown. O. J. Root is manager of the wholesale department and George B. Vaston has control of the retail trade.

Walter C. Barnes, Springfield, Ill., is now publicity and advertising manager of the Moon Motor Car Company, St. Louis, Mo., maker of Moon cars. Mr. Barnes was formerly connected with the advertising departments of the Illinois State Journal, Springfield, Ill., the Idaho Statesman, Boise, Ida., and the Oregon Agriculturist of Portland, Ore. During the past year he was with the Lord & Thomas agency of Chicago.

The Ignition Starter Company, which manufactures the Disco starter and lighter, recently opened a direct factory branch and service station at 448-450 North Capital avenue, Indianapolis, Ind. H. L. Morgan is manager.

A. G. Bayerline has secured space in the plant of the King Motor Car Company, Detroit, where he is at work on a car which he intends to introduce in the near future. Mr. Bayerline was formerly general manager of the Warren Motor Car Company, Detroit, maker of Warren machines.

Clark A. Oostdyke, former director of purchases of the General Motors Company, has incorporated the Oostdyke Gear Shifting Company, Detroit, with $100,000 capital to manufacture a gear shifting device which does away with shifting levers on the car, the gears being operated by a keyboard on the steering wheel.

The American Locomotive Company, New York City and Providence, R. I., announces the following new agencies: Jefferson Garage Company, Syracuse, N. Y.; Pawlik & McGuidwin, Rochester, N. Y.; Merchants' Auto Service Company, Reading, Penn.; Downs Company, Minneapolis, Minn.; William Motor Car Company, Kansas City, Mo.; Villamil & Miller, Havana, Cuba; Thompson Auto Company, Detroit.

The American Auto Top & Slip Cover Company, Hartford, Conn., although established a comparatively short time, reports a rapidly increasing business and may have to expand in the near future.

The Lumen Bearing Company, Buffalo, N. Y., is preparing an addition to the already large plant of the company. When completed the concern will have one of the largest brass foundries in the country.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, now maintains 60 branches throughout the United States, Canada and Mexico, each of which is in charge of an expert tire man as manager, who is assisted by a corps of workmen familiar with the Goodyear equipment. The object is to place at the disposal of motorists in the respective districts a service which shall be most complete in every way. An accompanying illustration presents the branch at 28 Custom House street, Providence, R. I., under the management of A. M. Bummister, and is typical of the various buildings devoted to the needs of the company in the smaller centres. Aside from the salesroom indicated, additional facilities are afforded in the rear for repair and replacement work, so that the branch becomes a service station in every sense of the word, as is true of all the other Goodyear branches.

Wallace G. Page, for many years connected with the Shawmut Tire Company as sales manager, has become associated with George S. Van Voorhis in the American Marine Equipment Company, Boston. The company has built up a large business selling automobile tires and supplies.

The Woods Motor Vehicle Company, Chicago, maker of the Woods electric, entered in the parade of old models under the direction of the Chicago Automobile Trade Association, the first electric built by the company. The car is 16 years old and is said to be the oldest electric pleasure vehicle in existence.

The Nyberg Automobile Works, Anderson, Ind., maker of Nyberg cars, has appointed the following agents: Harms and Cragun, Logansport, Ind.; Charles B. Hunter, Jr., Pittsburg, Kan.; D. E. Schwab, Sulphur Springs, Col.; Guild & Hackley, Medarysville, Ind.; A. D. Wright, Kansas City, Mo.

The McVey Manufacturing Company, Dayton, O., maker of the McVey automatic, portable vulcanizer, is making a novel offer to owners and dealers whereby it is possible to secure one of its vulcanizers free of charge.

The Studebaker Corporation, Detroit, maker of Studebaker cars, will soon open a model automobile garage, salesroom and repair shop as an object lesson to the army of dealers who annually visit the Detroit plants of the concern. The establishment, as shown in an accompanying illustration, will embody every advanced idea in arrangement, labor-saving devices and other details. A. K. McLuney is manager of the garage, which will be headquarters for the recently organized Detroit branch of the corporation.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, recently gave to the Oakland dealers of the country a dinner at the Pontchartrain hotel, Detroit, known as "The car with a conscience" dinner and a large number of dealers and employees of the concern attended. Previous to the banquet an inspection of the plant was made, the accompanying photograph showing the dealers at the factory. A feature of the dinner was the menu card, in the form of an Oakland radiator. Among those present were: J. W. Martin, Minneapolis; H. L. Hornberger, San Francisco; B. G. Campbell, San Antonio, Tex.; H. L. Leech, Philadelphia; L. F. Smith, Atlanta, Ga.; M. D. Stone, Nashville, Tenn.; J. G. Kreig, Oskaloosa, Ia.; C. L. Barnes, Birmingham, Ala.; H. G. Sperring, St. Louis, Mo.; W. H. Head, Omaha, Neb.; W. J. Sutliffe, Waterloo, Ia.; T. N. Shambaugh, Kansas City, Mo.; Theodore Brinkman, Kansas City, Mo.; R. R. Hall, New York City; C. Briggs, East Orange, N. J.; V. N. Weidman, Jersey City, N. J.; J. T. Fremont, Paterson, N. J.; R. J. Handerson, Toronto, Can.; G. O. Wildhack, Indianapolis, Ind.; C. W. Tremain, Fort Dodge, Ia.; H. C. Turner, New York City; Dean Schooler, Des Moines, Ia.; S. L. Stone, Buffalo, N. Y.; L. W. Smith, New Haven, Conn.; C. E. Hoffman, Buffalo, N. Y.; Frank O'Dell, Pittsburg, Pen.; W. L. Cameron, Dallas, Tex.; Will Tracy, Detroit; J. F. Montgomery, Detroit; F. C. Wood, Cleveland, O.; R. A. Wadsworth, Chicago; J. F. Walsh, Boston; W. C. Gray, Buffalo, N. Y.; Frederic Eaton, Pittsburg; R. A. Creek, Milwaukee, Wis.; H. I. Bunting, Cedar Rapids, Ia.; Frank Remsen, Atlanta, Ga.: President Thomas Neal, General Motors Company; G. E. Daniels, J. B. Eccleston, F. H. Berger, E. H. Tinsman, J. H. Newmark, T. W. Wilson, L. P. Stone, H. H. Thatcher, H. A. Bauer, J. S. Hull, T. D. Culberhouse, A. N. Greene, H. R. Voit, N. E. Wahlberg, F. O. Ronk, K. B. Alexander.

The Pennsylvania Rubber Company, Jeannette, Penn., manufacturer of the well known vacuum cup automobile tires, has opened a direct factory branch at 149 Berkeley street, Boston, at which place the company will carry a complete line of its tires and products. G. W. Lawrie is in charge.

The Oklahoma Motor Truck Company, Tulsa, Okla., manufacturer of commercial motor trucks, has started a new factory on Boulder street. P. E. Haworth is president of the firm.

The Federal Motor Truck Company, Detroit, maker of Federal trucks, has appointed new agents as follows: Federal Truck Company, St. Louis, Mo.; L. S. Mitchell Auto Company, Chattanooga, Tenn.; Wesley Hill Garage, Phoenix, Ariz.; Vancouver Isle Motor Company, Victoria, Vancouver Isle, B. C.

Norman Chilsen, Merrill, Wis., is causing to be erected near his garage a three-story building of solid brick construction, in which he will conduct his automobile business.

The K-R-I-T Motor Car Company, Detroit, maker of K-R-I-T cars, has recently closed a contract for 1913 with the Northwestern Automobile Company, Minneapolis, Minn., to handle its line in the northwestern territory. The sales concern is well known to the trade, not only in the Northwest, but throughout the country where it has been identified with the distributing end of the industry since its inception. The accompanying illustration of the showroom shows the modern quarters it possesses for handling its large and growing business.

GARAGE & DEALER

J. L. Tippins has opened a tire repair shop on Broughton street, Savannah, Ga.

The Lemaster Garage, Ottawa, Kan., has been sold to William D. Sprague by Glen J. Lemaster, the former owner.

John H. Gerhardt, Laurel, Kan., has purchased for $30,000, the Frizzel garage, formerly conducted by E. E. Frizzel.

Federal Auto Accessories Company, Columbus, O., is the name of a new concern which has started business in that city.

Ira N. Thompson, Columbus, O., has opened a new garage on North Fifth street, with a capacity for storing 36 machines.

W. C. Stopher has opened a garage on North Market street, Wichita, Kan., and will handle the Regal and Abbott-Detroit lines.

The Rude Auto Company, Perry, Ia., is planning enlargements to its establishment and will conduct a garage and repair shop.

F. W. Anderson has purchased the Henry garage at Coon Rapids, Ia., and will conduct a first class repair shop in connection with it.

The Warren Automobile Company, St. Louis, Mo., is temporarily located at 4376 Olive street pending the completion of its building on Locust street.

Edward Bean has opened a new garage and repair shop on Columbus avenue, New Haven, Conn. He will also use the rooms for storage purposes.

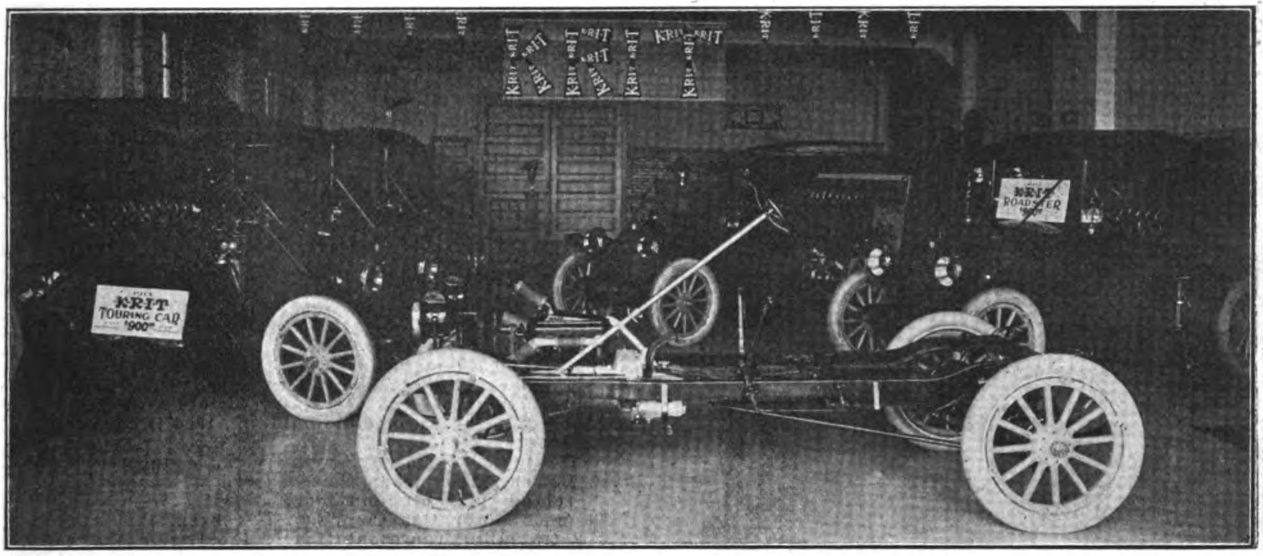
The Park Garage at South Pasadena, Cal., has undergone a change of management and incorporation papers have been taken out by the new partners.

The West Shore Garage Company, New York City, has leased the building at 406-408 West 45th street, of the Duross Company and the Cross & Brown Company.

Ralph Smalley has purchased an interest in the Eagle Grove Auto Company, Eagle Grove, Ia. He will handle the Overland car, made by the Willys-Overland Company, Toledo, O., besides doing a general auto repairing business in connection with the garage.

The Matthews Auto Company has moved into new quarters on South 20th street, Birmingham, Ala. The firm is composed of S. H. Matthews and Dr. J. E. Frazier, who handle the Inter-State, Firestone-Columbus and K-R-I-T.

The South End Garage, New Bedford, Mass., has just been completed for Manuel G. Souza. It is the first big public garage to locate in that section of the city and is equipped with every facility for the convenience of the car owner. Mr. Souza will make a specialty of supplies and repair work.



Salesrooms of the Northwestern Automobile Company, Minneapolis, Minn., Distributor for the K-R-I-T Line.

W. D. Nellis, Watertown, N. Y., is to erect a garage on Jackman street to be two stories in height. The building will be ready for occupancy in the near future.

The Oldsmobile Company of Missouri, of which Gratiot Cabanne is president, has leased for 10 years a new building of two stories and basement on Locust street, St. Louis, Mo.

A. L. Crowthers & Son, Coshocton, O., has opened a garage and salesroom and in addition to carrying the Studebaker and Flanders lines, will include several other makes of cars.

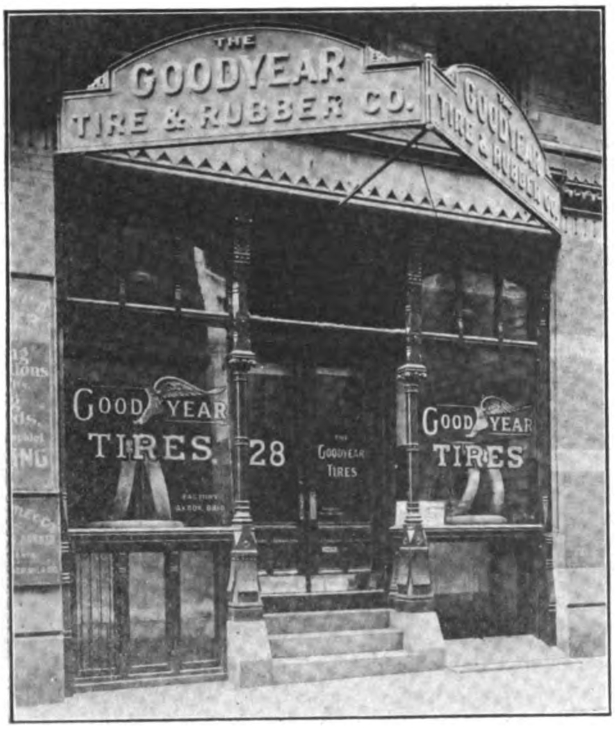
The City Hall Garage is a new establishment for the convenience of the automobile public at Saginaw, Mich. It is on South Washington street and is owned by Albert Marienthal and A. Smallwood.

The Motor Car Service Station, having outgrown its old quarters at 1935 Euclid avenue, has been located at 4824 Payne avenue, Cleveland, O., by the proprietors, H. Houserman and P. G. Forbush.

Steele & Metcalf, Howarden, Ia., implement and automobile dealer, has purchased the business of Charles W. Keniston, who was in the same line. The new firm will continue the business on a larger scale.

Edward Grover and Edward Scheuer, Two Rivers, Wis., have leased a building in which they will conduct a machine and automobile repair business. They will furnish automobile parts and accessories.

The Heimsch Automobile Company, St. Louis, Mo., has purchased a plot of land on Grand avenue upon which John N. Bleeck, president of the company, and his associates plan to erect a garage and repair shop to cost $30,000.



Goodyear Tire & Rubber Company's Branch at Providence, R. I.

Dr. D. F. Howard, president, and R. S. Brownlee, secretary and treasurer, have formed a stock company at Brookfield, Mo., with a capital stock of $10,000 for the purpose of building a modern garage at West Boston and Livingston streets.

John Sheridan and Albert Dennis, expert automobile men of Holyoke, Mass., have opened a garage on Main street, that city, which they later intend to remodel and extend. The plant is equipped with every modern convenience for the garage business.

The Finch-Freeman Auto Company, Indianapolis, Ind., has established a service station for the accommodation of the owners of Regal and Nyberg cars. The second floor of the building on North Capitol avenue has been given over to this department, which is one of the most complete of its kind.

The Cadillac Sales Company, Pittsfield, Mass., has just been organized and quarters have been taken on South street in a garage recently completed. The company is managed by Roy S. Bridge and Edward A. R. Brown, who have contracted for 23 of the 1913 model of Cadillac cars, made by the Cadillac Motor Car Company, Detroit.

Frank N. Phelps, Boston representative of the Baker Electric Vehicle Company, Cleveland, O., maker of Baker electric commercial cars, has recently moved into new quarters at Boylston and Fairfield streets. In connection with this sales department a service station for New England will be conducted at 90 Chestnut street, Boston.

Island City Garage, Galveston, Tex., has been purchased by Frank Freund, George Frank and Edwin Frank, the former owner, Joseph Bader, retiring from the automobile business. The establishment will be known as the New Island City Garage and special attention will be given to the repair of automobiles and their storage.

The Davenport Auto Company, Davenport, Ia., has been purchased of Steinhauer & Frey by A. Leberman and G. V. Davis. In addition to handling the K-R-I-T, made by the K-R-I-T Motor Car Company, Detroit, the Apperson, made by Apperson Bros.' Automobile Company, Kokomo, Ind., and doing general repair work, the firm will operate a line of taxicabs.

The Atlanta Automobile Sales Company, Atlanta, Ga., composed of some of the best known and successful automobile men of that city, is a new company recently organized to handle for that territory the National, Henderson and Flanders lines. The concern is located on Peachtree street in quarters formerly occupied by the Fulton Auto & Supply Company.

The Pierson Harris Company, Inc., Atlantic City, N. J., now occupies a three-story fireproof building recently purchased at Arkansas and Arctic avenues. The firm will retain its old location at 2013 Arctic avenue for carriage and wagon work. New capital has been added and the company proposes to do only the highest class of work in automobile painting and lettering, and manufacturing tops and trimmings.

Hawley, King & Co., Los Angeles, Cal., southern California and Arizona distributors of the Oakland car, made by the Oakland Motor Car Company, Pontiac, Mich., has moved its branch store into new quarters at 1027-1033 South Olive street. Hawley, King & Co., has dealt in vehicles since 1882 and one of the chief aims of the concern is service, which will be given special attention in the new quarters.

H. W. Pierce, automobile dealer at Butte, Mont., will engage in the automobile business at Spokane, Wash., operating as the Washington Motor Car Company, jointly with his Butte place, known as the Silver Bow Automobile Company. He has the agency for the Stevens-Duryea car, made by the Stevens-Duryea Company, Chicopee Falls, Mass., and is temporarily located in the garage formerly occupied by the Pacific Motor Car Company.

W. H. Fuller, who has a showroom at Washington and Snow streets, Providence, R. I., in the centre of the automobile trade, and a service station on East avenue, Pawtucket, R. I., has taken the agency for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., for Rhode Island, the Attleboros and Taunton, Mass. For the past four years Mr. Fuller has handled the Garford, E-M-F and Flanders lines.

Manager C. S. Henshaw, formerly of the Thomas Motor Company of New York, has established temporary quarters in the Automobile building, 1926 Broadway, New York City.

Fred W. Thomas, for many years connected with H. A. Lozier & Co., when that concern was manufacturing Cleveland bicycles and more recently with the E. R. Thomas Motor Car Company, has been appointed special travelling representative of the Lozier Motor Company, Detroit, maker of Lozier cars, in New York and Pennsylvania. Mr. Thomas succeeds W. L. Davis, formerly travelling in the eastern territory for the Lozier company.

J. W. Bowman, Boston distributor of the Stevens-Duryea machines and Waverley electric vehicles, has returned from England on the Franconia after an interesting tour abroad.

The W. E. Allen Company, Milwaukee, Wis., is planning the erection of new salesrooms on Grand avenue, between 27th and 28th streets.

J. P. Winterson, formerly connected with the eastern sales department of the Lozier Motor Company at New York City, has been appointed special travelling representative for that company in the Southwest, having in his territory, Colorado, Kansas, Missouri, Arkansas, Texas, Oklahoma, New Mexico and Louisiana.

J. S. Standlee, Ventura, Cal., formerly head mechanic of the Mission garage, has purchased the plant of the former owner, Bursen & Fowler.

The Tyler Bros. Corporation, a new Boston concern, has opened quarters in Motor Mart, Park Square, in that city and will handle several makes of cars exclusively in New England. Frank J. Tyler is president of the company and L. S. Tyler, who has long been identified with his brother, first with the Maxwell-Briscoe Boston Company and later with the United States Motor Company, is treasurer.

The Martin Sales Company, organized as distributor of Martin shock absorbers, has established agencies at San Diego and San Francisco, Cal., with the home office located at Los Angeles, Cal. A service station and salesrooms have been secured on West Pico street, the latter city, in which are ample facilities to equip automobiles with Martin shock absorbers. The members of the concern are: P. D. Mason, Allan T. Archer, W. L. Graves, Jr., and W. S. Ingram.

The Landman-Griffith Motor Company has been formed at Toledo, O., with a capital of $10,000 and a sales and service building will be erected at 14th street and Madison avenue to cost $25,000. The entire front of the building will be of glass. Charles P. Landman is president and W. E. Griffith is secretary and treasurer.

The Blackford Auto Inn., Hartford City, Ind., has been purchased by John Confer, who has taken possession.

Buchanan Auto Company, St. Joseph, Mo., has begun work enlarging and improving its garage on Frederick avenue and alterations will be completed soon.

Charles D. Brown has sold his interests in his stable and garage at Rochester, Minn., to Anton Hasley, who plans extensive improvements.

J. J. Strack, Blue Earth, Minn., has taken charge of the garage formerly owned and conducted by Hugh Lucas.

Paul Luge and Joseph Poiser, McKeesport, Penn., have opened an up-to-date machine shop on White street and are making a specialty of automobile work.

The Schornstein Automobile Company, St. Paul, Minn., has recently moved into its new quarters on Layton's Bluff. The concern represents the Lambert trucks and cars, made by the Buckeye Manufacturing Company, Anderson, Ind., and carries a complete line of accessories and supplies, in addition to doing expert repair work.

The Chessman Automobile Company, Salt Lake City, Utah, is building a new and modern garage to cost $10,000.

Charles Moeller & Son has occupied its new garage and wagon shop at Elizabeth, N. J., to be known as the New Point garage, which was recently completed. The firm will do repairing, painting and storing and will also carry a full line of automobile accessories. Moeller & Son will continue the building of wagon and automobile bodies in its new building, which is one story high and of concrete block construction.

The Savannah Auto Repair Company, Savannah, Ga., which started in business on a small scale a few years ago, has increased its equipment from time to time until today it has one of the finest and largest exclusive automobile repairing and rebuilding plants in the South. The company has a fully equipped woodworking plant, for building truck and pleasure car bodies and a few weeks ago a complete top department, equipped for making all kinds of tops, curtains and aprons, was added.

G. L. Hudkins of the Hudkins Motor Car Company, Salina, Kan., is to erect a garage and Ford hospital on 7th street, that city, in which modern and commodious quarters will be located. The second story will be used for Ford automobile supplies and the firm will engage in jobbing in connection with its other business.

The South Brooklyn Auto Livery and Sales Company, Brooklyn, N. Y., recently incorporated by C. H. Hohorst, J. B. Haff and C. Hohorst, has just opened its large garage, which has 25,000 feet of floor space. The establishment is not only for storage purposes for commercial and pleasure cars, but for repairs, painting, upholstering and supplies, with a rental department of taxicabs, touring cars and limousines. The company is agent for the R-C-H cars, made by the R-C-H Corporation, Detroit.

The Overland Motor Car Company, Hutchinson, Kan., has sold its garage, repair shop and accessories store to W. Hazlett, who will conduct these features of the business. The Overland company will devote its energies to the distribution of Overland cars and Goodyear tires.

O. C. Brown, Anderson, Ind., who has had extensive experience in the automobile business, has purchased the Central garage of Wagner Stitaman, who formerly conducted it.

William H. Bartleman is general manager and Richard F. Reed is sales manager of a new company formed at 620 North Broad street, Philadelphia, to handle the Regal cars, made by the Regal Motor Car Company, Detroit.

The Brown-Rawson Garage Company, Gardner, Mass., has been formed and a new garage and repair shop has been opened on North Main street.

C. W. Gray, proprietor of the State street garage, Watertown, N. Y., is building a second story to the present building, the lower floor to be occupied by the Watertown Auto & Supply Company.

Behrens & Bushnell, Centerbrook, Conn., has made plans to build a large garage addition to its present automobile works.

The Hibbing Automobile Company, Hibbing, Minn., a copartnership between J. R. Pomeroy and M. J. McGovern, was recently dissolved and the business was sold to O. W. Oldham, who is conducting it under the old firm name.

C. M. Barnes & Son is now the owner of the Garner Auto Company garage, Garner, Ia., which was recently purchased of H. F. Kellogg.

The Sidney B. Bowman Automobile Company, New York, has permanently located its salesrooms with its service department, 225-231 West 49th street. Extensive alterations have been made to the building and Theodore E. Schulz has charge of the sales department.

The J. D. Perry Lewis Automobile Company, St. Louis, Mo., has leased the store building at 4108 Olive street and extensive alterations have been made to accommodate the company, which will use the new quarters as the central salesroom for Moon cars, made by the Moon Motor Car Company, St. Louis. The new lease is for a term of years.

The Pioneer Automobile Company, Los Angeles, Cal., has opened headquarters for the Flanders electrics exclusively. The new concern will be housed on South Olive street and the Lord Motor Car Company, which formerly handled the Flanders line, will now concentrate its efforts in distributing the Reo and Garford products.

The Standard Auto Garage, of which Charles Johnson is owner, will erect a modern garage at Uniontown, Penn. It will be three stories high, fireproof construction and will cost $50,000.

The Woodbury Garage, Woodbury, Conn., formerly owned by Paul Bronson, has been purchased by Fred St. Pierre, who has taken possession.

Arthur McNall has moved into his new garage at Rochester, N. Y. The building is three stories high and Mr. McNall has the agencies for the Peerless pleasure and commercial lines and Rauch & Lang electrics.

The Rozell Harris Company, Hackensack, N. J., has established a new garage on Mercer street, in which a general repair business will be conducted.

The Overland Sales Company, Cleveland, O., has purchased property on East 22d street and will erect a new three-story building for automobile purposes. The new structure is to be of brick, fireproof construction. The present building of the concern will be enlarged.

L. F. Case, former partner of J. S. Landon in the operation of the Landon garage at Elkhart, Ind., has acquired full possession of the establishment.

J. Caesar, St. Louis, has purchased a half interest in the Palace garage, Webb City, Mo., owned by William Miller, Charles Marquis and Clarence Glazier. Mr. Caesar intends to add a large amount of supplies and equipment to the plant.

The Colonial Automobile Company, St. Louis, Mo., of which Louis Goodhart is vice president and sales manager, and Henry Deabold is president, has become the factory branch distributor in western Illinois and half of Missouri for the Flanders electrics. The company's location is at 3948-3950 Olive street.

The Congressional Garage, Washington, D. C., has been granted permission to erect an addition to the plant on Pennsylvania avenue at a cost of $7000.

B. Platt & Son, Hamilton, Ont., which has just completed the erection of a handsome garage at 752 King street, east, has been appointed representative of the Studebaker Corporation of Canada, maker of Studebaker cars, the American factories of which are at Detroit.

The Whittier Garage Company is now installed in its new home at Philadelphia street and Newlin avenue, Whittier, Cal.

George L. Gasler has purchased property at Niagara Falls, N. Y., for $15,000. It is centrally located and Mr. Gasler proposes to erect a large garage to be fitted with the latest facilities for conducting the automobile business. The firm which Mr. Gasler heads has been incorporated as the Niagara Falls Automobile Transit Company, the other incorporators being M. M. Gasler and E. U. Gasler. In addition to handling the Peerless cars, made by the Peerless Motor Car Company, Cleveland, O., and the R-C-H machines, made by the R-C-H Corporation, Detroit, the firm will conduct an auto livery business. The new garage will cost $50,000.

The Howard Automobile Company, 523-525 Golden Gate avenue, San Francisco, Cal., of which C. S. Howard is president, has taken the three floors and basement of a warehouse on Sutter street for a repair shop. The firm is wholesale distributor of Buick cars, made by the Buick Motor Company, Flint, Mich., and the National machines, made by the National Motor Vehicle Company, Indianapolis. Branches are maintained at Los Angeles and Oakland, Cal., and Portland, Ore.

The Main Street Garage Company, Pullman, Wash., has opened a general automobile supply and garage business under the management of A. L. Reid.

The F. S. Slansky Electric Company, Cleveland, O., has plans for the establishment of a modern garage and automobile shop to be erected in the near future.

The J. A. Wigmore Company, Cleveland, O., will erect a new garage in that city at a cost of $30,000.

The Charles Schrear Motor Car Company, Cincinnati, O., will make additions to its garage which will cost $5000.

George Wood, for a number of years connected with the Pittsfield Spark Coil Company's plant, Dalton, Mass., has removed to Hoosick Falls, N. Y., where he will open a garage.

The Perry Motor Supply Company, Hartford, Conn., has occupied new and commodious quarters at 100 Allyn street, that city, which will be conducted in connection with the company's store at 102 Allyn street. The improvements complete one of the finest stores in New England. The service department is equipped with a full line of supplies for motorists, both wholesale and retail. In conjunction with its automobile supply business the company has installed a repair station for the Stewart speedometers and will make repairs to lamps, radiators, fenders, etc., for which drills and other necessary machinery have been purchased.

James E. Morse, Watertown, Mass., has begun the erection of a garage on Prentiss street, having accommodations for 50 cars.

The Rockrimmon Garage, Portsmouth, N. H., formerly owned by J. H. Hyslop, has been purchased by J. W. Edwards and Ralph C. Dicket of Burlington, Vt.

The Indianapolis Automobile Clearing House, Indianapolis, Ind., recently incorporated for the purpose of dealing in automobiles, has the following officers: President, E. J. Kane; vice president, T. E. Byrne; secretary and treasurer, John L. Duvall, all of whom will act as directors of the company. The concern will specialize and act as a clearing house for second hand cars.

The Georgian Terrace hotel garage, recently completed at Atlanta, Ga., is said to be the largest building used exclusively as an automobile garage is the South. The establishment is conducted in connection with the Georgian Terrace hotel, which entertains many tourists throughout the year. In addition to having every equipment needed for the repair and upkeep of automobiles, the building is sufficiently large to have offices, sleeping rooms, a hospital, reading rooms, barber shop, tailor shop, club and billiard rooms, besides other modern conveniences for the benefit of employees and chauffeurs travelling with touring parties.

Brown & Fairbanks, proprietor of the Main street garage, Rochester, Minn., has opened its place of business to the public.

R. M. Owen & Co., New York City, has moved its executive offices and the New York Reo branch to new and more commodious quarters at 19-21 West 62d street. R. E. Ingersoll, manager of the branch, said that the high rent and limited space made the move imperative.

Electric Star Auto Headlights and Tail Lamps

The lamp that has no rivets nor solder, and only one screw used in its construction. It is made of cast silvered aluminum, and the interior is highly polished, which does not tarnish. The convex lenses are laid in rubber, which makes them water and dust proof, and same is the strongest lamp made. Write for cataogue. Mfd. by

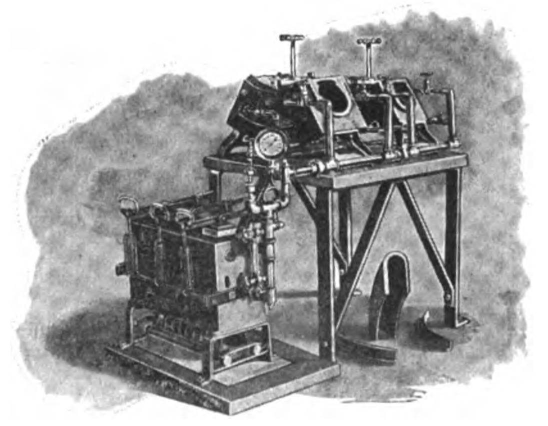
Are You Getting Your Share of The Dollars?



TIRE REPAIR MEN ARE MAKING MONEY. Right now and for the next two months this business will be at its best. Tires that were new in the spring need repairs. Auto owners are repairing tires to make them last out the season. An increasing number of cars will be run all winter.

YOU OUGHT TO SHARE IN THE PROFITS. Install an **AKRON-WILLIAMS** outfit, the kind used and recommended by twenty-seven out of thirty tire makers and by successful repair men everywhere. Ask your tire maker about us.

IT DOESN'T TAKE MUCH MONEY to buy the best plant and you can make more with it than with an investment four times as large in any other line. We have outfits from $40.00 to $1000.00, depending upon how much and what range of work is to be handled. Every outfit is standard.

Box 619, Johannesburg, South Africa. Advertisement 93, Description and Illustration 59.

TRADE MARK INDEX

BATTERIES, STORAGE.

Edison	Edison Storage Battery Company, Orange, N. J. Branches and represented in all principal cities.
Exide	Electric Storage Battery Company, Philadelphia, Penn. Branches: New York, Chicago, Cleveland, Denver, San Francisco, Portland, Ore.; Boston, St. Louis, Atlanta, Detroit, Los Angeles, Seattle, Toronto.

CARBURETORS.

Rayfield	Findeisen & Kropf Manufacturing Company, 21st and Rockwell Sts., Chicago, Ill.; George Summer, 1841 Broadway, New York, N. Y., and 745 Boylston St., Boston, Eastern Distributor. Agencies in all principal cities.

CHAINS, TIRE.

Weed	Weed Chain Tire Grip Company, 28 Moore St., New York, N. Y. Sold by all Dealers.

CHAINS, DRIVING.

Brampton	Chas. E. Miller, 97-103 Reade St., New York, N. Y. Branches: 202-4 Columbus Ave., Boston, Mass.; Bridge and Dwight Sts., Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York, N. Y.; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia, Penn.; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland, O.; 227 Jefferson St., Detroit, Mich.; 250 Peachtree St., Atlanta, Ga.; 601-3 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.

CRANES AND HOISTS.

Portable Floor	Canton Foundry & Machine Company, Canton, O.

ELECTRIC LIGHTING SYSTEMS.

Dynalux	Dean Electric Company, Elyria, O.
Gray & Davis	Gray & Davis, Inc., 55 Lansdowne St., Boston, Mass.

FUNNELS, MEASURES, ETC.

Dover	Dover Stamping & Manufacturing Company, Cambridge, Mass.

GREASE GUNS.

B-Line	Randall-Faichney Company, Boston, Mass. Sold by All Dealers.

GAS TANKS.

Prest-O-Lite	Prest-O-Lite Company, 237 E. South St., Indianapolis, Ind. Branches and Service Stations in All Principal Cities.

HORNS, ELECTRIC.

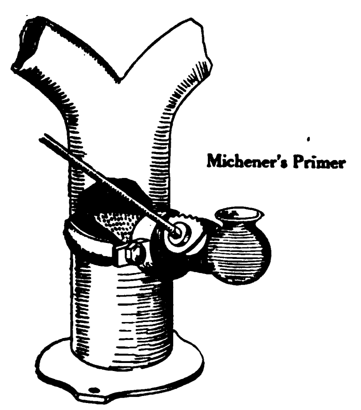
Newtone	Automobile Supply Manufacturing Company, 220 Taaffe Place, Brooklyn, N. Y. Sold by All Dealers.
Tuto	Dean Electric Company, Elyria, O. Sold by All Dealers.

LUBRICANTS, GREASES.

Colonial	Borne, Scrymser Company, 80 South St., New York, N. Y. Branches: Boston, Fall River, Mass.; Philadelphia.
Eagleine	Eagle Oil & Supply Company, 104 Broad St., Boston, Mass.
Harris	A. W. Harris Oil Company, 326 S. Water St., Providence, R. I. Branches: 148 N. Wabash Ave., Chicago, Ill.
Havoline	Indian Refining Company, 17 Battery Place, New York, N. Y. Branches: San Francisco, Chicago, Birmingham, Ala.; Cincinnati, O.; Lynchburg, Va.; St. Paul, Minn.
Monogram	New York Lubricating Oil Company, 116 Broad St., New York, N. Y. Branches: 126 Massachusetts Ave., Boston, Mass.; 37 New Jersey Railroad Ave., Newark, N. J.; 407 Franklin Bank Building, Philadelphia, Penn.; 1436 Michigan Ave., Chicago, Mich.; 1111 Superior Ave., N. W., Cleveland, O.; 435 Turk St., San Francisco, Cal.; 618 Banning St., Los Angeles, Cal.; Virginia and Railroad Ave., Seattle, Wash.; Spokane, Wash.; 117 The Vale, Acton, London, W., England; P. O. Box 619, Johannesburg, South Africa.
Motorol	New York & New Jersey Lubricant Company, 165 Broadway, New York, N. Y.
Non-Fluid	New York & New Jersey Lubricant Company, 165 Broadway, New York, N. Y.
Polarine	Standard Oil Company, New York, N. Y. Branches and Agents in All Cities.
Texaco	Texas Oil Company, 7 West St., New York, N. Y. Branches: Boston, Philadelphia, Chicago, St. Louis, Norfolk, Atlanta, New Orleans, Dallas, El Paso, Pueblo, Tulsa, Houston.

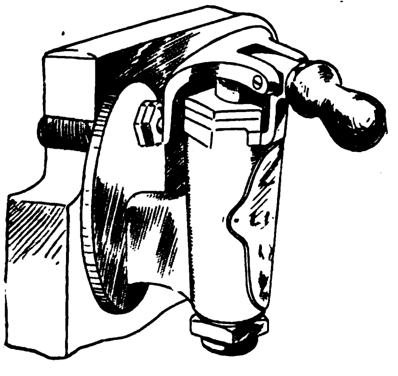
Examples of Car Equipment and Accessory Descriptions.

Michener's Gas Saver and Primer. This device, manufactured and distributed by E. S. Michener, New Castle, Pa., is designed for installation in the intake manfold of any internal combustion engine above the carburetor, to which it is attached by a brass strap and bolts and lock nuts. The primer is operated by a rod and linkage extending through the dash of the car or to a convenient place in a boat or engine room. A wire gauze cone is fitted in the device, through which the fuel gas is drawn from the carburetor, the mesh causing the heavy mixture to thoroughly atomize, greatly increasing its inflammability and adding to its power productiveness. In the heavy brass casing of the primer is a valve, that may be noted in the illustration, which is operated by the driver or engineer, and may be opened to any desired point to .5625 inch, permitting a wide variance of the fuel by this auxiliary air supply. A priming cup is made part of the device, so that in cold weather engine starting is facilitated. The claim is made for this instrument that it greatly reduces the fuel consumed. **Price, $5.**



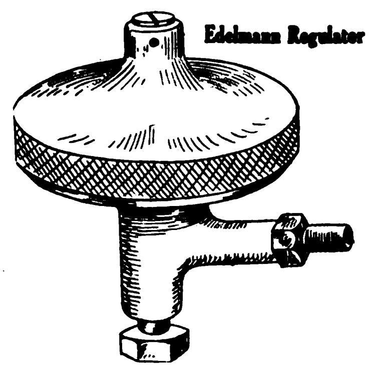
Michener's Primer

Flash Auto-Lighter. The Flash Auto-Lighter, made by the Motor Specialties Company, Motor Mart, Boston, Mass., is designed for installation on motor cars to make and extinguish the lights of the head lamps by manipulation from the driver's seat. The system is simple and substantial and consists of a pair of special burners for the lamps, an induction coil and a controller, the last named being illustrated. The controller is a combination gas valve and electric switch, the two being operated by a single lever. With the throwing of the switch sparks are made at the burners before the gas valve is opened, and these continue until the lights are made. The coil is a single unit type, finished with mahogany and brass, and that the system may be entirely independent of the engine ignition the coil has four terminals for the primary and secondary wiring. The burners fit any standard lamp. The sparking points are rigidly clamped over the gas vents of the burners, and will not interfere with the light and cannot be separated by the vibration of the car. Turning the switch handle toward the left will make the lights instantly, and they may be extinguished by moving the handle to the right. The installation is furnished complete with gas pipe, unions, wire, terminals, etc. **The price is $20.**



Flash Auto Lighter

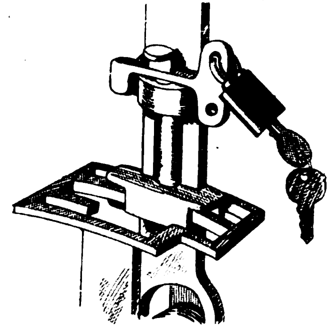
Edelmann Regulator. An extremely useful device is the Edelmann Regulator, manufactured by S. Edelmann & Co., Chicago, Ill., which is intended for attachment to tanks in which gas is stored under pressure, that the flow of gas may be equalized and the pressure regulated. The range of adjustment is wide and it is possible to vary the pressure from two ounces, which is the head recommended for two three-quarter foot burners, to considerably more than a pound, though the extreme is seldom if ever required. The metal diaphram of the regulator has extremely long life. The adjustment is made by turning a screw in the cover of the device. **Price, $2.**



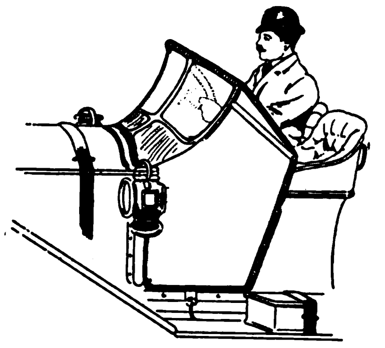
Edelmann Regulator

Saunders Auto-Lever Lock. F. H. Kelsey & Co., Cleveland, O., is producing the Auto-Lever Lock, a device intended to prevent the unauthorized use of a motor car, that consists of two parts. The one is the base, which is placed on the lever quadrant when the speed changing lever is in neutral and against the lever, so that the lever cannot be moved. To the lever is attached a clip that has two ears, in which are holes. When the base has been placed against the lever on the quadrant two holes in the upper part register with two holes in the ears of the clip on the lever, and through these the clasp of a heavy Yale lock is passed and it is possible to prevent the lever being moved until the lock is removed. The device is sufficiently strong to resist any ordinary attempts at theft. It is substantially made and should serve for a long period. It is furnished with keys in duplicate. **The list price is $5.**

SAUNDERS' AUTO LEVER LOCK

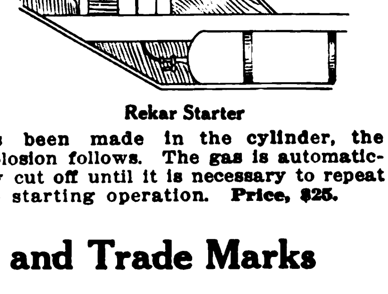


Auto Windshield. The Auto Windshield, made by the Auto Wind Shield Company, Cambridge, Mass., is an exceedingly practical device. It is extremely light, affords a very large measure of protection for the occupants of a car, may be removed whenever desired in a very few minutes, and easily replaced. As may be noted from the illustration, it is a form that will insure comfort for the driver. It is built with a metal frame that is supported by brass fittings, and the frame is covered with a fabric impervious to wind or water. In the front are two large sheets of a transparent material, through which the road may be seen, and which is said to be unbreakable. The shield may be used without the sides if desired. The shape of the shield is said to be such that the current of air is deflected above the heads of the passengers. **Price, $35.**



AUTO WIND SHIELD

Rekar Automatic Starter. An extremely useful device is the Rekar Automatic Starter, manufactured by the Rekar Automatic Starter Company, Sixth and Market street, San Francisco, Cal., a system by which a charge of acetylene gas is introduced into the cylinders of a motor and fired, this giving the initial impulse necessary to insure operation. A controller is attached to the dash of the vehicle and there is a system of tube to the engine cylinders and to the gas tank. This controller is substantially made and it is installed convenient to the operator of the car. There is a system of wiring connecting the ignition battery and the controller. Normally the controller is as seen in the illustration, with the plunger rod projecting sufficiently for instant operating, yet not so that it interferes with the use of robes or prevents freedom of movement of those occupying the front seats, or entering or leaving them. The operation is by pushing a rod or piston in the controller by the foot or hand, this forcing a charge of gas to the cylinders. As this is done after the spark has been made in the cylinder, the explosion follows. The gas is automatically cut off until it is necessary to repeat the starting operation. **Price, $25.**

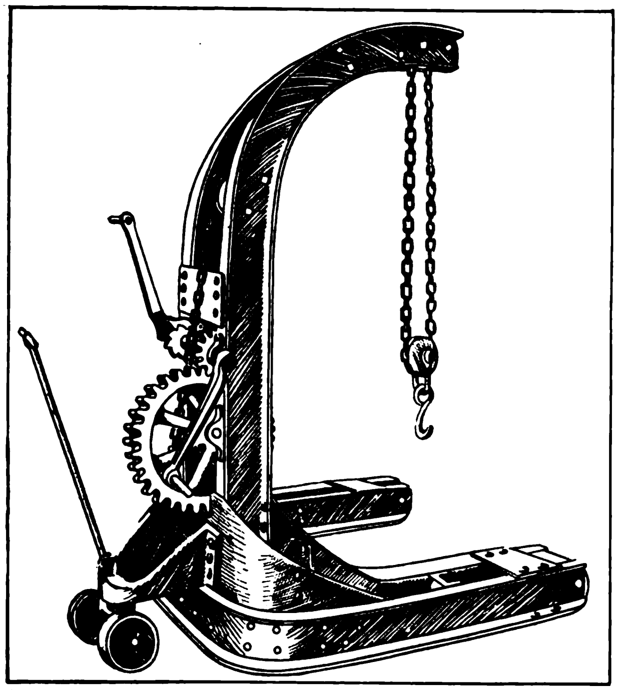


Rekar Starter

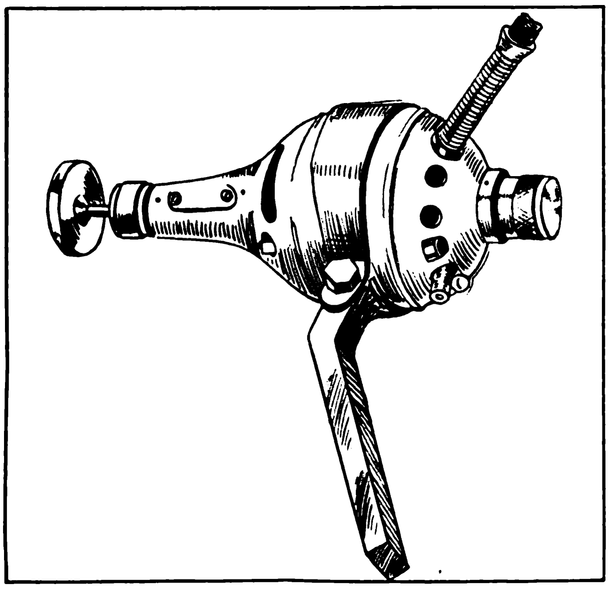
Examples of Machine and Shop Equipment Descriptions.

LAFAYETTE PORTABLE CRANE.

The Lafayette Engineering Company, Lafayette, Ind., is building a portable crane that is particularly suited for garage and repair shop service, and it is claimed that with it any man may handle work that would be quite beyond several men, and to decidedly economize in time as well. The crane is made of heavy steel channels and angles that are assembled with machine driven rivets, insuring a very durable construction. The feet of the base are long and may be extended under a chassis or object so as to insure certain stability, and as the crane has an overhang of 3.5 feet it can be used from practically any position about a vehicle chassis. The base is mounted on wheels fitted with roller bearings, so that even with a load the crane may be moved with ease on any floor. The weight is about 900 pounds. The lift is a chain hoist operated by a series of gears, but little manual labor being required to lift any practical weight, and the safety of the material lifted is guaranteed by the testing of the chain to endure a weight of three tons. **The price is $——.**



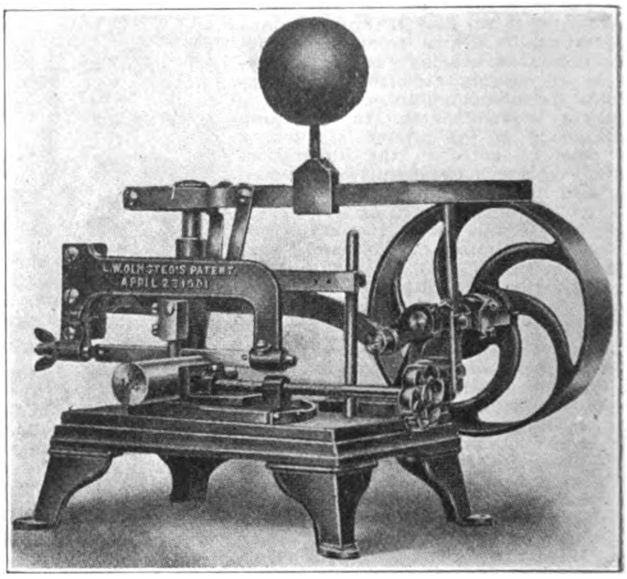
Lafayette Portable Crane.



Hamilton-Beach Grinder.

HAMILTON-BEACH GRINDER.

A tool of extreme serviceability in a garage or repair shop is an electric grinder, manufactured by the Hamilton-Beach Manufacturing Company, Racine, Wis. Being portable, it may be used wherever desired, and its efficiency is all that could be desired. This tool may be utilized for grinding dies, reamers, cutters, etc., and gives equally good results with external as with internal work. It is claimed by the maker that a quarter-inch hole may be ground to a depth of four inches with absolute precision, as there is no vibration and the construction is sturdy. Any kind of a wheel may be used, and felt or oil stone can be fitted when extremely fine finish is required. The grinder is operated by electricity and the current may be either direct or alternating. The motor is 1-12 horsepower and the grinding wheel is driven 10,000 revolutions a minute. The motor is air-cooled and it is capable of sustaining a large overload without heating. The outer casing is aluminum and the bearings of nickel babbitt are dust proof. The armature is ground on centres to a fine finish, and it is mounted in main and with end bearings that are adjustable for wear. The tool is furnished with a special cord 10 feet in length and a plug that may be fitted to any electric lamp socket. It may be used with a cable of any length. **The price is $35.**



Olmsted Power Hacksaw.

OLMSTEAD POWER HACKSAW.

L. W. Olmsted, Hasbrouck Heights, N. J., manufactures a line of power hacksaws that are adapted for garage and repair shop service and for either heavy or light work. Where even a few mechanics are employed the time required for cutting stock is considerable, and when the broken blades are accounted it is cheaper in every way to have the work done by machine. The value of these tools is in the fact that work can be placed in them and will be completed accurately without further attention. The type that is illustrated is designed to take stock up to 1.25 inches, either round or square, and it may be attached to a bench or table and driven from the main shaft if this is desired. It is fitted with a clutch for stopping or starting and a swivel device permits sawing at any angle. The driving pulley is six inches diameter and it should be turned 175 revolutions a minute in normal speed. The weight of the tool is 16 pounds. **The price is $——.**

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. PAWTUCKET, R. I., NOVEMBER, 1912. No. 7

SALE DATE SET FOR JANUARY 8.

Judge Hough Calls for Bids for United States Motor Company's Property---Flanders Expected to Head Reorganized Concern---New Men and Capital for R-C-H Corporation---General News of the Industry.

According to the Wall Street Journal, Walter E. Flanders, at present president of the Flanders Motor Company, Detroit, has signed his acceptance of the presidency of the reorganized United States Motor Company. Publicity issued by E. Le Roy Pelletier of the Flanders company would seem to bear out this statement. It is understood, however, that the move is contingent upon the successful issue of present plans.

At the adjourned hearing before Judge Hough in the United States District Court in New York City, Nov. 18, the demurrer filed by certain minority stockholders was overruled. A tentative decree of sale was ordered to be amended in certain minor details. Bids may be filed with the receivers, 61st street and Broadway, New York City, until 10 in the morning of Jan. 8, and will be opened by Judge Hough at 11.

The tentative decree provides that the property of the present company shall be offered for sale in six parcels, that of the several companies involved being separated as follows: United States Motor Company, Alden Sampson Manufacturing Company, Brush Runabout Company, Columbia Motor Car Company, Dayton Motor Car Company and Maxwell-Briscoe Motor Company.

The report of the receivers was filed early in the month and presented the following summary:

AGGREGATE ASSETS.

Real estate, buildings and equipment, estimated value as a going concern	$5,119,356.31
Furniture and fixtures	76,000.00
Inventories, estimated as going concern with all factories operating except Brush	4,500,000.00
Accounts receivable	550,000.00
Notes receivable	34,830.20
Cash in hand and on deposit	412,027.80
Cash, special fund to provide for dealers' deposits	62,513.24
Prepaid expenses, insurance premiums, unexpired portions	45,440.21
Total assets, other than inter-company accounts	$10,800,167.76
Inter-Company Accounts.	
Entire debt so far as unassigned	$1,198,769.54
Notes receivable	2,000.00
National Motors Company	4,042.23
Providence Engineering Works	....
Total assets, other than securities, going concern value	$12,004,979.53
Securities.	
Briscoe Manufacturing Company	$367,995.00
Providence Engineering Works	1.00
E. R. Thomas Motor Car Company	....
Courier Car Company	....
National Motors Company	355,190.07
Total assets, estimated value	$12,728,165.60

AGGREGATE LIABILITIES.

Real estate mortgages	$164,540.90
Debenture bonds, bond scrip and interest	6,161,509.87
*Notes of one or more subsidiary companies, indorsed by the United States Motor Company, and notes of one or more selling branches, similarly indorsed, with interest	2,194,258.12
Notes of United States Motor Company, indorsed by one or more subsidiary companies	650,820.99
Claims against United States Motor Company, of which approximately $100,000 is due for goods delivered immediately prior to receivership	1,961,875.99
Claim against Columbia Motor Car Company, or United States Motor Company, or both	91,789.60
Notes secured by sight draft on car shipments	63,691,26
Wages of employees and accrued expenses	74,256.30
Dealers' deposits, partly offset by accounts receivable	55,113.24
†Contingent liability on indorsement of notes of E. R. Thomas Motor Car Company	400,000.00
Providence Engineering Works, claim made for work performed (disputed) $138,532.26	....
Total liabilities, other than inter-company	$11,817,856.27
Inter-Company Accounts.	
Briscoe Manufacturing Company	$813,970.91
The capital stock of this company is owned entirely by the United States Motor Company and as it is regarded as solvent, this liability is taken at	....
Total liabilities	$11,817,856.27

Excess assets, estimated value as shown, over liabilities as shown	910,309.33
Total	$12,728,165.60

CAPITAL STOCK.

Outstanding, outside ownership, not included in this statement:	
United States Motor Company, preferred	$11,499,733.33
United States Motor Company, common	12,206,350.00
Columbia Motor Car Company, preferred	13,400.00
Columbia Motor Car Company, common	118,000.00
Total	$23,837,483.33

---

*It is estimated that the branch selling houses can pay $756,226.18 on their notes, after providing for local indebtedness.

†The receivers of the E. R. Thomas Motor Car Company estimate that that company will pay from 25 to 40 per cent. to its creditors.

BECOMES EASTERN SALES MANAGER.

E. A. Welch Takes Charge of the Distribution of Michigan Cars in This District.

E. A. Welch, Eastern Sales Manager, Michigan Motor Car Company.

Continuing its policy of surrounding itself with some of the best men in the industry, the Michigan Motor Car Company, Kalamazoo, Mich., has added to its sales department, E. A. Welch, one of the best known and most successful salesmen of the middle west. He becomes sales manager for the middle and eastern states, his territory including all the district east of a line extending from Chicago to New Orleans. He will reside in Kalamazoo and travel throughout the entire district, calling on distributors and dealers and establishing and supervising agencies.

Mr. Welch was for many years a successful merchant in Kalamazoo. Later he was in the tea and coffee business, with Dwinnell-Wright, from which firm he went to the Clark, Coggin & Johnson Company, and severed his connection with that concern to join the Michigan. His administrative ability commanded wide respect, and at one time he was offered the wardenship of the Michigan state prison at Jackson. He has a wide circle of friends, both in and out of the industry, and is particularly well known among the Elks, where he is much sought after as a toastmaster of social functions. The Michigan Motor Car Company is assured of a valuable assistant in Mr. Welch's appointment.

R-C-H STRENGTHENS POSITION.

Two New Men for Vice President and Treasurer and Additional Directors Named.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has secured additional financial support and will be enabled to take care of its business, which has grown too rapidly for the amount of capital invested. The creditors and stockholders were recently called into consultation and the company's financial condition was frankly stated in a report compiled by McPherson, Weiss & Co., expert auditor and accountant. This report showed an excess of assets over liabilities of $576,000.

As a result of this conference a plan was evolved which will permit the business to be extended. The board of directors was increased from three to nine, and the following were selected: J. W. Hartz, John Kelsey, R. C. Hupp, F. M. Randall, J. H. Clarke and C. P. Sieder of Detroit; G. W. Rogers and J. G. Robertson of Akron, O., and C. G. McCutchin of Jackson, Mich. At a meeting of the directors later, the following officers were elected: President, R. C. Hupp; vice president, C. P. Sieder; treasurer and general manager, J. F. Hartz; secretary, L. G. Hupp; assistant general manager, F. R. Bump. The active management of the concern rests with an executive committee of five composed of Messrs. Hartz, Kelsey, Randall, McCutchin and R. C. Hupp.

The new vice president is president of the Sieder Manufacturing Company, and one of Detroit's most successful business men. The new treasurer is president of the J. F. Hartz Company and a director in a number of other Detroit concerns. He became actively associated with the automobile industry four years ago when he organized the C. M. Hall Lamp Company. Mr. Bump was formerly sales manager, and as such built up a strong sales organization which sold 7000 cars during the first year of business and has contracted for the sale of 16,500 machines during 1913. Before his connection with the R-C-H Corporation he was sales manager for the H. H. Franklin Manufacturing Company, Syracuse, N. Y.

NEW PATHFINDER FACTORY.

Motor Car Manufacturing Company Finds It Necessary to Secure Additional Space.

The increased demand for Pathfinder cars has impelled the maker, the Motor Car Manufacturing Company, Indianapolis, Ind., to acquire additional facilities for handling its 1913 production. The decision made it necessary that workmen should be employed night and day in completing the new plant, adjoining the present factory on Division street, West Indianapolis, and but a short distance from that of the Nordyke & Marmon Company.

The new structures are two stories in height, with an office building facing Division street. They are constructed of brick, glass and steel, and the working floor space is paved with cement. Communication will be had with the present building, and new improved machinery will be installed throughout. The bilateral system of lighting will be employed, and elevators will connect all the floors. The office building will be furnished with modern equipment and one of the features of the plant will be a factory showroom, in which all the Pathfinder models will be placed on display.

G. O. Simons, Factory Manager Motor Car Manufacturing Company.

The above illustration presents G. O. Simons, factory manager of the company, who is well known throughout the industry. That he is held in high esteem by his associates is borne out by his recent election to the directorate of the Indiana Automobile Manufacturers' Association. He is a firm believer in pathfinding tours, in which the Pathfinder cars have taken a prominent part, and will assist Carl G. Fisher in the proposition to establish a national highway to the Pacific Coast.

AMES LINE FROM KENTUCKY.

Well Known Carriage Maker Enters Automobile Industry with Two Models on One Chassis.

The Ames Motor Car Company, Owensboro, Ky., with paid in capital of $100,000, an offshoot of the F. A. Ames Company, which has manufactured fine carriages for 30 years, has placed upon the market a new line of automobiles in which there are two models, a touring car and a roadster. George W. Yeoman, formerly general sales manager of the Continental Motor Manufacturing Company, has complete charge of the building of the Ames cars, and Charles T. Smith is general superintendent.

NEAL RETIRES FROM PRESIDENCY.

Becomes Chairman of Directorate While Nash Heads General Motors Company.

After a two years' term as president of the General Motors Company, Detroit, during which time a successful reorganization has been accomplished and the big company has been re-established on a profitable and stable basis, Thomas Neal is relinquishing that office to become chairman of the board of directors. He will be succeeded by C. W. Nash, for some time past manager of the big plant of the Buick Motor Company, Flint, Mich., one of the constituents of the parent organization.

The move is strictly in keeping with the understanding between Mr. Neal and the company when he took office. In the fall of 1910, when the big concern was refinanced and the executive offices were moved from New York to Detroit, the financial interests supporting the company realized the necessity of securing as president a man of very broad business experience. Mr. Neal was approached and urged to take the office, but he accepted with some hesitancy, because of the personal sacrifice involved, and only on condition that he might be permitted to retire at such time as the business was re-established on a satisfactory basis. When it is known that the General Motors Company was able to show a net earning of over 17 per cent. on the common stock during the past year, there can be little doubt that the task has been accomplished.

Under Mr. Neal's administration the company has concentrated its manufacturing operation at plants where large volume of production is possible. The result of this policy has been to make every plant an earner. The Cadillac, Buick, Oakland, Oldsmobile and Cartercar plants are all working to their fullest capacity to supply the trade which these well known cars have built up. All of the factories manufacturing accessories are enjoying similar prosperity, as well as the plant of the General Motors Truck Company at Pontiac, Mich., still another subsidiary.

To his many friends, Mr. Neal is best known as a man of domestic tastes, who derives his greatest pleasure from his home life, for the enjoyment of which the past two years have given him but little time. It will be a source of much gratification in the industry to learn that he is to retain his connection with the company and will serve in a definite and official capacity as chairman of the board of directors.

Thomas Neal, Retiring President, General Motors Company.

HEADS NATIONAL SALES FORCE.

J. M. Clarke Has Had Abundant Experience to Qualify Him for Position He Holds.

Few men connected with the automobile industry are called upon to play a more important part in the success of the company with which they are connected than the sales manager of a large factory. Of course it is essential that he should be backed by a good car, but the disposition of the product is strictly in his charge. J. M. Clarke is sales manager for the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars.

Mr. Clarke is eminently well qualified for his position, particularly as he has been connected with the industry since 1899, when he was associated with the Electric Vehicle Company, Hartford, Conn. He left that company in 1900 to spend the better part of two years with various factories in Europe. From 1902 to 1905 he was with the Pope Manufacturing Company, Hartford, Conn., and from 1906 to 1908 was connected with the retail sales business. He joined the National sales force in 1909. It will thus be seen that Mr. Clarke has had abundant experience both as a factory man and dealer, enabling him to keep in close touch with the sales organization.

J. M. Clarke, Sales Manager, National Motor Vehicle Company.

ADDING ANOTHER BUILDING.

Electric Auto Lite Company of Toledo Finds Imperative Need for More Room.

With the approach of 1913, the first year in which general complete equipment is the rule with automobile manufacturers, producers of accessories find themselves in urgent need of more factory space. The Electric Auto Light Company, Toledo, O., has found it necessary to erect an addition to its plant at 133-135 Michigan street, which will provide 40,000 square feet of floor space. The work already is under way and the concern expects to be installed in the new structure before the first of the year.

The Electric Auto Lite Company manufactures a new combined electric lighting and starting system for motor cars. The device, which will be included in the standard equipment of many machines for 1913 and 1914, is operated by a foot button in the floor of the car. The officers of the company are: President, Artemus W. Fisher; secretary and treasurer, Clement O. Miniger; manager, Sherman L. Kelly.

WILL MARKET NEW CAR.

King Company to Be Reorganized and Produce Model Designed by Bayerline.

Artemus Ward, the New York capitalist and member of the advertising firm of Ward & Gow, who recently purchased the plant of the King Motor Car Company, Detroit, will reorganize the concern on a more extensive scale. His son, Artemus Ward, Jr., will be connected with the new company. The reorganization will embrace some innovations and the concern will be a close corporation, limited to those now employed in the works.

The work of finishing all the stock of the King company will be carried out and a new car designed by J. G. Bayerline, who is general manager, will be placed on the market. Other officers of the proposed concern will be: President, J. G. Bayerline; superintendent, T. A. Bollinger; purchasing agent, J. B. Siegfried; factory foreman, J. Mohrhardt; sales manager, W. L. Daly; chief engineer, E. S. Chase. F. A. Vollbrecht will have charge of the accounting and George Gurney the service department.

NEW FORD POLICY.

Plan Evolved to Protect Dealers in Their Territories and Prevent Price Cutting.

In an effort to eliminate price cutting and to protect dealers in their respective territories, the Ford Motor Company is taking full advantage of its patent rights by affixing to every Ford car that leaves the factory a special restrictive patent license plate. This is mounted on the dash, just above the steering post, and after giving a list of the Ford patents, reads as follows:

"This Ford car is sold subject to restrictions as to price at which and territory within which it may be sold or delivered. Any violation of such restrictions makes the seller or user an infringer of said Ford patents and the title of this car reverts to the Ford Motor Company. The purchaser of this Ford car agrees at time of purchase to register his or her name, address, date of purchase and above car number with the Ford Motor Company at Detroit, Mich., U. S. A., as the owner of this automobile in order to be protected under the warranty of the manufacturer."

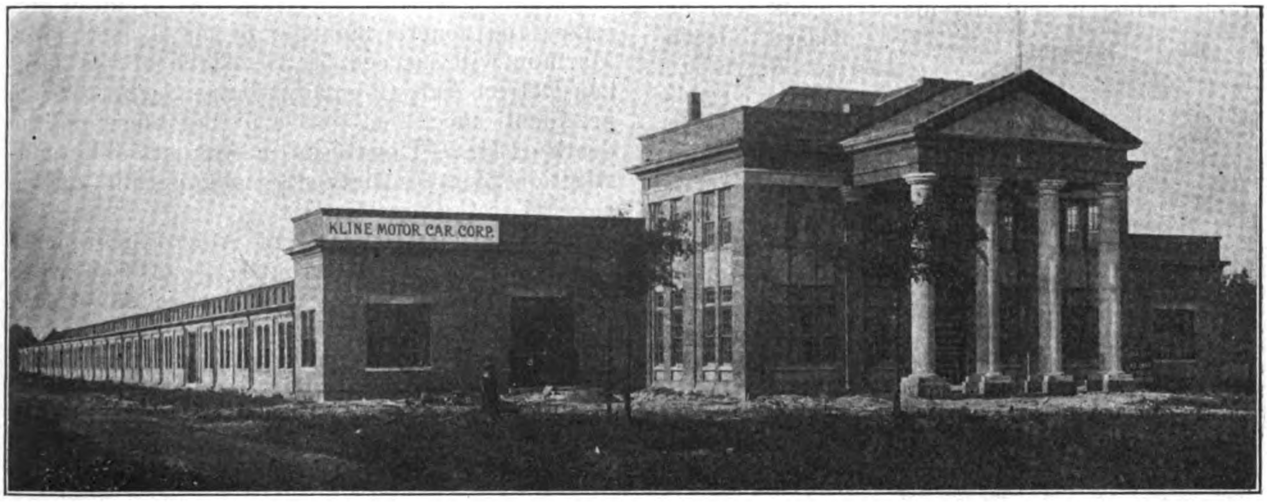
OPENS VIRGINIA PLANT.

Kline Motor Car Corporation Transfers Bulk of Its Business from York, Penn.

The new factory of the Kline Motor Car Corporation on a 15-acre tract in Richmond, Va., has been opened, and for the past month machinery and other factory equipment has been shipped from the old plant in York, Penn. It is not the intention of the company to abandon the York factory, but this will be maintained as a service station and sales branch.

The new building is shown in an accompanying illustration. It was erected at a cost of more than $100,000 and is fully equipped with all modern manufacturing facilities. About 750 men will be employed at first, but it is expected that the force will be augmented in the near future.

The factory is built in two parallel wings, connected at the end by a shorter wing, in front of which and joined to the rest of the plant is the 2.5-story office or administration building. Each of the main wings is 600 feet long and 60 feet wide. They are 1.5 stories in height, the upper portion being covered with a cone shaped roof, on either side of which are adjustable windows, operated from the factory floors by rods, thus affording excellent light and ventilation. The connecting structure between the two main wings is the same height and construction, and is 30 feet wide and 60 feet long. Within the court are the tracks of the Seaboard Air line, over which shipments will be made.



New Factory of the Kline Motor Car Corporation at Richmond, Va., Covering a Tract of 15 Acres.

The office building is of the Colonial type of architecture. Each floor is 30 feet wide and 60 feet long. Extending out from the eaves of the roof and supported by four white stone columns is a port cochere, covering a driveway which leads to the main entrance of the general offices. The officers of the corporation, the general manager and the purchasing agent will be located on the first floor, while the sales manager, advertising manager, engineer and other department heads will be on the second.

JOINS REMY ELECTRIC COMPANY.

Well Known Authority on Starting and Ignition Apparatus Becomes Consulting Engineer.

O. F. Conklin, for 16 years chief engineer of the Robbing & Myers Company, Springfield, O., and a well known authority on electric starting ignition systems, has become consulting engineer of the Remy Electric Company, Anderson, Ind., maker of Remy magnetos. It is understood that he will have charge of the design and construction of the new Remy electric starting device for application to automobile engines.

The Remy company also announces the appointment of P. E. Kempton of San Francisco as manager of the San Francisco Remy branch to succeed A. J. Rogers, who becomes manager of the New York branch in place of F. M. Henkel, resigned. W. F. Hamilton, formerly assistant manager of the Indianapolis branch, becomes assistant manager of the San Francisco branch and is succeeded at Indianapolis by A. H. Berndt, who has been connected with the sales department of the company for several months.

The concern is particularly busy, several large orders for 1913 equipment having been received for early delivery. One of these calls for a car load of Remy magnetos a week for the Willys-Overland Company, Toledo, O., maker of Overland cars.

ST. LOUIS TIRE FIRM.

New Concern Organized to Produce Equipment for Both Pleasure and Commercial Cars.

The St. Louis Tire & Rubber Company, with capital of $150,000, has been organized in St. Louis, Mo., for the production of tires for both pleasure and commercial vehicles. J. A. Swinehart, formerly associated with the Swinehart Tire & Rubber Company, Akron, O., has been active in the formation of the company, and this fact led to the original assumption that the Swinehart company was interested in the move. It is stated, however, that he has severed his connection with the Swinehart company and that the two concerns will have absolutely separate identity.

Among the St. Louis men associated with Mr. Swinehart are the following:

Nelson W. McLeod, Alfred C. Einstein, Morris Eisenstadt, Roy F. Britton, H. L. Parker, William H. Glasgow, C. C. Collins, William T. Jones, Eugene B. Stinde, Charles M. Skinner, H. C. Barker, H. L. Philo.

PEVEAR TO HAVE OWN AGENCY.

Well Known Advertising Man to Head New Concern Established in Rochester, N. Y.

Few men have enjoyed more success in the merchandising field than T. F. Pevear, who has just purchased the magazine business of the Myers Advertising Agency in Rochester, N. Y. Mr. Pevear is a young man well known in the automobile industry, and his many friends will be pleased to learn that he is to conduct his own agency in the future under the name of Pevear & Co.

T. F. Pevear, a Successful Advertising Man.

In 1905 he made his first appearance in the advertising field as an independent copy writer in Providence, R. I. In 1907 he took charge of the advertising department of the Shepard Company in that city and left Providence in 1909 to accept a similar position with the McCurdy & Norwell Company in Rochester. This department store experience proved particularly valuable to him when he decided to enter the agency field. In 1910 he joined the Myers agency, and his energy and keen insight into the various phases of advertising won him the promotion to become secretary the following year.

With his purchase of the old concern comes the announcement that he will devote his personal attention to the handling of campaigns involving wide publicity. A new suite of offices has been opened in the Cutler building, and associated with Mr. Pevear will be: Ralph H. Fulner, in charge of orders and estimates; Carl Raschen, art department, and F. A. Partenheimer, copy department.

ENGINEERS NOMINATE OFFICERS.

Howard Marmon Selected to Head National Society with Able List of Assistants.

Howard Marmon of Nordyke & Marmon Company, Indianapolis, Ind., maker of Marmon cars, has been nominated for the office of president of the Society of Automobile Engineers by the nominating committee. The officers of the society are elected by mail vote, the result of which will be announced at the annual meeting of the organization, which will take place in New York City in January. The nominees for the other offices follow:

Vice presidents, Russel Huff, Packard Motor Car Company, Detroit, and John C. Perrin, Lozier Motor Car Company, Detroit; treasurer, Herman F. Cuntz, Automobile Board of Trade, New York City; members of council, Eugene F. Russell, Locomobile Company of America, Bridgeport, Conn.; Harold L. Pope, Pope Manufacturing Company, Hartford, Conn., and Joseph A. Anglada. Coker F. Clarkson will remain secretary and general manager of the society. Mr. Marmon will succeed H. W. Alden of the Timken-Detroit Axle Company, Detroit, who, as vice president, succeeded to the higher office on the death of H. F. Donaldson in August. The constitution of the society does not permit of reelection to the presidency.

In addition to President Alden the officers who will retire are: Harold L. Pope, vice president; Herman F. Cuntz, treasurer; Henry May, Howard Marmon and Charles Ethan Davis, members of the council. The council members who hold over are: Charles B. Whittlesey, Hartford, Conn.; Arthur B. Cumner, Philadelphia, Penn.; Andrew L. Riker, Bridgeport, Conn.; Herman F. Cuntz, New York City; Howard E. Coffin, Detroit, Mich.; Henry Souther, Hartford, Conn.

WILL MAKE WALPOLE TIRES.

New Concern Organized to Take Over Business Formerly Conducted by Maine Corporation.

The Walpole Tire & Rubber Company has been incorporated under the laws of Massachusetts to acquire the good will, rights, property and assets of the Walpole Rubber Company, a Maine corporation. The capital of the new company is $4,500,000, of which $3,000,000 is 7 per cent. cumulative preferred stock and $1,500,000 common. The company will manufacture tires and all kinds of rubber goods at Walpole, Mass.

The preferred stock of the concern has no voting power and is retirable at the option of the directors at $120 a share and accrued dividends after five years from date of issue, in lots of $50,000 at a time. The incorporators of the corporation are: E. W. Tinkham, Harrisville, R. I.; A. T. Baldwin, Boston; F. J. Gleason, Walpole; E. C. Green, Boston; E. W. Furbush, Roxbury, Mass.; L. O. Dulcos, West Roxbury, Mass.; J. C. Blanchard, Jr., Boston.

TO PRODUCE KNIGHT MOTORS.

Stearns Company Has Acquired Rights to Manufacture These for the Trade.

Frank B. Stearns, president of the F. B. Stearns Company, Cleveland, O., which concern has been producing a Knight engined car for the past year or more, announces that the company is prepared to manufacture Knight engines for the trade. Under its agreement with Knight & Kilbourne, this right is understood to have been conferred upon the Stearns Company, and plans for putting it into force are said to have been under way for the past six months.

Recent factory additions have enabled the concern to make the present announcement, and it is stated that a number of car manufacturers have made arrangements for the Stearns company to supply them with motors. It is not known what effect this may have upon the future plans of the Lyons-Atlas Company, which recently purchased the business of the Atlas Engine Works, Indianapolis, Ind., formerly engaged in manufacturing Knight motors for the trade.

WILL MAKE SPECIAL WHEELS.

Cincinnati Concern Purchases Plant and Will Begin Operations in Near Future.

The Ideal Steel Wheel Company, Cincinnati, O., recently incorporated with a capital of about $500,000, has purchased the plant of the Seufferle Cooperage Company, on Spring Grove avenue, that city, paying, it is said, $41,000 cash for the property. The corporation, formed under the direction of the Kirgan-Parker Company, Cincinnati, will introduce a new method of utilizing the solid automobile tire, made possible through the manner in which the wheel is constructed.

The property just acquired, according to President J. B. Fitch of the company, will be enlarged at an early date. The main building is 200 by 226 feet, and there are several minor structures. As these are strongly built they will be utilized and connected with a large addition. Others interested in the company besides President Fitch are: Vice president, J. E. Strietelmeier, who is also the inventor; treasurer, E. H. Maffey; general manager, Harrie E. Walker.

CONCERN CHANGES HANDS.

E. E. Warner Retires from Milwaukee Motor Company but Will Act in Advisory Capacity.

The controlling interest and management of the Milwaukee Motor Company, Milwaukee, Wis., maker of automobile motors, have changed hands. E. E. Warner, for nine years president of the concern and owner of a majority of its stock, and C. F. Kaiser, secretary and treasurer, having sold their interests to retire. J. C. Coerper of Coerper Bros. Lumber Company, has become president; August John, vice president and general manager, and Henry John, secretary and treasurer of the reorganized company. J. D. Bowes, formerly vice president, still remains with the company as director, while Mr. Warner will for a time act in an advisory capacity.

The history of the Milwaukee Motor Company is one of prosperity. Organized by Edgar E. Warner nine years ago, it was capitalized at $10,000 and employed but a few workmen. Today it employs 350 and has under construction additions to the factory costing $78,000 which, when completed, will give employment to 500 skilled workmen. This increase was made necessary by the constantly increasing business. From the small beginning, Mr. Warner, by capable business methods, built up the concern until its present inventory is more than $400,000.

IS NEW FEDERAL EXECUTIVE.

Garvin Denby Appointed Secretary and Treasurer with Charge of Sales Department.

Garvin Denby, Treasurer, Federal Motor Truck Company.

Garvin Denby, prominent in business circles in Detroit and the East, has been added to the executive staff of the Federal Motor Truck Company, Detroit, maker of Federal trucks, his position being secretary and treasurer with general charge over the sales department. Mr. Denby is a salesman of proven ability and has achieved success in many past undertakings. His business career began in 1897 when he started with the Gilbert Wilkes Company of Detroit, in the electrical and mechanical engineering department. He passed two very successful years with this concern until the spring of 1899, when he was appointed attache of the first Philippine commission under Chairman Schurman, spending a year in the Insular possessions.

Mr. Denby left the government service in 1900, joining the forces of the Solvay Process Company of Detroit. He was appointed assistant in the soda ash department, where he was successful, being transferred in 1907 to the head offices at Syracuse, N. Y. His past excellent record resulted in his appointment as assistant to the president, which position he occupied until going with the Federal Motor Truck Company.

THE ACCESSORY -AND- GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. NOVEMBER, 1912. NO. 7.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building Pawtucket, R. I.
Publisher of
THE AUTOMOBILE JOURNAL THE MOTOR TRUCK
William H. Black, Treasurer. D. O. Black, Jr., Secretary.

EDITORIAL DEPARTMENT:
WILLIAM W. SCOTT. CARL A. FRENCH.
C. P. SHATTUCK.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 West 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4707 Magnolia Avenue.
BOSTON—John W. Queen, 6 Beacon Street.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Entered as second class matter Dec. 30, 1911, at the postoffice at Pawtucket, R. I., under the Act of March 3. 1879.

FORD ON UNIFORM LEGISLATION.

Henry Ford, head of the Ford Motor Company, Detroit, in discussing the question of uniform motoring laws, sets forth his opinion as follows:

"If each state would but enact automobile laws regulating the speed at which the cars may be driven and then prohibit any secondary legislation by small towns or cities, the problem would be solved. A motorist would then be able to familiarize himself with the law, and would be able to meet its requirements if he desired. If he did not, then every owner of a car should be interested in getting the violator punished.

"When the townspeople see it no longer possible to harass the motorist by unfair laws and are assured that automobile owners in general are endeavoring to enforce the laws, then motorists will no longer drive many miles to avoid buying anything in the town, and the town in turn will make the motorist welcome."

A BRITISH WRITER'S VIEW.

Lord Montagu, editor of the Car, a British motoring print, who recently paid a visit to America, writes as follows in a recent issue of his magazine:

"In the United States there is at least one serious inconvenience to motorists which should be removed before long. Every state, and there are 48 of them, makes its own laws under which motor cars are run, issues its own orders as to speed limits and has a different system of regulations. In every state there is a speed limit, sometimes the same as and sometimes different from its neighboring states. Needless to add, everywhere in America, as elsewhere all over the world, these speed limits are habitually disregarded, because they cannot be enforced."

LICENSING OPERATORS.

There is abundant evidence that the legislatures of several of the states are to be called upon at their forthcoming sittings to take up the matter of licensing and examining operators of motor cars. It will appear from the accompanying table that very few commonwealths at present require anything in the nature of an examination from those who seek to drive as chauffeurs, and in most states the ownership of an automobile is held to be sufficient qualification for operation. Several seek to put an age limitation upon the driver. The whole situation is set forth in the table.

Irrespective of the demand for better regulation in this respect, motorists will do well to interest themselves in the bills which shall be presented for consideration. Organized motorists have been endeavoring to secure uniform motoring laws, and it would appear that there is ample opportunity to bring about such action in connection with this situation. If more stringent laws are to be passed, there is no reason why the several states cannot reach a common ground upon which to base their provisions. It may result in a readjustment of other sections looking toward a proper uniformity, if the matter is given sufficient attention at this time.

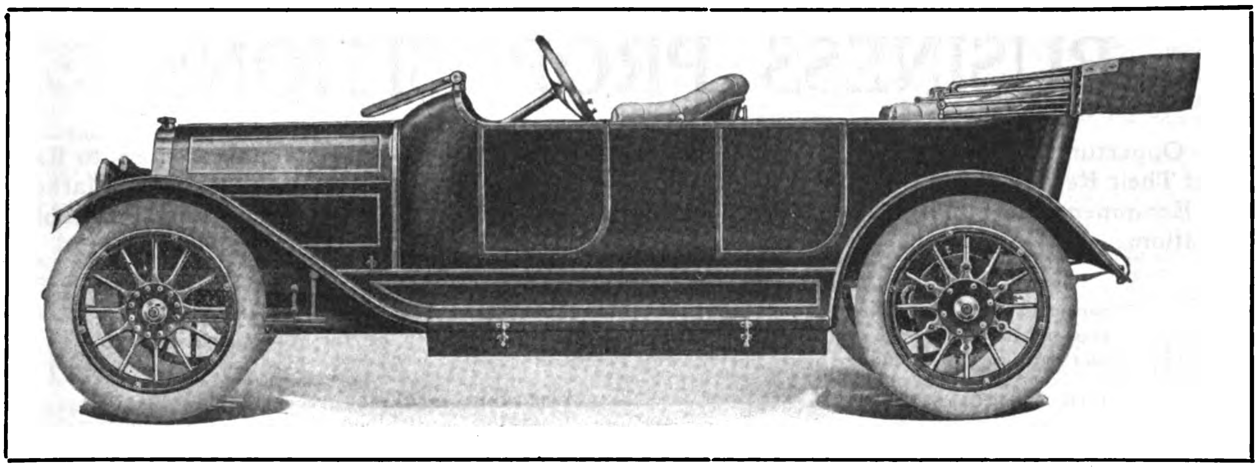
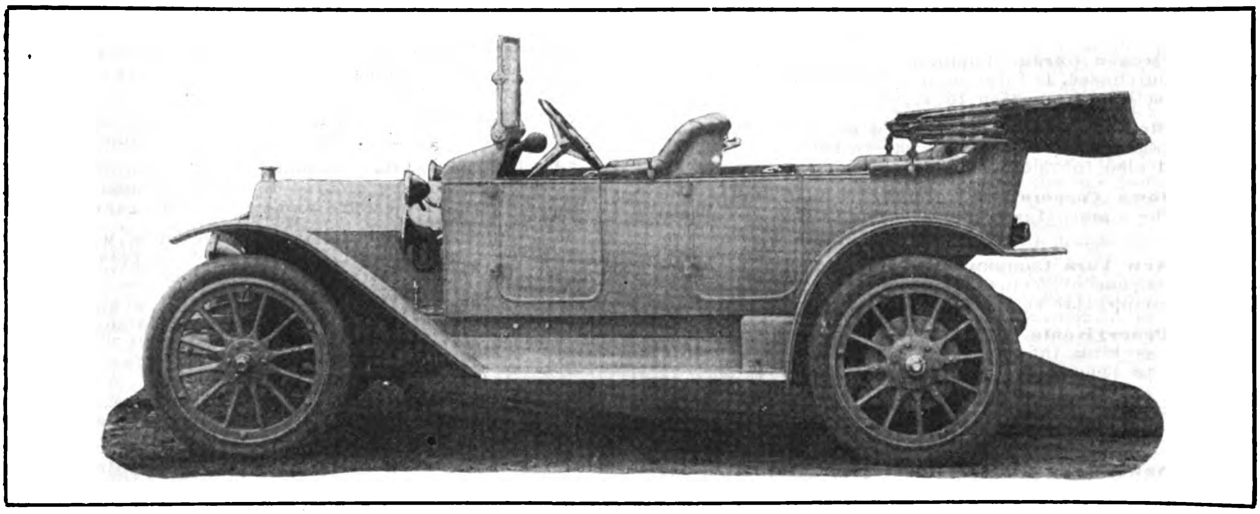
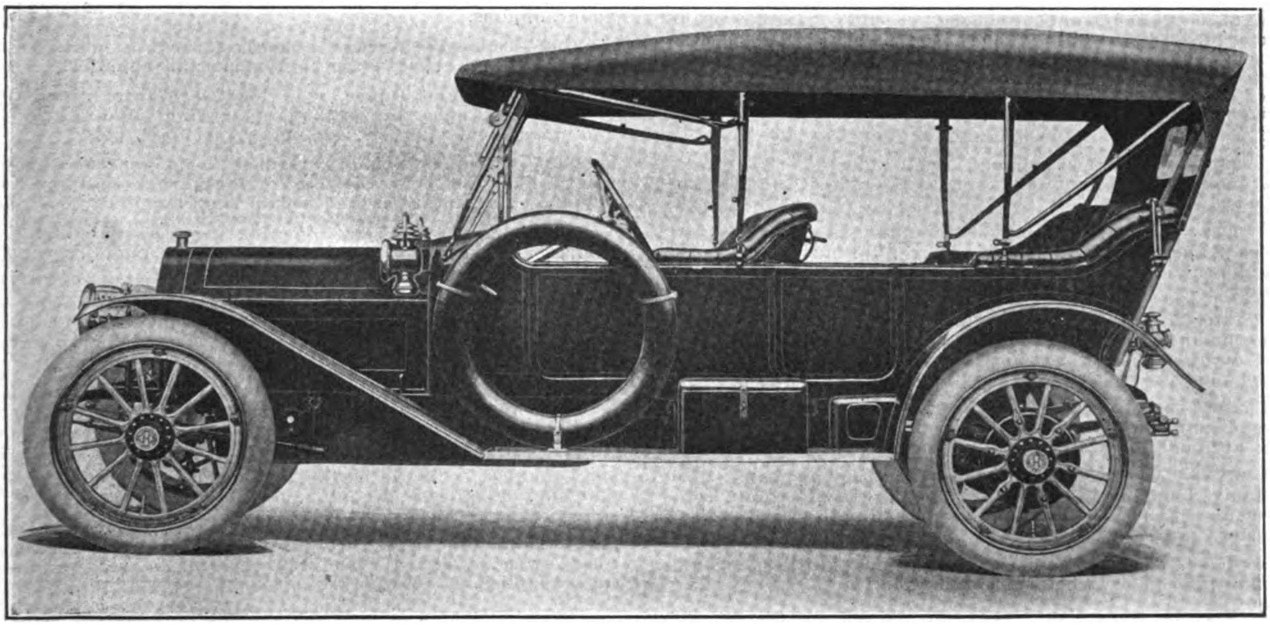
ATTRACTIVE NEW LINES FOR DEALERS.



Michigan "Forty," Made by the Michigan Motor Car Company, Kalamazoo, Mich.—Price, $1585, Including Equipment.



Lenox Four-Cylinder, 40-Horsepower, Made by the Lenox Motor Car Company, Boston, Mass.—Price, $2000, Fully Equipped.



Herreshoff Six-Cylinder, 36-Horsepower, Made by the Herreshoff Motor Company, Detroit, Mich.—Price, $1850, Fully Equipped.

TRADE INFORMATION EXCHANGE
BUSINESS PROPOSITIONS.

Opportunities Are Offered Below for Agents to Secure New Lines, for Manufacturers to Extend Their Representation, and for Producers to Get in Touch with Those Who Are in the Market for Equipment and Supplies. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without Names, Those Interested Desiring the Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding.

CAR AGENCIES DESIRED.

3243—New York Dealer desires the agency for motor trucks selling from $800 to $1500, gasoline or electric.

4267—Missouri Concern, recently formed, desires the agency for pleasure cars listing from $500 to $2000.

2385—Maryland House, just incorporated, will consider the agency for a line of pleasure cars listing from $1500 to $3500 and commercial vehicles from $1000 to $2500.

2001—Oregon Garage Company, enlarging a business recently purchased, is interested in the agency for pleasure cars selling from $800 to $1200.

2042—Montana Firm, located on a navigable lake, desires the agency for a pleasure car to sell from $700 to $2000, and also for motor boats.

6787—Iowa Corporation, recently formed, is in the field for the agency for a pleasure car selling from $800 to $2500.

6964—New York Company, now building larger quarters, is desirous of securing the agency for both pleasure and commercial vehicles at standard prices.

7677—Pennsylvania Firm, with new building completed, is seeking the agency for pleasure cars listing from $500 to $3000.

6056—California Concern, already handling standard trucks, is anxious to secure the representation of other lines of commercial vehicles to sell from $1500 to $5000.

6707—New Jersey Garage, building large addition to its plant, wants agencies for pleasure cars listing from $750 to $1400 and seven-passenger cars selling at $2000; also motor trucks listing from $750 to $1500.

6747—Minnesota Garage, which has changed hands, desires the agency for pleasure cars selling for $2500 and less.

6721—Pennsylvania Concern, recently established in new quarters, wants agency for pleasure cars listing from $500 to $2000.

ACCESSORY AGENCIES.

2674—Missouri Company, well located, will take agency for automobile supplies, equipment and accessories.

3852—Maryland Firm, engaged in accessory specialties trade, will take agencies for all kinds of pleasure and commercial vehicle accessories, equipment and supplies.

2679—Tennessee Concern, new corporation just starting business in new building, is desirous of securing lines of accessories and supplies of all kinds for commercial and pleasure vehicles.

2268—Michigan House, recently changed hands and undergoing extensive enlargement of scope, is interested in automobile accessories and supplies for the trade.

9768—New York Company, which has opened a new supply department for the automobile trade, would represent a general line of automobile supplies and accessories.

8160—Georgia Garage, doing a good business, would take agency for accessories and supplies.

8260—Montana Concern, occupying a new building for general automobile business, would like to secure agency for automobile supplies and accessories and commercial vehicle supplies.

7465—Indiana Garage, recently changed management, is interested in all kinds of pleasure and commercial vehicle supplies and accessories.

9664—New York Concern, about to build new, modern garage in tourist section, would take the agencies for supplies and accessories of all kinds for pleasure and commercial vehicles to supplement its good line of cars.

3019—Iowa Garage, just moved into new quarters and handling three lines of cars, is desirous of handling various kinds of supplies.

5601—California House, planning the erection of large garage establishment, is interested in accessories, supplies and equipment for power wagons.

7076—New Jersey Concern is seeking the agency for all kinds of supplies and accessories for automobiles.

7216—Pennsylvania Company, which has established new quarters, can be secured to handle accessories and supplies for both pleasure and commercial cars.

4677—Minnesota House, in good location, would like agency for a complete line of automobile accessories and for gasoline, oils, tires and other supplies.

6764—Kentucky Dealer, now handling a high grade pleasure car, is interested in accessories and supplies for pleasure cars and trucks.

EQUIPMENT NEEDED.

2680—Montana Company, which has just purchased a building to be remodelled into a general repair shop, is in the market for complete line of garage and repair shop equipment and supplies.

1608—Georgia Concern, about to enlarge its quarters, is interested in garage equipment of all kinds.

3645—Michigan Company, under new management and extending its business, is seeking a line of repair shop supplies.

2796—Tennessee Garage, recently formed, is interested in garage and repair shop equipment and supplies.

6828—Maryland House, well located, wants information of all kinds concerning repair shop and garage equipment and supplies, including machine tools.

4861—Missouri Company, formed to do general automobile business, is in the market for garage equipment, supplies, machine tools and repair shop supplies.

4766—Kentucky Firm, opening new establishment, desires information concerning garage supplies and equipment.

4785—Minnesota Concern, conducting an up-to-date business and handling two lines of pleasure cars, is desirous of securing equipment for garage, repair shop and salesroom to complete changes being made.

8573—Pennsylvania Company, in new quarters, wants machine tools, repair shop and garage equipment and supplies.

9211—Michigan Firm, which is to build a brick and steel factory, is in the market for machine tools and repair shop supplies and equipment of all kinds.

7584—New Jersey Garage, building addition to its plant, is in the market to purchase lathe, drill press, forge, grinder, etc., for running repairs, as well as garage supplies.

1105—California Concern, establishing business on a large scale and handling several lines of commercial vehicles, is seeking good supplies and equipment for garage and repair shop. Machine tools are needed.

7777—Pennsilvania House is in the market for equipment and supplies for its recently completed garage.

3911—Iowa Garage, recently moved into new building, is interested in garage and repair shop supplies.

7463—New York Company, which has purchased a site for a modern garage building, is in the market for all kinds of supplies and equipment for repair shop and garage.

6745—Indiana Firm, under new management, is seeking all kinds of first class garage and machine shop supplies and equipment.

6963—California Concern, actively engaged in the transportation of merchandise and freight, is in the market for power wagon equipment and supplies in general, also garage and repair shop equipment and supplies, including machine tools and mechanical equipment.

SPECIAL OPPORTUNITIES.

1425—New York Man is seeking information relative to concerns selling automobiles and accessories in Denver, Col., in which place he would like to locate as an agent for a good line that has a future in the trade.

3267—California Manufacturer, putting on the market a truck of undoubted quality, requires representatives of ability, particularly in the western part of the country.

4763—Massachusetts Concern is in the market for motor trucks and desires catalogues and information relative to gasoline and electric machines selling from $700 to $1200.

6734—Missouri House about to engage in taxicab business, desires full information concerning taximeters.

WHY PATENT PROTECTION BENEFITS EVERYONE.*

By Arthur P. Abbott.

In view of adverse criticism of the late decision of our courts regarding patent monopoly, it would appear that a defense of patent monopoly would be most unpopular. Yet it is a very rare occasion when any question does not have more than one side. And it is ignorance of the merits of the other side which frequently renders such questions unpopular. It is for this reason that educational campaigns on questions affecting a large number of people are most beneficial to all parties concerned.

In lines of trade requiring the selling of more or less patented merchandise, it is exceedingly important that dealers prepare themselves to meet the criticism offered by the consumer as to prices which patented articles frequently demand. And it is in hope of rendering the dealer assistance in such preparation that this article has been prepared.

The wisdom of Abraham Lincoln is best shown by his habit of soliciting opinions of parties having different viewpoints before forming one of his own. So in discussing this subject, which so seriously affects all classes, we shall not only present the views of those on the side of monopoly, but shall show, by a striking illustration, the validity of their claims.

As the careful analysis of any matter is important that it may be thoroughly understood, let us first trace the steps necessary to place any patented article in the hands of the consumer.

First is the inventor. The idea may have come to him in a flash, it may have been the outcome of accident or, as is more often the case, it is the fruit of years of brain-racking study, self-denial and expenditure of money, if not the dethronement of reason itself.

The second step is the appeal to our government to protect the rights of the inventor so that he may enjoy the fruits of his endeavor. In many instances this is the easiest step in the whole process. But in a large number of cases he finds that others have already appeared with the same or similar ideas, and unless he has funds, friends or an article of exceptional merit, his way is barred and all his labors go unrewarded.

But in looking at the matter in the most rosy light possible, if the invention has exceptional merit, he has only invited attacks from all sides. From those with capital who would, through infringement, if not absolute disregard of his so-called patent protection, proceed to place on the market the same or similar device. From other inventors who, discovering some loophole in his claims, devise some improvement which must be taken care of by purchase or royalty before the article can be properly placed on the market. And lastly, by the government itself, which by its lax methods, rulings and still more imperfect laws, gives him a license which is worse than useless as it leads him to believe he has protection which he has not.

It is not difficult to get "claims" allowed on most any device, and many "patent attorneys," after receiving a fee, which in many cases is contingent on a patent being granted, will use their knowledge of the lax conditions to put some claim by the examiners which, while it spells patent, does in no sense give protection.

No progressive, successful manufacturer today will accept patent papers from Washington at their face value. They require most careful search to be made to determine, not whether the article is patented, but how great will be the legal battle necessary to make the patent valuable.

The patent settled, so far as it can be before actual warfare is declared, the next step is to reduce the article to a marketable basis. While in this stage years are often consumed and frequently other patents are found necessary before the article can be successfully launched on the turbulent sea of commerce. More skill, more brains and a thousand times more money are required than in all the previous stages.

Some manufacturers, in their haste to reach returns, place articles on the market in imperfect condition with the result that the goods prove unsatisfactory to the consumer, unprofitable and annoying to the dealer and disastrous to the manufacturer. So those of most experience, prefer to test in the secret crucible of experiment till the dross has been extracted to the minimum.

When this has been accomplished, it would seem to the layman that the way is fully opened to successful and easy marketing. But on the contrary the real battle has scarcely begun. The public knows nothing of the device, does not feel especial need of its use, and if the price be above other articles on the market which, in an inferior manner, answer a like purpose, will be very slow in accepting.

For example: How many of us cling to the old hair pulling, skin slicing razor of our great grandfathers when a serviceable "safety" with automatic stropping ability is available? And all because we have not been induced to try or properly educated to use. In fact anything new is quite likely to meet with very cold reception from the general public before its merits have been demonstrated and properly exploited. So here comes the necessity of a long, costly campaign of education termed advertising. Fortunes are sunk in laying the foundation and in maintaining interest sufficient to reach a profit-producing stage.

"Surely now," says the layman, "you can sit back, put your feet on your solid mahogany desk, smoke your good cigars and watch your bank account grow." Not much. The battle is now on in earnest. The infringers are successfully battering down your defenses and must be repulsed. Grasping, dishonest dealers are cutting prices so as to dissipate not only their own profits, but the profits of legitimate and reputable dealers. Competitors are busy with schemes to get hold of your goods, where they have been defeated in producing them, that they may undermine profits and disorganize sales efficiency which has cost so much to build up. Then something new comes out and that which has cost you so much money and effort has, in a day, become a back number.

All this is not imagination or the dream of a pessimist. It is but the enumeration of some of the difficulties which beset nearly every article of great merit as all manufacturers of such can readily testify.

While all this trouble, expense and study may not interest the dealer and consumer, it does put us behind the scenes and show us first, that while the inventor is an important factor, he has only a small part in the production of the finished article. And secondly, that the dealer must depend largely on the manufacturer for protection in his efforts to market at profitable prices and in the education of the public to purchase. That if the manufacturer be negligent in his duties, the merchant will lose in profits. That the consumer, through ignorance of the merit of the article, will deprive himself of the blessings which inventive genius backed up by manufacturing ability does bestow.

Most of us are prone to look upon patented articles as a protected monopoly which force us to pay exorbitant prices above the actual cost of manufacture. We, as free-born American citizens, resent this and criticise the merchant who sells and the manufacturer who produces. We are ignorant of the great cost at which the article has been produced and placed in our hands that we might reap the benefits from those things which make living easier and life more secure. We are ignorant of commercial conditions which compel restric-

---

(Copyrighted by Author.)

tive selling methods that inventive talent may be encouraged and that legitimate dividends may accrue to those who have invested vast sums in its production and to those who have employed their capital in stocking and selling.

The results which would accrue from an attempt to market any new article of great merit, without patent monopoly, would not only be disastrous to the manufacturer, but the dealer as well. It would be like conducting a mercantile establishment without system or without the power to enforce system. A manufacturer who is unable to or who is neglectful in protecting by restrictions his product, is placed in the same position as the public official who is powerless or lax in the enforcement of the law. And those who obey the law are placed at a disadvantage to those who disobey. It is this phase of the question which has prompted our courts to rule favorably to those possessing valuable patented articles. There are good laws which at times work hardships on certain classes, but that all may be benefited in the greatest measure, their enactment and enforcement is necessary and just.

The right to control traffic, the right of society to protect itself against those things which tend to injure it are well recognized rights. So the right of those, possessing articles which tend to promote the public welfare, to regulate their sale that the article itself may be kept up to standard and that a proper educational campaign may be successfully and profitably carried on, should be as freely recognized. And this right should be restricted only where it can be shown that the consumer is being deprived of necessities on account of restrictions which make such articles prohibitive to certain classes. But so long as all classes are offered the article at a price in keeping with its value, and on terms which promote the best interests of the trade as a whole, any restrictions placed on their sale are not only legitimate but work for the common good.

Instances to illustrate the validity of these thoughts are so numerous that to use them would be to write the history of all manufacturers of valuable patented articles. So we will select from the number one which fully illustrates all phases of the subject.

The Weed Chain Tire Grip Company of New York City, some years ago purchased a patent on a device for preventing automobile wheels from skidding. After perfecting this invention, it discovered another patent which, in a manner, made its patent an infringement. It became necessary to purchase the other patent in order that it might produce an article on which it could offer valid protection to the dealer and consumer.

After spending large sums of money perfecting the device and preparing machinery to manufacture it, it began offering its goods to the public. It was something new and something which was to be used on an article which was, in a manner, in the pioneer stage—an automobile. Owing to the failure of previous devices to fill the need, the public was skeptical as to the efficiency of this device. So there was but one thing to be done and that was to begin an expensive campaign of education calling for not only thousands but hundreds of thousands of dollars. Advertising experts, costly pages of magazines, the product of skilled artists and the most painstaking and matured judgment of campaign managers, all demanding vast sums to successfully accomplish the end, namely to convince the public that the device was not only not in a class with others, but was effective and positive in its results.

As automobiles became more common, accidents from skidding tires began to multiply. Lives of not only users of cars but of the "innocent bystanders" were being sacrificed and all because of neglect to use what was already available, an efficient, simple and comparatively inexpensive device.

Municipalities began to take notice and lead the way by adopting them to publicly owned and operated cars. Gradually the far-reaching advertising and educative campaign began to show results. Weed chains began to sell not only by dozens, but by carloads. The public began waking up to not only the need but the efficiency of this device.

Then began the battle with infringers, cut price dealers and others, who by some device or other tried to evade the patented rights of the Weed company. And as expensive as was the advertising campaign it was carrying on, the patent warfare which followed far overreached it. Patent experts, costly and talented attorneys, detectives, witnesses who often were transported from long distances at the company's expense, all consumed money with appalling rapidity.

But they have finally fought their way through the courts and have at last won a complete victory. However, the battle is not ended by any means. Their guarantee of protection to the dealer calls for constant vigilance and sales restrictions which may seem to some to be unjust. But their guarantee of protection means just what it says and only so because of the careful restrictions which they have placed around their sales, the constant watchfulness they maintain on sale of infringing goods, the prohibition of price cutting, and the promptness with which they bring offenders to account.

The result is that while they have established a monopoly backed by a basic patent which has been thoroughly tried out in the courts on an article of merit and necessity, they have lowered their prices to the public as fast as consistent with reasonable profits. Not only this, but they have, by their sales restrictions, made it possible for dealers to handle an article with established demand and ready sale at a remunerative profit. There is no haggling of price as each package contains retail prices in printed form.

As we have before stated, this is only one illustration, but it is an example of what hundreds of other manufacturers are doing to establish better trade conditions and to serve the public with commodities which make for better living and the safeguarding of human lives and property.

When dealers and consumers become acquainted with this policy and appreciate the costly struggles that are made to protect and place on the market patented articles of public necessity at fair prices, all criticism will cease, and as soon as our government appreciates the necessity of making its patent licenses more protective, the consuming public will pay less for both necessities and luxuries and trade restrictions instituted by manufacturers will become less severe.

DEMAND UNIVERSAL LIGHTING.

At a recent meeting of the Sacramento Automobile Dealers' Association, Sacramento, Cal., a request was forwarded to the city commissioners and the county supervisors, asking for the enactment of a regulation requiring lights on all vehicles using the public streets and highways during the night season. This is in line with the activity manifested all over California, and it is probable that the matter will be taken to the legislature at its next sitting.

The Automobile Club of Southern California, in Los Angeles, already has taken the initial step in the latter move, and has requested the motorists throughout the state to aid it in bringing about a successful result to the campaign. The proposed law will call for one or more lights on all horse drawn vehicles, and if but one is to be carried, the placing of this on the left side, so as to determine the position of the vehicle at all times.

REGULATING PEDESTRIAN TRAFFIC.

While it has generally been admitted as a legal axiom that the pedestrian has the first right on the highways, and practically all attempts at regulating traffic have been made with this view in mind, there has been a growing feeling among motorists for some time that they were being called upon to assume a larger proportion of the responsibility along this line than was necessary in the proper safeguarding of the public. It is of interest in this connection to note that the cities of Europe are taking a new view of the matter.

According to the reports from abroad, London is taking steps to convince pedestrians that while they may have first right to the road, they do not have the sole right to it. Vienna appears to have taken a still more advanced step, the regulations compelling those on foot to keep to the sidewalk until they come to regular crossings. Violations exactly as in the case of vehicles which fail to observe the precautions assigned to them.

Mechanical Pointers for Garagemen and Repairmen

TIRE VALVE TROUBLES.

One of the simplest devices, and one with which all motorists have more or less unpleasant experience, is the tire valve. At Fig. 1 is shown a longitudinal section of a Schrader stem, which is used universally with its components clearly defined.

It consists of a tube-like section of brass, the outside upper end of which is threaded to take a cap, which is not shown. It will be noted that the inside is recessed to form a shoulder upon which rests the valve stem guide. Below this is an air passage leading directly into the inner tube. Another projection is fitted to form a seat for the rubber packing. Adjustment of the latter is obtained by utilizing the slotted end of the dust cap which fits the nib shown at the top in the drawing.

A threaded section screwing into the stem permits the raising or lowering of this part which is hollow, to allow the plunger rod to move freely. A cup shaped piece of metal, which is recessed to take the packing, fits into the threaded section and both of these move freely. This permits of the expansion of the rubber on its seat by screwing down the top member which rotates in the operation. These parts when in position, form a bearing for the plunger.

Midway in the centre of the latter is fastened a piece of metal which is slightly recessed, and to this is attached one end of a fine brass spring, at the other end of which is locked the guide. The latter is held on its seat by the compression of the spring through which the plunger slides.

Action of the Device.

In the sketch at the left is shown the components assembled in the stem and it will be noted that the valve is on its seat and the air vent closed. The spring is not fully compressed as the rubber packing is not screwed down to its normal position. Under such circumstances air would escape past the packing. In the drawing at the right is depicted the part in its proper place. The rubber has been expanded until it fills the recessed section. The plunger has been depressed, contracting the spring, and at the same time the valve has been forced away from its seat, and air is flowing up and outwards through the vent shown in the illustration.

The action of the device is automatic. When a tire is being inflated, the pump pressure being greater than that of the inner tube, the in-rushing air comes in contact with the valve, forcing that member downward, and passes on into the tube. When this energy ceases the compressed air in the tube forces the valve upward on its seat. This operation takes place on each stroke of the pump. As the volume of air increases in the inner tube more energy is required to open the valve and when that developed by the pump is not greater, difficulty is experienced in inflation.

How Air Escapes.

There are several causes for the escape of air, the most annoying of which is what is termed by motorists as a slow leak. It is almost imperceptible and the tire will not show its effect for several hours. It may be caused by the rubber packing being torn through careless adjustment, which frequently happens, or an imperfect seat of the member. Foreign elements may be present on the valve seat or the latter damaged.

Then again, the spring may stick preventing the valve from closing, but this seldom happens. Still another cause of trouble is cross threading the adjusting section as threads are small and destroyed easily. If a valve be suspected of leaking it can be tested by immersing the stem in water and escape of air will be noted by bubbles. Sometimes a leak may be cured by depressing the plunger several times which will tend to remove any dirt that may be on the seat.

It is a good plan to clean the valve stem and this may be done by removing the valve and inflating the tube, as the out-rushing air will have a tendency to remove foreign elements. Stems should be protected by utilizing the valve and dust cap which not only save the working parts but the inner tube as well. A valve tool should be included in the tire equipment. This instrument will recut both the inside and outside threads of the stem, smooth off the end and will facilitate the removal of stubborn valves. The device is inexpensive and will more than pay for itself in the event of trouble.

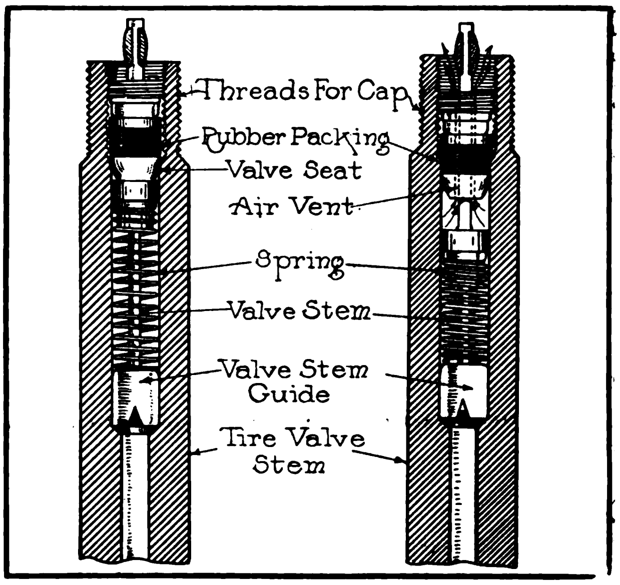


Fig. 1—Longitudinal Section of Valve Stems, Depicting Components.

CARE OF WIRES.

The average motorist does not give any attention to the wires of his car and these important members of the ignition system are frequently the cause of trouble. Some motors and transmissions leak oil and grease and the wires become coated with lubricant and dirt. Oil is fatal to the insulation and in time a puzzling skip may develop in the secondary system. Where wires are exposed to oils they should be cleaned with gasoline and wiped dry, especially the secondary. The rubber terminals attached to the magneto also should be kept clean, as any foreign substance at these points might occasion trouble.

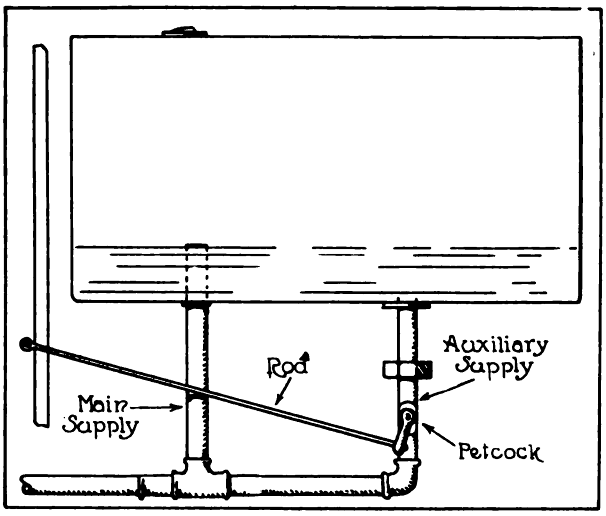

Fig. 2—Simple Method of Converting a Fuel Tank Into an Auxiliary Member.

BALL AND SOCKET JOINTS.

Ball and socket joints are utilized on many cars in the carburetion and ignition systems. These are seldom lubricated and as considerable wear takes place, there is more or less lost motion. Sometimes they become so worn that the ball drops out of the socket. When this happens on the road and an extra part is not available, the member may be repaired by removing it from the control rod and peining over the shell like part of the socket. This will enable the motorist to reach home, after which a new one should be fitted. Those on the commutator should receive attention from time to time as should any come apart, the timer is apt to advance and when cranking the car the operator is liable to be injured by a backfire.

AUXILIARY FUEL DEVICE.

Although the majority of the new cars are fitted with auxiliary fuel tanks, many machines are not so equipped. Such containers are built into the regular member and so arranged that the fluid is prevented from flowing into the main line by some form of shut-off valve. When the latter is opened the auxiliary gasoline runs through the regular channels to the carburetor.

The object of the reserve tank is to provide the motorist with fuel when the main supply has become exhausted. The operator who has not become stalled for lack of fuel is the exception rather than the rule, and often he is stranded some distance from a source of supply. Then again, many automobilists assume they have enough fuel and do not examine the tank.

At Fig. 2 is presented a simple method of converting the regular fuel container into an auxiliary member and the work is not difficult or costly. It can be performed by anyone familiar with the use of the soldering iron and possessing a slight knowledge of fitting brass piping connections.

It will be noted that the usual supply pipe leading from the tank is utilized for the auxiliary line and that a petcock is incorporated therein. To the lever of the petcock is attached a rod which leads to and through the seat partition, and which is fitted with a ring handle. In the sketch the petcock is depicted closed and when the auxiliary fuel is desired, the handle is pulled out, which opens the valve.

The regular supply of gasoline is obtained through a pipe which is cut into the main line and extended upward into the regular vessel. The height of the tubing will depend upon the capacity of the fuel container and the supply of auxiliary fuel desired. This may be determined by measuring the tank in the usual manner.

When the tank is filled with gasoline, the fuel will flow until the level of the standpipe is reached. The motor will then stop, denoting to the operator that the main supply has become exhausted. The rod leading to the petcock is then pulled forward, an operation that may be performed without the driver leaving the seat, and the reserve fuel is brought into service.

In fitting the standpipe to the tank care should be exercised in soldering because of the danger of the the gasoline vaporizing. Any plumber will fit the part needed and if one be not familiar with soldering, it would be best to have the work done by an expert. A shut-off valve may be incorporated in the pipe and located near the carburetor, which is decidedly more convenient than crawling underneath the machine to reach the usual member.

FRAME BRACING DEVICE.

Broken or sprung frames are not uncommon and many times these members being out of alignment are responsible for other mechanical troubles, among which may be named that of a leaking radiator, when the fracture is near the latter. There are several ways of repairing a frame, the methods varying according to the location of the break.

An instance of an effectual repair was noted by the writer recently. The frame was cracked near the goose necks and the workman fitted plates, riveting these members securely. As a severe strain was imposed upon the part, owing to the service performed by the car, a brace was employed as outlined at Fig. 3.

A .625-inch hole was drilled in each side member, these being directly opposite and on a line with each other. Two pieces of cold rolled steel, .625 inch in diameter, were threaded at each end, and a turnbuckle made as illustrated in the drawing. Each rod was fitted with two nuts, these being for the purpose of locking.

One of the rods was threaded into the turnbuckle and a nut screwed up after which it was inserted in the opening of the frame. The other rod was fitted with a nut and screwed into the turnbuckle. The nuts on either side of the frame were then locked and by means of the turnbuckle the tension adjusted.

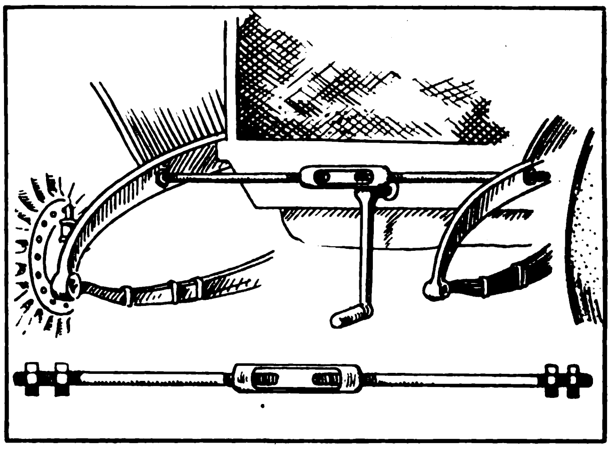

Fig. 3—Method of Bracing Securely Cracked Frame of Motor Car.

ADJUSTABLE SWINGING CRANE.

Many small shops are not equipped with any form of a hoisting device for lifting the motor or heavy parts from the chassis when overhauling the automobile. Under such conditions the general practise is to strip the engine, part by part, until but the crankshaft and flywheel remain for removal. In some garages but one repairman is retained during the quiet months of the winter and frequently he has to call for assistance in disassembling the car.

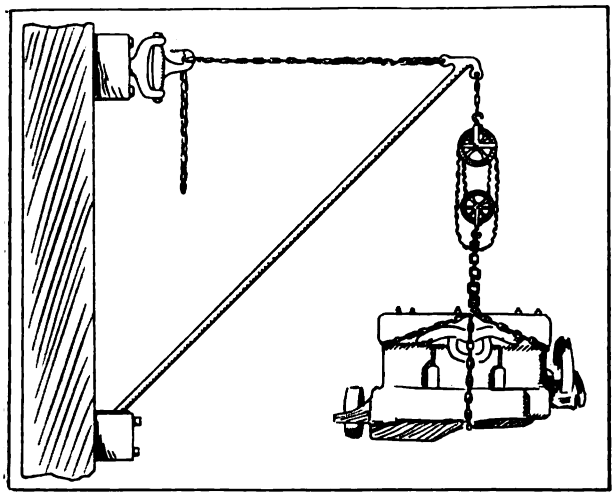

Fig. 4—Adjustable Swinging Hoist, the Material for Which Was Mostly Scrapped Parts.

A workman in one of these small shops made an adjustable swinging hoist which is depicted at Fig. 4, and the material used, with the exception of the chain eyes and pulley was taken from the scrap heap. The latter furnished a part of an old I beam section axle with the spindle bolt and bushing worn badly. The axle was cut to a suitable length, and a new bushing fitted to the spindle. It was then placed in a lathe and the arm turned down after which it was heated and bent in the form of a hook, as depicted at Fig. 5 A.

A wooden block was next procured, a hole cut to fit the axle and a strip of metal screwed on as shown at C to form a support to the axle. Four holes were next bored for the coach screws. Two more blocks were cut out and marked, holes corresponding to the others being bored. These were attached to the post by the screws as outlined at A in the sketch.

A small block was then made to fit between the upper and lower horizontal members and marked from the outside to provide an opening that would register with the vertical block. Metal strips were attached, as shown at B, these being for the purpose of providing a bearing for the axle and the retaining pin.

The axle was then passed through the opening in the vertical blocks and measured for the pin. After a hole had been drilled in the axle and the pin fitted, and the part replaced, the key was driven as shown in the sketch.

The lower support of the crane was made from a block of wood into which was set a ball socket E, the opening of which was enlarged slightly. The ball D was turned from a piece of stock, and enough shank left on the metal to fit into a piece of heavy tubing and a drive fit made. It was secured by drilling and riveting in two pins.

The piece with the eyes for attaching chain was made by a blacksmith and afterwards turned down and fitted to the pipe in the same manner as the ball member. The plates F were made to fit over the ball socket E after the latter had been placed in the block which was screwed to the post.

A suitable chain was utilized to connect the swinging spindle and crane, and the ball and socket bearing permitted this to be lengthened or shortened as desired. A two-sheave chain hoist of the Weston differential type was procured and attached as shown at Fig. 4. This enabled the operator to sustain the load in any position.

The device was attached to a post convenient to the work bench and its arrangement allowed it to be worked over 200 degrees. With it a motor could be lifted from the chassis and swung to any position within this radius, and lowered to the bench or to a stand. When not in use it was folded up and hooked against the post.

The device could be simplified by using a substantial hook in place of the spindle, while an eye bolt could be substituted for the block and the lower end of the crane made to fit.

CLAMPING WORK TO FACE PLATE.

With some work it is necessary to bolt or clamp a piece to the face plate, and many times it is difficult to keep the piece from slipping, especially it if become necessary to take a heavy chip in turning or boring. It is said that a piece of thin paper placed between the article and the face plate will hold it effectively.

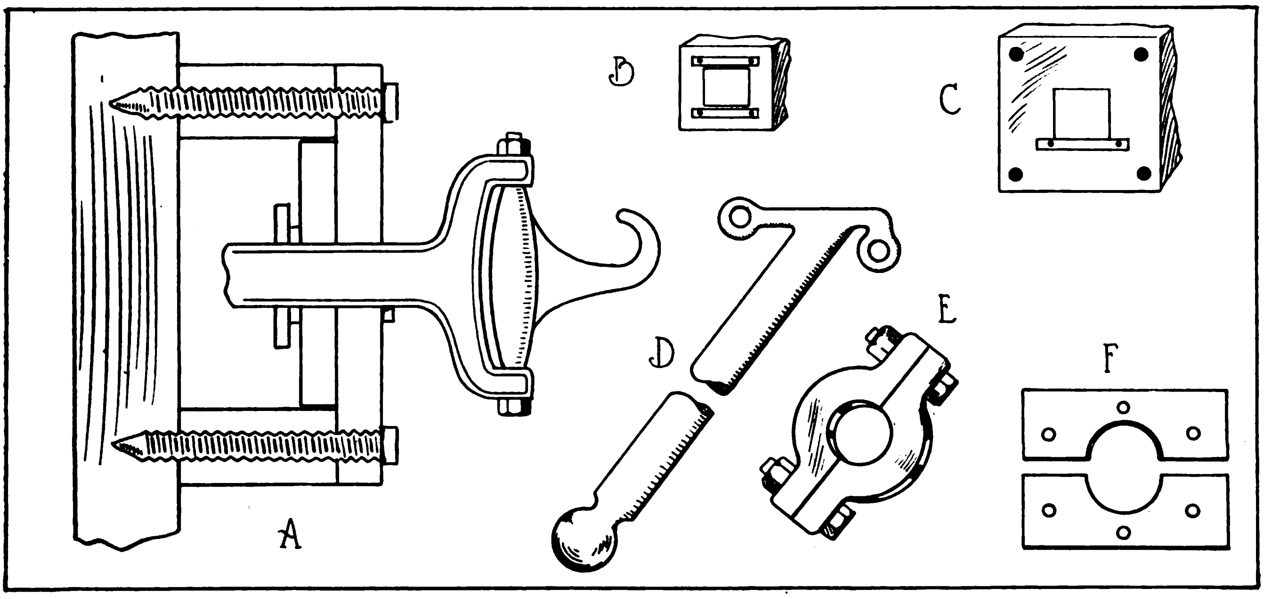

Fig. 5—Parts of the Hoisting Device: A, Depicting Method of Attaching Spindle to Post; B and C, Wooden Blocks Utilized to Secure Spindle; D, Upper and Lower Ends of Arm; E, Bearing for Ball End; F, Retaining Plates for Ball Member.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Wiring Splitdorf Coil.

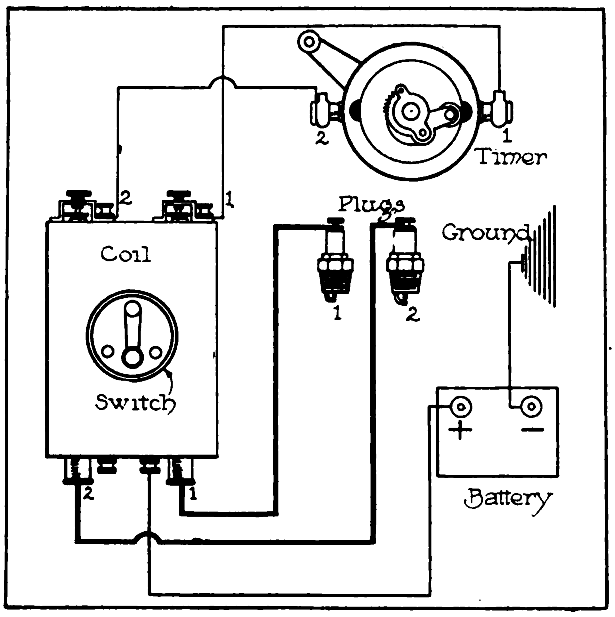
(117)—I have a burned out Splitdorf coil. I started to repair it some time ago and now find that I have lost the wiring diagram. There are two condensers in the unit and I don't know whether they are both connected in the primary circuit or not. The coil is fitted to a 1908 model A Maxwell machine and is a model 1905. Can you set me right in the matter?

CLARENCE H. PARKER.

Brockton, Mass., Oct. 12.

The coil referred to is of the vibrating type and in the accompanying illustration is presented the wiring plan. It will be noted that the battery is provided with two leads, these being marked positive + and negative —. The wire from the latter terminal is led to the frame and secured while the other wire is attached to the right hand terminal underneath the coil.

The leads from the timer or commutator are marked 1 and 2, representing the cylinders. The No. 1 is led to the right hand post or top of the coil and the No. 2 to the left hand terminal. The secondary wire, or cable, is next connected to terminal on the bottom of the coil and led to the plug of the No. 1 cylinder. The other lead will be the remaining cylinder.



Illustrating Wiring Plan of Two-Unit Splitdorf Coil of the Vibrating Type.

The diagram is followed easily but if desired the wiring may be tested. Take the spark plugs out of the valve caps and lay them upon the cylinders, taking care that their terminals do not come in contact with metal. Next, turn the No. 1 cylinder up on compression; that is, until the roller of the timer makes contact with the contact block marked No. 1 in the drawing. Upon throwing the switch to the "on" position the coil should buzz and a spark show at the plug of the first cylinder. The second cylinder may be tested in a similar manner.

Dynamo-Motor Wiring.

(118)—Will you please inform me whether a dynamo-motor could be arranged by having the positive and negative wires from a battery attached to the field of the dynamo-motor to start an automobile engine, and after it was started switch the positive and negative wires from the field of the dynamo-motor to the armature to charge a storage battery? It might be necessary to have two batteries. I will be greatly obliged for your opinion on the above question.

E. L.

Morristown, N. J., Oct. 15.

A direct current shunt wound motor will not turn over if either the field or armature is excited only. A direct current shunt wound dynamo will generate current only when the dynamo is capable of exciting its own field or this field is separately excited. In a motor the field and armature should be excited simultaneously by different sources or by one source of electricity. When the motor is driven by an engine conditions can be arranged for charging storage batteries and the motor then becomes a dynamo. Of course the desired results would depend upon the design of the electric combination.

Buying Second Hand Cars.

(119)—As a subscriber I would like to ask if you can give me some hints on how to judge a second hand automobile. I am thinking of purchasing a light touring car and would like all the information I can secure as to what parts should be examined and how to tell if the parts are in good condition. In short, what is the best plan to pursue in looking over a car in the few hours a buyer would have? Do second hand dealers have any way of fixing up a car so that it will appear all right long enough for them to demonstrate it and get the money?

H. O. WILLIAMS.

Concord, N. H., Oct. 11.

There are numerous parts which should be inspected for wear and condition, such as the power plant, clutch, transmission and rear system. The motor may be tested by turning it over slowly and noting if the compression is good and even on each cylinder. Its power will be noted in the demonstration during which the working of the clutch may be observed, especially if the prospective buyer drives the machine.

If possible the transmission should be inspected and the condition of the gears noted, as these may be badly worn. The rear system may be tested by jacking up the rear wheels and moving them to and fro to ascertain the amount of play. The steering gear should also be carefully tested, as this is a very important part of the mechanism of an automobile.

If not familiar with the mechanical details of motor cars it is advisable that some friend who is an expert look over the car. Regarding dealers fixing up machines, they generally repair and place a car in good running condition, and many concerns dealing in second hand vehicles maintain a repair shop for this work.

Charging Storage Batteries.

(120)—I have a six-volt, 60 ampere-hour storage battery and the charging rate given by the maker is three amperes. I have a 110-volt direct current in the garage and wish to employ it to charge the battery. Please inform me how to connect lamps to properly charge the cells.

C. BISK.

Hanover, Penn., Oct. 17.

Storage batteries can be charged with house or garage current provided it is direct. To reduce the rate to amount recommended by maker, lamps are employed and the number and candlepower depend upon the charging rate.

To determine the number required to bring about the necessary amperage is a simple matter, especially if carbon bulbs are employed. It is better to utilize this type as there is considerably more resistance than with the tungsten. Either 16 or 32 candlepower lamps may be used and six of the former will be required to reduce the rate to three amperes, or three 32 candlepower members.

A charging board is made easily, is not expensive and if considerable charging is to be done will more than repay for the labor. The material required is an eight-volt miniature switchboard voltmeter, an ordinary electric lamp wall socket, an electric door push bell button, a snap switch and six 16 candlepower carbon lamps or three 32 candlepower bulbs. These are mounted upon a hardwood board about 15 by six inches.

The positive wire + is led to the snap switch at the top of the board and the lead continued from the switch to the lamps, thence to the right hand side of the lamp socket. The negative wire — is connected to the other or left side of lamp socket. From these two terminals is connected the storage battery and care must be taken to note that the polarity is observed; that is, the negative wire from the battery must be connected to the negative lead from the lamp socket and the positive to the positive.

The voltmeter is placed in the centre of the board and the negative terminal connected by a wire to the negative lead from the main. The positive post of the voltmeter is led to the push button, thence to the positive wire leading from the lamps to the lamp socket.

Polarity must be observed and to determine which wire of the 110-volt current is the positive, immerse both leads in a glass of water to which has been added a little salt. By holding the wires apart, and turning on the current, bubbles will arise from one of the wires. This will be the negative and the connections are made to the charging board which should be marked + and — for future service.

Before charging, the cap or screw plug of each cell should be removed and if the plates are not covered with solution, distilled water should be added. This is accomplished by a syringe made especially for the work and it is not expensive. In charging the instructions of the maker should be followed carefully.

To test the battery with the current flowing from the main and through the lamps, press the button below the voltmeter. To test without the charging current flowing, turn the switch to "off" and press the button. Never press the button with the switch on and battery disconnected as the voltmeter will receive 110 volts, which will ruin it.

The function of the voltmeter is to enable the operator to note the action of the current. When the instrument is incorporated in the line it will be noticed that as the current is allowed to flow the voltage across the terminals of the battery will increase gradually, this being indicated by the instrument. When the rate is three amperes and the voltage reaches 2.5, reduce the current flowing to one ampere. The increasing or diminishing may be effected by adding or removing a lamp from the number specified in the circuit. Allow this one ampere to flow until each battery, if there are more than one, gives a voltage of 2.5 a cell, when it will be fully charged.

During the operation the plugs or screw members should be removed to allow the gas generated to escape freely and a naked flame should not be brought in proximity to the members. The charging rate should never exceed the maximum of the 10 amperes for the 60 ampere-hour battery. The maximum voltage on charge should be, for a three-cell, six-volt battery, about 7.5 volts. If no low reading voltmeter be at hand, charge freely at the high rate until the cells gas or bubble freely, and then cut down to the minimum rate until they again gas freely. When using lamp resistance not more than four batteries should be charged at the same time.

Excessive overcharging will bring about disintegration of the plates. If the cell be new the manufacturer should be consulted as to the proper purity and specific gravity of the electrolyte to be used and the duration of the initial charge. After the battery is charged the solution should be tested by placing some of it in a vessel made for that purpose. These are inexpensive and may be obtained at any supply house with the hydrometer, and an acid syringe also should be purchased.

The solution should register 29 degrees Baume, or 1.25 specific gravity; the division on the graduated scale of the tube at the level of the fluid will indicate the amount. Adding water lowers the hydrometer reading, while acid raises the specific gravity. When a new solution is mixed it should be allowed to cool before placing it in the cells. Chemically pure sulphuric acid should be employed and nothing but distilled water used. After charging is completed, remove all surplus solution with the syringe and wipe perfectly clean with tissue paper and replace the plugs.

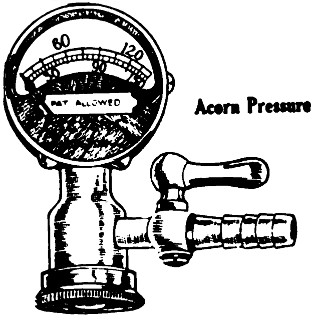
TREATING HARD CLUTCH LININGS.

When the leather lining of the clutch becomes hard and dry through neglect and slippage, and the limit of adjustment has been reached, the usual method is to reline the clutch, as oil will not penetrate the glazed surface. A driver who takes care of his own machine makes the following suggestion for treating leathers in above described condition: Take an old steel table knife and grind its end to an angle of 45 degrees and turn up outside edge about .0625 inch. The clutch is next thrown out and held, and the leather scraped with the upturned edge of the knife. This will remove the shiny surface, after which the material may be treated with oil. It is advisable to keep the clutch out over night, to allow the oil to soak in, and the surface should be cleaned before use.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

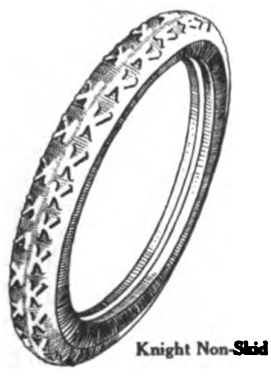
The Acorn Air Cock, produced by Stevens & Co., 375 Broadway, New York City, is designed for attachment to the end of the hose supplying pressure to a tire, and by utilizing the petcock attachment the supply may be regulated or shut off as desired. The gauge registers the pressure up to 150 pounds and is sturdily constructed of high grade material. The instrument is equipped with the patented Acorn device which eliminates screwing of a nipple to the valve stem.



Acorn Pressure Gauge

*

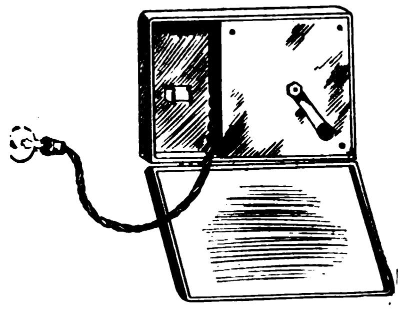
The Knight Non-Skid tire is manufactured by the Knight Tire & Rubber Company, Canton, O., and for it is claimed high grade material and workmanship. It is also stated that the thickness of the regular tread is such that the fabric is fully protected and that the anti-skid feature provides a shoe making for durability and long life. The traction is secured by two rows of elevations, these being in the shape of a letter K, and it is claimed by the maker that these with the depressions also prevent side slip. The casings are made in different types and sizes.



Knight Non-Skid Tire

*

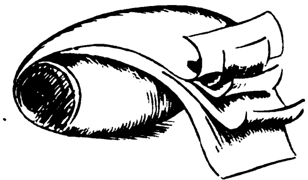
Woods' Extension Light varies from the usual inspection lamp in that the lamp itself is provided with a socket switch which is operated in the same manner as an ordinary electric lamp. The wires leading from the battery are always alive, an arrangement making for economy of time when the service of the light is desired. The entire apparatus is carried in a neat case, 4.5 by seven inches, and the device is installed easily on the car by three small screws. It is pointed out by the maker that the box may be concealed from view and fitted as convenient. It may be connected to the usual ignition batteries if desired. It is produced by the Flint Extension Light Company, Flint, Mich.



Woods' Extension Light

*

The O'Neil Tire Protector is marketed by the O'Neil Protector Sales Company, Cleveland, O., and is utilized to reinforce the casing irrespective of whether the member is old or new. It is composed of five distinct plies of fibre, thoroughly vulcanized and it is claimed by the maker that it protects the inner tube from punctures, as well as enables considerable service from an old casing. The protector is very flexible and is inserted easily, covering the entire inner surface of the shoe from bead to bead. It conforms to the shape of the tire, does not wrinkle or pinch the inner tube, and it is stated that it may be utilized indefinitely, as the protector is constructed of heavy material.



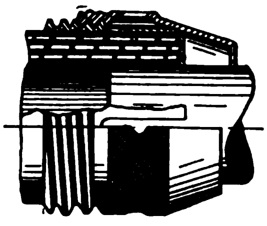
O'Neil Tire Protector

*

The Lavigne Hose Coupling, manufactured by the Lavigne Hose Coupling Company, Detroit, will appeal to motorists who undertake their own repairs and who have experienced difficulty in making water tight the connections between the radiator and cylinders or other components of the cooling system. The design of the device is such that it may be applied by the hands, the maker pointing out that tools are not necessary. It is slipped over the hose, which is compressed by screwing up the coupling. The latter is made in different sizes, of steel or brass and is inexpensive. The maker points out that in assembling manifold or nipple the coupling should be .03125 inch smaller than inside diameter of hose.

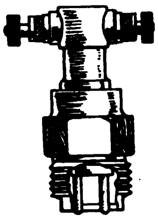
*

The Superior Double Spark Plug, marketed by the Superior Motor Specialty Company, 44 North Fourth street, Philadelphia, is provided with two electrodes and a like number of terminals, permitting the utiliza-



Lavigne Hose Coupling

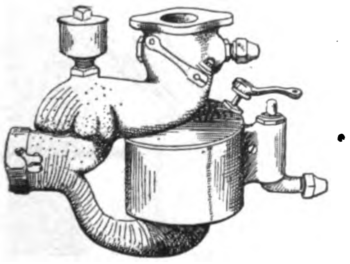
tion of independent ignition circuits if desired. Two simultaneous sparks are obtained increasing the efficiency of the motor as well as making for economy in fuel. The plugs are made of high grade material and it is claimed by the maker that the points are self-cleaning. They may be employed in the same manner as a single plug if desired.



Superior Double Plug

★

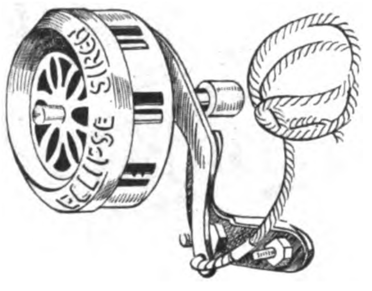
The Mayer Carburetor, manufactured by the Mayer Carburetor Company, 2673 Main street, Buffalo, N. Y., is compact in design and simple in construction, features which will appeal to the motorist caring for his own car. It is of the float feed, automatic type and the level of fuel at the spraying nozzle is held constant, insuring efficiency. The design is such that both the main and auxiliary air are obtained from the same source and the construction of the air inlet prevents the entrance of mud, water or foreign elements, as well as provides means for deflecting the stream of a backfire from the pan, eliminating danger of fire. A quality of the Mayer is the dashpot over the auxiliary air inlet, this being virtually an air chamber having a piston attached to the valve rod on which is seated the auxiliary air valve spring. It is pointed out that this arrangement makes it possible for the motor to respond quickly by virtue of the piston pushing against the air in the dashpot itself and creating correct resistance to the impulse of the auxiliary air valve to open suddenly. This regulation of the air valve makes, the company states, for flexibility, silence, economy and great power. The adjustment of the carburetor is a very simple matter, the dashpot and needle valve being the only parts requiring attention. The latter is provided with means for adjusting from the dash. The model H is water-jacketed and means are provided for fitting a connection for taking heated air from the exhaust if desired. One of the qualities claimed for it is that starting is made easy.



Mayer Carburetor

★

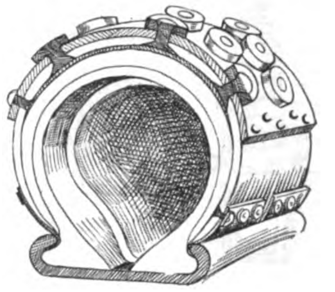
The Eclipse Siren Horn is a signalling device operated by friction and is designed for motorcycles and bicycles. A ball bearing wheel is forced in contact with the road wheel by a cord, and the momentum imparted causes the horn to give forth a penetrating sound. The device is nickel plated, is attached easily and is inexpensive. It is marketed by the Eclipse Specialty Company, 250 West 54th street, New York City.



Eclipse Siren Horn

★

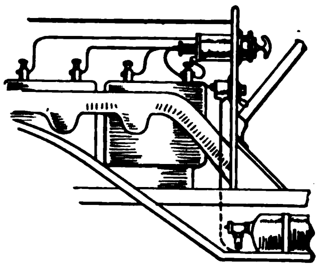
The Indianapolis Tire, made by the Indianapolis Tire Company, Indianapolis, Ind., is covered by a broad guarantee inasmuch as it is claimed it will wear 5,000 miles without puncturing, rim cutting or injuring the casing. There are three thicknesses of a special material through which it is stated that it is impossible to drive a nail. The tread is provided with a number of patented steel discs which prevent skidding and the members are made with taper holes so that they may be worn to the tread of the shoe without coming off. The tire is secured to the rim by means of steel hooks, a design which it is stated places the driving strain upon the wheels instead of the casing. It is claimed that the device is as resilient as a rubber casing and that it affords complete protection from water, sand or mud.



Indianapolis Tire

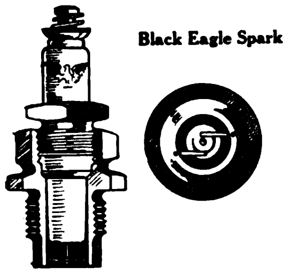
★

The Air-Gas Starter, produced and marketed by the Troy Auto Specialty Company, Troy, N. Y., is a self-starting device utilizing acetylene from a regulation tank, the gas being mixed with air and pumped to the cylinders by hand. The acetylene is led to a patent combination gas and air valve located on the dash, the device being equipped with a graduated dial and handle, by means of which the mixture may be controlled and the best results noted. To operate the starter, the valve lever is moved into its proper position and the handle of the pump drawn forward, after which it is depressed. The movement forces a mixture of acetylene and air to the cylinders through small tubing and the vapor is ignited by the usual spark. A feature of the system is the provision made for motors not equipped with priming cups. By the utilization of a



Troy Air-Gas Starter

specially constructed spark plug, the mixture is introduced through an aperture in the shell of the plug, and it is held by the maker that the car may be operated on acetylene alone by the proper adjustment of the gas and air valve. It is stated that the system may be installed easily, as it is free from complicated connections.



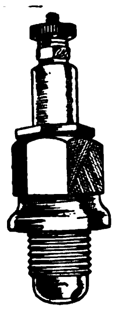
Black Eagle Spark Plug

* * *

The Black Eagle Spark Plug is manufactured by the Progressive Manufacturing Company, Torrington, Conn., and although moderate in price embodies all the desirable features of more expensive members. The best of material and workmanship are incorporated and a feature of the design making for high efficiency is that the base of the plug provides double electrodes so located that they present a round surface to the action of the spark, eliminating pitting. The design of the shell and shape of the insulator are such that the plug is absolutely gas tight, and it may be disassembled if desired without danger of breakage.

* * *

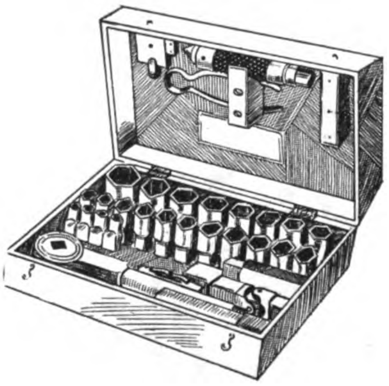
The Reflex Spark Plug, of the motorcycle type, is manufactured by the Reflex Ignition Company, Cleveland, O., and although designed for racing purposes is adapted for ordinary service as well. The electrodes are protected from oil or soot by a peculiar formation of the shell, which is globular in form and pierced by small holes. The insulation is a high grade mica although porcelain members are supplied upon special order. They are made in .5-inch standard, .87518 and metric threads, and each plug is covered by a liberal guarantee.



Reflex Spark Plug

* * *

The Starrett Ratchet Wrench, is a patented tool manufactured by the L. S. Starrett Company, Athol, Mass., well known maker of machinists' instruments. The outfit comes in a neat box and comprises a ratchet wrench with a reversible pawl, and an extension; a spark plug socket, universal joint, screw driver, drilling attachment holding standard square shank drills, .125 to .5 inch; holder or friction wrench for drilling attachment, drift pin and thrust plate for drilling attachment. The outfit also includes 28 hexagonal steel sockets, varying in size by thirty-seconds from .3125 to 1.25 inches. The parts are constructed of the very best material and nicely finished and are designed especially for motor car service.



Starret Ratchet Wrench

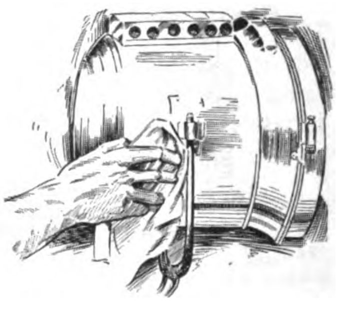
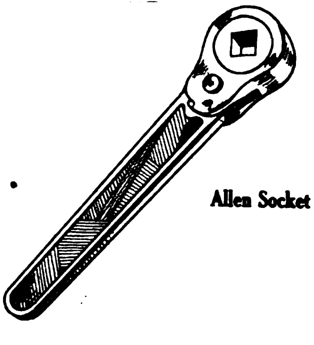
Silver Quick is a new preparation being marketed by the Atlas Auto Supply Company, 99 East Adams street, Chicago, and the utility of it will appeal to motorists who take care of their own machines. It is a liquid preparation which is applied to the brass and copper work of the lamps and other accessories of the car, and it is pointed out by the maker that one rub with it on a piece of cheesecloth will produce a genuine, lasting silver plate. By its application the tedious work of polishing brass is eliminated and the appearance of the automobile is considerably enhanced. The composition is claimed to be free from mercury or quicksilver and that it will endure for a long time. Each bottle contains enough to apply several coats of plating, which may be renewed from time to time.



Silver Quick

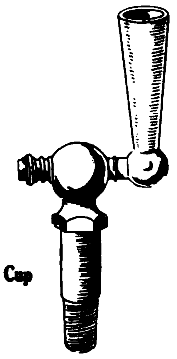
* * *

The Allen Friction Wrench is a patented device manufactured by the Allen Wrench & Tool Company, 4 Meadow street, Providence, R. I. It differs from the ordinary type of socket wrenches in that it operates on the friction principle and is consequently free from teeth, springs, etc. The inventor points out that its grip is instantaneous and its design is such that it may be operated in smaller spaces than a ratchet member, as well as in much faster time. The wrench comes in a neat box containing sockets of different sizes, a short and long extension, screw driver, universal joint, etc. The sockets are of pressed steel, heat treated and case hardened, while the wrench proper is of drop forged high carbon steel, carefully machined and finished. It is made in three sizes.



Allen Socket Wrench

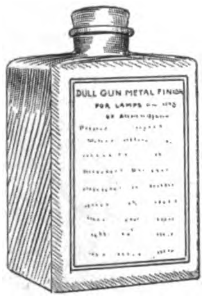
The Williams Priming Cup, marketed by the D. T. Williams Valve Manufacturing Company, Cincinnati, O., presents novel features, inasmuch as the operating lever or handle is funnel shaped and when placed in its proper position its opening registers with that of the cup, permitting the flow of gasoline to the cylinder. Another advantage is that when the handle is turned down or closed, the entrance of dirt is prevented. The cup is equipped with a spring key which automatically adjusts itself to any wear. It is made in three styles, adapted to any type of motor.



Williams Priming Cup

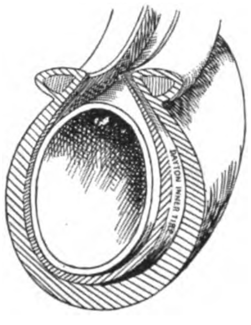
—— ★ ——

Gun Metal Finish is the product of the Gun Metal Finish Company, Decatur, Ill., and is a liquid which comes in a small can and is utilized for converting the brass or copper of the lamps, parts, etc., of the motor car into a dull finish. It is applied easily with a brush after the part has been thoroughly cleaned and it is claimed by the maker that the liquid will dry hard in 30 minutes. Usually one coat will cover, but in some instances a second may be necessary. If a gloss is desired it is obtained by treating the surface with linseed oil and rubbing with a soft cloth.



Gun Metal Finish

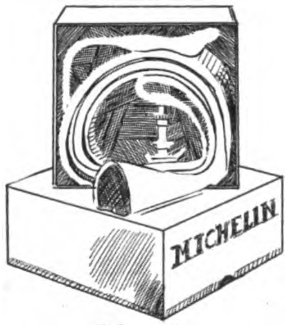
The Dayton Inner Tire is one of the products of the Dayton Inner Tire & Manufacturing Company, Dayton, O., and is utilized between the casing and the inner tube. It is constructed of a flexible but puncture resisting material and serves to strengthen the walls of the shoe, preventing blow-outs, etc. The edges of the liner are tapered, preventing pinching of the inner tube. As an example of the increased mileage obtained with the inner tire the company points out that one shoe gave over 14,000 miles service. The liner is made in two, three or four-ply, depending upon the size of the casing fitted, and special sizes are made to order.



Dayton Inner Tire

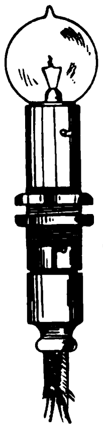
—— ★ ——

The Michelin Red Inner Tube for motorcycles is the product of the Michelin Tire Company, Milltown, N. J., and is of the butt end type, a design enabling the fitting of the member to the wheel without removing it or the tire from the frame. The tube is made of a high grade Para rubber and it is claimed it will retain its elasticity and will not crack, check or harden. It is made in four sizes for standard wheels.



Michelin Inner Tube

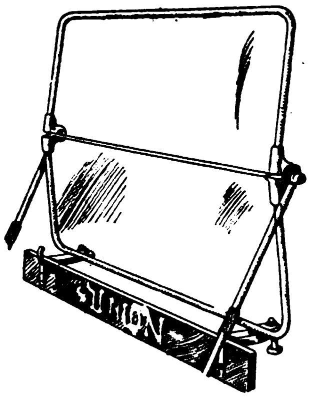
The Cello Adapter will appeal to motorists who desire to install an electric lighting system, as with the device the oil lamps may be converted into electrical units and without interfering with the service of the former. The device is installed easily by cutting a small hole in the lamp and is secured by two lock nuts. It is also provided with a bronze covered cable attached to a brass socket. The Cello adapter is manufactured by A. S. Campbell, Boston.



Cello Adapter

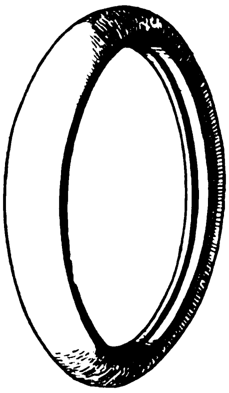
—— ★ ——

The Union Windshield, produced by the Union Auto Specialties Company, Brookville, Penn., is made in three models and is nicely finished. It is fitted with the Union patented automatic lock which provides three different positions as well as security. By means of the lock the shield is easily and quickly adjusted by one hand and it is claimed by the maker that after the desired positions have been obtained the lock automatically engages and is held rigidly. Absence of rattling is also claimed for the shield. Provision for ventilation is another feature included.



Union Windshield

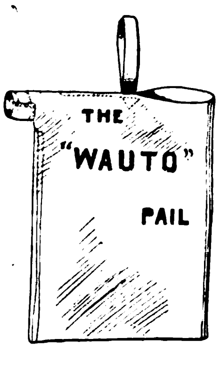
The Bourn-Goodyear Tires, manufactured by the Bourn Rubber Company, Providence, R. I., are extra high grade, guaranteed shoes of the wrapped tread type. They are vulcanized by an improved single cure process which, combined with high grade material and workmanship, make for a durable and efficient casing. Each tire is carefully inspected and guaranteed. They are produced in standard sizes and types, also interchangeable members for motorists desiring to fit a larger casing to a regular sized rim.



Bourne-Goodyear Tire

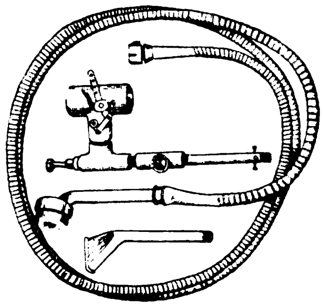
—— ★ ——

The Wauto Pail, manufactured by the Wauto Pail Company, New York American Building, New York City, is a practical and inexpensive device which will appeal to the tourist as it may be folded flat and placed under the cushion of the front seat of the motor car. It is constructed of a waterproof canvas, has a handle and spout of the same material and its capacity is two gallons. There are no hinges, rivets or pins utilized in its manufacture and it is claimed by the maker that it will withstand severe usage and last indefinitely.



Wauto Pail

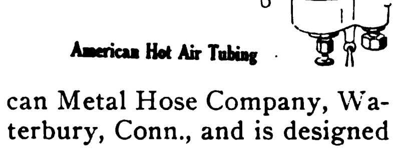
Auto-Vac is the product of the Auto Vacuum Cleaner Company, 253 23rd street, Milwaukee, Wis., and works on the same principle as the vacuum cleaner. It is operated by the exhaust of the automobile motor and comprises an attachment for the exhaust pipe, flexible metal tubing, suction brush and squeegee. By it the dust and dirt collecting in places inaccessible by the hand brush are removed easily and quickly, as well as from the clothing. It saves the trouble of brushing the clothes at the end of the day's run and as the connections are easily made it is a simple matter to operate the device. The hose is of sufficient length to reach all parts of the car.



Auto-Vac

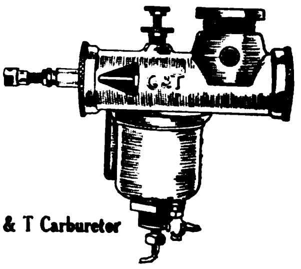
—— ★ ——

The American Hot Air Tubing is produced by the American Metal Hose Company, Waterbury, Conn., and is designed for conducting warm air from the exhaust pipe or manifold to the air intake of the carburetor. The tubing is flexible and made in inside diameters ranging from .75 to two inches. Its approximate bending radius is from 2.5 to five inches, a quality making for convenience in installation. The tubing is inexpensive and is furnished in exact lengths if desired.



American Hot Air Tubing

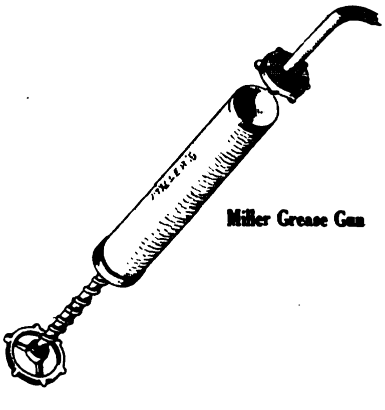
The G & T Carburetor is marketed by the Gallagher-Tompkins Company, 1876 Broadway, New York City, and a feature of the device is that it has but one wearing part. It is also claimed that the specific gravity of the fuel does not affect its proper operation. It has but one adjustment, springs are not employed and it is stated that the mixture is so controlled mechanically that the proper amount of air and gasoline is admitted at all speeds. A double nozzle is utilized, one set and the other mechanical, and the air is regulated by double intakes of a similar construction.



G & T Carburetor

—— ★ ——

The Miller Grease Gun, is manufactured by Miller & Starr, 250 Greene street, Brooklyn, N. Y. The plunger is actuated by a double spiral worm, and it is claimed by the maker that the device may be filled and emptied in 30 seconds, the operation involving eight turns of the wrist. The gun is fitted with a practical handle and it is stated that a stream of grease 30 inches long may be produced by one turn. The barrel is 17 gauge, made from heavy bronze and is said to be indestructible.



Miller Grease Gun

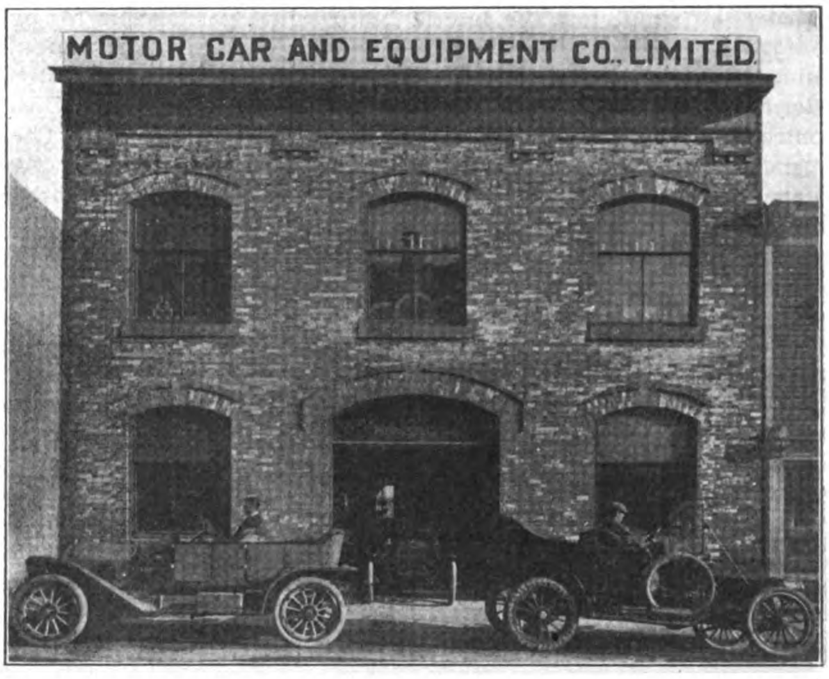
WITH THE INDUSTRY IN NEW BRUNSWICK.

Motoring Conditions Throughout the Province Indicate Increased Business in 1913—Special Reference to the Garage Situation in St. John.

WITHIN the past year the number of automobiles in use in New Brunswick, Canada, has increased over 100 per cent. The New Brunswick Automobile Association, which had been permitted to exist practically in name only, has elected a new set of officers, included among whom are some of the most influential men in the province, and its future programme is one modelled somewhat after the activities of similar bodies in the United States. At least one motor car factory is in process of erection, and the motoring situation, with reference to business for 1913 is decidedly promising from every aspect.

While Fredericton is the capital of the province, it is an inland city, and it may be assumed that St. John is the centre of the present organized effort to promote motoring in that section. St. John is within easy access of the provinces of Nova Scotia and Prince Edward Island, the former of which has but very few cars as yet and the latter none at all. While automobiles never were excluded from Nova Scotia, they have had little encouragement. Prince Edward Island gives every promise of removing the bann in the near future.

This situation explains in a measure the present activity looking toward the manufacture of cars, since St. John offers admirable shipping facilities to each of these neighboring provinces. It also accounts for renewed activity on the part of the St. John dealers, all of whom are making plans for increased business in 1913. The contract has been awarded for one splendid new garage and service station at Germain and Princess streets, in the heart of the city, and every effort will be made to attract and retain custom.



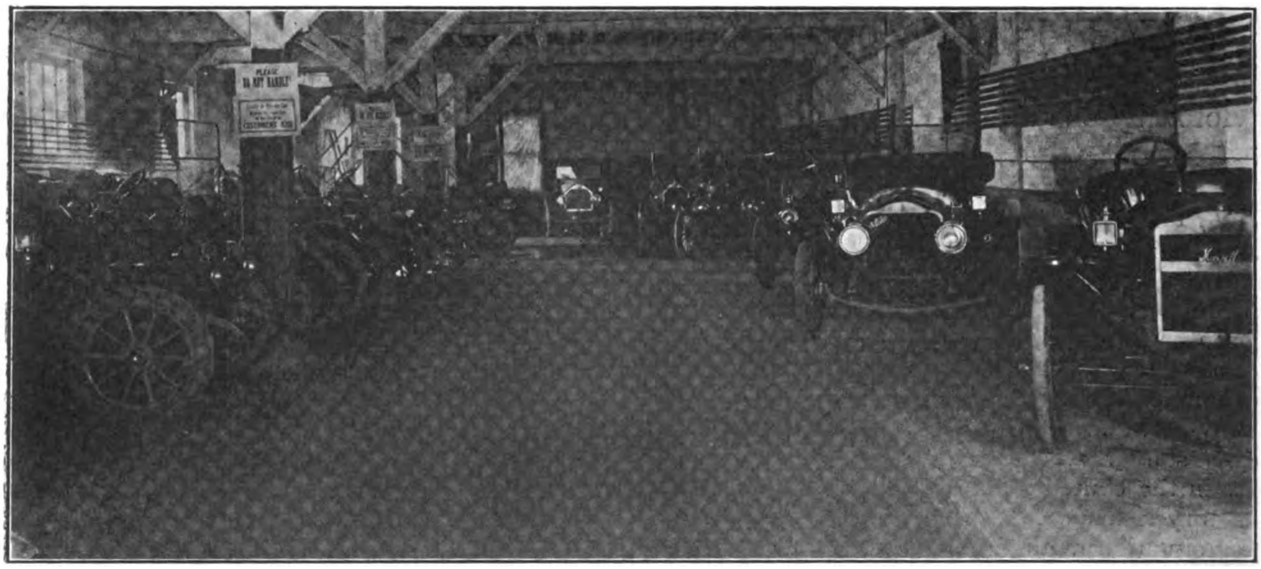
Exterior of the Princess Garage, Operated by the Motor Car & Equipment Company, Ltd., St. John, N. B.

The New Brunswick Automobile Association is to have its headquarters in this building, and it will be from this location that the campaign for good roads will be continued. The word is used advisedly, since some results already have been obtained. Tourists visiting eastern Maine have crossed over the border in years past with a view to visiting St. John and some of the other scenic points along the Bay of Fundy and beyond, but they have been impressed unfavorably by the lack of proper touring facilities. After reaching St. George, 32.7 miles from Calais, Me., and St. Stephen, N. B., a detour of some 25 miles has been necessary in order to avoid some five miles of desolate and impassable country over the old post road between St. George and Lepreaux.

After much persuasion upon the part of the New Brunswick Automobile Association, the townships between St. George and Lepreaux have united in the construction of a splendid gravel road over the old post road layout. This is practically completed and will be available for all tourists in the spring of 1913. As a result, it is anticipated that many more tourists will visit New Brunswick next year, particularly as Maine has been improving its roads through Washington county to Calais.

It should be remembered that as yet the New Brunswick parliament has practically no jurisdiction over the highways of the province. The association hopes to convince the legislators that it would be wise for the government to assume charge of the matter, in view of the fact that motoring tourists will leave large sums of money in the province each year, and it is not unlikely that this situation will enter into the selection of future members of parliament to a certain extent.

The new garage mentioned above is to be built for J. A. Pugsley & Co., one of the oldest automobile firms in St. John. Lockwood, Green & Co., Boston, Mass., is the architect, and when it is known that this concern drew the plans for the service station occupied by the J. W. Maguire Company, agent for Pierce-Arrow cars in Boston, it will be recognized that the structure is to be well adapted for the purposes to which it will be put. Its exterior largely will be of concrete and glass, particular attention being paid to the



Ground Floor of the Princess Garage,, St. John, N. B., Showing the Available Space for the Storage of Cars.

matter of supplying the interior with light.

J. A. Pugsley also is interested in the Maritime Motor Company, Ltd., which will occupy the factory now being erected. The location is on the line of the Intercolonial Railway and there are direct connections with the Grand Trunk and Canadian Pacific. Plans for the first Maritime cars are nearing completion, and it is anticipated that they will compare favorably with those produced in other Canadian factories. Many of the components will be purchased from American makers, this having reference to the motor, axles, etc.

At present the principal garage in St. John, and in New Brunswick for that matter, is the Princess garage, operated by the Motor Car & Equipment Company, Ltd., at 110-112 Princess street, and of which F. W. Coombs is general manager. As may be noted from the accompanying illustrations, the building is of brick construction, two stories in height and the provision for lighting has been considered carefully.

A major portion of the ground floor is utilized for storage of transient and regular service cars, and as a salesroom for demonstration machines. The office is at the left as the garage is entered. An electric elevator conveys the machines to the repair shop on the second floor, which is located at the rear of the building. The front of this floor is devoted to the storage of spare parts, supplies and accessories. All of the appointments are as complete and up-to-date as any modern garage in the States. It is but natural that the Motor Car & Equipment Company should have built up a good paying business, both in cars and supplies.

Mr. Coombs is very proud of his business methods, and it may be added that he has considerable reason to be. Transient trade is on a strictly cash basis, and the system in operation is not unlike that utilized in most garages of today. At Fig. 3 is shown the tag, eight inches

Total,

Fig. 1—Machine Shop Time Sheet Utilized by Princess Garage for Checking Up Workmen's Time.

long by 3.5 wide, printed on stiff board, which is filled out and attached to the car when it is left by the owner or chauffeur. The lower portion is detached and becomes the owner's check for his machine. If it should develop that repair work is needed, the method of procedure is the same in every way as that which applies to the regular patron, with the exception of the payment of cash when the machine is delivered, and will be described later.

With the regular customer, cars are washed and polished at stated intervals, according to the terms of the agreement. In case supplies of any nature are furnished, the owner or chauffeur is presented with a duplicate slip bearing the number of gallons of gasoline, etc., and the price. These may be retained for checking up with the bill, which is rendered twice a month.

Fig. 2 presents the bill sheet, which is made out in duplicate, the original on white paper, forming a part of a loose leaf ledger and the duplicate on yellow paper being forwarded to the customer. This is 11 inches high by 8.5 wide, and it will be noted that there is daily space for recording merchandise purchased, machinist's time for work done, and all the other items which go to make up the bill. At the end of the period for which the bill is rendered these items are carried out for each day and the grand total appears at the foot of the sheet. The entire transaction is thus spread out before the owner and garage proprietor, alike, and in such manner that there can be no questioning the bill. The slips retained by the garage and the duplicates of them presented to the owner or chauffeur at the time of each transaction should agree, and if for any reason they do not, the error can be detected and corrected at once.

No repair work is undertaken except upon order, and when it is begun, if additional work is found, the whole job is held up until the owner is communicated with and his wishes made known. This applies to the transient as well as the regular patron, since there is a space on the transient tag for the owner's temporary address in St. John, so that he may be reached by telephone should such occasion require. This obviates the possibility of misunderstanding.

Each morning the workmen are supplied with machine shop time cards, as indicated at Fig. 1. These are the same in size as the bill sheet and make provision for the recording of the work done by each man every hour of the day. The workman is required to fill out his card at the completion of each job. Each item is checked up by the foreman, and at the end of the day the sheet is signed by the machinist and foreman, and becomes a permanent record of the day's work. It is possible that this portion of the system could be improved by the addition of a time clock, but with this opinion Mr. Coombs does not agree.

All supplies and spare parts are under lock and key at all times, and are not available to any but those who have direct supervision over them. Each workman furnishes his own tools. When-

MOTOR CAR AND EQUIPMENT CO., Ltd.

Fig. 3—Princess Garage Transient Tag, Supplying Necessary Information for Workmen and Attendants.

The entire system is simple and sufficient in every way.

The character of repair work undertaken is somewhat more varied than that which is done by many garages in the States, since St. John is not within easy access of the factory which produces the car. It is possible to send to Boston, and await the arrival of parts by steamer or train, but in many cases it is found more desirable to undertake the necessary machine work at once in the company's own shop.

The company is agent for White cars, made by the White Company, Cleveland, O., and has been fortunate in creating a wide demand for this product. It also has taken upon itself to interest local merchants and business men in White trucks, or lorries, as they are termed in the British possessions, and three of these vehicles have been placed within a short time. These three trucks, with one other, a converted pleasure car, comprise the only commercial cars in St. John, and as far as is known, in the province.

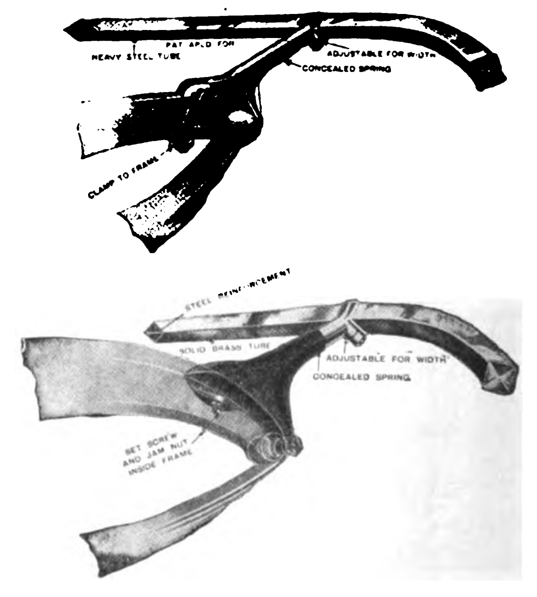
St. John has an abundance of steep hills and some road surface which cannot be regarded as ideal for mechanical transports. However, the city government is busily engaged in resurfacing many of the principal streets, and it is anticipated that there will be little difficulty in interesting business men in motor trucks, particularly as the White machines have given every evidence of their ability to cope with the situation in the short time they have been in service.

WILL USE SAGER BUMPERS.

Announcement is made by the J. H. Sager Company, Rochester, N. Y., that the Cadillac Motor Car Company and the Packard Motor Car Company, both of Detroit, have selected the Sager Diamond bumper as standard equipment for their 1913 models. The design to be employed by the Cadillac is shown in the upper portion of the accompanying illustration and a feature of it is that it is adjustable for width. The bumper proper is a heavy steel tube of diamond shape and finished in brass, black or nickel, making a decidedly attractive fitting.

The model to be fitted by the Packard company was especially designed and while it is of the clamped-on type, the clamps are invisible, a design that does not detract from the appearance of the car. The solid brass tube has a steel reinforcement and the retaining arms are adjustable for width. The finish is black and nickel, harmonizing with that of the machine.

Qualities emphasized of the Sager Diamond bumpers are their sturdiness and light weight, and the company is very much pleased with their indorsement by the makers of the Cadillac and Packard cars. The J. H. Sager Company also produces channel and round tube bumpers, and is marketing a special design for Ford cars.



The Sager Diamond Bumper Adopted as Standard Equipment for 1913 Cadillac and Packard Cars, the Smaller Model Being Used by the First Named Machine.

PRODUCTION AND PRICE OF GASOLINE.

BECAUSE of the rapid increase in the price of gasoline since the first of the year, those engaged in the sale and use of both pleasure and commercial automobiles have sought government aid in investigating the matter. The producers claim that there is ample reason for the increased cost, and their position is set forth, in a measure, by the following statement:

In order to understand fully the situation in this regard, it should be understood that a considerable proportion of the oil produced is not suitable for the manufacture of gasoline. The state which produces the largest number of barrels (California), with a total of 81,134,391 barrels, produces only a comparatively small amount of oil suitable for gasoline manufacture, the bulk of this oil being suitable only for fuel, road oil and asphalt production.

Dr. David T. Day of the United States geological survey, in his report on the production of petroleum for 1911, states that while fuel oils increased, refinery oils declined. It is from the refinery oils that the gasoline production is secured.

It should also be noted that gasoline can only be secured to the extent of the small percentage which is found in the oils, and where gasoline is not found in such percentage to pay for refining, the oil cannot be used for this purpose.

The figures given below show that while the general production of oil for 1911 increased over 1910, there is no increase perceptible in 1912 over 1911, and in all cases where increase has occurred the oil has been of such a character as to yield practically no gasoline.

In the meantime the consumption of gasoline has increased yearly between from 65 to 100 per cent. In other words, the oils from which gasoline can be drawn have not increased in quantity and it has been necessary to draw largely upon the accumulated stocks for the supply of gasoline. On account of the increased requirements for refinery oil, the price of crude oil suitable for refining purposes has risen approximately 33.3 per cent. during the last year. Not more than six months' supply of oil is in stock even in California, where much of the oil is not suitable for gasoline manufacture, and in many cases, the supply on hand is much less.

The total production of oil for 1911 (from the report of Dr. Day) was 220,449,391 barrels, and that delivered for all purposes during 1911 was 229,567,581 barrels. While the reports for 1912 are not yet available, the record so far given shows practically no increase over 1911:

December, 1910	93,038,828	bbls.
December, 1911	81,791,433	"
June 30, 1912	76,421,058	"

The production from the fields which supply most of the refining oil stands as follows:

1910	126,255,667	bbls.
1911	127,215,812	"
1912 (6 months)	62,900,069	"

In the meantime the best figures on the automobile business give the following number of cars in service:

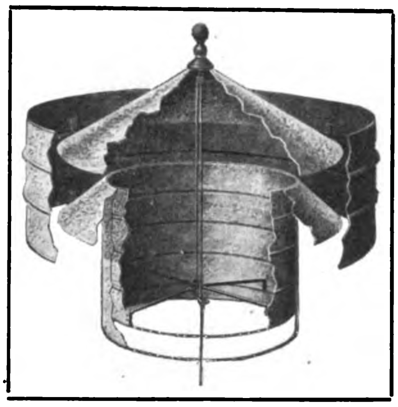
	Pleasure Cars	Commercial Vehicles
December, 1910	350,000	No record
December, 1911	550,000	No record
June, 1912	859,000	32,000

The estimated production of the automobile factories for 1912 is 300,000 cars. To this must be added the number of stationary engines, gasoline traction engines, motor boats and yachts, the production of which has increased several hundred per cent. in the last three or four years.

In other words, while the supply of oil has increased slightly, the supply of gasoline has not increased, but the demand is going up by leaps and bounds, and as a consequence the material is increasing in value.

VENTILATING THE GARAGE.

While the modern garage and repair shop are equipped with means for ventilation there are many old buildings which have been converted into automobile stations. With these it is a difficult matter to get rid of the smoke and fumes, and the usual method is to open the doors. In the winter time this means the loss of considerable heat. To overcome these difficulties the Burt Manufacturing Company, Akron, O., is marketing a ventilator, specially designed for garages and its construction is such that it may be fitted easily and at a slight expense. In the accompanying illustration is shown one of the several types made by the company and by it the smoke, etc., is carried out of the building. The device includes means for regulating the opening of the damper. Another design has a glass window, a quality which will appeal to garages not properly illuminated by daylight. A booklet upon ventilating the garage will be mailed free by the company upon application.



The Burt Ventilator.

SUCCESS WITH TIRE FILLER.

Meeting with a big demand for its product, The Resilient Auto Tire Filler Company of 41 Columbus avenue, Boston, which is producing a puncture proof tire filler claimed to eliminate 90 per cent. of tire difficulties, is offering a 30-day guarantee from the time of installation. During this time the full price of the tire filler will be refunded if the purchaser is not entirely satisfied with the service.

SIMPLICITY OF THE NEW J-M DEMOUNTABLE RIMS.

SIMPLICITY and ease of operation are among the qualities of the new demountable rim which has been brought out by the H. W. Johns-Manville Company, New York City. It is styled the J-M demountable rim, and as the accompanying illustrations show, comprises two main parts or band members, each of which carries one of the raised beads which hold the tire in place. As will be noted at Fig. 1 one rim is a continuous ring while the other is split diagonally and slips inside the solid member, where it is retained by dowels projecting from the under side of the main ring and engaging with depressions formed in the split ring.

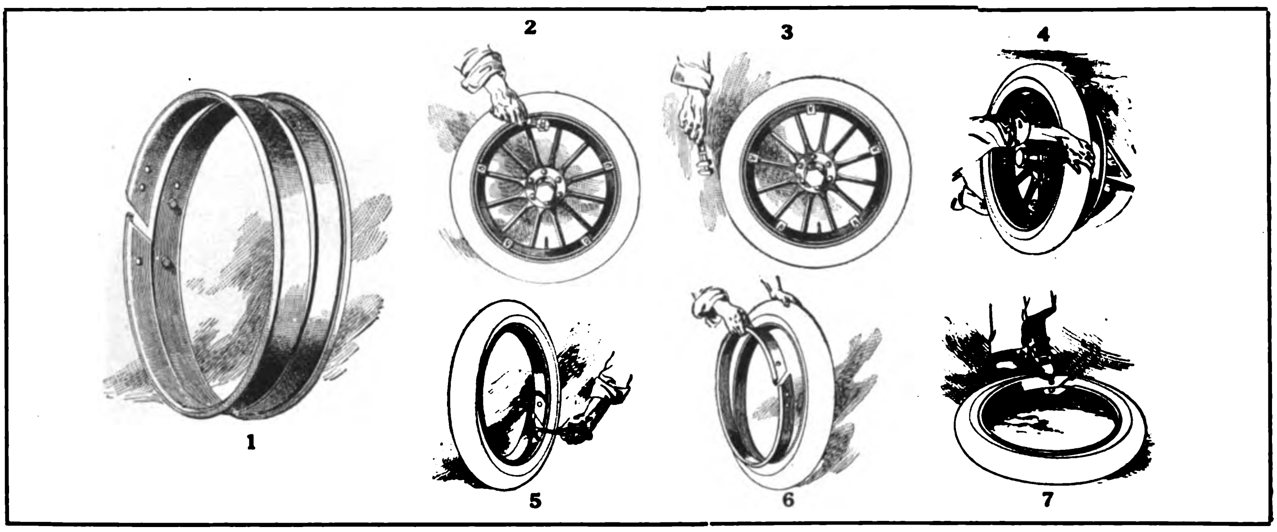
The construction is best explained by the operation of removing and replacing a rim, also the tire. After jacking up wheel, the top one of five simple but efficient clamps is loosened one full turn when the clamp will automatically drop down out of contact with the rim. The nut is then turned to retain the clamp, an operation performed easily with the fingers. The remaining clamps are similarly treated. The rim and tire are then removed as shown at Fig. 4. To remove the casing from the rim is a simple matter. A screw driver or J-M combination tool may be employed, and the end of either of these is inserted in the slot on the under surface of the demounted rim and pried out slightly, just enough to disengage the dowel pin and slip the two rim members apart as indicated at Figs. 5 and 6.

As the continuous ring has a perfectly smooth, flat surface, it is an easy matter to remove the shoe or the inner tube. After replacing the casing, which may be done easily, and without danger of pinching the inner tube, and before inflating the tube, the two rim members are assembled. This is accomplished by laying the main rim member with shoe flat upon the ground. After setting the tongue member into the groove of the other, the dowels are matched up with the dowel holes. The split rim is then pressed down with the foot as shown at Fig. 7, and the dowels and tongue snap into place when the rim is ready for mounting upon the wheel.

In replacing the rim and shoe the process is reversed. The lowest clamp nut is loosened enough to allow it to drop down over the rim and then tightened slightly. The wheel is rotated until the next clamp is at the bottom, when the operation of loosening and tightening is repeated, and so on until all five members have been secured. The nuts are then tightened with the offset wrench provided for that purpose, although an ordinary member may be utilized. The operation draws the rim into position and locks it securely.

As the two rings overlap for their entire width, water, dust or foreign elements cannot enter the shoe or inner tube and the tongue and groove form a block against the passage of dirt.

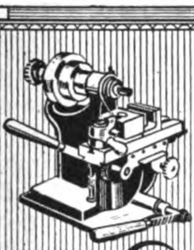
The J-M rim can be employed with any standard make of clincher tire, both quick detachable and regular. All parts are interchangeable and are Sherardized so that they are rust proof.



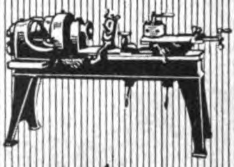
Illustrating the J-M Demountable Rim, Its Components and Method of Removing and Replacing Tires—The Design Is Noticeable for Simplicity and Few Parts.

MARION SHOWS ECONOMY.

The trip recently finished by F. J. Sleght of Indianapolis, Ind., in his Marion car, made by the Marion Motor Car Company, Indianapolis, bears special significance. For 2086 miles, through Indiana, Ohio, Pennsylvania and New York, Mr. Sleght, with three companions drove his car at an average cost of .5 cent a mile a passenger. Throughout the trip Mr. Sleght kept an accurate record of gasoline and oil consumption, charges for storage, washing and polishing, as well as incidentals and hotel expenses. The average cost of gasoline was 18 cents a gallon and that of oil 60 cents a gallon, the total cost of the former being $24.12 and the latter $7.20. For storage, washing and other incidentals there was expended an additional amount of $12.49.



Up-To-Date Shop & Garage Equipment



THE PERFECTION SPRING WINDER.

In fitting new accessories to the car and in the overhaul of the chassis, the work frequently requires a special sized spring or one of greater tension than may be secured readily from a supply house. The Remington Tool & Machine Company, Boston, is marketing a simple and inexpensive device known as the Perfection spring winder which is so constructed that it will wind accurately taper, double taper and right or left hand springs of any length, diameter or pitch from any gauge wire. It is constructed in three sizes having capacities ranging from the smallest wire up to .3125 inch.

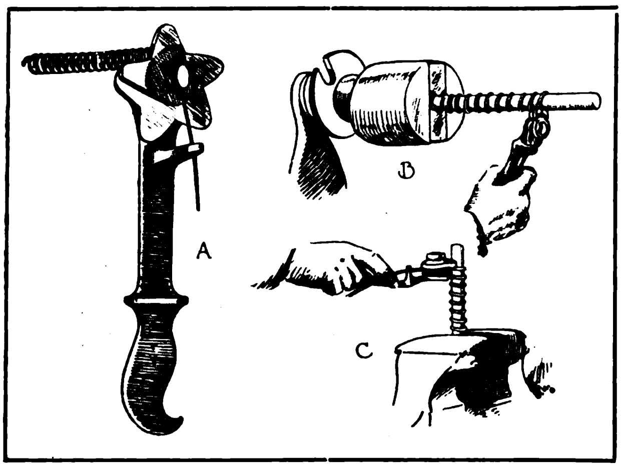


Fig. 1—Useful Tools for the Shop: A, the Perfection Spring Winder; B, Depicting Its Use in the Lathe; C, How Operated in the Vise.

The tool is illustrated at Fig. 1, the drawing at A showing how the wire is fed when the device is operated by hand, and that at C when in the vise with a mandrel. When utilized in the lathe or drill, an adjustable rotating disc provides for varying pitches as desired. The tool supports the arbor, making possible the winding of the very finest as well as the largest springs without kinking, as shown at B.

THE EDISON A. C. CURRENT RECTIFIER.

The growing tendency to light the automobile by electricity presents a new problem to the proprietor or manager of the garage and service station not equipped with means for charging storage batteries. In former years and before the magneto or mechanical generator of electricity replaced the battery as a source of current for ignition purposes, many shops installed charging panels and derived considerable profit thereby.

While the majority of lighting systems make provision for charging by means of the dynamo actuated by the energy of the motor, there are hundreds of cars on which the battery alone is utilized, the equipment being known as the straight storage battery system of lighting. The members employed must be removed from the machine and charged from time to time, the periods depending upon their capacities, lamp loads and hours of service.

In many garages the current is alternating and it is a well known fact that it must be converted into a direct when utilized for charging storage batteries. Many stations not equipped with rectifiers, send their customers' batteries to a charging station, and the practise not only means expense in time lost, but often the customer is inconvenienced as well.

These objections have been overcome by the invention and development of the Edison alternating current rectifier, produced by Thomas A. Edison, Inc., Orange, N. J., and shown at Figs. 2 and 3. The apparatus is stated by the maker to provide reliable and efficient means of charging batteries with an alternating current and the equipment does not require the services of an expert, it being operated easily by anyone familiar with the ordinary snap button type of switch.

The rectifier is practically a simple electromechanical valve in that it allows current waves of only one polarity to pass through it to the cells. The simplicity of operation is illustrated

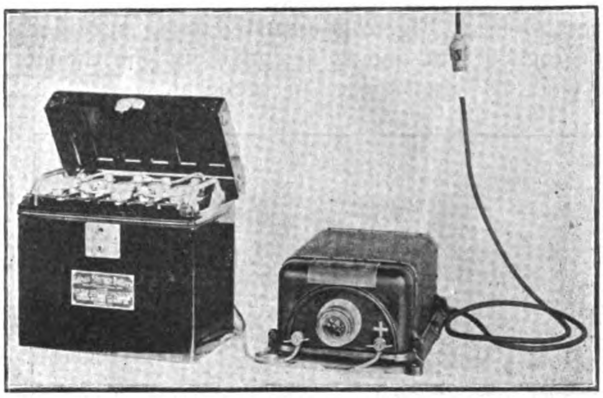

Fig. 2—The Edison Alternating Current Rectifier for Charging Storage Batteries.

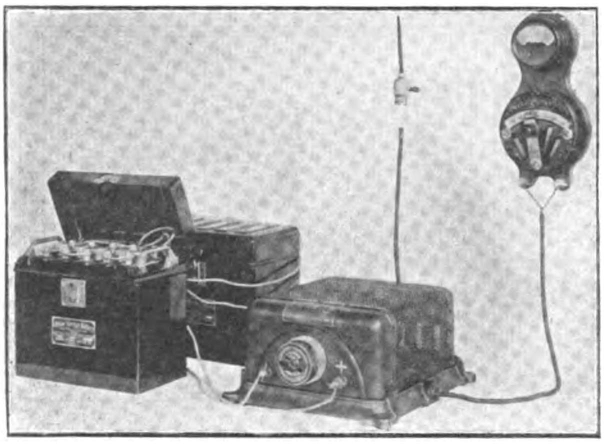

Fig. 3—The Edison Device with Rheostat and Ammeter for Service Where Different Charging Rates Are Required.

at Fig. 2, which shows the size B-2, eight amperes capacity, charging an Edison five-cell battery. The rectifier is provided with two wing nut terminals, the positive being indicated by a white +. This lead is connected to the positive of the cells and the other wire to the negative terminal. A connecting cord and plug provide means for supplying current from the main line.

The rectifier is equipped with a snap type of switch having "on" and "off" positions and by turning the lever to the former the proper charging current flows to the battery. It is pointed out by the maker that a battery may be charged in the same time with an Edison rectifier as with a direct current.

At Fig. 3 is shown the rectifier, size B-4, 16 amperes capacity, charging two sets of batteries. In order to insure correct adjustment of the charging current, a regulating rheostat and ammeter are employed as a unit. This equipment in conjunction with a cut-out switch and a fuse, inexpensive and easily installed, is recommended by the company when lead batteries of various types are to be charged and different rates of flow of current are required.

All rectifiers are provided with terminals for connecting rheostats in the charging circuit and are constructed for 110 or 220-volt circuits in various sizes to meet individual requirements. The type shown at Fig. 2 is adjusted for a specified charging current and is designed for the owner as well as the trade in general.

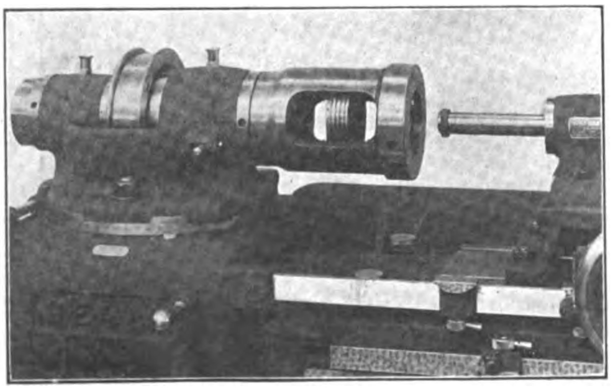

Fig. 4—The Heald Universal Bushing Chuck.

HEALD UNIVERSAL BUSHING CHUCK.

The improvements in the character of material utilized in the construction of motor cars, such as chrome nickel, and manganese steel, and other alloys, have made the use of a grinding machine a necessity in large shops. Carbonizing, heat treating and hardening produce more or less distortion, making the use of the grinder imperative to secure accurate diameters and true surfaces. The method is also valuable for finishing holes when one piece is to be held, for reaming without distortion is difficult when the walls of the work are thin and subject to collapse under the pressure of the chuck jaws.

Other materials, such as cast iron, phosphor bronze, etc., when used for work where accurately round and straight holes of definite diameter are required, such as wristpin holes, are handled easily by the grinding process and the possibility of distortion is eliminated when the walls of the piece are thin.

The Heald Machine Company, Worcester, Mass., is manufacturing the Universal bushing chuck shown at Fig. 4, designed especially for holding different bushings having thin walls. The bushing is clamped endwise while grinding the hole by a device comprising a barrel shaped holder mounted upon the work spindle of the grinder. On the front end is a removable cap threaded to the end to clamp the bushing, and this is removed to take out the work when finished. The collar at the rear of the bushing is threaded to fit the inside of the holder, and is adjustable for any length of bushing within the capacity of the holder. This rear collar is moved only when the work is changed. Both the collar and the clamp are fitted with interchangeable plates having holes slightly larger than that to be ground, and to handle bushings of different diameters substitute plates are employed.

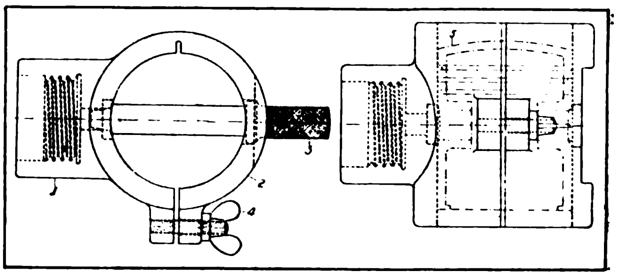

Fig. 5—Jigs for Holding Pistons When Grinding Wristpin Holes with Heald Machine.

At Fig. 5 is shown a jig for holding pistons for grinding the wristpin holes. The jig is threaded to the headstock spindle at 1, and the body 2 is bored to receive the piston 5, being held by the clamping screw 4. The piston can be located solely from the drilled hole by use of the plug 3, or if it is desirable to work from the head end of the piston for lengthwise location, a stop pin against the head end of the piston at the point 5 will insure the hole being at a definite distance from the head end, and the plug 3 can then be used simply to rotate the piston on its axis.

Recent Patents of Interest

Beck Priming Cup.

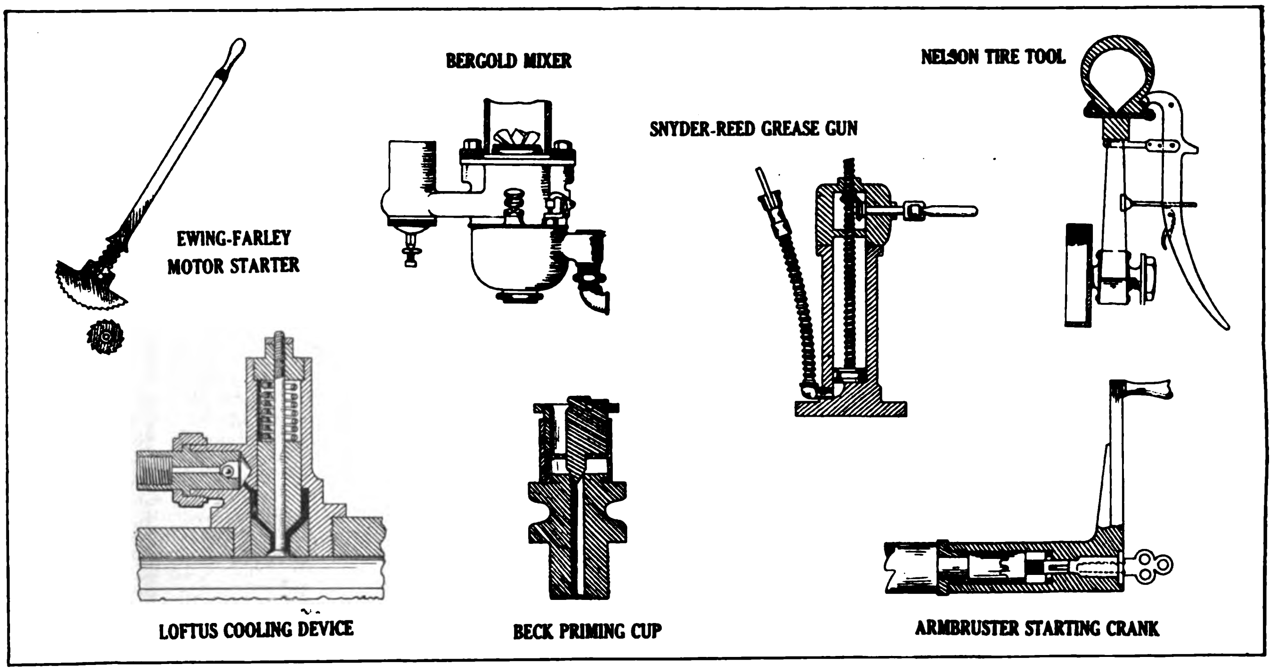
A patent has been granted to Charles W. Beck, Rockville Center, N. Y., for a gas engine priming cup in which the usual petcock and lever construction is eliminated. The cup comprises a base having a longitudinal priming aperture and an extension at its upper end. The cup proper is formed of a cylindrical shell having an inwardly turned annular flange at its lower end, the base extending into the cup and being enlarged at its upper end to interlock with the flange on the cup, thus securing it to the base. A closure plug is threaded into the cup, this being provided with a needle valve at its inner end so adapted as to close the outer end of the priming aperture in the base. The plug is so constructed as to permit of the passage of the priming fluid and carries a closure device adapted to close the outer end of the priming aperture.

Bergold Mixer.

Several devices for incorporation between the carburetor and intake manifold of the internal combustion motor, and designed to assist the vaporization of fuel, are noted among patents granted recently. Wilbur W. Bergold, Canton, O., assignor of one-half to J. M. Bergold of the same city, has secured letters patent for a mixing device which comprises a gauze interrupting disc provided with an offset rim portion and flanged rim members mounted above and below said offset rim portion of the disc. Upwardly and laterally inclined stationary deflecting blades are secured to the disc, which is provided with a plurality of openings. The mixture from the carburetor strikes the gauze and is broken up into a fine spray and deflected by the blade members.

Loftus Cooling Device.

Thomas J. Loftus, Castella, Cal., assignor of one-half to Harmon Bell, Oakland, Cal., has been granted a patent for a device to automatically inject water into the cylinder of a combustion engine. It comprises a supplementary cylinder fixed in the main cylinder and has two parts of dissimilar diameter, also a closure for the outer end. A valve member is located contiguous to the main cylinder, having a screw threaded and adjustable stem in the closure at its outer end. A spring actuated plunger is fitted in the part of the larger diameter, which is bored for the passage of the valve stem, which has its seat at the lower end of the part. The plunger seat is kept normally closed upon the valve member and is raised therefrom by the explosions in the main cylinder. The flow of the water is controlled by a valve



Illustrating Recent Inventions of Interest to the Manufacturer, Agent and Owner, Including Key Actuated Starting Crank, Tire Tool, Motor Starter, Grease Gun and Priming Cup.

member and passes into the cylinder when the port of the seat and that of the water inlet register.

Snyder-Reed Grease Gun.

Henry C. Snyder and Charles Reed, Minneola, Kan., have been granted a patent for a grease gun that presents interesting features in that it is provided with a flexible tube for conveying the lubricant to the part. The shell is made in two portions, one of which forms a removable head. The latter has an annular opening which fits an annular flange upon the shell member, making a joint. The plunger or piston is threaded and carries a small bevel gear loosely mounted upon it and is actuated by a similar member attached to a handle. Rotating the latter moves the plunger, forcing the grease out through the flexible tubing and nozzle.

Nelson Tire Tool.

A tire tool that is an improvement over devices of a similar nature is that patented by Axel A. Nelson, Washington, D. C. The lever is provided with an offset arm at one end for engaging the casing ring and the fulcrum bearing is secured through an extension having a curved end for the purpose of gripping the spoke of the wheel. A strut is incorporated between the fulcrum member and the handle and is provided with a ratchet and pawl mechanism, which secures the lever in the different positions into which it may be moved when in engagement with the tire.

Ewing-Farley Motor Starter.

George K. Ewing and Colby R. Farley, Ewington, O., have been granted a patent for a mechanical motor starter for automobiles. A horizontal shaft at right angles to the motor shaft carries a bevel gear which is meshed with a similar member upon the engine shaft. A ratchet toothed pinion is secured to the starter shaft and a ratchet toothed sector is so constructed and arranged as to mesh with the other pinion. The hand lever is longitudinally slotted and shouldered and carries the sector. An abutment is opposed to the shoulders of the lever and a horizontal pivot extends through the slot of the lever. A helical spring is compressed between the abutment and shoulders whereby the lever and sector are normally retracted.

Armbruster Starting Crank.

John C. Armbruster, Minneapolis, Minn., assignor of one-half to Ernst A. Armbruster of the same city, has patented a key actuating motor starting crank designed for the purpose of preventing others than those possessing a key from starting the engine. The device is simple in its operation, and when the key is removed, the interlocking teeth of the motor shaft and starting crank cannot be meshed. The lever of the starting crank is provided with a long sleeve like hub in which is mounted a pair of co-operating clutch members having interlocking teeth at their abutting faces. One clutch member is provided with a reduced stem portion, to the outer end of which is secured a hollow ratchet tooth head, the teeth being adapted to engage with similar members upon the shaft of the motor. The stem portion is journalled in a sleeve like bearing, the reduced end of which is screwed into the hollow end of a lever hub. In this manner this clutch member and head are held against endwise movements in respect to the lever hub, but are free to rotate in respect thereto. The clutch member is free for sliding movements within the lever hub, but is held for rotation by lugs on the other clutch member, that engage with slots formed in the interior of the hub. The rotary clutch operating bolt or stem is rotatively mounted in the outer portion of the lever hub, has threaded engagement with the first clutch member, and itself is held against endwise movements, so that by rotation thereof the two clutch members may be engaged and disengaged. The clutch operating bolt is constructed with threads of such pitch that one rotation will move the first clutch member from its normal inoperative position into operative, or vice versa. A small tumbler lock of the Yale type is employed, the barrel of its case being seated within and rigidly secured to the outer end of the lever hub, and its rotating tumbler is flexibly connected by a link to the outer end of the rotary bolt. When the clutch members are disengaged by the movement of the key mechanism, the starting crank is rendered inoperative in that the lever and its hub will rotate freely and will not mesh with the other clutch member.

OTHER PATENTS GONE TO ISSUE.

Muffler, George Cormack, Plano, Ill., assignor to Independent Harvester Company, same place. A muffler comprising a chamber having a series of baffle plates extending alternately from either side of the chamber, and outlet openings in the side walls between the position of the baffle plates.

Tire Tightener, Theodore F. Chrane, Gravette, Ark. The felloe of the wheel has an opening with reduced ends and spacing blocks with teeth having screw openings, and means are provided for moving said blocks.

Anti-Skid Device, Stephen S. Miller, Akron, O., assignor to the Consolidated Rubber Company, New York City. An anti-skidding device for dual block tires, comprising a chain extending over the tires and a plate and eye bolt for securing same.

Nut Lock, Otto Terrian, Manistique, Mich. A lock comprising a set screw adapted to pass through one side of the nut and engage with the bolt also a plate retaining device.

Battery Connector, James Monroe Hall, Sulphur Springs, Tex. A rotably mounted rod carries a number of fingers which contact with the poles of the cells and suitable wires and means for moving rod members into and out of engagement.

Motorcycle, Edwin O. Himes, Albion, Ind. A motorcycle carrying two persons, the main frame having side bars with upturned rear portions and a seat supporting frame attached thereto. The operator occupies the front seat directly in front of the rear passenger.

Motorcycle Stand, Samuel T. Steinberger, Peoria, Ill. Telescoping members are provided and incorporated with these are cylinders and pistons, the former containing a fluid, and a valve controlling mechanism.

Resilient Tire, Hugh A. Carmichael, West Lorne, Ontario, Canada. Coils of wire having an annulur form encircle the rim of a wheel and plates are secured to the coils.

Cushion Tire, Michael M. Weiss, Detroit. The tire is composed of solid material having inner and outer series of transverse passages of different diameters, the inner ones being arranged opposite the spaces between the outer ones.

Headlight Controller, Wilson B. Hargreaves, Bloomingdale, N. Y. The lamp bracket is secured to a spindle having a bearing head and to the spindle is attached a rod like member leading to and connecting with the steering mechanism of a motor car.

Plant of the Romadka Trunk Company, Milwaukee, Wis., Recently Purchased by Kissel Motor Car Company.

WITH THE MANUFACTURER

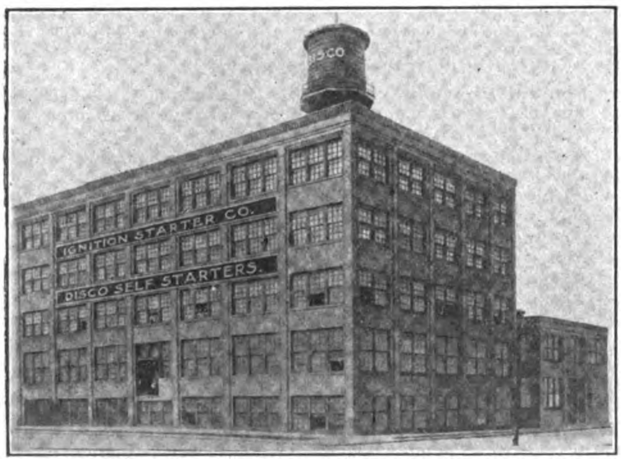
The Motz Tire & Rubber Company, Akron, O., maker of Motz cushion tires, has opened a direct factory branch at 4 Dundee street, Boston, Mass., in charge of M. A. Frank. This will succeed the New England agency formerly held by the Standard Tire & Rubber Company in that city.

Harry H. Elmer, formerly director and general manager of the Grant Motor Car Company and the Grant-Lees Machine Company, both of Cleveland, O., has resigned. Although he has been approached by several interests since this fact became known, it is understood that he will devote his attention to certain personal matters for the present.

The Century Electric Motor Car Company, Detroit, of which John Gillespie is the head, has moved its factory to the new building erected by the company at Woodward and Lathrop avenues and has started work with two shifts, night and day. The offices also will be moved to the new plant.

The Star Carburetor Company, 685 East Atwater street, Detroit, maker of Star carburetors, will be known in the future as the Star Foundry & Machine Company. The plant has been extended so that the making of carburetors is now a small part of the work done. Another new building will be added at once to take care of the rapidly increasing business.

The Apperson Bros. Automobile Company, Kokomo, Ind., held a meeting of its stockholders at the company's office recently, when Elmer Apperson, Edgar Apperson and T. E. Jarrard were elected as directors for the coming year. Later, at a meeting of the board of directors, officers were elected as follows: President and general manager, Elmer Apperson; vice president, T. E. Jarrard; secretary and treasurer, Edgar Apperson.



New Factory of the Ignition Starter Company, Detroit.

The K-R-I-T Motor Car Company, Detroit, maker of K-R-I-T cars, will provide for a salesroom in the new one-story service station now in course of erection at the factory.

The Ignition Starter Company, Detroit, has moved into the new factory building shown in an accompanying illustration. This concern manufactures the Disco starting system, now in use on some 30 different makes of cars, and one of the features of its business has been the fact that no matter how rushed it has been it always has been able to make prompt delivery. This same service is still further guaranteed by the completion of the new building.

A. T. Carbahan, veteran tire salesman of the Swinehart Tire & Rubber Company, Akron, O., has been appointed district manager in charge of Ohio, West Virginia, Kentucky, western New York, western Pennsylvania and eastern Michigan.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, has opened a factory branch at Birmingham, Ala. The salesroom and service station is located at 619-621 South 20th street, where trained factory men are ready at all times to give factory technical service. L. L. Barnes is manager of the plant.

L. A. Austin, until recently sales and advertising manager of the Rutenber Motor Company, Marion, Ind., has resigned to become general sales manager of the Mais Motor Truck Company, Indianapolis, Ind.

The Sturdy Manufacturing Company, Chicago, maker of Sturdy spark plugs, has taken over the Sta-Rite line of ignition plugs, consisting of the Venus, Vulcan and Gotham. The Sta-Rite Vulcan plug is of the double porcelain type, the Venus, a mica plug and the Gotham a single hollow porcelain spark plug. The Sturdy company will also build special brand spark plugs on a large scale for the 1913 season.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, has closed contracts for the following agencies during 1913: Henry L. Hattemer, Montgomery, Ala.; Herbert Nuttall, Pacific Grove, Cal.; S. F. Ruff, Stockton, Cal.; J. Ramselius, San Jose, Cal.; Wesley B. Parker, Ventura, Cal.; Williams Bros., Lordsburg, Cal.; P. J. Weisel & Co., Anaheim, Cal.; Dr. Charles L. Wetzel, Miami, Fla.; Wynn W. Scott, Haines City, Fla.; R. C. Neely & Co., Waynesboro, Ga.; D. D. Snyder & Co., Danville, Ill.; Frank J. Adams, Salisbury, Md.; W. S. Farrant, Grand Rapids, Mich.; The Bergen Auto Company, Fargo, N. D.; Monroe City Auto Company, Monroe City, Mo.; H. J. Morse, Saranac Lake, N. Y.; Falls Auto & Sales Company, Cuyahoga Falls, O.; C. D. Hershberger, Wilkesbarre, Penn.; Automobile & Supply Company, Lancaster, Penn.; George T. Bergeron, Calvert, Tex.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has closed 1913 contracts with the following dealers, who will handle the cars in their respective territories: C. H. Dean, San Antonio, Tex.; Harry Washburn, Bath, Me.; J. J. Youd, Mt. Bullion, Cal.; E. M. Dates, Santa Rosa and Sausalite, Cal.; George C. Hupp, Birmingham, Mich.; George W. Garland, Holyoke, Col.; Crescent Garage & Supply Company, Crescent City, Ill.; Muncie Garage, Muncie, Ind.; Burkhalter Bros., Mulberry, Ind.; Greider & Hawkins, Flora, Ind.; H. L. Gilbert, Chillicothe, Mo.; Howard C. Parker, Center, Tex.; C. M. Story, Wabash, Ind.; Kathryn P. Carroll, Hartford City, Ind.; Becker Automobile Company, Portland, Ore.; G. E. Kelly, Kossuth, Penn.; Dr. P. M. Raysor, Bryan, Tex.; Rudolph Dittmar, Massbach, Ill.; Perry & Westin, Newberry, Mich.; Berry Garage, Chicago; W. W. Calhoun, Fort Gaines, Ga.; K. W. R. Detwiller, Palmerton, Penn.; Max Wolcott Garage, Corning, N. Y.; A. S. Baker & Son, Stratton, Col.; Newton Root, Kalamazoo, Mich.; Grant S. Emery, Jonesville, Mich.; V. H. Hancuff & E. S. Shelly, Williamsburg, Penn.; P. E. Weimer, Rockwood, Penn.; Corn Belt Auto Company, Waterloo, Ia.

The Kissel Motor Car Company, which is soon to establish a branch factory at Milwaukee, Wis., recently invited the members of the Milwaukee Merchants & Manufacturers Association to make a pilgrimage to its plant at Hartford, Wis. The accompanying illustration shows the party about to leave the station in Hartford in 24 KisselKar pleasure cars.

The Imperial Automobile Company, Jackson, Mich., maker of Imperial cars, has established a factory branch at San Francisco. G. A. Troutt, direct from the Imperial factory, has taken over the Imperial interests for the entire Pacific Coast and a large service station has been established at San Francisco for Imperial owners.

The Marathon Tire & Rubber Company, Cuyahoga Falls, O., will soon enter the market with pneumatic tires and reliners. Will Ridge, vice president and general manager, was formerly with the Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires. Walter Jenks, secretary and treasurer, is an engineer of repute who has much knowledge of the tire business. Franklin Kesser, sales manager, enters his duties after long training, lately with the Firestone organization. The company expects to have its new factory in operation in a short time.

The M. & M. Company, 500 Prospect avenue, Cleveland, O., has placed on the market a new product, the Lubro non-freeze fluid for radiators. It is claimed to withstand a temperature of 10 degrees below zero without freezing. It does not expand when frozen, so that even if it should freeze in exceptionally cold weather there would be no harmful results. The M. & M. lubricants have enjoyed a reputation in the market that will give an impetus to the new article.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has appointed the following agents for the coming year: L. Kampf, Armington, Ill.; C. C. Hinckley, Aurora, Ill.; C. W. Walters, Bloomington, Ill.; F. W. Davis & Sons, Fall River, Mass.; Ft. Wayne Iron Store Company, Fort Wayne, Ind.; Model Machine Works, Frankfort, Ind.; H. A. Knease & Sons, Iowa City, Ia.; Fleming & Brown, Kankakee, Ill.; Kewanee Garage, Kewanee, Ill.; Eisen & Phillips, La Crosse, Wis.; Hotel Brown Garage Company, Middletown, N. Y.; W. J. Riley, Momenee, Ill.; J. L. Wiese & Son, Champaign, Ill.; John Henwall Auto Company, Chicago; J. B. Chambers & Son, Danville, Ill.; Cole-Montgomery Motor Company, Montgomery, Ala.; Royal Automobile Company, Montreal, Can.; L. M. Magee, Needham, Ind.; B. E. Brading & J. M. Swick, Olney, Ill; C. W. Robison & Co., Peoria, Ill.; A. R. Slinger, Portage, Wis.; Dale Dietrich Ravenna, O.; Welby C. Waterfield, Sandusky, O.; Cole Motor Company, Sioux City, Ia.; Van Duyn & Mathias, Springfield, Ill.; Frank L. Winters, Decatur, Ill.; G. H. Dean & Co., De Kalb, Ill.

The Rutenber Motor Company of Marion and Logansport, Ind., has acquired a plant at Chatham, Ont., where Rutenber engines will be manufactured for the Canadian trade. G. W. Bowen, the new president of the Rutenber company, will be at the head of the concern.

The Knight Tire & Rubber Company, Canton, O., has increased its capital from $500,000 to $1,500,000 in order to make large extensions and improvements to its plant.

H. D. W. Mackaye, assistant to the president and director of affairs of the Keeton Motor Car Company, Detroit, maker of Keeton cars, and also of the Keeton Motors, Limited, Brantford, Can., has announced that eastern interests with which he is connected contemplate the establishment of one of the largest body building plants in the world for the manufacture of automobile bodies of both wood and steel. Joseph W. Mackaye will be president of the concern and H. D. W. Mackaye will be treasurer and general manager. The capitalization of the company is understood to be $200,000.

C. W. Jacoby, who has been long connected with the automobile industry, has resigned as eastern sales manager of the Standard Electric Car Company, Jackson, Mich., maker of Standard electrics, to become general sales manager of the Pullman Motor Car Company, York, Penn., maker of Pullman machines.

William J. Slater, assistant sales manager of the Michigan Motor Car Company, Kalamazoo, Mich., maker of Michigan machines, has been elected a member of the executive committee of the central division of the Associated Advertising Clubs of America.

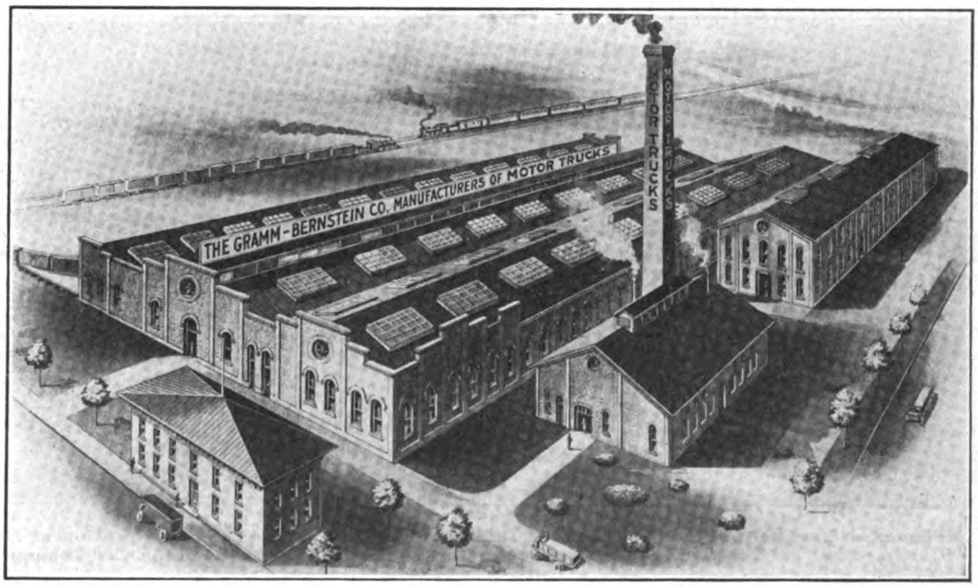
F. W. Kurtz has resigned as advertising manager of the General Motors Company after a campaign which has been very successful in paving the way for the sales department and giving the company an increased business. He will take a rest after which he will again identify himself with the automobile industry.

The K-R-I-T Motor Car Company, Detroit, maker of K-R-I-T cars, has established a factory branch at 1008 Commonwealth avenue, Boston, with Dayton G. True as manager. The retail sales agent for Boston and vicinity is F. E. Proctor.

The Gramm-Bernstein Company, Lima, O., has practically completed its new factory, which is expected to prove one of the largest plants in the country erected for the exclusive manufacture of motor trucks. With the exception of one building, all are of one story, from 50 to 63 feet wide, and running a total distance of 316 feet in length. No posts are to be found in any part of the plant, which is located along the main lines of two cellent manufacturing and shipping facilities.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland branch at 5913 Baum street, Pittsburg, Penn., which will be under the management of Frank S. Odell.

The Herbert Manufacturing Company, Detroit, maker of automobile bodies, has secured plans for a one-story addition to its plant, to cost, it is understood, $45,000.



THE GRAMM-BERNSTEIN CO. MANUFACTURERS OF MOTOR TRUCKS
MOTOR TRUCKS
MOTOR TRUCKS

New Factory Buildings of the Gramm-Bernstein Company, Lima, O.

The Flint Axle Works, Flint, Mich., has been purchased by Thomas Walker, Superintendent Weiss and other associates, and the firm name will be changed to the Walker-Weiss Axle Works. The facilities of the plant will be greatly enlarged.

The Griffin Wheel Company, Chicago, will be reorganized under Massachusetts laws, it is reported. The present Illinois corporation has $8,000,000 capital stock. The new company, it is said, will have $12,000,000 authorized common stock, of which $9,500,000 will be issued and $9,000,000 authorized 6 per cent. cumulative preferred stock, $6,000,000 to be issued.

The Stens Manufacturing Company, Springfield, Mass., capitalized at $200,000, has purchased land in that city on the line of the new Hampden railroad, not yet built, and will erect a three-story factory building 100 by 40 feet. The company was organized last summer to make automobile tires.

The Stevens-Duryea Company, Chicopee Falls, Mass., has established headquarters at Toledo, O., and a display and salesroom will be opened there soon. C. B. Cook of Toledo has been appointed district manager and superintendent of the sales and service departments for the Toledo district.

P. J. G. Kelly, for many years connected with C. F. Splitdorf in the conduct of the latter's large magneto and ignition business, has severed his connection with the Splitdorf Electrical Company of New York City. Mr. Kelly has no plans for the future, but after a much needed rest it is said he will identify himself with a well known electrical concern. His connection with the Splitdorf company dates back a dozen years and his retirement comes as a surprise to the trade.

The Dahl Punctureless Tire Company of America has been organized under the laws of South Dakota. This company was organized for the purpose of taking over the business of the Dahl Punctureless Tire Company, a Minnesota corporation, but the transfer has not yet been made. The Minnesota concern still continues its business as heretofore, with headquarters at Minneapolis, for the present at least.

GARAGE & DEALER

H. F. Peterson, Chicago, is planning to build a two-story brick garage at 4254 Hazel avenue, to cost $3000.

J. C. Lewis, Savannah, Ga., formerly with T. A. Bryson, has secured the agencies for the Ford and Cole machines and has entered business for himself, now being busy making contracts for automobiles and supplies.

The Clearmont Motor Company, Clearmont, Mo., has been formed by Guy C. Clary, William G. Carpenter, Bert R. Reynolds and Fred C. Newlon to sell automobiles and do repair work. They have purchased two corner lots at Clearmont and also two lots adjoining the first purchase and will erect a building 40 by 80 feet.

L. S. Turner of Kansas City, Kan., has purchased the Abilene Garage, Abilene, Kan., of Herman Herr.

The Automobile Tire Filling Company of Maryland and District of Columbia has been incorporated to engage in the tire filling business. Headquarters have been established at 2207-2209 Madison street, Baltimore, Md.

The Westcott Motor Car Company, Little Rock, Ark., has taken the agency for the Pierce-Arrow cars, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., for the state of Arkansas.

George Hummel, 25 North Dearborn street, Chicago, is to erect a one-story garage, to cost $16,000.

The Fisk Rubber Company of New York City has completed additions to its branch at 1725 Broadway, New York City. A new four-story and basement service building on 55th street has been merged with the quarters which front on Broadway. The branch is in charge of Jay B. Cothran.

Paul R. Pelz, who has been temporary director of the Benz Automobile Import Company, will soon return to the Benz headquarters at Mannheim, Germany. The management of the American branch will be taken by William F. Dietzsch, who has been previously connected with the automobile industry abroad.

The Federal Motor Supply Company, Cincinnati, O., has been formed with capital of $250,000 and will handle accessories and supplies for automobiles, trucks and motor driven vehicles of all kinds. Five retail houses are to be established immediately in the Middle West, which will draw their supplies from the Cincinnati house. The officers of the company are: President, George W. Platt; vice president, Fred H. Berold; secretary, Jesse W. Wozencraft; assistant secretary, F. W. Stukenborg, formerly with Coughlin & Davis; treasurer, Emil G. Schmitt.

Frank R. Parker, Boston, well known as Elmore agent in that territory since 1905, has joined the sales force of the Motor Car Manufacturing Company, Indianapolis, maker of the Pathfinder pleasure and commercial lines, representing the concern in New England with headquarters in Boston.

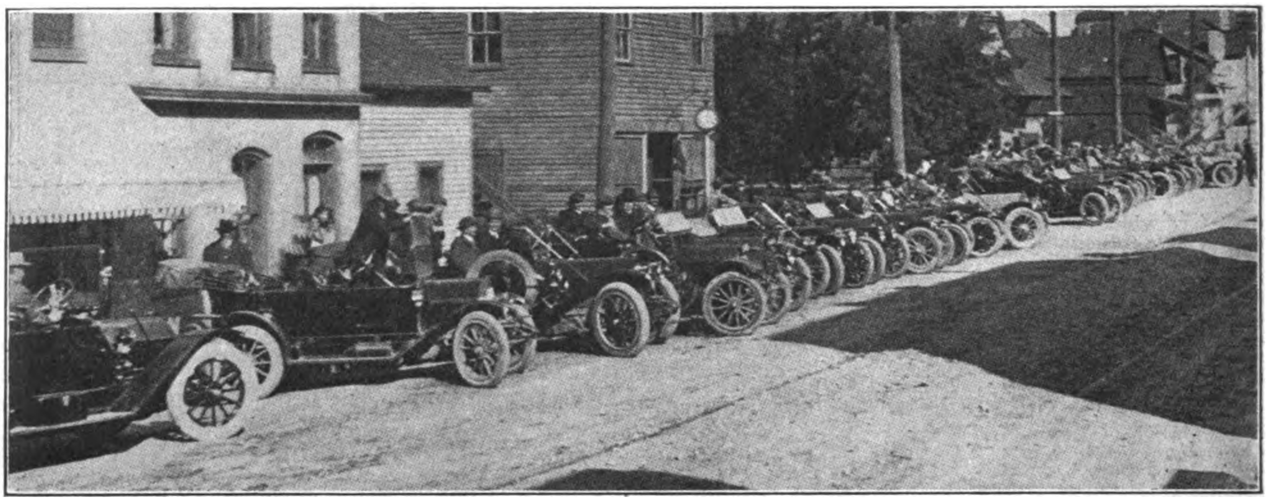
L. W. Place, at one time connected with the sales force of the Buick Motor Company, Flint, Mich., maker of Buick cars, and later with the Olds Motor Works, Lansing, Mich., maker of Oldsmobile machines, as assistant to the general manager, has been appointed foreign representative of the General Motors Company. He sailed from Vancouver, B. C., and his first stop will be Australia. He will be gone 18 months, during which time he will visit every country of note in the eastern hemisphere.

F. McFadden, formerly affiliated with the American Roadster Company, New York City, has signed a three years' contract with the Kline Kar Motor Company of Pittsburg, Penn., and will be sales manager of the Pittsburg district.

The Frederick E. Murphy Automobile Company, Minneapolis, Minn., is to erect a new and modern automobile building at Hennepin avenue and 13th street, to cost $140,000. The building will front 137 feet on Hennepin avenue and have a depth of 144 feet on 13th street. It will be three stories high and will have the largest showroom devoted to motor vehicles in the West. It will be ready by March 1.

A. G. Schonacker, general manager of the Marvel Carburetor Company, Flint, Mich., has resigned on account of ill health and expects to locate in the West, where he hopes to take up an agency in a section that will be conducive to building himself up physically. Mr. Schonacker joined the Marvel company when it was comparatively small and leaves it at a time when its output for the current year is contracted for.

H. R. Averill, who has been connected with the Pullman Motor Car Company, York, Penn., maker of Pullman machines, has resigned his position.



Members of the Milwaukee Merchants & Manufacturers Association Leaving Station at Hartford, Wis., in 24 KisselKars to Visit the Hartford Plant of the Kissel Motor Car Company.

David C. Fenner, Jr., New York sales manager of the International Motor Company, maker of Mack, Saurer and Hewitt trucks, has been promoted to be manager in full charge of the New York branch of the company, with all its territorial departments.

Col. K. C. Pardee, a pioneer of the retail trade, has resigned as general manager of the United States Motors New York Company, distributor of the Maxwell lines, to become identified with a concern now forming to enter the manufacturing field. The nature of the business has not been stated.

C. E. Osborn has been appointed Pacific Coast manager of the Speedwell Motor Car Company Dayton O., maker of trucks and pleasure vehicles, succeeding R. Harry Croninger, who will return to the Dayton factory to assume the management of the truck department, although retaining the presidency of the Pacific Coast branch.

William A. Baxter, formerly general sales manager of the Dayton Auto Truck Company, Dayton, O., maker of Durable Dayton motor trucks, has been appointed sales manager of the Pan-American Motors Company, San Francisco, distributor of the Durable Dayton trucks in the Pacific Coast states.

J. K. Gewinner, prominent in the automobile accessory field in Atlanta, Ga., has severed his connection with his former associates and organized the Johnson-Gewinner Company, at 83-85 North Forsythe street and 124 Peachtree street. The firm will carry a varied assortment of automobile accessories. It will also conduct a finely equipped shop in charge of a man educated at the factories, for the care of magnetos, carburetors, etc. The company will specialize in this work so as to give service and satisfaction to manufacturers whose lines have been neglected in that territory and whom Johnson-Gewinner Company will represent in a thorough manner.

Capt. John J. Seay has purchased of Capt. J. L. Bass, Rome, Ga., as an investment, the building now occupied by the Seay-McCartha Garage & Auto Company and the Southern Steam Laundry on East First street. He will remodel the building for the exclusive occupancy of the garage. The consideration is said to have been $14,000.

R. S. Keeves, Oregon, Mo., has disposed of his interest in the J. H. Keeves Automobile Company, to his son, John H. Keeves, for $6200. The latter has sold a half interest to H. G. Cook and the firm is now known as the Keeves-Cook Auto Company.

Simon Westra and Edward Van Woudenburg have taken charge of the Parkinson garage, Rock Valley, Ia., which they recently purchased.

E. E. Harlan and John Pitka have purchased the interests of Clinton Fosnacht and L. L. Hufford in the National Auto Specialty Company, Tama, Ia.

A. I. Reifsnider, Baltimore, Md., has purchased a large commercial garage on the west side of Madison avenue, between Lafayette avenue and Mosher street. The consideration is said to have been $15,000.

F. O. Calkins and John Thompson, Wadena, Minn., propose to enlarge their garage to double its present capacity and the work has already been begun.

D. C. Hathaway, assistant sales director of the Foraker-Dayton Motor Truck Company, reports that an agency will be established at St. Louis, Mo., of which Allen Baker will be manager.

J. H. Hileman, Waterloo, Ia., has taken the agency in that city for the Haynes line, made by the Haynes Automobile Company, Kokomo, Ind., and has established headquarters at 310 West Park avenue.

W. L. McQuerry, De Soto, Ia., has established a large and modern garage in the Hich building, that city.

Frederick W. Davis, Fall River, Mass., has purchased property on North Main street and will open an up-to-date garage and machine shop.

Frank L. Seaker and Elmer C. Curtis, Watertown, N. Y., have secured the building formerly occupied by the Abbott shirt factory, which they are having remodelled and converted into a garage.

The M. & A. Garage is the name of the new establishment opened in the Gowdowsky building, Macomb, Ill., for the care and repair of motor vehicles. The firm is composed of J. C. McDonald and Joseph Atherton.

Rekenthaler & Heilman, Cushing, Ia., has dissolved partnership, Mr. Rekenthaler retaining the garage in his own name.

The Service Motor Company, Antigo, Wis., has purchased the garage at 626 Superior street. G. A. Zwicky and F. J. Zwicky have been put in charge.

The Heitz Garage on East Second street, East Hill, Ia., is being enlarged by an addition to be absolutely fireproof.

The South Dakota Cadillac Company, Watertown, S. D., is planning extensive improvements and enlargements for the 1913 season.

Frank Leamer of Brooklyn, N. Y., is to erect a two-story brick garage at Caton avenue and East Second street, that city, at an expenditure of $10,000.

The Barker, Rose & Clinton Company, Elmira, N. Y., has opened a new supply department and will cater to the automobile trade.

A. D. Russell of Princeton, N. J., will erect a six-story garage on West End avenue, between 63d and 64th street, New York City, at an estimated cost of $250,000, for the International Motor Company.

NEWS NOTES OF THE INDUSTRY.

National Automobile Owners' Association, Asbury Park, N. J.; $25,000; automobile business; incorporators, A. M. Hushart, W. F. Paterson, D. W. Edwards.

GARAGE AND DEALER.

The Lozier Sales Company, with capital of $50,000 subscribed by prominent men in Akron, O., has been organized in Cleveland, O., to take over the business of the factory branch formerly conducted in that city by the Lozier Motor Company, Detroit, maker of Lozier cars. A. W. Woodruff has been appointed manager. The salesroom is located at 2336 Euclid avenue.

The Lambert Auto Company, Baltimore, Md., has been appointed agent for the Church-Field electric pleasure cars, made by the Church-Field Motor Company, Sibley, Mich.

G. F. Green, Brewster, Wash., has taken the agency for the Ford car, made by the Ford Motor Company, Detroit, and will establish a garage in that city.

The General Motor Car Company, Philadelphia, Penn., agent for Lozier, Paige-Detroit and Rauch & Lang electrics, has leased premises at 21st and Ludlow streets, containing 52,000 square feet of floor space for salesrooms, repair, paint and body shops. After an expenditure of $40,000 to adapt the building to its uses, the company will occupy it in the near future. Until that time it will be in its old quarters at 227-229 North Broad street.

The Meriden Auto Service Company, Meriden, Conn., has been formed to buy and sell automobiles and motor trucks, with offices at 35 State street. The officers of the company are: President, Dr. H. L. Patzold; secretary, Paul C. Booth; treasurer, William H. Cumberidge.

James S. Butler is occupying his new garage, which has just been completed on New Derby street, Salem, Mass. The structure is held to be absolutely fireproof.

The S. L. Crosby Company, Bangor, Me., has moved into its new fireproof garage on Salem court. The firm now has one of the largest workshops devoted to automobile repairing in Maine. The company has the agency in eastern Maine for the Ford car, made by the Ford Motor Company, Detroit.

The Kansas City Automobile Supply Company, 1504 Grand avenue, Kansas City, Mo., has purchased of J. C. Gates 49.5 feet of land on McGee street between 18th and 19th streets, at a cost of $25,000. The company will erect a four-story building on the site, to cost $40,000.

F. J. Tyler of the Tyler Bros. Corporation, Boston, has announced the establishment of a factory branch to handle in New England the products of the Little Motor Car Company and the Chevrolet Motor Company, both of Flint, Mich., and both controlled by the Republic Motor Company, Detroit. The branch will be conducted under the style of Republic Motor Company of Massachusetts and will be under the management of W. C. Sills, who has been assistant manager of the Buick Boston Motor Company for the past three years.

The Van Vliet-Bradt Motor Company, Des Moines, Ia., has been incorporated with a capital of $10,000 and quarters have been secured at 919 West Locust street. The officers of the new company are: President, W. E. Moyer; vice president, W. J. Bradt; secretary and treasurer, C. G. Van Vliet.

The Reliance Automobile Company, San Francisco, Cal., has secured new headquarters at 1655 Van Ness avenue, formerly occupied by the Stearns Company. The building will be remodelled and Knox pleasure cars and Detroit electrics will be handled. The salesroom for the Knox trucks and the repair and service departments will be at the company's machine shops, 547-557 Fulton street, which will be in telephonic communication with the headquarters on Van Ness avenue.

Henry Donnecke of Le Claire, Ia., has purchased the interest of C. S. Fries in the Fries & Dittmer garage.

The Gamble Motor Car Company, Toledo, O., owned by Carl and Lyman Spitzer, has decided to build an addition to its headquarters at 1211-1215 Madison avenue.

Lon Gephart of New Castle, Ind., has opened a modern automobile repair shop at 311 North 11th street.

W. M. Chellis, Portland, Me., has purchased the garage at the rear of 684 Congress street and has added a first class service station in which all kinds of repair work will be undertaken.

The Weller Auto Company, Bay City, Mich., is a new concern which has located at 905 Saginaw street.

Simpson, Swain & Simpson, Gridley, Cal., has purchased the City garage, heretofore conducted by J. F. Shaeffer & Son, and will operate it in connection with its original garage.

O. R. Fuller, Los Angeles, Cal., has secured plans for the erection of a garage at 719 North Alameda street, to cost $20,000.

The Meyer-Busch Auto Company, St. Louis, Mo., is now in its new home at 5072 Delmar boulevard. The sales department is in charge of W. G. Laves.

The St. Louis Lozier Company, St. Louis, Mo., has been incorporated with capital stock of $25,000, to handle the Lozier car, made by the Lozier Motor Company, Detroit. H. B. Graham is president and Nelson S. Getshall is vice president and general manager. The office is at 4160 Olive street.

The William E. Ball Auto Company, 115 East Markham street, Little Rock, Ark., which has the state agency for the Cole machines, made by the Cole Motor Car Company, Indianapolis, Ind., has secured the agency for Packard cars, made by the Packard Motor Car Company, Detroit.

William B. Waters and Fred Waters, who at present conduct the Red Bank garage, Red Bank, N. J., have purchased of Morgan V. Disbrow the large two-story brick garage on Bridge avenue, recently erected by the latter.

The New Automobile Company, Jacksonville, Fla., has entered business in that city and has opened a garage at 919-921 Main street. Judge H. B. Phillips is president and N. B. Downey is sales manager.

John Christensen & Co., Galveston, Tex., is to erect a building on Tremont street similar to the one recently built for the company on Church street, both to be used for its automobile business. The cost will be $20,000.

The Star Garage, Mishawaka, Ind., has been purchased by Robert Harvey, owner of the Harvey Auto Livery, operating for some time at Mishawaka and South Bend. M. W. Stark, Elkhart, Ind., was the former proprietor.

The Southern Motors Company, Louisville, Ky., has taken over the garage of the Miles Auto Company, 615 South Third street. The Packard cars, formerly handled by the Miles company, will now be distributed by the Southern Motors Company, which also distributes Hudson cars, made by the Hudson Motor Car Company, Detroit.

The Tudor Garage on Washington avenue, Chelsea, Mass., has been purchased by L. and S. Gale of Everett, Mass., and business will be conducted under the firm name of L. Gale & Son. Harry Snowman will be retained as assistant manager. Samuel Gale will be manager and treasurer.

George Figel, who has temporary quarters on University avenue, San Diego, Cal., has secured a lease of a new garage which will be erected at City Heights at a cost of $10,000, by S. M. Toole, capitalist. The building will contain all the modern apparatus for repair work.

J. S. Morrison is manager of the new agency at Phoenix, Ariz., which will distribute the Hupmobile, made by the Hupp Motor Car Company, Detroit, in Arizona and New Mexico. The distributing agency does not conflict with the retail agency conducted at Phoenix by John A. McCondra and L. E. Hoeye, with offices at First and Monroe streets.

The Stewart-Borcher Auto Repair Company, Waterloo, Ia., has located a first class repair shop at 219 East Sixth street, where repairs to all makes of cars will be undertaken. A complete line of supplies is to be kept in stock and the company intends to add a new automobile to its line in the spring.

The Blackhawk Auto Company, Waterloo, Ia., will move to larger and more modern quarters in the near future.

The Barr-Morgan Auto Company, Sioux City, Ia., has located at 525 Sixth street and will handle the Cole machines, made by the Cole Motor Car Company, Indianapolis, Ind.

J. W. Mooman has sold his interest in the Urbana Auto Company, Urbana, Ill., to his partner, John F. Miller. F. L. Cannon is manager.

The Iowa Auto & Tire Company, Davenport, Ia., has been reorganized and will be known in future as the Iowa Taxicab Company. It is located at 112 Commercial alley and has the agency for the Pierce-Arrow cars, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y.

W. L. Bunker and A. V. Reopell, well known in automobile circles, have opened salesrooms on Fort street, Springfield, Mass., having formed a company to handle the Rambler, Little and Chevrolet cars. Plans are being made for doing an extensive business.

The Cole Motor Car Company, local branch, Indianapolis, Ind., has completed the equipment of its new service station at 524 North Capitol avenue. It occupies two floors of one of the handsome concrete showrooms which form Automobile row in Indianapolis. One unique feature is a bell on the outside of the building by which the passing motorist can summon the foreman without delay.

The Isotta Fraschini Motors Company, New York City, is now in its new quarters at 1920 Broadway. The change in location was due to the fact that the company had outgrown its old quarters. A service station, with a full and complete stock of parts has been established on the third floor and excellent service will be given to owners of Isotta cars.

The Thomas B. Jeffery Company of California, San Francisco, Cal., has moved into its new three-story building on 12th street near Market street, where more than 30,000 square feet of floor space will be devoted to the care and sale of Rambler cars, made by the Thomas B. Jeffery Company, Kenosha, Wis. The lower floor cares for the general offices, the display room, parts department and space to make minor repairs and adjustments. The second floor will be given over to the storage of new cars and the top floor will be devoted to the machine shops and general repair work. No delay will be encountered in any department of the firm, which now enjoys as good facilities as any on the Pacific Coast.

Charles Wedding, Jerseyville, Ill., has purchased the interest of his partner, Clarence Heidscheid, in the firm of Wedding & Heidscheid, and will continue the business alone.

A. F. Shallberg, Moline, Ill., is to open the first exclusively electric garage in that city, at 1521 Library avenue. He will handle the Rauch & Lang line.

The Robertson Tire & Auto Company, Birmingham, Ala., is a new concern formed with W. W. Robertson as manager. Associated with him are J. E. Vandergriff and E. R. Minhinnette. It will handle Cole cars, made by the Cole Motor Car Company, Indianapolis.

Morrison & Dains, Mount Pleasant, Mich., has sold its repair shop to C. A. Kellogg and J. M. Taggart, who will move the plant from South Main street to 220 East Broadway.

The Hailey Auto Company, Hailey, Idaho, has been reorganized and will be operated in future under the name of the Fowler, Stimson & Furcht Auto Company.

The Maurer Garage Company, Sheboygan, Wis., has been dissolved and its business taken over by the Sheboygan Auto & Supply Company. C. F. Kade, Caroline F. Thieman and Felix Benfry are the incorporators of the new concern and Carl Kade and Robert Thieman will manage the business.

S. E. Brune & Son, Woodburn, Ore., has purchased the Public garage, automobile and repair business of L. M. Remington, on South First street. They have the agency for the Michigan line, made by the Michigan Motor Car Company, Kalamazoo, Mich., in addition to motorcycles and bicycles.

Harold E. Wolcott has established a salesroom at 100 Cass street, Joliet, Ill., in which he will handle the Cadillac cars, made by the Cadillac Motor Car Company, Detroit.

The Akron Tire Company, Philadelphia, Penn., has opened a branch at 1024 14th street, Washington, D. C., with N. A. Brandriff as manager.

The Mason City Vulcanizing Company, Mason City, Ia., has been formed by Nels Narveson and W. A. Childress, who will conduct a repair shop.

The Co-Operative Auto Company, St. Paul, Minn., has secured the garage at 199 West Fifth street. The firm will do a general garage business, including storage and repairing. S. W. Wicks is president of the concern.

Peddycort & Lahr, Cheyenne, Wyo., have opened a garage at 19th and Thomas streets and will do a general repair business.

The Williams-Hasley Motor Car Company, Pittsburg, Penn., has just moved into its new quarters, Baum street and Euclid avenue, where a first class service station will be maintained.

The Luttrell Company, Washington, D. C., has opened its new service station and garage on New Hampshire avenue. The building is the largest of its kind in the city, two stories high and of steel and concrete construction.

The City Auto Company, Athens, O., is to reconstruct its Carpenter street garage into a building three times its present size, which will be occupied exclusively by this company. Work will begin immediately.

The Missouri Taxicab Company, St. Louis, Mo., has purchased land on Euclid avenue upon which it will erect a garage building to cost $25,000.

A Few of the 410 Members of the Cleveland Chamber of Commerce Visiting the Plant of the B. F. Goodrich Company, Akron, O.

W. H. Shimman of Toledo, O., will erect in the spring a garage fronting on Mason street. The establishment will have modern facilities.

F. S. Cropley has taken over the old Federal tire agency at St. Louis, Mo., and established a factory branch at 4628 Olive street. He will handle a complete stock of tires and tire accessories.

WITH THE MANUFACTURERS.

The B. F. Goodrich Company, Akron, O., maker of Goodrich tires, recently entertained 410 members of the Chamber of Commerce, Cleveland, O., at its factory. The task of meeting and arranging these guests so that each should obtain accurate information concerning the various departments of the plant, which affords 65 acres of floor space, was carried out successfully. An accompanying illustration shows a portion of the party about to enter one of the buildings.

The Knight Tire & Rubber Company, Canton, O., maker of Knight tires, has opened a branch office at 221 Peachtree street, Atlanta, Ga., under the management of H. C. Ross, for the past seven years connected with the Diamond Rubber Company's interests in the South. The branch will be the general distributing point for six or seven states surrounding Georgia.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has signed the following 1913 contracts: Rudolph Dittmar, Massbach, Ill.; Perry & Westin, Newberry, Mich.; Barry Garage, Chicago; W. W. Calhoun, Fort Gaines, Ga.; K. W. Detwiller, Palmerton, Penn.; Max Wolcott Garage, Corning, N. Y.; A. S. Baker & Son, Stratton, Col.; Newton Root, Kalamazoo, Mich.; Grant S. Emery, Jonesville, Mich.; A. H. Hancuff and W. Shelly, Williamsburg, Penn.; P. E. Weimer, Rockwood, Penn.; The Corn Belt Auto Company, Waterloo, Ia.; Davis & Turney Company, Dallas, Tex.; Ernest C. Currier, Ipswich, Mass.; W. H. Carll & Sons, Rochester, N. H.; William G. Dupont, Berlin, N. H.; E. J. Weese, Ipava, Ill.; Terre Haute Machine Works, Terre Haute, Ind.; George McDonald, Akron, Col.; Ray Danner, Loveland, Col.; Fancher Bros., Evanston, Ill.; Shean Auto Station, Springfield, Mass.; W. D. Havens, Schenectady, N. Y.; A. H. Wilson Motor Car Company, Canton, O.; K. A. Knudson, Delhi, Minn.; W. F. Schroeder, Danube, Minn.; Martin Rimestad, Olsen, N. D.; Lon Sellars, Amarillo, Tex.; Walter-Hafner Jewelry Company, Hillsboro, Tex.; G. R. Daniels, Olean, N. Y.; B. D. Smith, Odell, Tex.; J. N. Ginter, Wooster, O.; Beyer & Feakes, Hackensack, N. J.; Karlson's Garage, Hicksville, N. Y.; W. S. Lawrence, Moira, N. Y.; Julius Lichtenstein, New York City; N. C. Doering, Gaylord, Minn.; R. J. Orchard, Garske, N. D.; J. B. Siegfried, Canbridge, O.; George D. Woods, Mancos, Col.; Elm City Publishing Company, Waterville, Me.; Kansas Motor Car Company, Wichita, Kan.; Dupont Motor Company, Washington, D. C.; Westcott Motor Car Company, Little Rock, Ark.; Modern Garage, Jacksonville, Ill.

William H. Hotchkiss of Buffalo, N. Y., formerly a member of the American Automobile Association and also state superintendent of insurance of New York State at one time, has been elected president of the twin automobile insurance companies, known as the National Motor Indemnity Company and the National Motor Insurance Company of New York City.

The Fisher Auto Top Company, Norwalk, O., manufacturer of automobile tops, has extended its factory facilities and in addition to its quarters on West Seminary street has occupied space in the Hull building on Hester street.

The Cole Motor Car Company, Indianapolis, Ind., has appointed the following agents for 1913: F. W. Davis & Sons, Fall River, Mass.; Palace Auto Station, Worcester, Mass.; Pawtucket Auto Company, Providence, R. I.; Anderson Automobile Company, Anderson, Ind.; W. H. Dykeman, Bayonne, N. J.; Hager Bros., Baxter, Ia.; A. H. Krauss & Co., Blue Springs, Neb.; Churchill & Lockwood, Burlington, Vt.; J. R. King, Charleston, W. Va.; Kehay L. Hosmer & Co., Cairo, Ill.; E. J. Quigley, Canton, O.; Guy Coleman, Canton, Ill.; Ostrand & Lampert, Cedar Bluffs, Neb.; D. Scott Thompson, Clarksburg, W. Va.; W. E. Campbell, Clarksdale, Miss.; Covington & Smith, Clio, S. C.; A. J. Dischner, Columbus, Neb.; Franklin Cycle & Supply Company, Columbus, O.; Letts Farrell Company, Cortland, N. Y.; Boehmer & Sheridan, Fort Smith, Ark.; J. R. Kiser, Fremont, O.; W. S. Wright, Greenwood, Miss.; B. L. Lyford, Helena, Ark.; Townsend & King, Itta Bena, Miss.; L. F. Weathersby, Jonestown, Miss.; Craven & Moberly Company, Kellogg, Ia.; L. L. Sybee & Co., Knoxville, Ia.; Alfred Lofland and C. E. Layton, Lebanon, Ind.; E. Norwuist, Lexington, Miss.; Miles Auto Company, Louisville, Ky.; Cary S. Davis, Ypsilanti, Mich.; William Hillsamer & Son, Marion, Ind.; W. B. Park, Marigold, Miss.; Tipping Bros., Marshall, Mo.; J. H. Fisher, Marshalltown, Ia.; Clover Leaf Company, Mason City, Ia; W. M. James, Merida Yucatan, Mex.; E. S. Curtis, Meridian, Miss.; Bloch Bros., Mobile, Ala.; W. M. Moore & Co., Moro, Ore.; J. M. Granberry, Mt. Pleasant, Tenn.; Knight Garage, New Haven, Conn.; Lathrop & Smith, New London, Conn.; Crow & Marder, Oakland, Miss.; Oblong Auto Company, Oblong, Ill.; C. H. Weaver, Oil City, Penn.; Oklahoma Motor Car Company, Oklahoma City, Okla.; Trerir & Snyder, Rock Island, Ill.; Harry W. Smith, Scranton, Penn.; W. K. Nulsen, Shreveport, La.; R. W. Russell, St. Marys, W. Va.; Bagnell Auto Company, St. Louis, Mo.; X. A. Oliver, Summerville, Tenn.; J. B. Pennington Company, Tarboro, N. C.; J. B. Kirk, The Dalles, Ore.; H. C. Van Meter, Van Meter, Ia.; A. W. Lee, Wheeling, W. Va.; Wedge Garage Company, Zanesville, O.; J. P. Rusthoi, Arenta, Cal.; W. B. Thompson, Atlantic City, N. J.; A. W. Tindall, Hartford City, Ind.; C. L. Young, Norfolk, Va.; Reo Nevada Company, Reno, Nev.; B. E. Parker, Suffolk, Va.; Kirkew & Ickman, West Point, Neb.

J. C. Ayres has been appointed manager of the newly completed Detroit branch of the General Motors Company at Fort street, 12th street and Lafayette boulevard. Mr. Ayres has been connected with the motor truck industry since its early inception.

The Lavigne Gear Company, Corliss, Wis., has leased the plant of the Racine Sattley Company, Racine, Wis., which recently suspended operations, and will manufacture steering gears.

The Motor & Accessory Manufacturers' Association has elected the following concerns to membership: John W. Blackledge Manufacturing Company, maker of auxiliary springs and shackles and automobile accessories, 2210 Michigan avenue, Chicago; James L. Gibney Rubber Company, rubber tires, rubber goods and vulcanizers, 215-217 North Broad street, Philadelphia, Penn.; Westinghouse Electric and Manufacturing Company, electric vehicle motors, ignition and lighting systems, East Pittsburg, Penn.

JEFFERY-DEWITT COMPANY
MANUFACTURERS OF
J-D VISIBLE AND RELIANCE SPARK PLUGS
JEFFERY-DEWITT CO. PLANT NO. 2.
JEFFERY-DEWITT PLANT NO. 2

New Factory of Jeffery-Dewitt Company, Detroit, Known as Plant No. 2.

The Universal Wheel Company, Fort Wayne, Ind., with a capital stock of $1,000,000, will establish a large factory in that city for the manufacture of puncture proof automobile wheels. Temporary quarters have been secured on Pearl street.

The Parker Motor Company, Detroit, Mich., has been formed to manufacture a rotary valve motor and temporary quarters have been established at 660 Grand River avenue. V. C. Parker, formerly of Winnipeg, Can., is the manager.

The Marshalltown Motor Material Manufacturing Company, Inc., Marshalltown, Ia., or as it is generally known, the M. M. M. M. Company, Inc., has filed with the secretary of state a revision of the corporate name and will be known in the future as the V-Ray Company, Inc. The company produces the V-Ray spark plug and is enlarging its facilities anticipating a five-fold increase in output for the next year. The product will be displayed at booth 629 at the Madison Square Garden show in New York City, and booth 31 in the Chicago exhibition.

The Jeffery-Dewitt Company, Detroit, maker of Reliance and the new J-D Visible spark plugs, has been forced by increasing business to occupy another building, affording 6000 square feet of floor space, in addition to its original quarters. This is shown herewith and will be known as plant No. 2. It is located on East Grand boulevard, and from this point the entire assembling and shipping will be carried on. The old factory, which will be known as plant No. 1, will be devoted solely to the manufacturing of porcelains and the machining of metal parts.

A STANDARD LIBRARY OF AUTOMOBILE MECHANICS

Used by All Leading Technical and Automobile Schools

The **AUTOMOBILE JOURNAL**—Devoted to the Interests of the Owner and User of the Motor Vehicle for Pleasure. The Most Comprehensive Popular-Priced Magazine Published. The year, **24** issues, **$1**; the Copy, **10** Cents.

The **MOTOR TRUCK**—The National Magazine of the Power Wagon Industry, Promotive of the Interests of the Manufacturer, Distributor and Owner of Industrial Transports. The Leader of Its Class. The Year, Monthly, **$1**; the Copy, **15** Cents.

The **ACCESSORY and GARAGE JOURNAL**—The Only Publication in America Given Over to the Motor Car Industry and Allied Interests. Exclusively a Medium of Trade Information for the Trade. The Year, Monthly, **$1**; the Copy, **15** Cents.

TEN STANDARD MECHANICAL AUTOMOBILE HANDBOOKS

The **A B C OF INTERNAL COMBUSTION ENGINE MAINTENANCE AND REPAIR**—The Most Complete Work Ever Written of Gas Motors. Not Principles, But Practise. Illustrated by More than 50 Cuts and Drawings and Eight Full-Page Charts. Price **35** Cents.

The **A B C of MAGNETO IGNITION SYSTEMS**—Every Detail of Construction, Maintenance and Care, Covering Standard Makes of Instruments and Their Service, Illustrated by More Than 100 Cuts, Drawings and Wiring Diagrams. Price **35** Cents.

The **A B C OF CARBURETOR CONSTRUCTION, MAINTENANCE AND REPAIR**—Theory and Practise of Carburetion by All Recognized Methods and Devices Exhaustively Reviewed and Described, with More Than 125 Special Illustrations and Charts. Price **35** Cents.

The **A B C OF BATTERY IGNITION SYSTEMS**—All Standard Constructions and Their Adaptations in Practise, Together with Special Applications and a Series of Wiring Diagrams for All Installations, Shown by 50 Illustrations and Charts. Price **30** Cents.

The **A B C OF MOTOR CAR OPERATION**—A Complete Text Book of Theory and Practical Experience with All Types of Standard Automobile Vehicles, Systematically Written and Illustrated by More Than 200 Cuts and Full-Page Charts. Price **50** Cents..

OVERHAULING, REBUILDING AND REPAIRING THE MOTOR CAR—A Treatise of All Conventional Types of Cars with Advice for Meeting All Service Conditions, Based on Practical Experience. Containing More Than 200 Illustrations and Diagrams. Price **50** Cents.

The **A B C OF MOTOR CAR CHASSIS MAINTENANCE AND REPAIR**—Systematic Presentation of Conditions Resultant from Use, and Means for Remedy and Restoration Applied from Practical Knowledge. Contains More Than 50 Cuts and Charts. Price **25** Cents.

MAINTENANCE AND REPAIR OF MOTOR CAR TIRES—An Exposition Treating of Tire Service from the Viewpoint of Economy, Founded on Manufacturing, Repairing and Operating Experience. Illustrated by More Than 100 Cuts and Charts. Price **25** Cents.

LIGHTING THE MOTOR CAR BY ELECTRICITY—A Comprehensive Work on All Current Producers, Lamps, Lights, Installations and Practical Wiring Diagrams for Every Type of Vehicle, Singly or in Combination. More Than 75 Cuts and Diagrams. Price **25** Cents.

The **A B C OF AERIAL NAVIGATION**—A Veritable Encyclopedia of Aerial Science, Dealing with the Latest Designs and Types of Airships, Construction, Materials, Equipment, Control, Etc. Containing More Than 200 Illustrations and Charts. Price **50** Cents.

FULL SET, 10 VOLUMES, $3.60.

VOL. II. PAWTUCKET, R. I., DECEMBER, 1912. No. 8

STEWART AND WARNER COMBINE.

New $11,000,000 Corporation Takes Over Business of Two Old Companies---Alliance Between Two Well Known Electrical Houses---New Car and Accessory Manufacturers Announced---Changes Among Official Heads.

The Stewart-Warner Speedometer Corporation was organized Dec. 19, under the laws of Virginia with a capital of $11,000,000, taking over the entire stock of the Stewart & Clark Manufacturing Company, Chicago, and the Warner Instrument Company, Beloit, Wis. The new concern also will acquire all of the speedometer patents owned by the Warner Instrument Company, A. P. Warner, C. H. Warner and J. K. Stewart.

The officers, directors and sales forces of the Stewart and Warner companies will remain as before, and the product of each factory will be marketed separately. Whiteweld & Co., a New York and Chicago banking house, underwrote the proposition and financed the purchase. J. K. Stewart will be president of the new company and C. B. Smith secretary and treasurer. The board of directors will be composed of representatives of the selling interests and of the banking house.

ALLIANCE OF ELECTRICAL CONCERNS.

Western Electric Company Becomes United with Pittsfield Spark Coil Company.

An alliance between the Western Electric Company, New York City, and the Pittsfield Spark Coil Company, Dalton, Mass., about which rumors have been in circulation for some time, has been confirmed by both firms. It has been expected that since the enormous increase in the use of electrical apparatus with gasoline automobiles one of the big electrical companies would take up this branch of the business. The Western Electrical Company is one of the biggest companies in the United States, doing $70,000,000 business a year, and the new alliance places it back of a line of ignition devices having a reputation for high quality such as the Pittsfield products have always enjoyed. The large engineering force of the Western company will work in conjunction with the Pittsfield engineers in developing new apparatus.

Under the arrangement between the two companies the entire line of Pittsfield products including magnetos, spark coils, spark plugs, timers and switches are now to be marketed exclusively by the Western Electric Company, under the name of Western Electric-Pittsfield. For a time the Pittsfield company will continue to market some magnetos direct. The sales efforts of the Western Electric Company will be directed largely towards manufacturers and supply houses. Ample stocks will be carried at each of the 28 Western Electric distributing houses located at shipping centres throughout the country. This brings the Western Electric-Pittsfield products within over-night shipment of every automobile manufacturer, dealer and owner. It is understood that beginning Jan. 1 a sales campaign will be launched covering the entire line of devices which has been materially extended to take care of the allied business.

TWO LEAVE ABBOTT COMPANY.

Report That Spitzley and Bush Have Resigned Causes Much Surprise.

B. C. Spitzley, assistant general manager, and W. T. Bush, general sales manager of the Abbott Motor Company, maker of Abbott-Detroit cars, have been reported as having resigned their positions. No reasons were given for the action and neither man would make any comment upon the matter, while the officials of the Abbott company were equally as reticent.

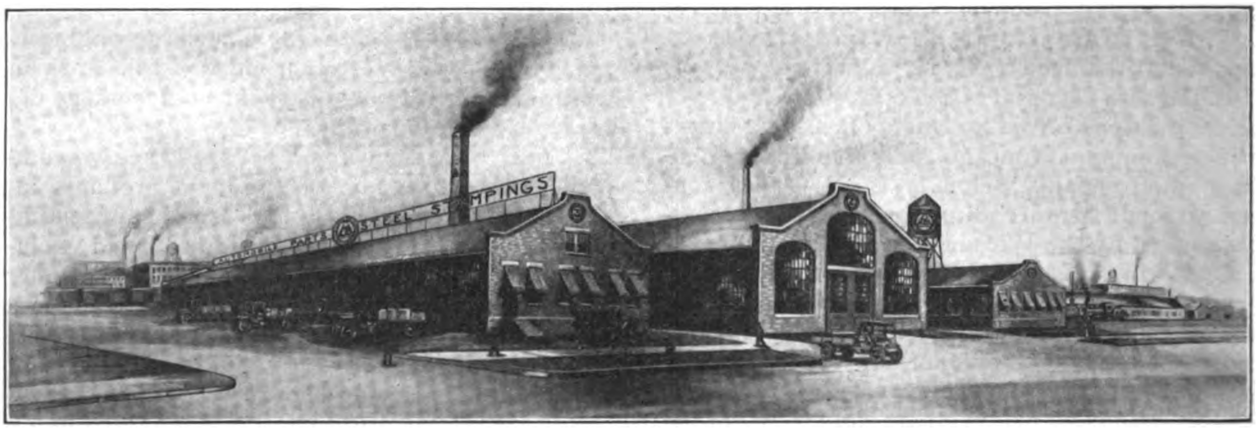
It was stated that nothing would be given out by the company until a later date. Both men have been connected with the concern for a long time and the report came as a distinct surprise to the trade. Mr. Spitzley recently returned from a business trip of two months through the West, at which time he reported trade conditions as exceptionally good.

TO BUILD NEW FACTORY.

Guide Motor Lamp Company Has Outgrown Its Present Quarters in Cleveland.

As an evidence of the permanent popularity of electric lighting for automobiles it is only necessary to point to the steady increase in business which has been enjoyed by the makers of such equipment during the past year. The Guide Motor Lamp Company, Cleveland, O., is another concern which has outgrown its present factory and facilities for production.

This company is erecting and will soon move into a strictly modern factory building occupying the entire block between 114th and 115th streets, on Madison avenue in that city. It will afford 14,000 square feet of floor space and will be equipped with the latest improved machinery for the manufacture of Guide electric lamps.



General View of the Davies-Bach Manufacturing Company's New Plant at Alliance, O.

UTAH DEALERS COMBINE.

Unite in Effort to Solve Second Hand Car and Other Problems.

The Utah Automobile Trades Association is the name of a new association of automobile, tire and accessory dealers which has been organized at Salt Lake City to protect its members from some of the evils which have grown up in the trade. The new body has opened an office at 251 State street, Salt Lake City, with a manager in charge. The question of credits will be handled through a credit bureau within constant telephonic communication with its members.

The second hand car situation, which is attracting attention throughout the country, will also be handled by dealers in this manner. When an offer is made on a second hand car by any member of the association this offer is immediately telephoned to the central office. Such information is confidential, but in case the person wishing to dispose of his car goes to another dealer, such dealer can find out by telephone just how much has been offered on this particular car, although the name of his competitor is not given. In this manner dealers are at all times protected from persons who go from one to another, getting them to bid against each other by inflating the price which has been offered.

Other important problems will also be handled in a manner of benefit to the members. The new association is composed of all the large concerns in the state and nearly all the smaller ones as well.

NEW ACCESSORY CONCERN.

Davies-Bach Manufacturing Company Will Locate Plant in Alliance, O.

The Davies-Bach Manufacturing Company, Cleveland, O., has been incorporated under the laws of Ohio and will locate its factories in Alliance. The concern has acquired 17 acres of land on the main line of the Pennsylvania railroad and three buildings already have been erected. Its own list of patented specialties, including radiators, airless tires, horns, etc., will be produced.

The manufacturing end of the business will be in charge of Supt. John Hughes, who for the past four years has been superintendent of the Kinsey Manufacturing Company, Toledo, O. He will be remembered as having been identified prominently with the Hydraulic Pressed Steel Company and Parrish & Bingham, both of Cleveland.

The officers of the company are: President. C. H. Davies, a western capitalist and an experienced automobile man; vice president and secretary-treasurer, J. J. Schmitt, formerly chief auditor of the Packard Motor Car Company, Detroit; directors, George R. Nash, prominently connected with the People's State Bank of Detroit; C. F. Bach, of the Michigan Sugar Company, Sebewaing, Mich., and W. F. Schmitt, also of Sebewaing.

An accompanying illustration gives a splendid idea of the present plant. Factories 1 and 3 are 52 by 206 feet and No. 2 is 63 by 206 feet. These are of the class A construction and were erected by the McClintic-Marshall Construction Company of Pittsburg, Penn. Plans for other buildings already are under way.

INCREASING CAPITAL STOCK.

Croxton Motor Car Company Finds It Necessary to Double Its Output.

The Croxton Motor Car Company, Washington, Penn., maker of the Croxton line, was organized Oct. 23 with authorized capital of $300,000. Of this amount $180,000 was paid in, leaving a balance of $120,000 in the treasury. A few days ago the company closed a contract with a Chicago house for more cars than it was originally intended to build. This, with the contracts already closed, made necessary an additional capital of $100,000, making a total of $400,000.

The capacity of the new plant, which is an all steel structure, with concrete floors, 500 by 120 feet, is rated at 1000 cars, but it is the desire of the stockholders to increase this at once to a capacity of 2000 machines. It is expected that 200 men will be at work by the first of the year, and that deliveries will begin about Feb. 15.

The officers of the company are: President, J. P. Stoltz; vice president, B. D. Arthur; secretary, G. W. Dudderar; treasurer, J. B. Allison. Mr. Arthur, who formerly was western sales manager of the Ohio Motor Car Company, Cincinnati, O., has been made sales manager of the Croxton concern.

UNITED STATES MOTOR COMPANY.

Plans for Reorganization Expected to Be Carried Through with Success.

While definite details regarding the reorganization of the United States Motor Company must await the court's action with respect to the sale of the present company's holdings, which has been set for Jan. 8, it is understood that there is every indication that the plans will meet with success.

A number of stockholders, the total reaching nearly 50,000 shares, are said to have failed to accept the proposition to subscribe $24 a share in the reorganization scheme, but it is announced in New York that the underwriting firm of Hallgarten & Co. is prepared to pay any assessments not met by stockholders.

In the meantime preparations are under way to remove the headquarters of the company from New York to Detroit, although it is not expected that this will take place until after the sale has been confirmed. Several department heads are said to have resigned, and there is every indication that steps are being taken to insure an early return to business activity, as soon as legal proceedings have reached a point where a definite policy can be decided upon.

The Brush and Sampson plants are understood to be idle, except for the production of spare parts. The Stoddard-Dayton factory has completed its schedule and the Columbia organization is said to be finishing the last of its work. The Maxwell's chief plant at Tarrytown, N. Y., is still active, but the factories in Newcastle, Ind., and Providence, R. I., are not being worked. The machinery and material at the latter plant are being shipped to Newcastle, where it is expected to arrive about Jan. 1.

ENTERS ACCESSORY FIELD.

Motometer Company Organized in New York to Produce Novel Heat Indicating Device.

The Motometer Company, Inc., 1784 Broadway, New York City, recently organized, is one of the latest entrants in the automobile accessory manufacturing field. George Townsend, 2d., formerly an amateur racing driver well known in automobile circles, is president and treasurer and Harrison Boyce is secretary. The company will market a new device invented and patented by Mr. Boyce and known as the motometer. It is an instrument which by an ingeniously arranged dial tells the driver at all times the exact heat of his motor and warns instantly when overheating is about to take place.

Mr. Townsend, together with Caleb Bragg, organized the first Yale hill climb at New Haven, Conn., some years ago and together they became well known amateur drivers, racing at numerous meets. Townsend ceased racing prior to Bragg's turning professional. Mr. Boyce has a reputation as an inventor of marked ability. He invented the first demountable rim upon which a patent was granted in this country. It was used on the Locomobile racer in the 1905 Vanderbilt Cup race. He conceived a leather non-skid tire and formed the Healy Leather Tire Company and later he invented the Sireno horn and has been connected with the company manufacturing it for some time.

TONE HEADS NEW COMPANY.

Another Car to Locate in the Middle West, Probably at Indianapolis.

Although not yet ready to make a public announcement, it is understood that another Indiana motor car manufacturing concern is about ready to enter the field with a medium priced machine which will bear the name of Tone. The company is to be known as the Tone Car Corporation and will be headed by Fred I. Tone of Indianapolis. It is expected that the factory will be located in that city.

Mr. Tone became connected with the automobile industry in 1896, starting with the Locomobile Company of America, now at Bridgeport, Conn. Later he was engineer with the Marion company in Indianapolis. In 1905 he was instrumental in creating a radical departure from conventional lines by producing the American underslung design. For the past two years he has been general engineer for the Willys-Overland Company, Toledo, O.

It is understood that the Tone Corporation will built but one style of chassis, with a choice of standard bodies, including roadster, touring, coupe and light delivery. The complete car will be constructed in the factory of the company.

WITH STEINBOCK CONCERN.

Gormully Resigns as General Purchasing Agent of United States Motor Company.

A. R. Gormully, for four years purchasing agent for the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., and since its formation general purchasing agent for the United States Motor Company, has resigned to become treasurer of the Steinbock Engineering Company, New York City, maker of engines for automobiles, motor boats, aeroplanes, etc. He expects to reconnect more directly with the motor car industry in the near future, however.

A. R. Gormully, Treasurer, Steinbock Engineering Company.

Mr. Gormully was born and educated in London, England, and came to Boston in May, 1892. He began active business life with the Gormully & Jeffrey Manufacturing Company, Chicago, as an office boy, and arose to become manager of the export department before leaving this concern in 1900. The next two years were spent with the Electric Vehicle Company in its first plant in New York City as superintendent's assistant. From 1902 to 1904 he was assistant manager of the Erie Basin Works, maker of general machinery, and in 1905 he went with the Vehicle Equipment Company, Long Island City, as purchasing agent. His connection with the Maxwell and United States Motor companies followed.

ADDS ANOTHER NEW PLANT.

Willard Storage Battery Company Now Has Four Separate and Distinct Factories.

The Willard Storage Battery Company, Cleveland, O., maker of LBA batteries, recently purchased property adjoining its plant No. 1, affording 50,000 feet of additional manufacturing space. Since that time the company also has acquired the plant adjoining this, a building of brick and steel construction with 32,500 feet of floor space.

This will furnish the Willard Storage Battery Company with four separate and distinct plants, all conveniently located close together, but not connected. Three are individually equipped for the manufacture of storage batteries and the most recent purchase is intended for future expansion. It will be used for storage purposes only, for the present, or until such time as the rapidly increasing business warrants other plans.

NEEDS MORE ROOM.

Myers Becomes Swinehart's General Manager and Concern Will Build New Plant.

Clifford B. Myers has been chosen general manager of the Swinehart Tire & Rubber Company, Akron, O., maker of Swinehart tires, to succeed W. W. Wuchter, president of the company, who has for some time acted as general manager. The change is an initial move towards enlarging the plant and expanding the business generally.

According to the present plans it is probable that in the near future the company will build a much larger factory than it now occupies. The site has not been selected, but as the present plant is in the heart of the city with no vacant space in proximity, property probably will be purchased in the suburbs and eventually the old building will be sold.

RECEIVER IS APPOINTED.

Creditors for the Flanders Manufacturing Company Consent to This Plan.

Owing to the refusal of certain creditors to act with the committee which assumed charge of the affairs of the Flanders Manufacturing Company, Pontiac, Mich., maker of Flanders electrics, etc., a few weeks ago, the Detroit Trust Company was named as receiver by Judge Tuttle of the United States district court, bond being fixed at $50,000. The dissatisfied creditors attempted to have the firm declared bankrupt, but the directors prevailed upon them to consent to the receivership.

It was pointed out that the assets of the company were greatly excess of the liabilities and that the difficulties were merely through a lack of ready working capital. A statement has been sent out by the creditors' committee that the company will be operated until such time as an inventory can be made, when it will be definitely decided whether to liquidate or continue operations. The business will be continued if the refinancing and production plans are agreeable to the receivers, it is stated.

A KEROSENE DRIVEN CAR.

Arthur Mason Said to Be Engaged in Designing Machine to Use No Gasoline.

It is understood that Arthur C. Mason is designing a car to be produced by the Republic Motor Company, Flint, Mich., which will use kerosene exclusively. This statement is taken to mean the motor will be supplied with kerosene only, since Mr. Mason is quoted as saying that it was possible to do away with the use of gasoline even for starting purposes.

The Republic Motor Company was organized recently to include among its constituents the Little Motor Car Company and Chevrolet Motor Company, and it is anticipated that one of these concerns will undertake the manufacture of the new car. Further announcement will be awaited with interest.

TO MANUFACTURE CROCE TRUCK.

Company Organized in Asbury Park, N. J., Will Manufacture Two Chassis Models.

The Croce Automobile Company, Asbury Park, N. J., has been incorporated with capital of $250,000, of which $50,000 is paid in, for the purpose of manufacturing the Croce truck. The incorporators are Louis P. Croce, designer of the new vehicle; T. Frank Appleby, formerly mayor of the city, and Harry A. Watson. Others interested in the company are Henry C. Winsor, Col. John W. Aymer, Stuart Appleby, Theodore Appleby, Richard W. Herbert, Samuel A. Reeves, Charles R. Zacharias, Charles Rugerber, Albert Robbins, E. W. Krymer and J. Voorhees Krymer.

The first story of a handsome two-story steel and brick factory building at First and Railroad avenues has been completed and it is expected that the second will be ready in February. It will contain 8000 square feet of glass, indicating that plenty of light will be a feature of the construction. The first floor will be devoted to chassis work and the second to the production of bodies. Two models will be made, one of 1500 pounds and the other of two tons. One of the former has been placed with Vogel Bros. Company of Asbury and one of the latter with the Wesley Engine & Hose Company of that city

GENERAL MOTORS' NEW HEAD.

Life History of the Man Who Will Direct the Destinies of Big Factory Group.

Charles W. Nash, who has succeeded Thomas Neal as president of the General Motors Company, Detroit, one of the largest, if not the largest, group of motor car producing factories in the world, was born near Dekalb, Ill., Jan. 28, 1864. At the age of seven, his parents having moved to Michigan in the meantime, he was bound out to a farmer in Flushing. By the terms of the agreement he was to receive a suit of clothes each year and to go to school three months in every 12. At the age of 21 he was to get two suits of clothes, both at the same time, and $200 in cash.

But the lad did not like farming, apparently, for he ran away at the end of the fourth year of service. At the age of 11, therefore, he began to learn the carpenter's trade with a salary of $7 a month. Later he secured a raise of $1 a month. At 18 he became a hay presser and at 21 he went back to farming, staying at it for seven years this time.

In the meantime he was married, and as Mrs. Nash's health was not good they moved to Flint, where he became a clerk in a grocery store. Not long afterward J. Dallas Dort of Flint wanted some plums picked and young Nash applied for the job. He picked plums so well that Mr. Dort gave him a job in the trimming department of the Flint Road Cart Company, then a small but thriving concern, which in later years developed into the Durant-Dort Carriage Company.

Charles W. Nash, President, General Motors Company.

At the end of six months he was made superintendent. It was a comparatively few years before he was vice president and director. In the fall of 1910 he was called to the general management of the Buick Motor Company of Flint, and under his leadership the company has increased its earning power with a rapidity which has surprised the industry. His selection to head the General Motors group, of which the Buick is but one of the constituents, is considered by his many friends throughout the country as a suitable recognition of true merit.

It may be permissible to add a word concerning Mr. Nash's personality. Back in the days when he knew his "boys" by daily contact with them, he took the time to inquire about the wife and baby and how things were going in the home. When he found the wolf showing his fangs he would call the man into his office and ask all about it. In the end perhaps it would mean a small loan without interest, or a big loan, without interest, or the purchase of a house and lot to be paid for on the installment plan, also without interest. And it was years before anyone knew of the things he was doing. This is the first time anything about it has been published.

NEW REPUBLIC RUBBER OFFICERS.

Board of Directors Fills Vacancies and Considers Other Details of Management.

At the directors' meeting of the Republic Rubber Company, Youngstown, O., the following officers were elected: First vice president, L. T. Peterson, to succeed L. J. Lomasney, deceased; second vice president and director, succeeding L. T. Peterson as second vice president, John H. Kelly; director to fill remaining vacancy on the board, A. H. Harris.

In addition to his work as general sales manager, Mr. Kelly, as second vice president, will co-operate with the president and other officers in the general matters of management.

PRODUCING FEPS CARBURETOR.

Something About the Men Who Comprise the Schoen-Jackson Company.

The announcement of the Feps carburetor, which was described in detail in a recent issue of The Automobile Journal, has served to bring the Schoen-Jackson Company, Media, Penn., into prominence in the motor car industry. The concern is composed of Charles T. Schoen and M. R. Jackson, two men who have had wide manufacturing experience.

Members of Schoen-Jackson Company: At Right, C. T. Schoen; at Left, M. R. Jackson.

Mr. Schoen is well known as the inventor of pressed steel cars and pressed and rolled steel wheels, for which over $7,000,000 have been paid by the railroads of the country. Since disposing of this business to the United States Steel Corporation he has been engaged in the manufacture of flexible metallic tubing. Mr. Jackson has been associated with Mr. Schoen in a business way for the past eight years. Upon him is devolved most of the active management in connection with the production of the tubing.

Some 20 years ago Mr. Schoen devoted considerable thought to the subject of carburetion and took out several patents on successful carburetors. Recently, J. L. Fritz, the young man who invented the Feps vaporizer, called Mr. Schoen's attention to his device and the latter was immediately impressed by its construction and design. The skilled mechanics of the Schoen-Jackson Company were invited to prepare the production for the market, and after more than 100 road and dynamometer tests the Feps carburetor made its appearance in public. That the company is convinced that the new vaporizer will meet the requirements of the motor car industry, particularly with reference to the use of low grades of gasoline, is borne out by the fact that a new plant, entirely apart from the tubing factory, has been constructed for its manufacture.

SOLVING CAR SHORTAGE PROBLEM.

Service Bureau of National Association of Automobile Manufacturers Adopts Trial Plan.

The service bureau which the National Association of Automobile Manufacturers at its last meeting voted to establish at Detroit, Mich., the heart of the automobile industry, has been installed and already a comprehensive system is being arranged to improve the railroad traffic in motor cars. It is thought that the new system will give the automobile manufacturers many more freight cars during the shipping season than has been the case heretofore and thus the car shortage will be greatly minimized.

When a shipment is made the numbers of the cars are taken and forwarded to the railroad officials who will make delivery of the freight, with a request that the cars be protected and returned as soon as possible to the railroad which made the original shipment. A system of daily reports has been arranged to show the location of the various cars en route. A large percentage of the delays is occasioned by the demurrage rules, but the service bureau hopes to improve largely the present service by its new system.

PEERLESS TO INCREASE CAPITAL.

Stockholders Meeting Called to Act on Proposition to Add $7,000,000 to Present Stock.

Stockholders of the Peerless Motor Car Company, Cleveland, O., maker of Peerless trucks and pleasure cars, will be asked at a special meeting Dec. 20, to consider and vote upon the proposition to increase the capital of the company from $3,000,000, its present authorized stock, to $10,000,000.

This is to be divided, according to the plans, into 100,000 shares of $100 each, of which issue 50,000 shares shall be disposed of as preferred stock and the remainder as common stock, subject to the usual restrictions. The stockholders also will vote upon the matter of authorizing the directors to dispose of the increased stock and also upon a proposal to amend the code of regulations of the company.

ENOS SUCCEEDS HOOPER.

Buffalo Man Selected to Head American Automobile Association—Annual Reports.

A balance of $3293 in the treasury, all bills paid and the good roads movement making satisfactory progress throughout the country as a result of the efforts of the organization were the features brought out at the annual meeting of the American Automobile Association, held at Chicago, Dec. 2-3. Robert P. Hooper retired as president, as previously announced, and Laurens Enos of Buffalo, N. Y., was elected as his successor.

There was shown to have been a deficit in the contest department when William Schimpf became chairman of the contest board, but he was able to pay all bills and show a small surplus in the bank. The board granted 132 sanctions. Twenty more tracks were licensed than ever before and 94 meets were held during 1912 as against 52 in 1911 and 72 in 1910. The board took in $13,225 in sanction fees; $100 for stock car certificates; $1140 for drivers' fees; and $320 for track licenses. The expenses of the board for the season amounted to $8170.

The new officers elected follow: President, Laurens Enos, Buffalo; first vice president, John A. Wilson, Pennsylvania; second vice president, Dr. H. M. Rowe, Maryland; third vice president, R. W. Smith, Colorado; fourth vice president, F. L. Baker, California; fifth vice president, Asa Maine, Minnesota; secretary, J. N. Brooks, Connecticut; treasurer, H. A. Bonnell, New Jersey; chairman of executive committee, A. G. Batchelder, New York. It was decided to open a branch headquarters at Washington, D. C., and the next annual meeting will be held at Richmond, Va.

President Enos, at the first meeting of the new executive committee, announced the reappointment of the following chairmen: Contest committee, William Schimpf; good roads, George C. Diehl; touring, Howard Longstreth; legislative, Charles T. Terry.

FEDERAL DECLARES STOCK DIVIDEND.

Exclusive Manufacturer of One-Ton Vehicles Meets with Splendid Success.

The Federal Motor Truck Company, Detroit, maker of Federal trucks, has declared a stock dividend of $100,000 and a 10 per cent. cash dividend, according to an announcement recently made by General Manager Martin L. Pulcher. The company was incorporated only three years ago with capital of $100,000, and during that time the output of trucks has steadily increased. The first year 50 commercial vehicles were manufactured, while 135 were made the second and 750 the third. The output for 1913 is scheduled as 1500 trucks, but this may be greatly increased.

The company has been forced to move three times to care for increasing business and it now occupies the large and modern factory originally constructed for the Van Dyke Motor Car Company. Additions doubling the plant's capacity are planned for the near future. T. E. Reeder is president of the company; Edwin Denby is vice president, and Martin L. Pulcher, to whom is ascribed a large part of the concern's success, is general manager.

WESTINGHOUSE IN ACCESSORY FIELD.

Will Open New Plant Giving Employment to 400 Additional Workmen.

The Westinghouse Electric & Manufacturing Company, Pittsburg, Penn., is adding to its production of automobile accessories and will soon open a new plant for this purpose, which will employ 400 workmen. The outlook for the accessory product is said to be brighter now than at any time in the past.

The first floor of the former warehouse of the Bindley Hardware Company, at Shadyside, Pittsburg, has been taken over by the Westinghouse interests and the machinery has been installed. The plant will be in operation in a few weeks. Two hundred men and a like number of women will be employed at the start.

MILLIONS FOR FACTORY EXTENSION.

United States Tire Company Planning to Expend Large Sums During 1913.

The United States Tire Company, New York City, which operates four big plants, announces arrangements for an expenditure of $3,000,000 in factory improvements and extensions during 1913. The Morgan & Wright plant in Detroit, which it owns, is to be doubled in both area and production. Ground has been broken for several new buildings and work will be rushed forward as rapidly as possible. Its employees, now numbering 2500, will be increased to 6000 when the improvements are finished. The output of the factory will be in excess of 5000 tires daily.

It is planned to erect 16 new factory buildings ranging in size from 2000 to 131,000 square feet. Among these will be a finely appointed laboratory, where the scientific experimental work will be carried on, several warehouses and at least a half dozen manufacturing buildings, the largest of which will be 230 by 60 feet and six stories high. A new power plant will also be installed, doubling the boiler capacity of the factory.

The United States Tire Company operates extensive rubber works in Indianapolis, Ind., Hartford, Conn., and Providence, R. I., and is increasing the facilities of all these plants to provide for the tremendous growth of the tire industry. At Indianapolis a building 80 by 170 feet and six stories high is being erected; at Providence another structure 75 by 300 feet and three stories high will be added, while at Hartford a fine new power house and power plant have been installed at a cost of more than $175,000.

WILL MAKE MOORE TRUCK.

Syracuse Concern Increases Capital and Purchases Building for Manufacturing Purposes.

The Palmer-Moore Company, Syracuse, N. Y., has increased its capital stock from $100,000 to $200,000 and will at once begin the manufacture of motor trucks in the plant of the Syracuse Stove Works in North Geddes street, which has been purchased by this concern. The following are the officers: President, T. G. Meachem; vice president, T. W. Meachem; treasurer, Charles L. Palmer.

For about two years the company has been experimenting with a two-cycle motor patented by Edward Moore and the perfected motor will be embodied in the new truck, which will be known as the Moore. It will be air-cooled in the lighter type of vehicle and water-cooled in the heavy type. The plant has been appraised at $76,000, covers 3.5 acres of land and is well located.

NAME CHANGED TO PALMER.

R. A. Palmer Becomes General Manager of the Reorganized Suburban Motor Car Company.

Randall A. Palmer, formerly organizer and general manager of the Cartercar Company, Pontiac, Mich., maker of Cartercars, has become vice president and general manager of the Palmer Motor Car Company, which is the new name of the Suburban Motor Car Company of Detroit, Mich. The plant which was being built for the Suburban company at Ecorse is partly completed and it is hoped to have the work finished by the first of the year so that manufacturing operations can be begun by the Palmer company.

Mr. Palmer will have entire charge of the engineering and manufacturing departments. He is also president of the Palmer-Bee Company, dealer in power transmission and power machinery. W. A. DeSchaum, who designed the Suburban car, will not be connected with the reorganized company. The plant has a frontage of 353 feet on the main lines of all the railroads entering Detroit from the South, and enjoys unexcelled shipping facilities.

RAYMOND CAR COMING.

Company Secures Factory Facilities at Hudson, Mass., and Will Begin Manufacture.

The Raymond Engineering Company, incorporated under the laws of Massachusetts in 1911, to manufacture, develop and deal in gasoline engines for marine, automobile, motor truck and stationary purposes; light, low-priced automobiles and delivery wagons, has occupied a large factory building at Lincoln park, Hudson, Mass. The firm has capital of $150,000 and H. M. Warner is to be superintendent of the factory operations.

A. B. Raymond, M. E., a graduate of Cornell University, and vice president of the firm of Swasey, Raymond & Page, is president of the concern and the board of directors include Mr. Raymond, E. V. Henderson and J. L. Donovan of Boston. Previous to his connection with Swasey, Raymond & Page, Mr. Raymond was in charge of the calculating department of the Wm. Cramp Ship & Engine Building Company of Philadelphia. The knowledge gained in this experience resulted in the development of the "R-V" motor, now built in sizes from 10 to 160 horsepower; the Raymond runabout, a 100-inch wheelbase pleasure car of 25 horsepower, and the Raymond roadster.

SCHEBLER RETIRES FROM FIRM.

Sells His Interest in Wheeler & Schebler Because of Continued Ill Health.

Announcement has been made that George M. Schebler, inventor of the Schebler carburetor and member of the firm of Wheeler & Schebler, Indianapolis, Ind., has retired from business on account of ill health. The news will come as a surprise to many, but to Mr. Schebler's friends it had been known for some time that he intended to close out his business interests.

Mr. Schebler was one of the first men in America to devote his time to the construction of a carburetor for gasoline engines. At that time he had a small shop for experimental purposes, which has since grown into the largest plant of its kind in the United States. For the past several years Mr. Schebler's health has been failing and his retirement comes only after the most mandatory advices of his physicians. By the retirement of Mr. Schebler, F. H. Wheeler will become the sole owner of the plant, having purchased Mr. Schebler's interest. He states that the firm name will not be changed.

LENOX IN NEW FACTORY.

Plans Under Way for Still Another Addition to Accommodate Rapidly Growing Business.

The Lenox Motor Car Company, Hyde Park, Mass., maker of Lenox cars, has moved into its new factory, recently completed. The company now has 30,000 square feet of floor space in addition to office rooms. Despite the fact that the company has been operating only three years the demand for Lenox cars has been so great that the first plant at Jamaica Plain was speedily outgrown, necessitating more room.

Even the new plant is not sufficient to carry on the business and plans have been drawn for another new factory building adjoining it, to be four stories high and having 120,000 square feet of floor space. Work will be begun upon this immediately and it is hoped to have it in operation early next year.

DURANT HEADS CHEVROLET.

Plans Being Made to Perfect Organization to Take Care of Increased Demand for Product.

The board of directors of the Chevrolet Motor Company, Flint, Mich., maker of Chevrolet cars, has elected W. C. Durant president and J. Dallas Dort vice president of the concern. W. H. Little was chosen second vice president; Dr. E. R. Campbell, treasurer; Curtis R. Hathaway, secretary; F. A. Aldrich, assistant treasurer, and W. W. Murphy, assistant secretary.

It was announced that the company would take over the factory buildings of the Imperial Wheel Works, but it now appears that this will not be done for several months, as the Imperial company is still utilizing the buildings. However, a part of the plant, now being made ready, will be used by the Chevrolet company and plans are going forward to perfect an organization capable of caring for the output when manufacturing begins on a large scale.

RECEIVER TO SELL ASSETS.

Griswold, Ellis & Dickinson Secures Property of Wyckoff, Church & Partridge for $150,000.

The creditors of the bankrupt firm of Wyckoff, Church & Partridge, Inc., New York City, maker of Guy Vaughn cars and Commer trucks, at a recent meeting accepted the offer of Chester Griswold, George A. Ellis and Howard C. Dickinson of the firm of Griswold, Ellis & Dickinson, of $150,000 for the assets of the company, and John S. Sheppard, Jr., the receiver, was given the power to transfer the property at that figure.

The appraised value of the assets is $171,000, but in addition to the $150,000, the receiver has about $40,000 in cash on hand. There are about 800 creditors and the known unsecured claims amount to about $575,000, not including unliquidated or contingent claims. The terms of the sale are said to provide for payments of $50,000 in four, eight and 12 months respectively.

THE NEW YORK SHOW.

Exhibit of Machine Tools Will Be an Important Added Feature This Year.

A machine tool exhibit will be an added feature at the 13th national automobile show in Madison Square Garden and Grand Central Palace, New York City, Jan. 11-25, this having particular reference to the second portion, or that beginning Jan. 20, when the commercial vehicles will be the centre of attraction. This decision was reached last week after a conference between Secretary Merle L. Downs of the Automobile Board of Trade's show committee, and President Bullard of National Tool Builders' Association.

That this is to be an accessory year is now pretty generally known and appreciated, but it is learned that a large number of makers are reserving new products of this nature for their initial appearance at the show. The list of exhibitors indicates that there will be no less than 530 separate concerns represented, of which 43 makers of pleasure cars and 272 accessory firms will display their wares the first week, and 25 truck manufacturers will exhibit the second week in the Garden. At the Palace, 46 pleasure car makers, 25 motorcycle concerns and more than 100 accessory firms will be seen the first week, and at least 41 truck producers the second. The vehicles will be divided as follows:

Madison Square Garden, First Week.

Alco, Auburn, Buick, Cadillac, Cartercar, Chalmers, Columbia, Cunningham, Stoddard-Dayton, Flanders, Franklin, Garford, Haynes, Hudson, Jackson, Knox, Locomobile, Lozier, Matheson, Maxwell, Mercer, Mitchell, Moline, Moon, National, Marmon, Oakland, Oldsmobile, Packard, Peerless, Pierce-Arrow, Pope-Hartford, Premier, Pullman, Reo, Selden, S. G. V., Stearns, Stevens-Duryea, Warren, White, Overland and Winton.

Madison Square Garden, Second Week.

Alco, Autocar, Buick, Federal, Garford, G. M. C., Gramm, Hewitt, Hupmobile, Kelly-Springfield, KisselKar, Knox, Locomobile, Mack, Packard, Peerless, Pierce-Arrow, Pope-Hartford, Reo, Saurer, Selden, Speedwell, Velie, Walter and White.

Grand Central Palace, First Week.

Abbott, American, Atlas, Bergdoll, Briggs-Detroiter, Buffalo, electric, Church-Field electric, Cole, Firestone-Columbus, Cutting, Davis, Edwards-Knight, Empire, Fiat, Havers, Henderson, Herreshoff, Hupmobile. Stutz, Imperial, Inter-State, Rambler, KisselKar, K-R-I-T, Lenox, Marathon, Marion, Metz, Michigan, Pathfinder, Norwalk, Only Car, Paige, Paterson, Case, R-C-H, Regal, Speedwell, Standard electric, Studebaker, Velie, Westcott and Republic.

Grand Central Palace, Motorcycles, First Week.

Eagle, M-M, Thor, Yale, Emblem, Excelsior, Flanders, Greyhound, Harley-Davidson, Indian, Henderson, Flying Merkel, Minneapolis, New Era, Pierce, Pope, R-S, Schickel and Triumph.

Grand Central Palace, Second Week.

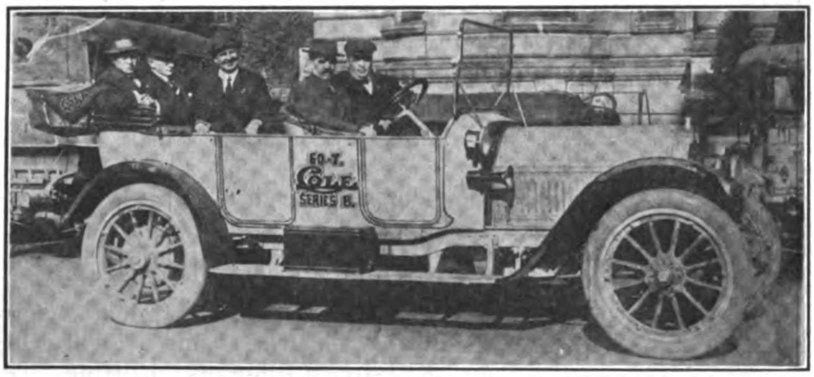
Atlantic, Atterbury, Baker, Bessemer, Blair, Modern, Brown, Buffalo, Chase, Dart, Durant-Dort, G. M. C., General Vehicle, Gramm-Bernstein, Grand Rapids, La France, Koehler, Lansden, Lauth-Juergens, Lippard-Stewart, Mais, Mercury, M. & P., Randolph, Rowe, Sanford, Schacht, Service, A. O. Smith, Standard, Stegeman, Sternberg, International, Stewart, Studebaker, Sullivan, Universal, Ward, Waverley, Webb, Maccarr and Kreb.

TAKES OVER OLIVER TRUCK.

New Concern Formed in Detroit to Continue the Manufacture of This Line.

The Oliver Motor Truck Company was recently organized at Detroit and has purchased all material, blue prints, patterns, jigs and dies, together with patents and all future rights of manufacture of Oliver cars from the receiver of the Oliver Motor Car Company, Detroit. Gus A. Meyer is president and general manager, while Fred J. Meyer is treasurer of the new company. Both are Detroit business men. The organization of the sales department is being intrusted to Ray F. Beach, who was formerly connected with the sales department of the Oliver Motor Car Company.

It is the intention of the Oliver Motor Truck Company to continue the manufacture of the Oliver 1500-pound light delivery wagon and the 3000-pound Oliver truck, with a few changes in the nature of improvements. The company will be located at 460 Lawton avenue, Detroit. It is said that the first cars will be ready for shipment in about 30 days. Mr. Beach recently returned from a trip through Missouri and Nebraska and reports a large demand for light delivery cars and trucks in that section.



President J. J. Cole at the Wheel of the Latest Six-Cylinder, 60 Horsepower Cole Model.

MILLER'S ADVANCE CATALOGUE.

Well Known Accessory Concern Preparing Annual List.

Each year Chas. E. Miller, 97-103 Reade street, New York City, the pioneer jobber, manufacturer, exporter and importer of automobile accessories, prepares 100,000 copies of his annual advance catalogue for use at the shows in the various cities in which he has branches. These include 15 stores in nine different states, and the first show at which the 1913 volume was seen was at Atlanta, Ga., Nov. 16-23. Several copies will be reserved for more general distribution.

Following the example of other years the cover design includes suggestions of motoring, motorcycling, motor boating and aeroplaning, signifying that "Try Miller" is an axiom which applies to each of these fields. Another Miller slogan is presented in: "We either carry in stock, will get it—or it isn't made." The list of accessories and supplies represented in the book is much too large to permit of detailed mention. An attempt would prove little short of cataloguing the entire accessory business, at least that portion which has come to be standardized by consistent advertising. The enviable position occupied by this house since its establishment in the early days of the automobile industry, almost before there was any demand for accessories and supplies, enables it to produce a work of this nature which is particularly valuable as a reference book in buying standard articles.

STEAL MARCH ON PRESIDENT COLE.

Incident Serves to Illustrate How Well Cole Sales Force Watches the Factory.

For over two years President J. J. Cole of the Cole Motor Car Company had been hiding the secret that he was to produce a six-cylinder model. The Cole sales department, although it keeps in the closest touch with the factory, had been unable to get more than a confirmation of the rumor.

Recently Mr. Cole, off his guard for a moment, drove down to the Columbia Club in Indianapolis, in his new six-cylinder, 60 horsepower Cole. Two days later he received a telegram from W. S. Gotshall of St. Louis, as follows: "Coming in private car with 20 to see Cole 60." The next day similar telegrams were received from New York, Boston, Cleveland, Louisville, Chicago and Newark. President Cole said:

"Well, they stole a march on me this time, but I am thoroughly satisfied with the 60. I believe that the automobile industry has a future and so there is more and more perfection waiting for us over the hill. But this series eight comprises the best cars I have ever built.

"I will have to wait until many months of correspondence comes in before the public can improve on it. I say the public because automobile owners have built this car. My distributors send me everything they hear about automobiles. Our mail is carefully scrutinized in order to find out what the public needs. That is why I do not blame the distributors in the field for stealing a march on me. They beat me by one day."

TO PRODUCE NEW TRUCK.

Leo Gillig of San Francisco Enters This Field on the Pacific Coast.

Leo Gillig, who has been connected with the motor car trade at San Francisco, Cal., for a number of years, has entered the manufacturing field and has turned out the first Gillig truck from his plant at San Francisco. The vehicle has 1500 pounds capacity and shows some new and decidedly interesting features. Mr. Gillig has contracted to place 50 of his trucks on the market for the 1913 season.

The new light delivery wagon has chain drive with patented differential of the most simple design. Either solid or pneumatic tires can be used and the bodies are built to suit the convenience of the purchaser. The truck has left hand drive and is durable in construction. It will be marketed at a popular price, and is expected to meet a long felt want in its particular field.

NEBRASKA'S GOOD ROADS BILL.

State Automobile Association Prepares Legislation Creating Highway Commission.

At the recent convention of the Nebraska State Automobile Association a bill was prepared for introduction into the legislature, creating a state highway commission, the members of which shall receive no compensation, except their actual expenses. The commission will have power to employ a competent engineer, who will work under its direction, and sufficient clerical assistance.

Among the proposed duties of the commission will be that of investigating and carrying on experimental work in road and bridge building, different methods of construction, kinds of material and the various methods of drainage which will be best adapted to the soil of the separate sections of the state.

THE MODERN SALES FORCE.

Weinstock-Nichols Company in Favor of Reform in Salesmanship.

An idea which will bear passing along to other concerns in the industry comes from the Weinstock-Nichols Company, San Francisco, Cal., manufacturers' agent and distributor for several well known brands of automobile accessories on the Pacific Coast. It takes the form of a bulletin which was issued recently to the sales force, and it has the title of "The Bar-Room Salesman."

Briefly, the circular sets forth that "Customers can no longer be bribed with champagne and cigars and a good time into buying anything connected with the auto trade." It holds that the customer of today demands two things—good service and good value—and that he has a right to expect of the salesman: That he shall know his business from start to finish, that he shall be able to give intelligent information, that his statements shall be truthful and dependable, that his promises shall be faithfully kept, and that he shall treat the customer as a gentleman would treat him.

"It's a good thing for the customer, the salesman and the trade that the day of the bar-room salesman in the auto accessory trade is a thing of the past," is the final summing up of the document. "Goods must now be sold on their merit and the salesman who hopes to succeed must substitute real knowledge for bluff and good fellowship."

JOINS PHILADELPHIA CONCERN.

J. W. Drown Becomes Sales Manager of the Pressed Steel Manufacturing Company.

The many friends of John Wilson Drown will be glad to learn of his appointment as sales manager of the Pressed Steel Manufacturing Company, Philadelphia, maker of ball bearings. The field is not new to Mr. Drown, since he has been representing ball and roller bearings to the trade for some little time past.

Mr. Drown will be remembered as a former advertising manager of the Corbin Motor Vehicle Corporation, New Britain, Conn., with which concern he was connected for a number of years. Later he accepted the same position with the Standard Roller Bearing Company, Philadelphia. His wide acquaintance in the industry and his thorough knowledge, both of the manufacture of cars and of ball bearings, should make him particularly well fitted for his new position.

ADOPTS TRUFFAULT-HARTFORD.

Well Known Shock Absorbers Become Regular Factory Equipment on National.

Announcement is made that the National cars will be equipped with Truffault-Hartford shock absorbers by the factory in the future, the maker, the National Motor Vehicle Company, Indianapolis, Ind., having closed a contract with the Hartford Suspension Company, Jersey City, N. J., to furnish these devices for all vehicles. This adds still another concern to a long list.

It is maintained by the Hartford Suspension Company that probably no other factor means so much to the car owner as comfort. Truffault-Hartford shock absorbers are held to give ideal riding comfort, and with them it is claimed every road becomes a boulevard.

In order that there may be greater co-operation between the road officials of the several towns and cities throughout the state, the Association of Connecticut Road Officials has been formed in that commonwealth with the following officers: President, W. Scott Eames, director of public works, New Haven; secretary, Charles J. Bennett, superintendent of streets, Hartford; executive committee, Alfred H. Terry, city engineer, Bridgeport; James H. Macdonald, state highway commissioner, Hartford; Robert E. Mitchell, city engineer, Willimantic; Fred L. Ford, city engineer, New Haven, and Charles J. Bennett, Hartford.

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. DECEMBER, 1912. NO. 8.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building Pawtucket, R. I.
Publisher of
THE AUTOMOBILE JOURNAL THE MOTOR TRUCK
William H. Black, Treasurer. D. O. Black, Jr., Secretary.

EDITORIAL DEPARTMENT:
WILLIAM W. SCOTT. CARL A. FRENCH.
C. P. SHATTUCK.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 West 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4707 Magnolia Avenue.
BOSTON—John W. Queen, 164 Federal Street.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Entered as second class matter Dec. 30, 1911, at the postoffice at Pawtucket, R. I., under the Act of March 3, 1879.

IMPORTANT BAY STATE DECISION.

Justice Braley of the Massachusetts supreme court has written an opinion, in which three other members of the court agree, construing the law of the road as passed in that state in 1820 to compel the driver of an automobile or any other vehicle to pass street cars on the left. The decision was handed down late last month, in the suit of J. Sidney Foster against Thomas P. Curtis, in which the plaintiff sought damages for personal injuries as the result of being struck by the defendant's automobile when alighting from a street car in Broadway, Revere.

With this majority opinion three members of the court, including Chief Justice Rugg, dissented. The majority opinion holds that a street car is a vehicle within the meaning of the law and takes cognizance of the fact that in many places street car tracks are laid at the extreme edge of the highway. It adds: "The requirement, however, is only that the passing vehicle shall 'drive to the left of the middle of the travelled part of the way,' and, as we have pointed out, where the jury finds the circumstances to be such that in the exercise of reasonable care the statute could not be literally obeyed, no inference of negligence can be drawn."

The dissenting opinion holds that to interpret the statute literally would occasion unnecessary traffic congestion. The majority opinion contends that if this be true, it is not possible to disregard the express requirements of the statute and that it is for the legislature to provide a remedy. The minority holds that: "A penal statute cannot be interpreted so that it cannot be obeyed, or so that it will require further legislation to make it workable unless no other course is open. We think it was plain that the legislature did not intend to include electric cars or horse cars within the law of the road."

William A. Thibodeau, attorney for the Automobile Legal Association, has prepared a bill amending the law of the road so as to eliminate street cars from its provisions.

GRADUATED FEES IN INDIANA.

Senator J. J. Netterville of Anderson, Ind., has been looking over the motoring laws in the other states and believes Indiana needs a graduated annual license for automobiles and fees for chauffeurs and manufacturers. At present the only requirement of the Indiana law in this respect is a perpetual registration with the secretary of state at a cost of $1. Senator Netterville expects that his proposed bill will net the commonwealth between $175,000 and $250,000 for good roads.

The proposed schedule of license fees is as follows: Cars of less than 25 horsepower, $5; 25-35, $10; 35-50, $15; over 50, $25; chauffeur, $5 for first two years and $3 a year thereafter; manufacturers, $10. The bill also will contain the following speed provisions: Business districts, 10 miles an hour; residence sections, 12; outlying districts, 15; open country, 25.

AMENDMENTS IN WEST VIRGINIA.

The Ohio Valley Automobile Club, Wheeling, W. Va., is enlisting the support of the state association and the members of the incoming legislature in a proposition to amend the present motoring law. Special attention is being paid to three matters which are considered of the utmost importance—making it unlawful to drive an automobile while intoxicated, prohibiting the throwing of glass and other sharp pointed articles in the roads, and forbidding the use of muffler cut-outs and the making of other unnecessary noises. The provision against intoxicated persons reads as follows:

> No person when intoxicated shall operate a motor vehicle, and any person guilty of so doing shall be subject to a fine of not less than $100 nor more than $300, or imprisonment for not more than one year, or both; and the license of any person guilty of a violation of this section may be suspended for six months by the highway commissioner.

Mechanical Pointers for Garagemen and Repairmen

LINING UP CRANK AND GEARSHAFTS.

If the crankshaft and gearshaft of a motor be suspected of being out of alignment these parts may be tested without dismantling either the engine or the gearbox. If the clutch be of the leather faced cone type it should be examined to note if the cone engages evenly with the flywheel member. If not it may be assumed that the engine and gearbox are not aligned. If on turning the flywheel with the clutch held stationary, the former is inclined to wobble, then the crankshaft is out of line. When the flywheel is held and the clutch revolved the latter shows a tendency to oscillate, then the clutch or gearshaft is out of true. If both shafts be true and the clutch does not engage properly, then the motor or gearbox is out of line.

By attaching a pointer to the clutch coupling so that it will just touch the outside edge of the flywheel, the gear and crankshaft may be tested for alignment without having to dismount the clutch, but if the two shafts require lining up it is advisable to remove the clutch.

When the pointer makes contact with any point of the periphery on the wheel, then the two shafts are in line. If the clutch be removed the pointer may be used on the inside of the wheel. Where fan blades are fitted to the rim of the flywheel this will be necessary. Care should be taken to note if the bushing of the clutchshaft is not worn as this condition will lead one to surmise that the clutch is out of line.

CURING SPRING SQUEAKS.

Occasionally the repairman will be called upon to locate a mysterious squeak or rattle in a car which has puzzled the owner, and an instance of this was noted recently. The motorist complained that the noise was only discernible when the machine was travelling over rough roads and that the rattle seemed to be in the front of the car.

The ball and socket joints of the crossrod and those of the tierod and steering gear were examined but the play in these members was too slight to cause the trouble. Finally one of the workmen began to pull the goose necks up and down, simulating the action of the car in passing over rough roads.

It was discovered that the noise was caused by the side play between the ends of the goose necks and those of the springs, this condition being due to the wear of these parts. When the car was traversing rough roads the axle rarely was parallel with the machine in front elevation, as at one moment the left side was higher than the right and vice versa. This caused the ends of the springs to strike the lugs of the goose necks. The pins were removed and a washer fitted eliminating the noise.

STEERING WHEEL WINDSHIELD.

Although the majority of manufacturers include a windshield as part of the car equipment, there are a number of automobilists whose machines are not fitted with the device and who cannot afford the accessory. A type of windshield, that is not expensive and one that can be made easily, is shown in Fig. 1. It may be made either from glass or celluloid and in size according to the taste of the operator. From 12 to 16 inches will answer the purpose and provide an efficient shield against the wind as well as to protect the driver from foreign elements.

If celluloid be utilized a metal frame will be necessary and this can be made from thin flat or half-round iron. The celluloid is then cut to the shape of the frame and bound with leather. If the device be placed upon the steering wheel it should be made in the form of a half circle. If fastened to the steering column, it can be made round and its method of fastening so constructed as to be adjustable, enabling the operator to raise or lower it at will.

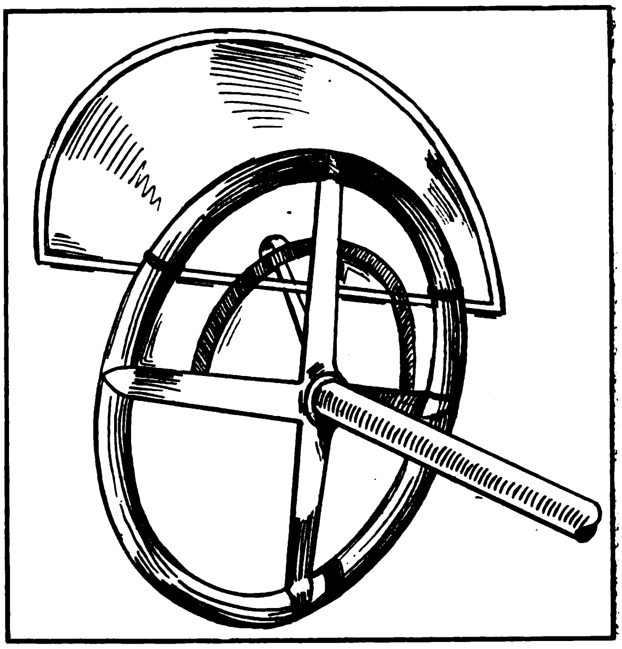


Fig. 1—An Easily Made and Inexpensive Windshield.

CUTTING GEARS.

When cutting gears care must be taken to have the cutter central with the index centres, and to have the cut exactly the depth required. A good method of testing the setting is to cut a groove in a piece on the centres, then shift the piece end for end and try the groove upon the cutter. A good method of holding the gear blanks is on an arbor with a taper shank which fits in the index spindle, the outer end of the arbor being supported by the foot stock centre. Frequently in cutting gears a shank arbor is used with an expanding bushing and a nut at each end of this, one nut forcing the bushing up on the arbor and holding the gear blank, while the other pushes the bushing off the taper and releases the gear when finished.

If the ordinary arbor and dog be used, care must be taken that the dog does not spring the arbor. The depth of the cut can be gauged from the outside of the blank, or if so desired, marked on the side by a gear depth gauge. In cutting gears, when the blank has been placed in position it is raised by the elevating screw until it just touches the cutter. The graduated column on the vertical feed shaft is placed at the zero line and the blank moved horizontally away from the cutter. Then the work is raised the number of thousandths of an inch required for the depth of the tooth.

LATHE APPLIANCES.

There are many special tools which may be utilized with the lathe to facilitate the work of the repairman, especially the small shop where it is customary to send certain pieces outside. The greater part of these could be handled successfully and profitably if the equipment included the necessary special machinery, but much may be accomplished with simple home made tools. Then again, quite a number of old cars being overhauled, frequently require a new part which cannot be secured, requiring a pattern, a casting and subsequent machining.

In the illustrations presented herewith are a number of devices that can be made and will permit of a fairly wide range of work. Those shown at Fig. 2 are of the external type of cutters some of which are superior to the ordinary slide-rest tools, especially the device depicted at A, which may be employed in radius work, such as turning flywheels, hubs, flanges, etc. It is customary to rough out nearly to size and finish with a spring tool. An instrument for centring this as well as other cylindrical work is shown at F.

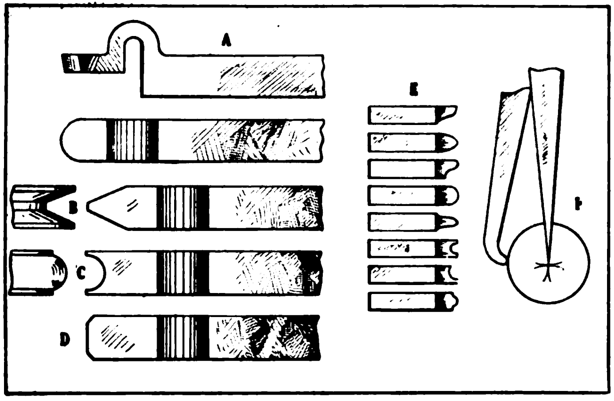

Fig. 2—Handy Lathe Devices: A, Spring Tool for Radius Work; B, Implement for Finishing Small Pulley; C, Device for Bead Forming; D, Utilising File for Finishing Iron Castings; E, Small Cutters; F, Instrument for Centring Cylindrical Work.

For turning a groove in a pulley, the tool shown at B will prove handy and it also can be utilized for similar purposes. Where beading is to be done the instrument at C will be useful.

At D is illustrated a tool that will facilitate the facing of a casting. If a cast iron disc, four inches in diameter, and having a cored hole, is to be trued up and polished on one of its sides, it would be bored while in the chuck and then faced up for polishing. The usual method is to finish some castings with hand scrapers, made from worn out flat, smooth files, the teeth of which on both sides have been ground away and the end of the member finished square.

A bar of square iron or steel is clamped in the slide-rest, with one end projecting about four inches, at right angles to the lathe centres, and close to the work to be scraped. The file is securely fitted into its handle, then held with the right hand, the other end resting on the steel bar in the rest. A piece of leather may be placed under the scraper, when in use, to prevent chattering. This tool is presented squarely to the rotating work until a fine surface is obtained after which it can be polished easily with emery cloth and oil. The device can be used in place of a scraper and will accomplish the work much quicker, the lathe being run a trifle faster than for ordinary turning, and by taking a light cut it should leave nearly a polished surface on the work.

The tool shown at Fig. 3 A may be employed for boring in cast or mild steel while the one at B will prove handy in finishing the bore when cast iron is being handled. When machining the latter, if the object has a cored hole, it is a good plan to remove as much of the core sand as possible before trimming out the interior. Sometimes it is a difficult matter to get below the skin of the metal, as it soon takes off the cutting edge. This may be obviated by first facing up the casting; then using a boring tool shaped like that shown at C. The front of this cutter is started into the clean metal on the face of the work, and as it progresses by means of a mechanical or hand feed, it will break away the hard skin of the casting, facilitating the boring operation.

A holder for these is denoted at D. It is made from a piece of .5-inch round cast steel about six inches in length. A hole .25 inch in diameter is drilled through to take the small cutters illustrated at E. These are made of .25-inch round steel and are held in place by a .25-inch set screw. The holder is made from a three-inch piece of .75-inch square mild steel which is drilled through its length and the hole finished with a reamer. A longitudinal saw cut is made to permit it to clamp to the tool-bar in the slide-rest. This piece, when completed, should be case hardened.

The one depicted at F is used for external work and can be a forging. A .3125-inch diameter hole is drilled through at one end and enlarged to .5-inch diameter, to within .125 inch of the bottom. A bolt for holding the tool is shown at G and is made from cast or a mild steel and case hardened. A .3125-inch thread is cut for .75 of an inch. The bolt above the thread is turned to .5-inch diameter and is .375 inch long. The head is .75 inch over all, and 15 teeth are cut around the circumference. A hole .25 inch in diameter is then drilled through its centre, and filed to take the square tools shown at Fig. 2 E. When the bolt is placed its teeth engage with the points filed on the holder, and prevent it from turning when tightening the nut. The combination can be swivelled to any desired angle.

SPEEDS OF CUTTING TOOLS.

To secure the best results from steel used for cutting purposes, attention must be given to the use of calculations in determining the proper speed of the work or tool, according to the conditions. The average machinist in ordinary practise does not make use of these rules but depends on the knowledge acquired through experience and observation. For the benefit of those who are not familiar with rules for finding cutting speeds, and to obviate the necessity of guessing at the proper speed, the approximate cutting speed at which tools or work should be run in the machining of different metals is herewith given:

Cast iron, 14 to 16 circumferential feet a minute.
Malleable iron, 16 to 20 feet a minute.
Steel, 12 to 15 feet a minute.
Brass, 28 to 40 feet a minute.

The circumstances and conditions upon which slight variations of the speeds given depend are numerous, among which are: Whether a rough or finishing, coarse or fine cut, is being taken; the form and shape of the cutting tools; the toughness and density of the metals being worked upon, and the surface machined without regrinding. There is considerable work done in the lathe or planer which requires cutters that project far out of their holders. For such work the cutting rates must be considerably less than above given. Very often the texture of the metal is tough and hard, necessitating slower working and fine feeds in machining.

TEMPERING SPRINGS.

In overhauling a car the repairman sometimes discovers that a spring has lost its elasticity and that a new one should be used. If on a rush job, the member has to be made although spiral springs are to be had in an endless variety of sizes and forms and can be secured readily.

The best steel for making springs that will stand severe use should be a fine grained, tough, mild steel, with just enough carbon in it to harden at a low red heat, hard enough so that a file will just cut it. The temper should be just sufficient to give the proper elasticity, as if too hard the springs will break and if too soft they will set without giving any elasticity.

There are several methods of hardening among which is that of heating carefully and evenly over a forge fire that has burned down, or with a gasoline torch. A clean heat is essential. The metal is heated to a light red, then hardened by plunging in lard oil, or any animal oil.

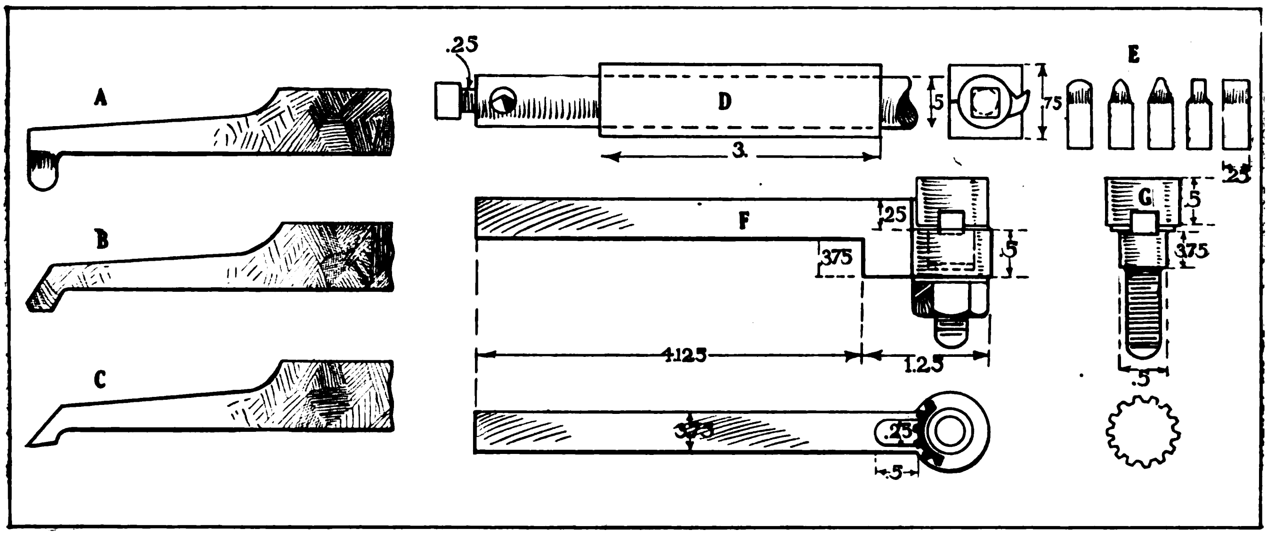

Fig. 3—Handy Home Made Lathe Attachments: A, Internal Boring Tool for Steel; B, Finishing Instrument for Cast Iron; C, Appliance for Roughing Out Castings;D, Internal Tool Holder; E, Small Cutters; F, Tool Holder for External Work; G, Clamping Screw.

Remove from the oil and hold it, dripping with the grease, over a clean fire until this takes fire and blazes off. If a file will not scratch it, it is too hard. Blaze off again until a file will just cut it. The oil should be placed in a receptacle large enough so that the spring can be dipped entirely therein. It is best to temper each spring separately, as no uniformity can be had by tempering a number at the same time, using ordinary methods.

Another way is to heat the spring to a light red, in the shade, and then plunge in water just warm. This is a cheap and easy way and will give the right temper if properly done. A third method, in addition to the above, is after plunging in water, heat again until to a red, not as dark as before, hold it in a dark place, then let cool. Still another way is to heat the spring evenly and cool in raw linseed oil. Then hold the spring over the fire until the oil blazes off. This may be repeated once or twice, as the thicker the spring the more blazing off it will require.

Spiral springs can be tempered by any of the above methods, depending on the quality and kinds of springs to be made. Make a mandrel the size the spring is to be on the inside. A small hole, the size of the wire to be used, is drilled in the mandrel for holding one end of the material. Then wind the wire around the mandrel. It is next taken off and the end in the hole removed either by cutting or pulling out. The spring is then ready for hardening.

If a spiral spring with small ends and large centre, a barrel spring, is required, string a number of washers on an iron rod. Screw them up tightly by means of a nut on either end of the rod. Then place the bolt in the lathe and turn the washers to the required size, winding the spring as above described. The rod may be removed by taking off nut, and the washers can be slipped out between the coils of wire.

UTILIZING OLD FILES.

Files that have lost their cutting edges can be utilized for scrapers and punches. Some repairmen make these tools in preference to using those to be purchased. In making the punch, the file should be annealed by slowly heating to a bright cherry and then buried in air slacked lime to insure slow cooling. The teeth are ground out, although enough may be left at one end for a grip when using the member. One end is then rounded to the shape required and hardened. To temper, heat the punch end to a cherry red and then plunge about two-thirds of it in cold water, moving it to ensure even cooling, and continue until the rest of the tool fails to color. Clean with emery cloth and note colors. They should appear slowly. The tool should be completely quenched when the end is brown.

Broaches handy for removing broken studs and screws may be made from different sized square files. The teeth are ground off after annealing and shaped to the desired size. These should be tempered to a dark blue. Scrapers for bearings can be made from half-round or three-cornered files. The half-round makes the best curved scraper as it can be bent to the required angle. A three-cornered scraper can be made from a file by grinding on a small emery wheel to obtain a concave and the cutting edges ground to a small angle with this face. A scraper for removing carbon may be made from a small mill file. In tempering the files should be heated to a bright cherry and then dipped in water to obtain as hard a temper as possible.

To Waterproof Canvas—Dissolve soft soap in hot water and then add a solution of sulphate of iron, this is washed and dried and mixed with linseed oil. The soap prevents the oil from becoming hard, and water has no effect on it.

CORRESPONDENCE ON MECHANICAL SUBJECTS.

Magnetos and Dynamos.

(121)—Will you kindly explain the difference in the operation and construction of a magneto and dynamo? What is meant by residual magnetism? Also how a permanent and electro-magnet differ? W. E. H.

Holyoke, Mass., Nov. 12.

A dynamo has an electro-magnet which is known as the field magnet to produce the magnetic field, whereas in a magneto this field is produced by means of permanent magnets. The latter are so termed because they are excited by a powerful current and retain their magnetism for a very long time, and to distinguish them from electro-magnets which are excited only so long as a current is passing through wiring coiled around them.

The flat horseshoe magnets sold as toys are permanent magnets and lines of force pass from one end or pole, called the north or positive, to the other, known as the south or negative. If a small piece of iron or steel be brought close to the ends of the magnet or within the zone of magnetic influence, it will be attracted quickly. The magnet, however, will have no influence upon a piece of brass, copper, tin or zinc. This influence radiating from the poles of the magnet is termed the magnetic field.

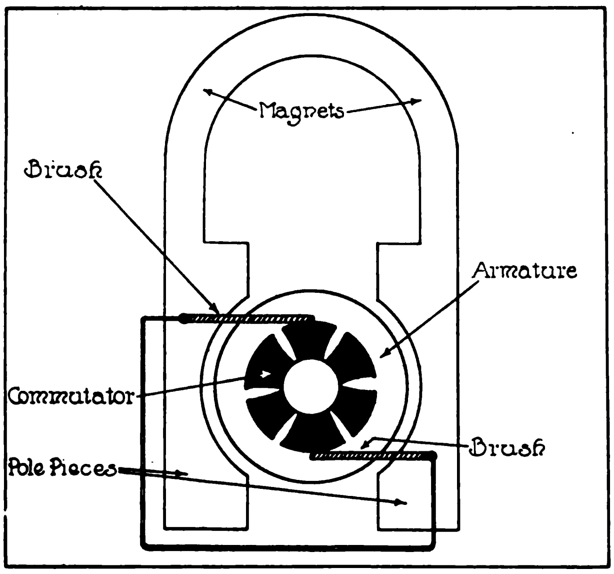

Fig. 1—Illustrating the Components of a Magneto.

If a length of insulated wire be wound into a coil and passed through this magnetic field, a current will be produced in the wire and the magnetic lines of force will be travelling in one general direction on the inside of the coil and in the opposite direction on the outside. In the magneto the coil of wire passes through the magnetic field by rotation, it being wound upon a cylinder or armature as shown at Fig. 1, which depicts a diagram of a magneto. Upon each revolution of the armature the wires become saturated with electricity. Attached to the lower ends of the magnets are the pole pieces and the armature revolves very closely to these members, which increases the magnetic field.

The armature is provided with two deep longitudinal grooves, one diametrically opposed to the other, so that the transverse section looks like a letter H. Insulated copper wire is wound onto the armature lengthwise, so as to lie in these grooves. The wire is short and thick, or long and thin, according to whether a low-tension or high-tension current is desired. As there are two pole pieces, each time the armature makes a revolution the coil member goes through the magnetic field twice and the lines of force are cut by the coil. The intensity of the current varies according to the position of the armature, being strongest where the magnetic pull is the greatest. The direction of the current is reversed each half-revolution as previously explained.

One end of the coil is attached to the end of the iron core which is grounded when attached to a motor car by the metal of the base of the instrument. The other end of the wire coil is insulated by a ring of non-conducting material. The current generated is collected from this ring member by a brush led to a distributing plate, thence to the proper spark plug, and back to the coil by the way of the metal of the car.

The electro-magnets utilized with dynamos are made by placing a bar of soft iron, wrought or cast, within a coil of insulated wire through which a current of electricity is passing. The magnetic lines of force about the wire pass through the iron and convert it into a magnet. When the flow of current is stopped, however, the magnetism almost instantly leaves the iron bar which returns to its original condition. A faint trace of magnetism remains, called residual magnetism, and this is present more or less in all iron or steel. This assists to a certain extent in the operation of the generator. The strength of the electro-magnet depends upon the number of turns in the wire coil and the strength of the current passing through it.

In the lighting dynamo the current generated is usually direct; that is, it flows in one direction all of the time. At Fig. 2 is presented the wiring plan of a dynamo and the components are outlined. It will be noted that the armature rotates upon the longitudinal centre line of its core and carries a large number of coils of wire placed in planes, which pass through the longitudinal centre line of the core, and these coils are so distributed that they cover practically the entire outer surface of it.

At one end of the core is located the commutator, which consists of a number of segments of a cylinder made of copper, insulated from one another and connected, in pairs diametrically opposite, with the ends of the various armature coils. With a bipolar machine, two brushes make contact with the surface of the commutator, one on each pair of segments, forming electrical contacts between the outside circuit and each of the armature coils successively as the armature is rotated.

Assume that the field magnets are already energized when the armature is rotated by belt, chain, gears, etc., and that the magnetic lines of force are flowing across the gap between them and through the armature core from one pole to the other. The movement of the armature coils within this magnetic field sets up an electric current within them, which is collected by the brushes and sent through the outside circuit.

A part of the current, however, is shunted in practise, that is, run from the brushes in the same way as the outside circuit, and is passed through the field windings to energize the electro-magnetic field pieces. Just so long as the armature is kept revolving, so long will an electric current be generated if the exterior circuit be kept closed. The faster the armature is revolved the greater is the amount of current delivered to the field coils, the stronger becomes the magnetic field and greater the output of the generator. When utilized for lighting a motor car a device, either mechanical or electro-mechanical, is incorporated to prevent the high speeds which would tend to burn or fuse the windings.

Dynamos utilized for motor car lighting may be series wound, shunt wound or compound wound.

Timing Renault Motor.

(122)—I have a Renault car which is about eight years old, and would like to secure the timing plan.

W. H. G.

Lawrence Mass., Nov. 11.

The timing plan of the Renault mentioned is not found in the files of the Accessary and Garage Journal. Renault Freres Selling Branch, Inc., 57th street and Broadway, New York City, will doubtless supply the desired information.

Mean Effective Pressures.

(123)—What is the mean effective pressures of standard automobile motors and what is meant by the thermal efficiency of an engine?

STUDENT.

Cambridge. Mass., Nov. 14.

In modern automobile motors the mean effective pressure is about 71 pounds a square inch. This pressure has increased since the beginning of the automobile industry, but in a lesser proportion than the speed. It varies with the size of the motor. Thus, in a current type of motor with cylinders having a 2.4-inch bore and 4.8-inch stroke, it attains about 57 pounds to the square inch. In a motor having a bore of 3.2 inches and stroke of 5.2, it is 71 pounds to the square inch. That of a motor having a bore of 4.4 inches and stroke of 5.6 inches is 85 pounds to the square inch, all other things being equal. This is at 1000 revolutions a minute. The mean effective pressure increases as the result of increased compression. It decreases as the number of revolutions a minute decreases.

The thermal efficiency of a motor, by which is understood the ratio between the work done and the thermal energy contained in the fuel consumed, is about 14 to 15 per cent., corresponding to a fuel consumption of one-eighth of a gallon a horsepower-hour.

The mechanical efficiency, by which is understood the ratio between the work actually done to the energy expended on the piston by the expanding gases, is approximately 70 per cent. The efficiency of transmission or the work done at the wheel rims as compared to that delivered at the crankshaft is generally conceded to be about 75 per cent.

Annealing Boxes.

(124)—Kindly give me the address of concerns making boxes for annealing and case hardening.

REPAIR SHOP.

Hartford, Conn., Nov. 15.

There are several concerns manufacturing the boxes named. Among those listed are: The Wilfong Iron Works Company, Philadelphia; the National Manufacturing Company, Pittsburg, Penn.; Knox Pressed & Welded Steel Company, Pittsburg, Penn.; and the Leetonia Boiler Company, Leetonia, O.

Firing Order of Six-Cylinder Motors.

(125)—What is the firing order of the Pierce-Arrow six-cylinder motor, and do all six-cylinder engines fire alike?

W. E. WHITEHALL.

Washington, Ill., Nov. 11.

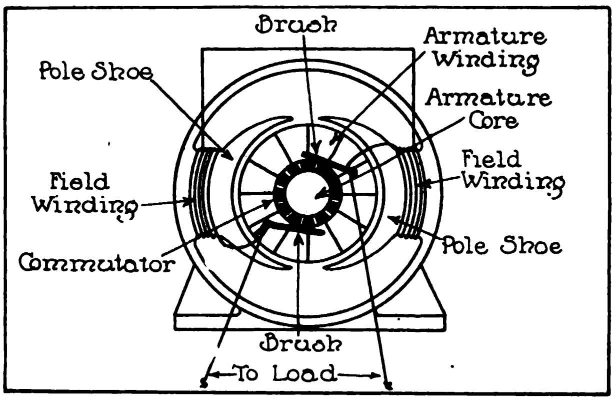

Fig. 2—Showing the Wiring Plan of Components of a Dynamo.

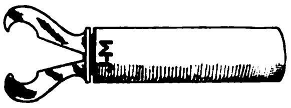
The firing order of the Pierce-Arrow six-cylinder motor is 1-5-3-6-2-4. The firing order is not alike with all motors and it may be arranged 1-3-2-6-4-5, 1-3-5-6-4-2, or 1-4-2-6-3-5, depending upon the design or make. Of 11 leading makes, four fire as does the Pierce-Arrow.

REPAIRING LEAKY METAL FLOATS.

Metal floats ordinarily do not give trouble, but if the walls become punctured through misuse or wear, the mixture will become rich and the exhaust will give off clouds of dense black smoke. If the float be suspected of causing the trouble it may be tested by heating it, then applying a flame, when the leak, if any, will be detected. The aperture should be marked with a pencil, then stopped by a very fine film of solder. This is a delicate task as the balance of the float may be disturbed. After soldering the surplus should be removed with a piece of very fine emery paper, removing as much of the solder as possible.

DESIRABLE ACCESSORIES FOR THE DEALER.

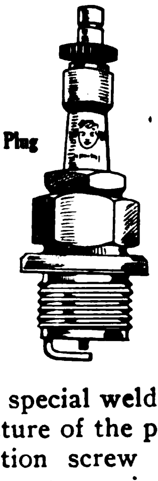
Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.



J-M Terminal

The J-M Universal Terminal, marketed by the H. W. Johns-Manville Company, New York City, is designed for attachment to any type of spark plug and may be detached or replaced by the fingers, dispensing with the use of pliers, etc. The device is provided with a pair of elliptic brass jaws which are contracted or expanded as desired by simply turning the fibre sleeve. It is pointed out by the maker that the accidental breaking of the threading device does not incapacitate the terminal as proper contact can be secured through the design of the jaws. The secondary wire is attached easily, the exposed strands being locked by a simple device.

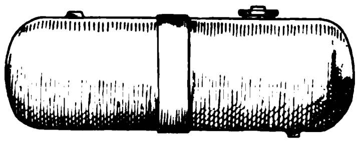
—— ★ ——



Red Head Magneto Plug

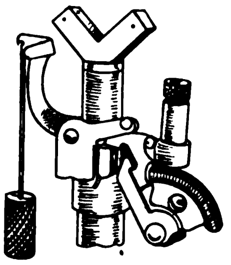
The Red Head Magneto Plug is a new product of the Emil Grossman Company, 250 West 54th street, New York City, and to identify it from the other plugs made by the company the shell and cap are nickel plated. The shell and bushings are similar to the other members and the central electrode has a solid platinum point, .03125 inch thick which is secured by a special welding process. A feature of the plug is the combination screw top and magneto type terminal which will accommodate snap, ring or slip cable connections. The plug comes in a torpedo shaped telescopic box and threads into a cavity in the base of the container, protecting the points and preventing disarrangement of the spark gap.

—— ★ ——



Janney, Steinmetz Tank

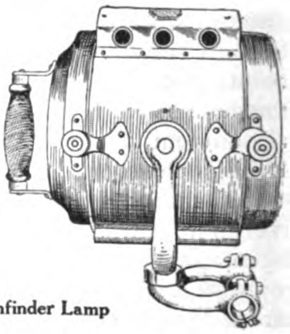
Seamless Steel Tanks are favored for the storage of gasoline and compressed air as the construction eliminates the possibility of leaks, making for economy. Janney, Steinmetz & Co., Fourth and Market streets, Philadelphia, manufactures a large variety of steel tanks which are carefully tinned and tested. The company also makes special tanks for containing compressed air for motor starting and tire inflating. A large number of fuel and air tanks are carried in stock.



Alco Lighter

—— ★ ——

The Alco Lighter is marketed by Chas. E. Miller, 97-103 Reade street, New York City, and is designed for attachment to the base of the acetylene burner. By it the gas may be lighted easily, the operation simply involving the pressing of a lever which moves in contact friction material producing a shower of sparks in the path of the escaping gas. The tip is the well known Alco and throughout the mechanism is sturdily constructed and of high grade material. The sparking material is said to be very durable, may be replaced when worn out and is inexpensive, the same as the device itself.



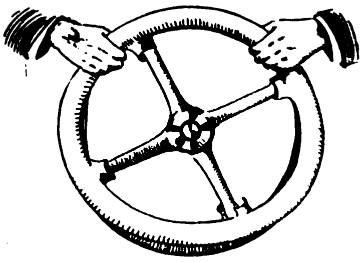
Pathfinder Lamp

—— ★ ——

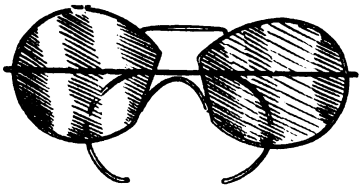
The Pathfinder Lamp is the product of Bennett & Morse, Columbus, O., and is designed for attachment to the handle bars of the motorcycle. It is of the searchlight type, being equipped with a swivel bracket and is turned easily in the desired direction by means of a handle. A quality of the lamp is that the rear opens, facilitating cleaning.

—— ★ ——

Steerease, as the name implies, is designed to eliminate vibration to the hands when operating a motor car. It comprises a soft, flexible, corrugated rubber covering which is split for attachment to the hand wheel. It is fitted and applied easily, being retained with cement, is made in different sizes, two colors, and is inexpensive. It is manufactured by the Goodyear Rubber Hose & Packing Company, 221 Chestnut street, Philadelphia.



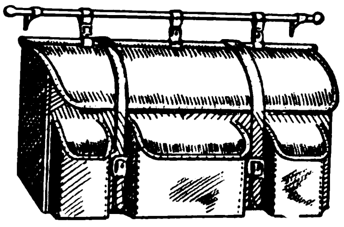
Autosun Glasses are manufactured by the Brown Autosun Company, Cleveland, O., and are designed especially for motorists, although they may be used by those exposed to artificial light. It is stated by the company that the peculiar blending of amber shades in the lenses neutralizes the ultra-violet rays of sunlight which disturb the eyes. The glasses are fitted easily and not only save the eyes from bright lights, but prevent the entrance of dust or foreign elements.



Autosun Glasses

★

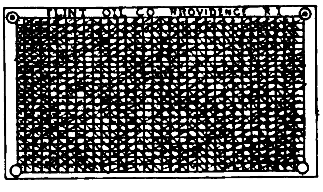
The Gordon Luggage Bag, manufactured by the Vehicle Apron & Hood Company, Columbus, O., will appeal to touring motorists as it is designed for attachment to the robe or coat rail and is provided with three collapsible pockets in addition to the main space. It is 30 inches long, 18 wide and five deep and when not in service occupies but little room. It is constructed of high grade material, weather and dust proof.



Gordon Luggage Bag

★

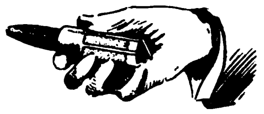
Flint's Heel Plates are marketed by the Flint Oil Company, Providence, R. I., and comprise an aluminum member five by eight inches. They are designed for attachment by screws to the floor boards, preventing the deterioration of the rubber matting by constant contact of the heels. The device may also be utilized to cover worn places and being corrugated prevents slipping of the foot. They are inexpensive, readily installed, and being of aluminum are maintained easily in a serviceable condition.



FLINT OIL CO. PROVIDENCE R. I.
Flint Heel Plate

★

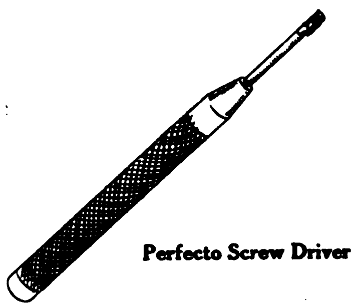
The States Cigar Device, marketed by the States Manufacturing Company, 1035 West Adams street, Chicago, is a cylindrical aluminum holder in which the cigar is inserted and held. Its design is such that ashes and sparks are prevented from being blown into the faces of the other occupants of the car. It is provided with a lid for removing the ashes, and it is pointed out by the maker that a cigar will burn twice as long, as the member is protected from the wind.



States Cigar Device

★

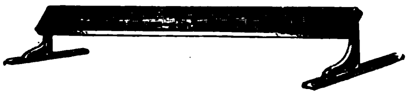
The Perfecto Screw Driver is produced by E. Edelmann & Co., 221 West Illinois street, Chicago, and being three inches in length is adaptable for making fine adjustments. The handle is knurled, providing a firm grip, and the blade is made of a high grade carbon steel, nickel plated. The device costs but a few cents and should prove a valuable addition to the tool equipment.



Perfecto Screw Driver

★

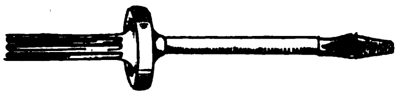
The Milwaukee Foot Rail is the product of the Garage Equipment Manufacturing Company, Milwaukee, Wis., and differs from the usual members in that the foot rest proper is constructed of wood covered with rubber matting bound with brass molding. It is produced in two styles, one having a track in which the rail proper slides, and the other non-adjustable. They are made in four sizes, 11, 15, 29 and 32 inches, respectively, and are moderately priced.



Milwaukee Foot Rail

★

The Owen Valve Grinder is made by the Stewart Grinder Company, 171 Broadway, New York City, and is designed to take the place of the screw driver, or brace and bit. The weight of the tool is such that no downward pressure is necessary in grinding a valve, the device simply being rotated in the usual manner. The handle is corrugated and the grinder is nicely finished. Its price includes a supplementary spring for lifting the valve. The company also markets Gryndyn, a valve grinding compound which comes in screw top tin boxes and which is inexpensive.

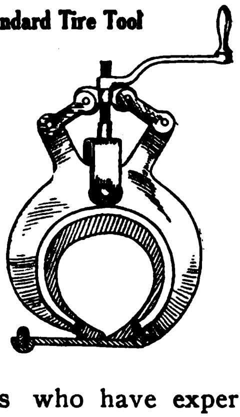


Owen Valve Grinder

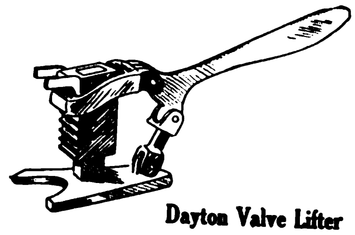
★

The Standard Tire Tool is manufactured by the Standard Tool & Supply Company, 42 West 15th street, New York City, and will appeal to motorists who have experienced difficulty in removing a shoe which has become rusted or frozen to the rim. A pair of

Standard Tire Tool



arms encircles the shoe, these being provided with recesses which engage with the bead of the tire and rim. The upper portions of the movable arms carry a toggle mechanism mounted upon a threaded bolt secured to the arm members. A handle having a threaded portion is rotated upon the bolt member which in turn imparts movement to the toggles and arms, causing the latter to contract and force the shoe away from the rim. The maker states that it will start the most stubborn tire and that it is guaranteed against breakage. It is made in two sizes and is designed solely for quick detachable rims.



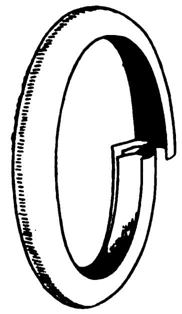
Dayton Valve Lifter

★

The Dayton Valve Lifter is manufactured by the Dayton Malleable Iron Company, Dayton, O. Qualities emphasized of the tool are that it may be operated by one hand and that it automatically locks into position upon the valve spring being compressed. These are made possible through a ratchet and pawl mechanism, the operating lever being provided with teeth registering with similar members on the stem of the tool.

★

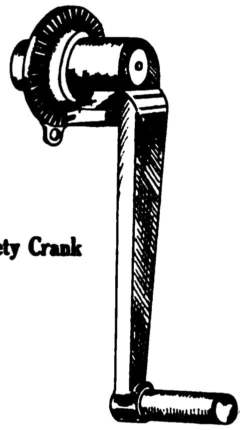
Kant-blo Innerliners are marketed by the Hampton Manufacturing Company, 1520 West Washington street, Indianapolis, Ind., and features claimed of these members are that they are self-vulcanizing and do not creep, chafe or buckle, creating damage to the inner tube. They are constructed of a layer of specially treated chrome leather placed between two layers of high grade Egyptian fabric and the materials are so placed together as to form a single yet flexible piece. The ends are lapped to facilitate installation.



Kant-blo Innerliner

★

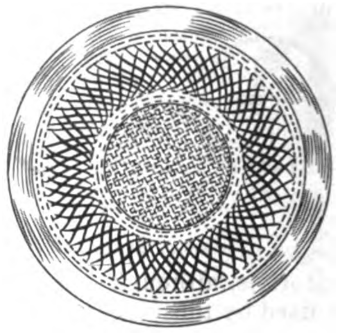
The Cukor Safety Crank is designed for attachment to the crankshaft of the motor and to replace the usual handle, the maker claiming that it may be installed easily in a few minutes and without any alteration to the shaft. It is simple in construction, having but two parts, a ratchet and pinion, and its design is such that it does not detract from the appearance of the machine. When the motor is cranked a pinion engages with a ratchet, the latter being actuated by a plunger member. Any backfire or reverse movement is compensated for by the pinion automatically breaking contact with the ratchet. The plunger member also is disengaged with the motor shaft, allowing it to rotate, although the starting handle remains stationary. The device is manufactured by the Cukor Safety Crank Company, 58th street and Broadway, New York City.



Cukor Safety Crank

★

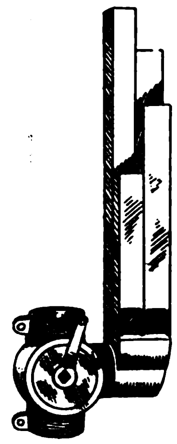
The Gasosava is the product of the Gasosava Company, Inc., 1270 Broadway, New York City, and is a device which is inserted between the carburetor and intake pipe or manifold. Its function is to assist in the complete vaporization of the fuel, and the maker holds that a decided economy is effected by its use. It differs from the usual devices of this nature in that it is fitted with a wick like screen which is so proportioned and constructed that the fuel is broken up as well as effectually screened. The maker states that after installation it is essential to restrict the opening of the needle valve as less gasoline is required to maintain the maximum efficiency of the motor.



Gasosava

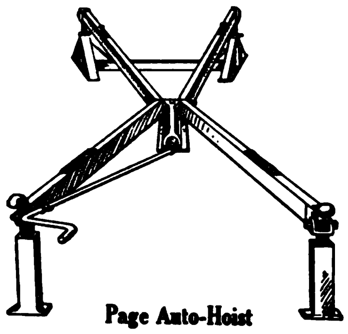
★

The Trinity Chimes Horn, for motorcycles is operated by the exhaust of the motor and it is said that a beautiful four-tone chime is obtained by the construction of the square brass tubes, four of different length being employed. Each tube is slotted in a manner similar to the pipes of an organ. The horn is connected on the exhaust pipe between the motor and the muffler and a cut-out valve is incorporated, which is actuated by a wire cable secured to a pedal near the driver. The tone of the



Trinity Chimes

signal may be varied by the opening of the valve member. It is marketed by the Waite Auto Supply Company, Providence, R. I.



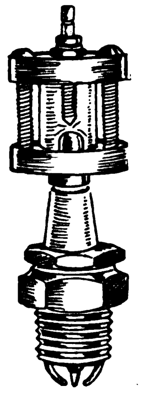
Page Auto-Hoist

* * *

The Page Auto-Hoist, manufactured by the Page Auto-Hoist Company, Grand Rapids, Mich., is designed for jacking up the car, thereby relieving the tires of its weight when the machine is not in service, or repairs or adjustments are to be made. It occupies but little room in the garage. The machine is run over it and by rotating a handle the car is hoisted free from the floor. It is claimed that but little exertion is required to work the hoist and that a child may complete the operation in 10 seconds. It is made in differing sizes for varying wheelbases.

* * *

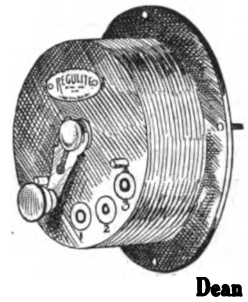
The Hemmeter Spark Gap, produced by the Hemmeter Spark Gap & Specialty Manufacturing Company, Pontiac, Mich., is a device which may be attached to any standard type of spark plug, its function being that of an auxiliary gap. By it the points of the plug are cleaned, as the flow of the secondary current is interrupted and built up sufficiently to overcome the resistance at the auxiliary gap. The current jumps the latter, increasing the intensity of the flame at the gap of the spark plug. The auxiliary member is composed of two pieces of fibre which are countersunk to take a section of glass tube, secured through the medium of two screws. The fire pin is adjustable as are the fibre pieces. A quality of the device is that it enables the observance of the spark.



Hemmeter Spark Gap

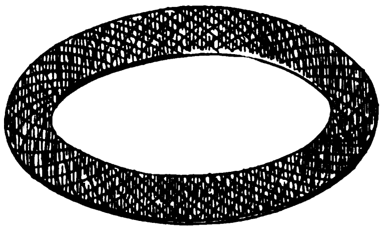
* * *

The Dean Regulite, marketed by the Waite Auto Supply Company, Providence, R. I., is an electrical device for utilization upon model T Ford automobiles when the magneto is employed as a source of current for lighting the headlights. With this type of generator the voltage varies with the speed of the motor and if the lamps are not of proper size, at high motor speeds they are likely to become damaged. The Dean Regulite regulates the voltage, its principle being that of resistance in the circuit, and it is so designed that a steady light is provided at different speeds, the lamps being protected from excessive voltages. The switch member has four steps or contacts to enable the adaptation of the system to generators of varying output of current. Another quality of the device is that it permits of dimming the lights when operating in the city. The Regulite is neatly constructed, takes the place of the usual lighting switch, and may be located upon the dash or in any other convenient place. It is moderately priced.



Dean Regulite

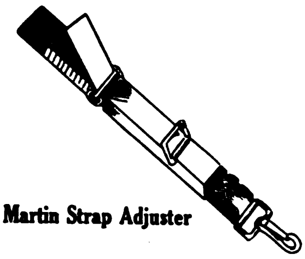
Burgmann's Gaskets are manufactured by Feodor Burgmann, 5 Beekman street, New York City, and are constructed in varying sizes to meet individual requirements. They are made of a high grade asbestos cloth, with and without wire insertion, as well as graphited or ungraphited. They are designed to withstand high temperatures and moisture, and are made in different thicknesses. The maker also produces Janos sheet, a high grade packing particularly adapted to motor work, and Joudol "M," a packing lubricant.



Burgmann Gasket

* * *

The Martin Strap Adjuster will appeal to motorists who have experienced difficulty in attaching the top strap hook members to the eyes of the frame member when the top is raised. Sometimes it is necessary to exert considerable energy to accomplish the operation and the top and bows are strained. The Martin device is so constructed that its locking mechanism may be loosened easily and quickly, the strap lengthened and the hook snapped into place. The adjuster is then locked to its original position. Two comprise a set which is moderately priced. The device is made by the Martin Manufacturing Company, 515 Vine street, Cincinnati, O.



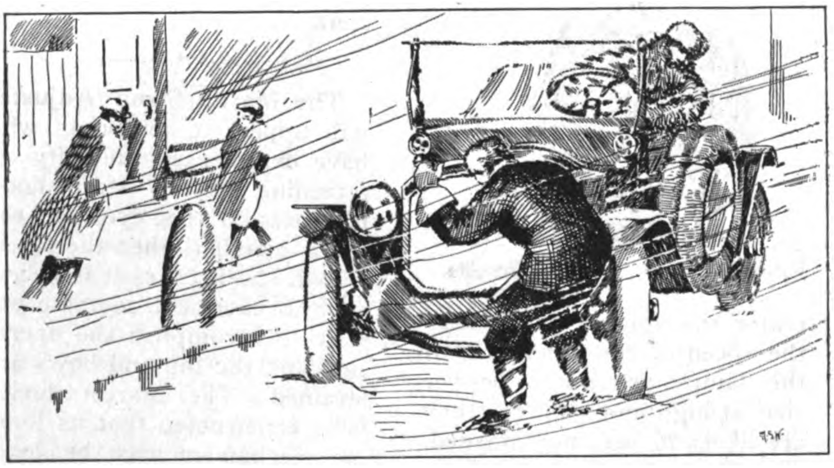
Martin Strap Adjuster

EFFECT OF COLD ON CARBURETION.

Why Motors Are More Difficult to Start with Heavy Fuel—Reasons Advanced for Its Use—Factors Making for Proper Vaporization—Priming Devices Which Will Appeal to the Owner.

PROPRIETORS of garages are being called upon these cold days to advise their customers how to overcome the starting troubles created by the heavy grade of gasoline now being marketed. More or less complaint always arises at this season, but the situation presents new features which have not been noted heretofore except in the severe cold weather of the winter months. While it is admitted by refiners that the motor fuel of today is heavier than it was several years ago, there may be a number of reasons for starting troubles, such as ignition, etc. Before considering the devices produced for overcoming these difficulties, a few words upon carburetion will prove of value.

Gasoline, as is well known, is extremely volatile; that is, it will evaporate readily and its vapors will combine with air to form an inflammable gas, and at ordinary temperatures. To carburet means to combine certain proportions of air with any gas so that its combustion or burning will be so rapid that it becomes an explosion. The amount of air required will vary within certain proportions and some mixtures will burn sooner than others. Combustion is simply burning, and may be very slow, moderately fast, or practically instantaneous.



Starting a Cold Motor in Winter Is Usually Accompanied by Considerable Effort on the Part of the Driver.

If there is too much or too little air in proportion to the fuel vapor, the burning or combustion will be slow and the explosion weak. It is evident, therefore, that the richer the mixture in fuel, the quicker it burns, though best operating results are not obtained with a rich mixture, this being better adapted for starting or slow running. While it would appear a simple matter to obtain the desired mixture, and that almost any device which would permit of a current of air coming in contact with the liquid fuel could produce a combustible gas, it should be borne in mind that the object sought by the makers of carburetors is to design an appliance capable of producing a mixture which will be of proper value at all motor speeds, as well as permitting of flexibility without excessive use of fuel.

As previously stated, gasoline vaporizes very readily at ordinary temperatures, but if it is very cold it will not vaporize in sufficient quantity to make the proper mixture and ordinarily there will be too much air and not enough vapor, making for a lean mixture which is slow burning. Condensation is another factor to be considered and although the carburetor may be performing its function properly, the mixture may be "killed" on its way to the combustion chamber. Obviously the remedy would appear to be the enriching of the mixture, but while this would favor starting it would not make for proper carburetion at high speeds nor compensate for the varying compression values with the throttle opening. To vaporize the heavy fuel successfully for starting purposes, as well as to provide a suitable mixture at varying speeds, the carburetor manufacturer incorporates self-priming devices for enriching the mixture for starting or for restricting the air, or both. With either construction it is held by carburetion authorities that it is possible to start the motor in cold weather provided its components are performing their functions properly. This contention appears to be borne out in practise by some cars, the owners of which experience but little trouble in starting the motor when it is cold.

Reverting to the subject of fuel, the heavy grade and increased cost of which are viewed with alarm by motorists and those utilizing internal combustion engines: Those who are familiar with the products of petroleum, from which motor fuel is derived, hold that the advancing demand has compelled refiners to obtain a greater percentage of carburetant from their crude oil.

Technically, gasoline is the lightest distillate obtained from petroleum and its gravity is 90 to 78 degrees Baume. Only 1.5 per cent. is secured from the total weight of crude oil. Next in the list comes naphtha C, amounting to 10 per cent. of the whole and having a gravity of from 78 to 68 Baume. These two distillates were formerly combined for motor car use, but the increased demand for fuel forced the refiners to add to these, naphtha B and A having two and 2.5 per cent., respectively, of the crude petroleum base and gravity ranges between 68 and 60 degrees Baume.

While it would appear from these figures that a gallon of crude oil yields 16 per cent. of its weight in motor fuel, it should be borne in mind that no crude will show this percentage at all times. Even the best of Pennsylvania crude will only show 16 per cent. occasionally, while others yield but two, and some none at all. The amount of motor fuel distilled from the crude varies from four to 16 per cent., according to the richness of the oil. When it is considered that one state yielded 81,000,000 of the 220,000,000 barrels of crude in 1911, and that the percentage of motor fuel derived was exceedingly small, it would appear that the average would be nearer 10 than 16 per cent.

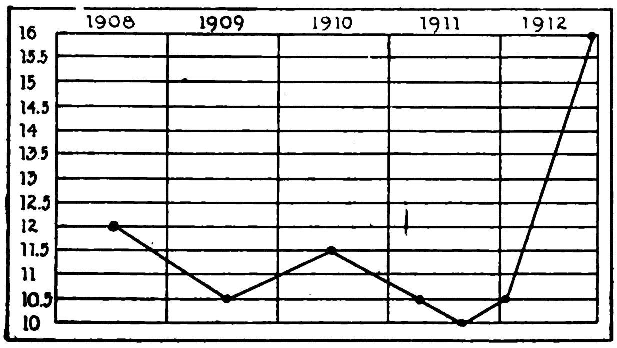


Chart Showing the Fluctuation in Price of Motor Fuel from 1908 to the Present.

It is held by some that the refiners have not increased their output, but statistics show this to be erroneous. The total production of crude petroleum in 1908 was 178,527,355 barrels, this yielding 115,000,000 barrels of refinery crude, from which motor fuel is obtained. The total production of crude in 1911 was 220,449,391 barrels or approximately 118,000,000 barrels of crude refinery, an increase of nearly 42,000,000. It is estimated that for the first six months of the present year the oil fields yielded 62,000,000 barrels of crude refinery, at which rate the total production for 1912 may be placed at 124,000,000.

It is but natural to assume that the refiner is interested in the by-products, the marketing of which has a decided bearing upon the price of motor fuel. One authority holds that the products of the distillation of crude petroleum yield approximately the following percentages:

Gasoline (petroleum spirit)	1.5
Naphtha C	10.0
Naphtha B	2.5
Naphtha A	2.0
Kerosene	50.0
Lubricating oil	15.0
Paraffine wax	2.0
Residue and loss	16.0

Another claims that but 40 per cent. of the crude refined is kerosene, having a gravity of between 56 and 32 degrees Baume—too low for motor use. These figures, however, will vary according to the richness of the crude, the method of refining, etc., as previously explained. It is evident that to obtain the desired motor fuel an enormous amount of kerosene is left on the producers' hands and that gasoline is the principal product and kerosene the by-product, a condition dissimilar to that previous to the appearance of the internal combustion engine when there was practically no market for the inflammable fluid.

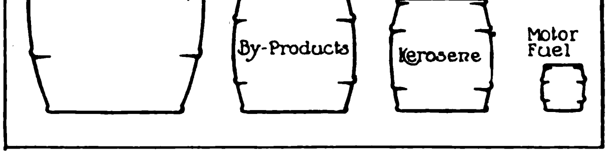
As the price of a product is governed largely by the prices of its by-products, it follows that the increased production of kerosene bears a very close relation to the cost of motor fuel. With the amount of kerosene increasing proportionately with the distillation of motor fuel, the marketing of the by-products becomes a serious problem with the refiners.

It is pointed out that the demand for kerosene is not keeping pace with that of motor fuel and this contention appears to be borne out when it is taken into consideration that electricity is replacing oil even in the agricultural districts. Thousands of farmers and others residing beyond the limits of the central service station install their own lighting plants, operated by gasoline motors. It is estimated that over 800,000 gasoline engines were sold last year, these ranging from the tiny machines that run separators to those of 3000 horsepower utilized in larger power plants for generating electricity and other purposes.

The demand for motor fuel is further augmented by the increasing popularity of motor boats and while figures are not available dealing with the fuel consumed by these engines, they doubtless would prove interesting. Statistics of motor cars show that the number of machines in 1908 was approximately 150,000, and that up to June of the present year there were 890,000, a gain of nearly 500 per cent. Add to these the thousands of motorcycles and there is reason for apprehension. The day is not far distant when the motor fuel problem will assume serious proportions.

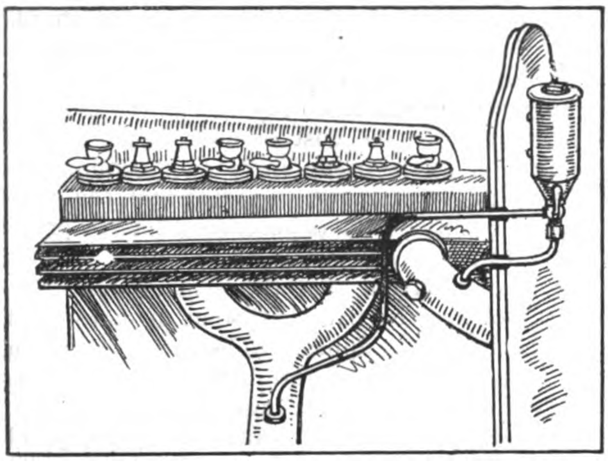
Many motorists believe that the heavier fuel is not as good as that of lighter gravity, but although starting is made more difficult, the new product has a greater number of heat units and consequently makes for more power.

It is possible, however, even with improved carburetors and certain types of motor starters, that the temperature may be so low that the fuel will not vaporize sufficiently to make an explosive mixture. In such instances the temperature must be raised to a carburetion value.



The Amount of Motor Fuel Obtainable from a Barrel of Crude Refinery Varies from Four to 16 Per Cent.—The Increased Production of Kerosene and Other By-Products Bears a Very Close Relation to the Cost of Motor Fuel.

For the automobile that is garaged in a cold building there are a number of devices which have for their object keeping the motor or the water warm. These include an electrical heater manufactured by the Consolidated Car Heating Company, New York City. It is placed on top of the motor, being connected to the main line by a plug, and it is held that by its use freezing of the water is prevented, making starting an easy matter in the morning. Another type, the Never-out, made by the Rose Manufacturing Company, Philadelphia, utilizes a small amount of city gas which is consumed in a special burner contained in the heating apparatus. This is attached to the radiator, and when in operation the water is kept warm, as well as the motor. A safety screen eliminates possibility of fire.



With the Gilson Motor Starter the Intake Manifold Is Primed and Heated Air Is Taken from the Exhaust.

While the regular fuel will yield good results for this purpose in ordinary temperatures, when zero weather is encountered it will be necessary to employ a more volatile fluid, such as sulphuric ether. This should not be used alone, but mixed with the fuel, utilizing about 25 per cent. ether. It should be carried in a bottle having a ground glass stopper as it evaporates easily.

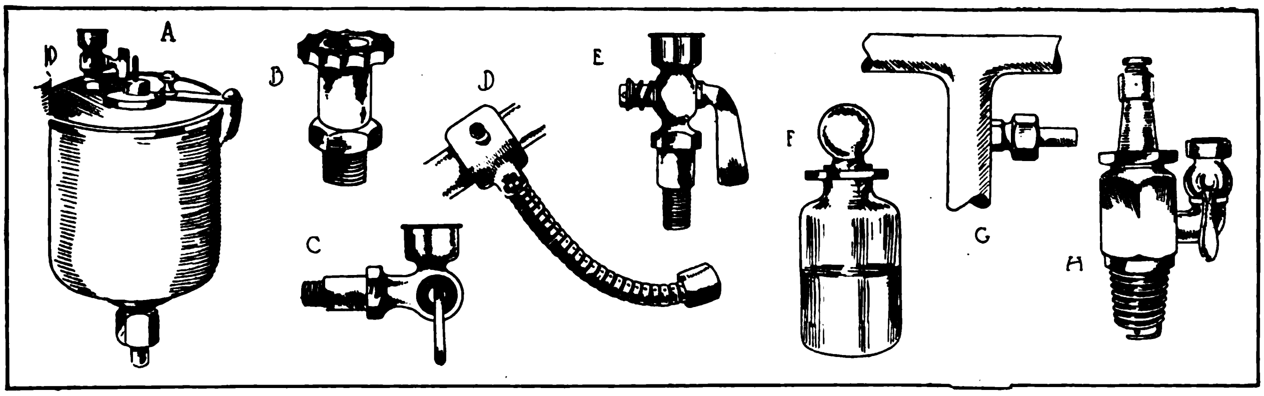
The heavy motor fuel has resulted in the exploitation of a number of devices for making starting easy. The majority operate on the priming principle, although one heats the walls of the intake manifold by electricity. The Gilson motor starter, made by the Gilson Motor Starter Company, Indianapolis, Ind., not only makes for easy priming of the inlet pipe, but after the first explosion the mixture is preheated before entering the cylinders. The supply of gasoline is carried in a neat brass cup on the dash and the fuel is fed to a three-way valve. From the latter a tube leads to the exhaust manifold, around which it is wound once, and another pipe is tapped into the intake manifold. In starting the valve member is opened, allowing a small quantity of gasoline to flow to the intake pipe. Cranking the motor results in air being drawn over the wet pipe, making a rich mixture. Continued operation is assured through heating the intake pipe by the hot air drawn from the exhaust. The company announces a 1913 model which differs from that described in that the fuel container is located inside the hood and control of the fuel and hot air is by a handle located convenient to the driver.

Two priming attachments are marketed by the Fowler Lamp & Manufacturing Company, Chicago, these being the Webb Jay Automatic and the Fowler. The former comprises a container having a screw cover and a controlling handle. The supply of fuel is taken by suction from the main fuel line by a pipe and another tubing leads to two points in the intake manifold. The gasoline is fed automatically to the container and the flow of fuel to the intake is easily controlled by the operating handle. It is claimed of the device that the mixture may be enriched for starting and operating the engine until it has become sufficiently warm. Another feature lies in that the cylinders may be primed upon stopping the motor, making it possible to start on the spark.

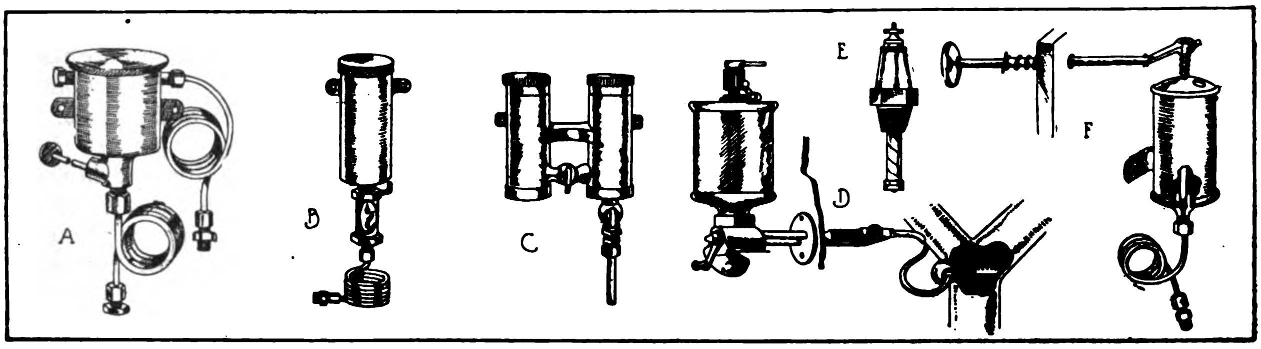
The Fowler device permits of priming the intake pipe from the seat, it being operated by a push handle and the controlling valve closes automatically when the handle is released.

The Sight Feed primer, made by the Nelson Manufacturing Company, Chicago, operates on a similar principle, but differs in that a sight feed is incorporated, permitting the operator to note the amount of gasoline fed to the intake manifold. The National Manufacturing Company, Kalamazoo, Mich., markets the National compound mixer and primer, comprising two vessels, one of which contains the fuel. The flow of the fluid to the intake manifold is controlled by a valve and the mixer regulates the amount of air.

The Buckeye Sure Starter, manufactured by



Illustrating Devices Facilitating the Starting of the Motor: A, Petcock for Injecting Ether in Float Chamber; B, Morgan Priming Cup; C, Design for Horizontal Cylinders; D, Flexible Tubing for Conveying Heated Air to Carburetor; E, Conventional Type of Priming Cup; F, Ether Should Be Carried in a Bottle Having Ground Glass Stopper; G, Tapping Intake Pipe; H, All-in-One Spark Plug.



Illustrating Devices Designed for Priming the Motor: A, Webb Jay Automatic Suction System; B, Nelson Sight Feed; C, National Mixer and Primer; D, Buckeye Sure Starter; E, Stalit Plug, Heated by Electricity; F, Fowler Self-Closing Priming Cup.

the Central Brass & Fixture Company, Springfield, O., is held to produce a starting mixture within the intake manifold by a special spraying device. The fuel is contained in a glass member of the oil cup type. To utilize, the control lever is moved to the left and the fuel valve opened, allowing a small quantity of gasoline to flow. The control handle is then moved to the right and the motor cranked. The amount of air led to the spraying nozzle in the intake pipe may be regulated and the maker points out that proper carburetion is secured easily and full economy is effected thereby. In cold weather it is recommended that a one-quarter solution of ether be employed. The vessel holds enough fluid for 12 to 16 starts, depending upon the size of the motor.

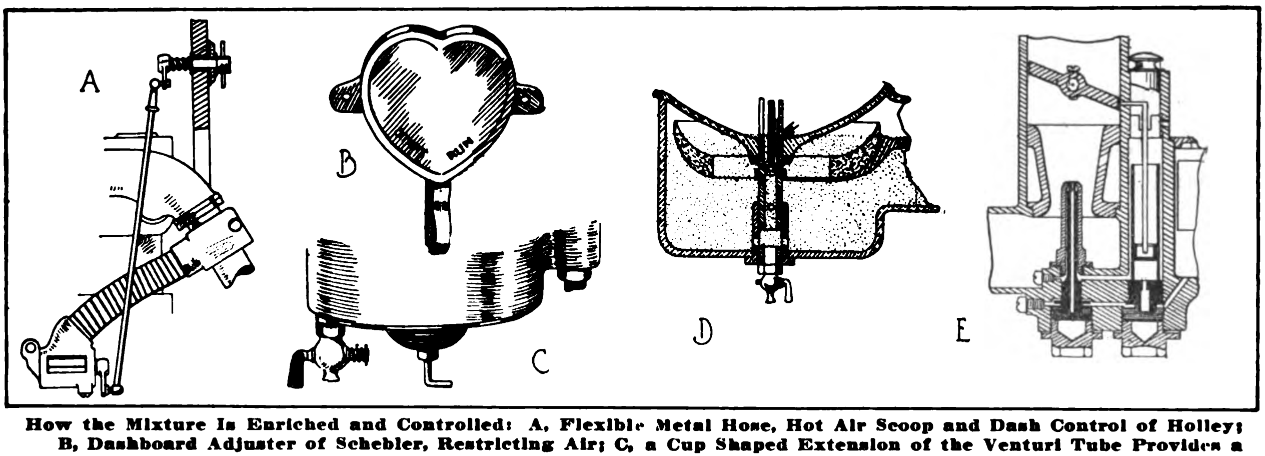
With the Stalit heating plug, marketed by George Staats & Co., Brooklyn, N. Y., the air in the intake pipe is heated by electricity. The plug is screwed into the intake manifold and a wire is led to it from the battery. By closing the circuit it is held that the plug will heat the manifold, preventing condensation of the mixture as well as making for easy starting. It is operated by any six-volt battery.

Reference has been made to the devices incorporated in carburetors for making possible starting the motor with a heavy grade of fuel. The principle involved is that of enriching the mixture, and this is accomplished by restricting the air or by using an abnormal amount of fuel. This practically is what the motorist does when he shuts off the air by closing a butterfly valve and by depressing the float or flooding the carburetor with an abnormal amount of fuel.

Several manufacturers, including the makers of the Rayfield, Stromberg, Schebler, Holley, Newcomb, New-Miller and others, provide dash controls whereby the air may be restricted, the carburetor primed, etc., by the driver without leaving his seat. By the use of these dash controls it is possible for the operator to change the mixture for starting or running as desired.

It is noticeable that many makers are equipping their carburetors with means for conveying warm air from the exhaust pipe to the air intake of the vaporizer in addition to water jacketing the float chamber. While either construction does not effect starting, the use of a flexible metal tubing does facilitate the vaporization of the fuel after the first few explosions are obtained. Lack of space prevents describing the various methods employed in carburetor construction for making starting possible without priming or the use of artificial means, but the accompanying illustrations depict sectional views of vaporizers in which the mechanism is incorporated, and a little study will enable the reader to understand the principles involved.

Motorists recently visiting the Dead River region, Skowhegan, Me., reported considerable trouble on "Horseback" road, Highland. A culvert where a brook crosses the road had been dammed by beavers and the highway was flooded for over a foot. When a dam is removed the animals, who never desert a work once established, rebuilt it in a night. Old trappers maintain that this will occur as long as there are two beavers left in the colony.

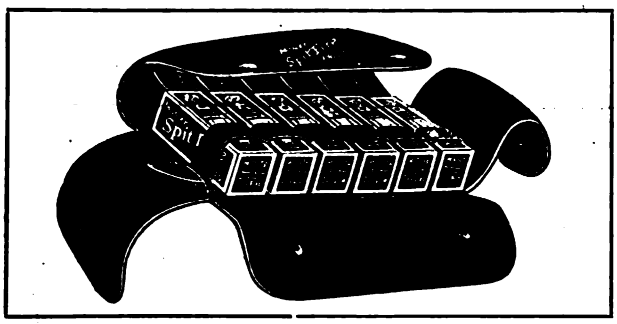


How the Mixture Is Enriched and Controlled: A, Flexible Metal Hose, Hot Air Scoop and Dash Control of Holley; B, Dashboard Adjuster of Schebler, Restricting Air; C, a Cup Shaped Extension of the Venturi Tube Provides a Starting Charge in the B-D; D, Self-Priming Feature of the Bennett, on the Surface Principle; E, Showing the Priming Tube and Secondary Well of the Zenith.

MOSLER'S CHRISTMAS PRESENT.

Spit Fire Spark Plug Maker Also Specializing in Plugs for Particular Motors.

As a Christmas present, the offer extending from Dec. 1 until the close of the New York shows, A. R. Mosler & Co., Mt. Vernon, N. Y., is giving with each order for six platinum pointed, .5-inch metric or 7 8-18 platinum pointed Spit Fire spark plugs, a handsome genuine leather Spit Fire spark plug case, like that illustrated herewith. The case not only holds the plugs in their individual cartons, the strap being so arranged that they may be carried in the original packages, but affords the proper protection for the extra members which the careful driver has with him.



Leather Spit Fire Spark Plug Case, Which A. R. Mosler & Co., Offers as a Christmas Gift.

Another important announcement is made by this concern in that it is maintained that almost every engine built for 1913 cars embodies some peculiarity or eccentricity, these features changing conditions so that it has been deemed advisable to specialize in plugs for several of the foremost motors now being used. In the future each plug sold will carry a special tag stating for what particular car it has been designed.

The cylinder walls of every motor vary, according to the Mosler concern, thereby making it necessary to furnish plugs of different lengths in order to bring the bases far enough through the wall to make them self-scavenging. One cylinder cap is held to require a longer threaded plug than another. If the plug is set in a recess it is considered advisable to have a deep chamber construction to make the member easily accessible and convenient for ordinary or even special wrenches.

The question of placing the ignition spark in the proper manner at the exact point in the cylinder where it will give the best results has been studied with much care by this company and it is stated that many of the 1913 models of the leading factories will be found equipped with Mosler's special plugs, some of which are shown in an accompanying illustration. Some engineers specify the closed end Spit Fire type with platinum points, while others have chosen the open end plug, either with one or two points, as best suited to their motors. This discriminating policy of the manufacturers has resulted in about 20 new models of the Spit Fire, some of which will be found on the following cars: Alco, Atterbury, Bergdoll, Chalmers, Cunningham, Dorris, Fiat, Hudson, Lippard-Stewart, Locomobile, Paige, Pierce-Arrow, R-C-H and White.

In this connection it will be proper to note that Mr. Mosler has issued the third edition of his spark plug size booklet, which gives the size of plugs used on each American made automobile. This valuable information is for free distribution to those who make request of the company.

THE SECOND HAND CAR PROBLEM.

Metropolitan Dealers' Association Believes It Has Discovered a Satisfactory Solution.

Recently the Automobile Dealers' Association, Inc., of New York City, held several meetings relative to the second hand car problem and the situation that was developed proved somewhat startling to the dealers themselves, as many of them had not realized to what an extent this feature of the industry had grown. It was pointed out that many customers, having an old car to trade in on the price of a new one, managed to get the best of the dealers by bidding one against another, often forcing allowances on the old cars far in excess of their real market value. This resulted in a cut in the small margin of profit that should be received from the sale of the new car. The dealers frankly admitted the situation had arrived at a stage where curtailment was necessary or many would have to go out of business.

It was agreed that when customers have second hand cars to trade in, the dealer will take the car, place it on the floor, advertise it and endeavor to secure a customer for it at the best possible price. In the interim, if the customer signs an order for a new car and demands immediate delivery, he is to pay cash for it. When the old car is sold the money is given to the customer with-

out any charge for disposing of his car. Should the old car be sold before the new one is delivered the proceeds can be credited on the new car. In this way the dealer makes a clean sale and except for the expenses of selling the customer's car, receives the profit on the new car to which he is entitled.

AUTOMOBILE SCHOOL METHODS.

Students at Boston Y. M. C. A. Have Opportunity to Study Along Varied Lines.

Day Baker, New England Manager, General Vehicle Company.

The methods of teaching automobile courses vary greatly in different sections of the country. Perhaps no institution in the East has a better record for successful management than the Boston Y. M. C. A. Automobile School, which not only has the usual evening classes, but can boast of a large day class as well. An accompanying illustration shows 55 day students on a tour of inspection of the Packard service depot in that city.

Officials of the Packard company placed a truck at the disposal of the class and took particular pains to explain all the details of the big establishment, not forgetting the various systems and methods in use in each department. The students were very glad of the opportunity to gain first hand information concerning the practical workings of the service station, and the tour came as a fitting adjunct to a series of talks now being delivered by several Boston dealers.

Included in this list of talks was a recent illustrated lecture by Day Baker, New England manager of the General Vehicle Company, his subject being "Electric Wagons and Trucks and Their Relation to the Gasoline Driven Vehicle." Mr. Baker did not confine himself to the products of his company, but gave a general discussion of the whole industry. Several factory representatives also have been heard by the students.

Party of Students at Boston Y. M. C. A. Automobile School, Inspecting Packard Service Station in Packard Truck.

ADDS MORE FACTORY ROOM.

Goodyear Tire & Rubber Company Acquires Another Plant to Prepare for Growth.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has acquired the entire property of the Akron branch of the Great Western Cereal Company, which is near the present Goodyear plant, and three new buildings are in course of construction. They will be used for storage until such time as it is necessary to utilize the space for manufacturing. When the additions are entirely completed, about March 1, 1913, the Goodyear company will have a capacity of 8000 tires a day, which will be just double that of the plant a year ago.

"The three latest additions will aggregate 335,300 square feet of floor space," says C. W. Sieberling, vice president of the Goodyear company. "This brings the total up to 1,935,300 square feet. To realize what this means, imagine a factory 50 feet wide and one story high. If the Goodyear factory were built in that way it would be over six miles long. Our sales for the fiscal year ending Nov. 1, approximated $25,000,000. At least one-third of the total cars produced during the 1912 season were equipped with Goodyear tires and it is safe to say that Goodyear tires will go on half the cars built next year. Contracts indicate that we shall supply to car makers 200,000 sets of tires."

WHITE'S NEW BOSTON BRANCH.

Arrangements Completed for New Sales and Service Station.

The White Company of Boston, the New England branch of the White Company, Cleveland, O., maker of White pleasure and commercial lines, has completed the preliminary arrangements for the erection of a new sales and service station at 1024-28 Commonwealth avenue.

Clinton J. Warren has been selected as architect and has the plans for the new building well in hand.

REEVES WITH TRUFFAULT-HARTFORD.

Former United States Motor Manager Now Vice President of Hartford Suspension Company.

Edward V. Hartford, president of the Hartford Suspension Company, Jersey City, N. J., maker of Truffault-Hartford shock absorbers, electric starter and lighter and other high grade motor car specialties, has announced that Alfred Reeves, formerly general sales manager of the United States Motor Company, has been elected vice president and general manager of that concern. Mr. Reeves, it was stated, has acquired a substantial interest in the company. He will assume his new duties early in January.

Probably no man in the industry has a wider acquaintance or is more favorably known among automobile manufacturers, engineers and dealers than Mr. Reeves, and coupled with the inventive genius of Mr. Hartford he may be expected to bring the company's products into greater prominence than ever before. The company has just completed in Morgan street, Jersey City, an additional eight-story steel and cement factory structure, supplying more than 100,000 square feet of floor space for its productive work.

W. K. Hadley, Factory Representative, on 35,000-Mile Trip in Lenox Six.

A LITTLE TIRE HISTORY.

Interesting Evolution of the Present Day Non-Skid Pointed Out.

It appears that the present day non-skid tire is an evolution from the vacuum rubber flesh brush, and that A. E. Morrison, once noted as a bicycle racing rider and now western sales manager of the R-C-H Corporation, maker of R-C-H cars, is responsible for its adaptation to the automobile. In 1898 a widely known manufacturer of rubber goods decided that his flesh brush idea might be applied to the bicycle tire. He got into touch with Morrison and equipped his bicycle with his new non-skid tires. The latter went from coast-to-coast demonstrating their value in various racing events.

Six years later Morrison had won fame throughout New England as an automobile racing driver. He recalled his experience with the non-skid bicycle tires and decided to try them on his car. The manufacturer of 1898, to whom he unfolded the proposition, declared he did not have the necessary capital, and Morrison offered to pay for the molds, the two rough tread tires to be ready for his race at Readville, Mass., May 30, 1904. That day he won two five-mile events, going the distance in 6:00, a remarkable record for the time, in a touring car with body.

In view of this interesting resume, it is not strange that Morrison was able to induce the R-C-H Corporation to equip its 1913 model with non-skid tires all around. It is stated that this is the first instance in which a moderately priced car has thus been fitted as regular equipment.

LONG TRIP IN LENOX SIX.

Factory Representative Plans to Cover 35,000 Miles in New Car Before Returning.

That this is to be in many respects a six-cylinder year is being brought home to prospective owners nearly every day. Among the manufacturers who are bringing out new models with motors of this type is the Lenox Motor Car Company, Boston, Mass., which experienced such splendid success with its four-cylinder car last year.

An accompanying illustration presents W. K. Hadley, one of the factory representatives of the company, who recently began a 35,000-mile trip in the interest of the concern. Already he has covered 5000 miles, visiting the cities in New York, New Jersey and Pennsylvania and closing numerous agencies. He expects to arrive in Chicago in due time and may possibly reach the Pacific Coast. Thus far he has met no trouble of any nature.

CARROLL PURCHASES BUSINESS.

Removes Carriage Shop to New Bedford and Will Specialize in Automobile Bodies.

William E. Carroll, for 14 years with the G. L. Brownell carriage factory and for the last three years with the S. C. Pease Carriage Building Company, Merrimac, Mass., has purchased the latter business and has transported it to New Bedford, Mass. In addition to continuing the carriage business, Mr. Carroll will manufacture specially ordered bodies for automobiles, motor hearses and undertaking wagons, fire and patrol wagons. Mr. Carroll has already achieved some success along this line, having built, it is said, the first complete automobile hearse ever made in the United States, for Frank E. Campbell, New York City.

Recent Patents of Interest

Wright Windshield.

A patent for a windshield adaptable to motorcycles or bicycles has been granted to Chauncey M. Wright, Philadelphia. It comprises two shields, so mounted as to form a triangle with the apex in the direction in which the machine is travelling. The shields are clamped to the handle bars and springs are provided as well as means for folding the shields.

Bishop Vehicle Lock.

The increasing number of thefts of motor cars has been productive of several patented devices to prevent use of the machine by others than those intended. Ephriam M. Bishop, Kingston, N. Y., has applied a principle employed with horse drawn vehicles, by securing the wheels on either side with chains to prevent traction. In the Bishop device one end of the chain member is provided with a casing having a slot, also a spring member having a rigid connection with the casing. A locking head is utilized on the free end of the spring member and is adapted to be inserted through the slot. The chain encircles the felloe of the wheels, preventing their rotation.

Hevey Tire Tool.

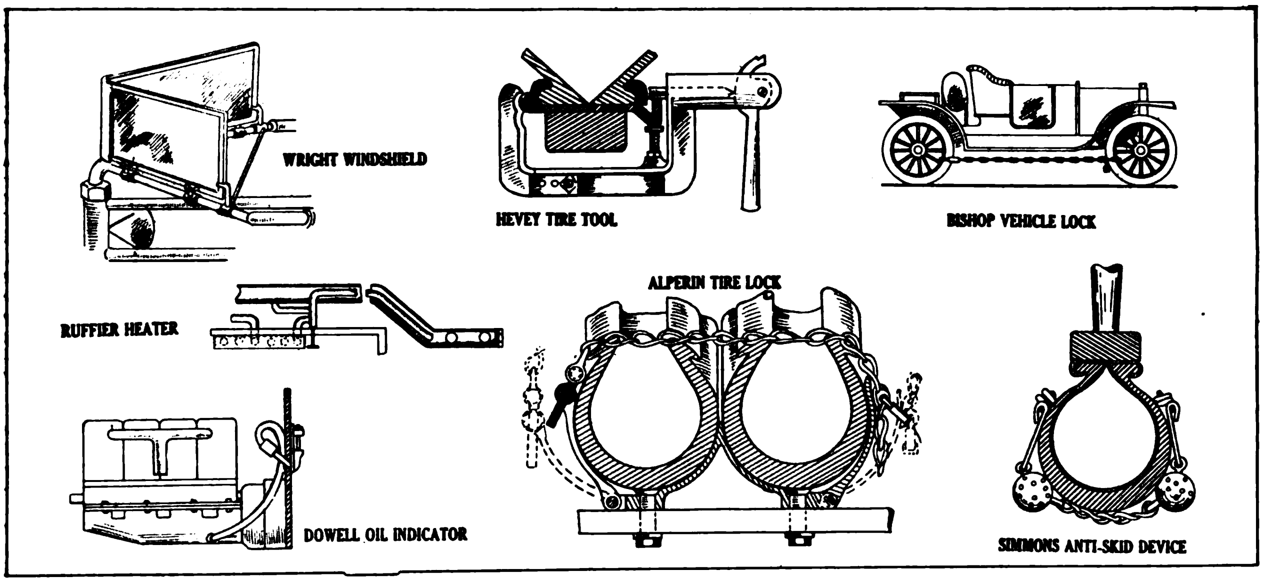
Herman Hevey, Biddeford, Me., has been granted a patent for a tire removing tool which is constructed to exert considerable energy through a lever and fulcrum arrangement. The body portion of the device is provided with spaced arms, one of which is designed to engage with one side of the rim while the other is fitted with a casing. The arm members are adjustable and the casing member carries a vertical member which may be raised or lowered to engage with the rim. A plunger is horizontally mounted in the casing and is movable toward the first named arm. The rear of the plunger is formed with oppositely inclined faces. Energy is imparted by an actuating lever fulcrumed in the outer end of the casing and provided with a cam surface adapted to bear against the rear end of the plunger. The cam surface is notched at one end for engagement with the inclined faces of the plunger for the purpose of locking it.

Ruffier Heater.

Gaston Ruffier, New York City, has patented a device for heating the interior of the motor car by utilizing the exhaust gases of the engine. The interior of the exhaust pipe is provided with a tubing so arranged that the gases are led to a radiator member, thence to the outer air by the way of the regular exhaust pipe. The device is provided with a by-pass so that the flow of gases to the radiator may be controlled.

Alperin Tire Lock.

A device for locking the tires to the running board of the car and thereby preventing their theft, has been patented by Bernard A. Alperin,



Showing Some of the More Recent Ideas of Inventors of Appliances Adaptable to the Motor Car, Including a Heating Device, Tire Lock, Anti-Skid Attachment, Vehicle Lock, Etc.

New York City. A pair of supports, each having a movable arm, are secured to the running board by means of bolts and lock nuts. The inner and outer arms are adapted to be moved to permit of fitting the tires which are retained by a chain secured to one of the movable arms. The other arm is provided with an eye member which engages with a link of the chain and means for locking are secured through a padlock or other suitable member.

Simmons Anti-Skid Device.

Turner W. Simmons, Bridgeport, Conn., assignor of one-half to William C. Bowers of the same city, has patented an anti-skidding device which combines chain or link members with flexible rubber balls. A pair of side links have eyes disposed at an angle to each other and have central enlargement at the apex of the angle. The rubber balls are provided with studs and links are utilized to connect or retain the spheres, the chains extending across the tread of the tire.

Dowell Oil Indicator.

A device for indicating the amount of lubricant in the crankcase or sump of a motor has been patented by Chester M. Dowell, Huntington, Ind. It comprises a plate having a tubular extension at one side and arranged at an acute angle, also a hollow projection on the opposite side of plate. The openings of the tubular and hollow members are in communication to form a U shaped passage. The plate has a projection on the same side with the hollow projection and spaced therefrom. A sight tube is arranged between the projections, and a plug is threaded into the upper member and adapted to confine the sight tube which is formed with a vent opening.

OTHER PATENTS GONE TO ISSUE.

Window Cleaner, Elkana F. Cunningham, Clarksburg, W. Va. A window cleaning device including a slide and swinging bar and means for actuating the same.

Gas Lighting Device, Lucius James Bachus, Louisville, Ky. A wheel of sparking material is mounted on a clamp member in proximity to the burner and the gas is ignited by rotating the wheel.

Top Attachment, Lewis P. Halladay, Chicago. A holder for top bows comprising a slotted tube having recesses to engage the bows and means for locking same in position.

Grease Cup, Robert Hickish, Tuckahoe, N. Y. The plunger actuating the piston is provided with a ratchet stop and the base of the cup has a shut-off valve.

Spring Frame, Charles G. Stephenson, Denver, Col. A spring frame for motorcycles, two being employed, these being secured to the upper and lower part of the main frame and attached to the rear fork and frame of the wheel.

Distributor and Insulator, Ernest H. Kuntz, Arcata, Cal. A combined insulator and distributor of current comprising an internally threaded body portion, and petticoats depending therefrom, said body portion having an external thread having its ends terminating short of the ends of said body.

Motor Starter, William Emil Block, Toledo, O. The flywheel of the motor is provided with ratchet teeth meshing with similar members on a plunger and pawl mechanism which is actuated by fluid pressure.

Motor Starter, Milton E. Cole, Akron, O., assignor of one-sixth each to Charles A. Smith, Albert Burnett, Edward L. Scrote and James R. Rowlett, all of the same city. The crankshaft of the motor has rack teeth and a plunger rod having similar teeth is actuated by pressure. Means are provided for sliding the rack member on the crankshaft out of and into engagement with the plunger.

Auto-Fender, Artie L. Raven, Vista Grande, Cal. A fender for vehicles comprising a vertical screen, means for connecting same to the vehicle, and a horizontal apron pivoted to the screen member. A lifting device is incorporated in the apron and automatic means provided for moving the apron in a sweeping path to pick up objects in front of the vehicle.

Storage Battery, Orlando Oldham, Denton, near Manchester, England. A storage battery comprising a cell having a cover member, a gas collecting chamber in the latter and a tube having an exit opening in the bottom of the cell, extending to and into the collecting chamber and accessible to the gases which are formed within the cell.

Tire Mounting Tool, Benjamin Dahl, Minneapolis, Minn. A clamp device having a screw bolt member for attaching punctureless tires.

Tire Grip, Richard A. Breul, Bridgeport, Conn. A tire grip formed of chains, the main members being fitted in the form of a square. The traction members are attached to the main members and extend across the tread of the shoe.

Lever Locking Device, William J. Riddell, Pittsburg, Penn. The gear shift levers of the car are locked in a neutral position by means of an arm registering in slots, thereby preventing the moving of the lever member.

Shock Absorbing Device, Charles S. Moore, Danvers, Mass. The device is adaptable to springs of the elliptical design. The absorber is bow shaped, curled in the centre, and the lower portion is secured to the spring clip. The upper end is free to slide between two rollers mounted on a bracket on the underside of the top frame member.

Automobile Bumper, John and Albert Henry Hanna, Troy, N. Y., assignor to John P. Randerson, Albany, N. Y. A plate is secured to the frame of the machine and a second member is rotably attached; also an arm. Sliding connections are provided between the arm and plate and the former carries a bar. Means are provided for manually releasing the second plate as well as automatic means for locking the same when it is returned to normal engagement.

Gas Engine Attachment, Lambert J. Bordo, Hillside, Penn. A priming cup device having a valve mechanism permitting the introduction of fluids and for closing the aperture.

Throttle Controller, James J. Quigley, Mamaroneck, N. Y. A form of accelerator pedal is utilized to actuate the throttle of the carburetor and a dash pot is pivoted to a fixed support and means for pivotally connecting the piston rod of the dash pot to the accelerator member.

Traction Wheel, Kenneth N. Avery, Covina, Cal. A wheel comprising a drum, a rim portion outside same, a series of tangential springs carried by said drum and having ground engaging points at their free ends.

Electrolytic Cell, Frank H. Briggs, Elyria, O. The combination of an electrolyte container and electrodes, of an electrolytic cell, of a fixed support normally extending within the container, a cover and heating elements carried by said support, and means for removing the container without disturbing other parts.

Governor, Norman T. Harrington, Lansing, Mich. A governor for an explosive motor. The combination comprises a periodically opening admission valve, of a continuously moving oscillating valve controlling the same conduit having an instantaneous closure at the centre of its oscillation, and means for varying the amplitude of oscillation.

Traction Wheel, Walter S. Morton, Harrisburg, Penn. The rim is composed of two angle irons each connected with the outer extremities of one series of spokes and a tread made up of a series of three-legged members having outstanding ribs along their outer faces.

Vehicle Body, Frederick A. Brand, assignor to the Broc Electric Vehicle Company, Cleveland, O. In a coupe vehicle body having a window therein, the combination of a seat disposed below said window; a fixed back for said seat, said back extending to a point below the level of window sill, and a vertically movable supplementary back adapted in its lower position to rest upon fixed back and to extend therefrom to the level of the window sill.

Motorcycle Saddle, Frederick Mesigner, New York City. A saddle provided with a post clamp, a pair of arms extending laterally therefrom and having seats at their outer ends, a pair of flat cradle springs engaging said seats at their forward ends, bolts passing through said springs and arms, a saddle top and means for securing the rear ends of springs to said top.

Spring Wheel, Walter Hill, Mattoon, Ill. Between the solid shoe and rim of the wheel are fitted U shaped springs arranged transversely, and secured to a plate carrying the tire and to the rim of the wheel by a bolt and clamp device.

Cranking Device, Peter Christensen, Kingsville, Tex. A starting device comprising a clutch, a toothed sleeve slidably mounted in said clutch and adapted to be mounted upon an engine shaft, a pawl pivotally mounted upon said clutch and adapted to engage said teeth, means carried by said pawl for limiting the inward movement of said pawl, and an operating mechanism for moving said clutch to bring pawl into and out of engagement with said teeth.

MILLIONS FOR TIRE REPAIRS.

Figures Which Indicate Growth of This Business—What Capital Is Required.

During the coming year at least $40,000,000 will be spent by American automobile owners for tire repairs, according to the Williams Foundry & Machine Company, Akron, O., which has made a study of this branch of the industry. This estimate is based upon the announcement that there are 900,000 motor cars in use today and that 600,000 are to be built for 1913. It is assumed that 200,000 of the machines now in use will be scrapped, leaving 1,300,000 to wear out tires.

Tire makers say that each machine consumes an average of six outer casings and nine inner tubes a year. If this be cut to five casings and seven tubes, a total of 6,500,000 casings and 9,100,000 tubes will be used in 1913. It is claimed that at least $5 a casing and $1 an inner tube will be expended for repairs, making a total of $41,600,000.

It is conceded that tire upkeep is the heaviest item in motor vehicle operating expense. Good tires cost money and the best often are subject to blow-outs, due to under-inflation, rim cutting, punctures and the many severe strains caused by carrying loads at high speeds over rough American roads. Fortunately the motorist can have these damaged tires repaired, so as to give much additional mileage at a low cost, and the business of tire repairing has grown to be one of importance.

Thousands of men who have learned to repair tires by working for a few months in a tire factory or repair shop, have purchased equipment and started in business for themselves to find that few lines offer as prompt or as large returns for the needed experience and capital. The repair equipment manufacturers, in the front rank of which must be included the Williams company, have kept pace with the industry and offer a line of appliances that enable the repairman anywhere to do work on damaged tires as satisfactorily as that done by the tire maker.

An investment of $50 will buy the tools and a steam vulcanizer that will cure inner tube and all minor repairs to casings, a work that can be undertaken by the ordinary mechanic without special training. Two hundred dollars will fit out a small plant that not only will take care of all inner tube work, but the most serious casing repairs. The equipment for a plant doing a business of $25,000 a year need not cost more than $1000, and it will last indefinitely. It need not be added that the appliances should be purchased of a reliable maker with long experience.

Many garages, repair stations and general repair shops are making good money out of tire repairing as a side line. Of course where there are many automobiles there are independent shops doing a large business in nothing but tire repairs. As each 100 machines can be counted upon to produce $3500 worth of such work a year, it will be seen that even a small community can offer good returns to a tire repair shop.

The Williams Foundry & Machine Company publishes some interesting literature upon this subject, which will be mailed free upon application. When it is known that the average job will pay 50 per cent. profit, it would appear that the subject was one with which the repairman should become familiar. It has been proven that a repair shop employing one man and having not over $500 invested will often earn a larger profit than a machine shop with an investment of $5000 and five mechanics.

NO BOSCH EXHIBIT AT SHOWS.

Well Known Magneto Manufacturer Will Display at Own Headquarters.

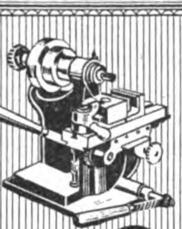
For the first time since 1909, the Bosch Magneto Company, New York City, maker of Bosch magnetos and plugs, will not be represented at either the New York or Chicago show. This decision was reached early in the month and cancellation of the spaces allotted to the company by the Motor & Accessory Manufacturers followed almost immediately. It is explained that this move was made necessary by the fact that the spaces assigned were found to be entirely too small for a proper display of the company's products, which include over 200 types. In lieu of representation at the shows, special displays will be arranged at the offices of the company during the progress of the exhibitions. The New York Bosch exhibit will be found at the main office, 223-225 West 46th street, and that at Chicago, in the local branch on 24th street near Michigan avenue. Manufacturers and others are invited to visit these displays and obtain full information concerning Bosch ignition, ample room being provided for a special investigation of the entire subject.

PLANNING FOR PROVIDENCE DISPLAY.

Rhode Island's Second Annual Show to Be Held Early the Coming Year.

Following the plan adopted by the Rhode Island Automobile Dealers' Association, Providence, R. I., last year, the annual Providence show will be held in the state armory, Cranston and Parade streets, Jan. 25-Feb. 1, immediately following the commercial vehicle display in New York City. The management will be the same as in 1912, and all applications for space should be made to Arthur S. Lee, 52 Richmond street.

Thirty-eight thousand square feet of floor space is available for the exhibition of pleasure and commercial cars and accessories, and present indications would seem to insure that it all will be filled. The interior of the armory lends itself admirably to a special decorative scheme, and it may be stated that the treatment will be quite as striking as that of a year ago.



Up-To-Date Shop & Garage Equipment

WESTERN ROADWAY FILLING OUTFIT.

There is profit to be derived in the sale of gasoline if the equipment for handling it is such that little time is lost by the attendant in supplying the needs of the customer. When the tank is located within the garage and the fluid has to be drawn in five-gallon lots and carried out to the car, considerable time is lost in the operation. Sometimes it is necessary to search for a funnel to fit the opening of the car's tank.

The Western Oil Pump & Tank Company, St. Louis, Mo., is marketing an equipment known as the roadway filling outfit, illustrated at Fig. 1, the views depicting the device closed and open.

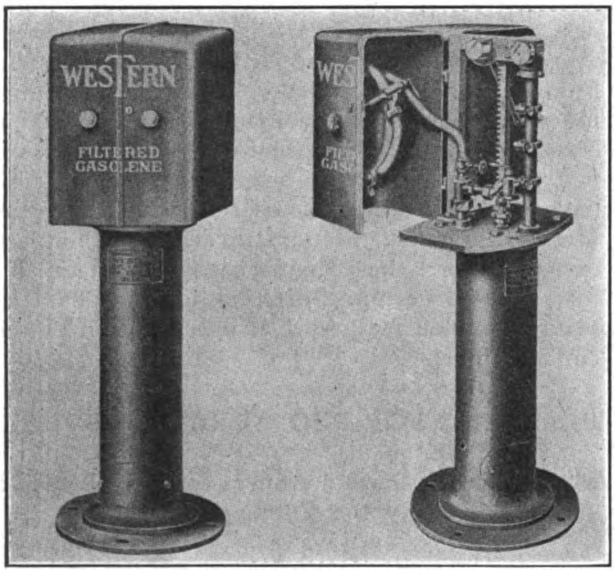


Fig. 1—The Western Roadway Filling Equipment: At Left, Showing Doors Closed; at Right, the Pump Ready for Service.

It is designed for bolting to the sidewalk near the curb and the pumping apparatus is enclosed by a cabinet mounted upon a hollow metal column. The cabinet is constructed of a heavy gray cast iron and all bolts and connections are inside, preventing the possibility of tampering.

The double doors are hinged and swing backward, permitting of easy access to the mechanism, overlap when closed, and are fitted with a Yale lock. A two-way nozzle is attached to six feet of steel lined hose, permitting use of the hose when the tank of a car is to be filled as well as with the usual five-gallon can. A swivel coupling allows the nozzles to be turned to either side and they may be utilized independently of each other, or both may be in use at the same time.

Special provision is made for separating all water and foreign elements from the gasoline. A gravity filter is connected to the base of the cylinder and is made an integral part of the pump. All impurities are collected in a chamber which is accessible through a small door. Means for draining are provided.

The pump is of the long distance type, measuring gallons, half-gallons, quarts or pints at one stroke of the handle. All parts are constructed of high grade material. The pump is equipped with a meter that keeps an accurate account of all fuel drawn up to 10,000 gallons, at which point it reverts to zero. Every tenth of a gallon drawn is denoted. The pump and cabinet are finished in vermilion enamel with nickel trimmings. The height is 52 inches.

WILLIAMS TIRE REBUILDING STAND.

With proper equipment the work of repairing tires is greatly facilitated. The Williams Foundry & Machine Company, Akron, O., maker of tire repairing equipment, is manufacturing a tire rebuilding stand which is a great saver of time in that the shoe to be repaired may be quickly mounted and easily handled during the operation.

As will be noted by the illustration presented at Fig. 2 the device comprises a regular clincher rim upon which the tire to be repaired is mounted. It may be secured in this manner or on one of the company's regular retreading rims with a coil inside the casing, or with the special reliner building form.

When the retreading rims and coils are utilized the old tread may be torn off and the carcass roughed, the new tread applied, rolled down, and the wrapper applied without removing the casing from the stand. The tread rolling attachment includes five tread rollers, the one fitting the tire being placed upon the spindle. The levers are so arranged that the rollers will swing down below the tread on each side. They are pressed against the tread when the tire is revolved by hand.

The casing may be adjusted to any angle. Pressing upon the pedal releases the ratchet flange at the end of the spider shaft so that the

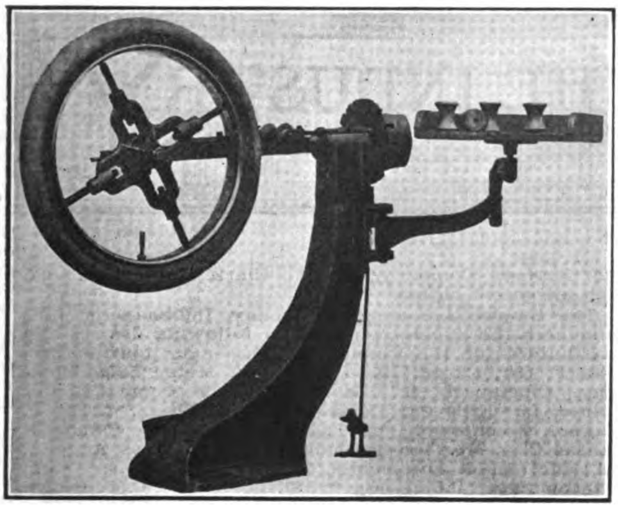

Fig. 2—The Williams Tire Building Stand, Making for Convenience in Repairing Shoes.

shoe may be swung to the desired position. Releasing the pedal locks the tire. A reversible ratchet attached to the spider permits the tire to be revolved in either direction or locked. The table is adjustable and may be swung to either side of the stand and a feature of it is that the required tools are always accessible, a quality making for economy in that time is saved. The stand is constructed of high grade material.

THE AUTOMATIC VALVE GRINDER.

One of the most common tasks in the repair shop is the grinding in of the valves on the gasoline motor. It is work that cannot be rushed as the valves must be ground until a good seat is secured, else the time is wasted. Formerly the operation was performed by hand utilizing a screw driver or a bit stock, but the progressive garage now employs a tool specially designed for the work.

One of the difficulties makers of these devices have had to overcome is to design the tool so that it will not only impart a reciprocating motion, but lift the valve from its seat in the cylinder at stated intervals. With the bit stock or screw driver this is accomplished by placing a spring under the head of the valve.

An automatic valve grinder, which was patterned after the operation of the ordinary carpenter's breast drill, is the invention of R. H. Hazeltine of New York City, and is manufactured by the Specialty Machine Company of 94 Liberty street, of that city. The device, two views of which are presented at Fig. 3, consists of an oscillating arm, a bevel pinion, a driving rod for the valve and two plain gears with a turning crank; also a cam, roller, clutch and spring.

Its construction is best outlined by its operation in service. When the handle A is rotated the crank B revolves in the slot C, imparting a reciprocating motion to the arm and segment D, which also reciprocates the small pinion E, the clutch I transmitting this movement to the driving spindle E. The gear G is driven by the small pinion K. Located on the inside of larger gear is a cam which periodically comes under a roller mounted upon the carrier L, and lifts the clutch I from engagement, but holding it until the pinion E has rotated through a given arc, whereupon the cam drops the clutch back into engagement.

This movement lifts the valve from its seat. A spring M insures the engagement of the clutch at the proper time and supplies the proper pressure. The nut R locks the valve on the rod M. The weight of the tool and the operator's pressure is sustained on the shoulder N and the valve opening on the engine.

The cycle of operations is as follows: First, the valve is reciprocated on its seat for a given number of times, is lifted, released and automatically placed in a different angular position on the seat, then moved forward through a given angle and reciprocated as before.

FREEING FROZEN PISTON RINGS.

In the event of a piston ring becoming frozen in the piston through a lack of lubricant or other inattention, it is sometimes a difficult matter to remove it without breaking the fragile member. A suggestion for completing the work is given in the Commercial Motor, for which the workman was awarded the first prize in a competition.

The piston is removed from the cylinder and connecting rod and placed upon two bricks laid lengthwise and about two inches apart. A gasoline torch is next utilized, playing the flame on the head of the piston until the metal is a blood red heat. The piston is then allowed to cool slightly, and a little kerosene applied to the seized ring. This method is said to result in freeing the ring even if it is carbonized in.

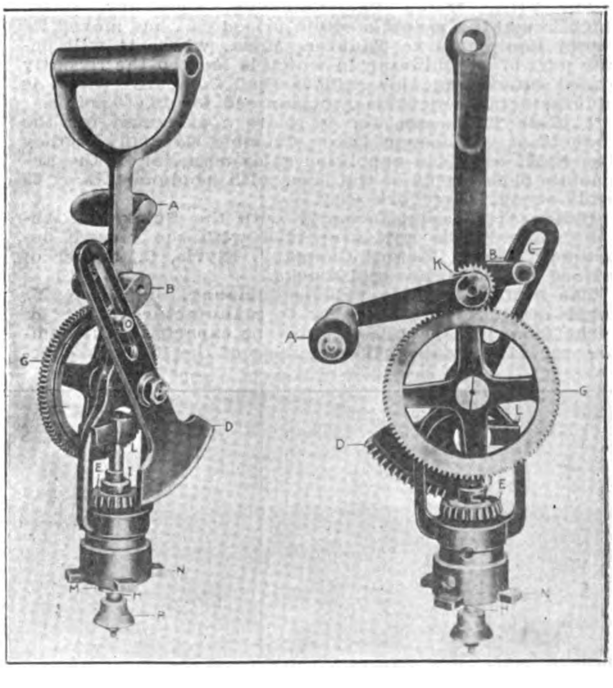

Fig. 3—The Automatic Valve Grinding Tool, a Device Lifting Valve, Also Imparting Reciprocating Movement.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following concerns have been recently incorporated to deal in motor cars, accessories, etc.:

Miller-Brisben Company, Inc., New York City; $25,000; automobiles; incorporators, John McNeill Brisben, Irving Jaffe, Warren A. Miller.

Stegeman Motor Truck Company of New York, Inc., New York City; $25,000; incorporators, John A. Kent, James C. Smith, John G. Anderson.

S. & M. Company, Taunton, Mass.; $5000; garage; incorporators, Frederick A. Shaw, Chester H. Morse, Rachel Morse.

Stats Motor Car Company of New Haven, New Haven, Conn.; $10,000; incorporators, John P. H. Chandler, Edward J. Bartlett, Dana B. Jefferson.

A. W. Cox & Co., Inc., Boston; $10,000; operating and maintaining garages; incorporators, N. B. Todd, Charles B. Baldwin, A. W. Cox.

Elgin Motor Company, Elgin, Ill.; $20,000; to manufacture motors; incorporators, Edward J. O'Beirne, E. G. Adamek, Charles G. Adamek.

Torkington Tire Company of America, Wilmington, Del.; $1,300,000; incorporators, I. Fogg, G. D. Hopkins, G. W. Dillman.

Niagara Motors & Manufacturing Company, Dunkirk, N. Y.; $275,000; to manufacture motors and parts; incorporators, Edward J. West, Morris M. Hedden, Daniel W. Frey.

Chandler Engine Valve Company, Chicago; $60,000; incorporators, G. A. Critton, N. B. Dearborn, E. S. Hoskin.

Knight Motor Car Company, San Antonio, Tex.; $10,000; to deal in motor cars; incorporators, H. L. Knight, A. H. Danforth, A. H. Elmore.

Anderson Electric Car Company, Boston; $10,000; to deal in motor cars; incorporators, Albert Weatherby, Frank R. Keith, Alonzo E. Yont.

WITH THE MANUFACTURER

The Ultra Motor Car Company, Amesbury, Mass., which is making a new medium priced car, has moved its factory equipment to Taunton, Mass., where it will occupy part of the building in which is located the recently formed Interchangeable Rubber Heel Company, which is manufacturing a new tire, guaranteed for 10,000 miles.

A. Gale Thompson, for 16 years a salesman for the products of the Joseph Dixon Crucible Company, Jersey City, N. J., has been appointed sales manager of the automobile department of the firm, with headquarters at 68 Reade street, New York City.

Henry A. Wagner, formerly with the Buick and Abbott companies, is now connected with the service department of the Garford Company, Elyria, O., maker of Garford pleasure cars and trucks.

The Buffalo Electric Vehicle Company, Buffalo, N. Y., maker of Buffalo electrics, is to manufacture a line of trucks from 1000 pounds to two tons capacity. The company recently acquired the interests of the Babcock Electric Carriage Company and the Clark Motor Company, with all patent rights.

The Empire Automobile Company, Indianapolis, Ind., announces the appointment of the following dealers and distributors for the Empire five-passenger touring car: John F. Orr, Carmi, Ill.; Commercial Motor Sales Company, Cincinnati, O.; Cartercar Iowa Company, Des Moines, Ia.; Ellis Car Company, Greenville, S. C.; H. F. Wagner, Greentown, Ind.; England Bros. Motor Company, Kansas City, Mo.; Greer Robbins Company, Los Angeles, Cal.; McDonald Automobile Company, Memphis, Tenn.; Johnson Automobile Company, St. Louis, Mo.; C. F. Brown Automobile Company, Shreveport, La.; Crist Motor Sales Company, Toledo, O.; Peru Can Zandy Implement Company, Wichita, Kan.; C. J. Reeve, Cleveland, O.; Sherman Bradley, Corning, Ia.; Somerset Automobile Company, Somerset, Penn.; Cumberland Valley Garage, Carlisle, Penn.; Galion Motor Car Company, Galion, O.; Haines Bros., Quincy, O.; W. S. Woodring, LeCarne, O.; Columbus Automobile Company, Columbus, Neb.; W. H. May, Pompton Plains, N. J.; R. W. Taylor, Mokane, Mo.; Silas Lieb, Pender, Neb.; Schoepp & Karch, Mascoutah, Ill.; W. G. Hunt, Brighton, Ill.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure cars and trucks, has established a large service station at 1030 Commonwealth avenue, Boston, with Manager Pruden of the New England branch in charge. The building is of reinforced concrete and is two stories high. The second floor is used for the truck department, the pleasure car salesrooms being on the ground floor. A large turntable is provided for the handling of the large trucks. The rear of the second floor has the repair shop, which is thoroughly equipped, including electrical machines of all modern kinds to facilitate the repair of pleasure and commercial vehicles.

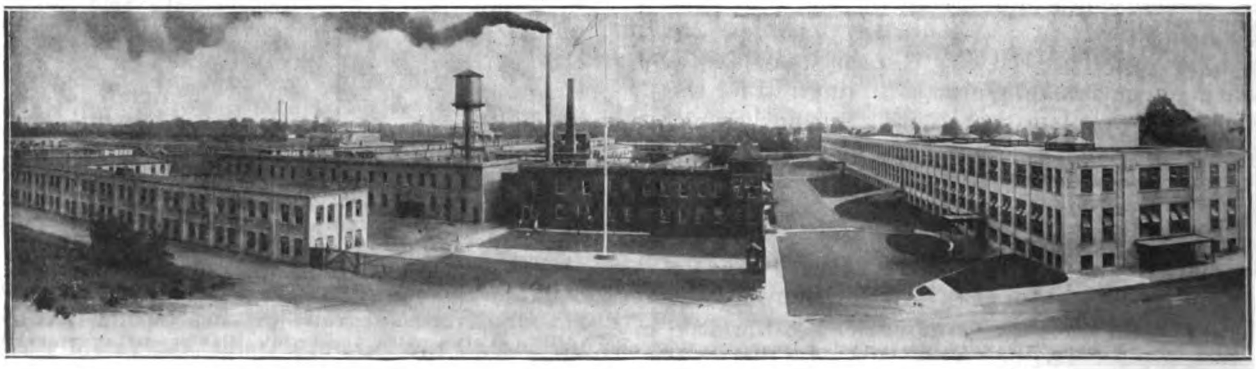
Gerald Fitzgerald, who has for some time been assistant manager of the Chicago branch of the Remy Electric Company, will assume the position of manager of the factory branch to be opened at Minneapolis, Minn. M. C. Kent, also of Chicago, will be assistant manager.

Cyril J. Atkinson, M. E., inventor and patentee of the Atkinson gas producer and a number of special devices pertaining to gas producers, has severed his connection with the Dornfield-Kunert Company of Watertown, Wis. Mr. Atkinson's services and the use of all his patents have been secured by Fairbanks, Morse & Co., Chicago, maker of all kinds of motors, and a number of Mr. Atkinson's valuable patents will be incorporated in the Fairbanks-Morse gas producers at once.

W. Krafve has joined the sales force of the H. J. Koehler Sporting Goods Company, New York City, distributor of the Koehler commercial car. Mr. Krafve for a number of years handled the Cadillac and Buick cars in New England territory and his friends will, no doubt, be interested in learning of his new connection.

The Reo Motor Car Company, Lansing, Mich., maker of Reo cars, has recently completed its new three-story shipping and assembly plant, 252 by 252 feet, providing 190,512 additional square feet of floor space with a capacity of 1600 cars. The floors are of cement, and the structure is fitted throughout with an effective automatic sprinkling system. A feature in connection with this plant is the special overhead runway leading to the main factory.

H. L. Shepler, general superintendent of the Willys-Overland industries, of Toledo, O., has gone to Europe



Bird's-Eye View of the Olds Motor Works Plant in Lansing, Mich., Where Oldsmobile Cars Are Produced.

for two months, during which time he will pay particular attention to the foreign motor car industry, especially as related to the question of proposed production of high-grade cars at low prices which is being agitated in England and Germany at present.

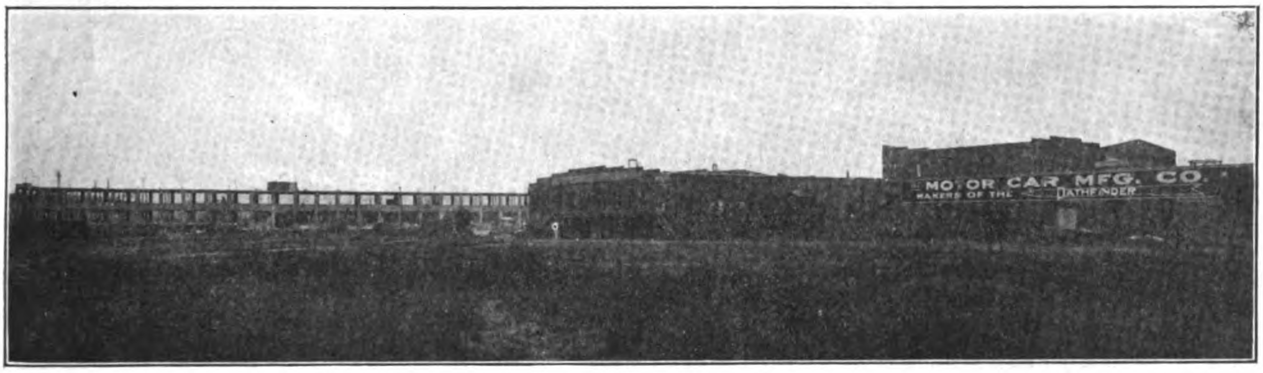
The Globe Seamless Tube Company is seeking a location for a factory in Detroit. The plant when in operation will give employment to a large number of men.

F. W. Kurtz, who has just completed his work with the General Motors Company, Detroit, having been the director of advertising since May, 1911, and having perfected an organization whereby each subsidiary company now has its own efficient advertising department, has returned to Philadelphia, where he has resumed his connection with the well known advertising firm of N. W. Ayer & Son, with which house he had been associated for 12 years previous to his removal to Detroit. Mr. Kurtz's knowledge of advertising, acquired through his long agency experience, was particularly valuable in the special character of work that he did for the General Motors Company.

J. B. Maus, formerly district manager of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, and William Ellenbeck, Jr., manager of the Brooklyn branch of the same company, who recently resigned, are now associated with the main office of the United States Tire Company, Broadway and 58th street, New York City.

H. G. Salisbury, general manager of the California territory of the Motor Car Manufacturing Company, Indianapolis, Ind., maker of the Pathfinder 40, has announced the appointment of Barry Cool, a well known automobile man of Los Angeles, Cal., as manager of the northern branch.

The Henderson Motor Car Company, Indianapolis, Ind., has appointed the following new agents for Henderson cars: American Motor Sales Company, Toronto, Can.; The Henderson Motor Sales Company, Baltimore, Md.; Howard D. Graves, Hartford, Conn.; Knowles & Collins, New Haven, Conn.; George O. Franklin, Pulaski, Fla.; F. D. Aiken's Sons, Brunswick, Ga.; Cummins Motor Car Company, Harrisburg, Ill.; Ajax Motor Sales Company, Springfield, Ill.; J. I. Johnson, Palmer, Ia.; James N. Kemp Machine Works, Albany, N. Y.; Earl Knickerbocker, Binghamton, N. Y.; H. L. Mann, Portland, Ore.; G. C. Brenner, Mechanicsburg, Penn.; T. H. Sutherland, Washington, Penn.; J. B. Higginson, Providence, R. I.



General View of the New Addition to the Factory of the Motor Car Manufacturing Company, Indianapolis, Ind.

The Nichoalds Company, Detroit, heretofore engaged in the manufacture of automobile parts, has taken up, in addition, the production of automobile chassis for the trade.

Smalley Daniels, formerly of Boston and now with headquarters in Detroit, who has specialized in metal boxes among other automobile equipment, has become financially interested in a new box factory at Cleveland, O., under the style of G. F. Mitchell & Son., and will act as sales manager. The concern also will produce a line of funnels, measures, mufflers and drip pans.

John G. Perrin, chief engineer of the Lozier Motor Company, Detroit, maker of Lozier cars, who was recently elected vice president of the Society of Automobile Engineers, has gone to Europe to study the trend of design of the foreign motor car industry and to compare the progress made by foreign manufacturers with that of the makers in this country He will visit many of the best English factories.

Morton H. Luce, who has been associated with the Velie interests in the Boston and Chicago branches for the past four years, has resigned to accept a position with the Marion Motor Car Company, Indianapolis, Ind., maker of Marion cars. He will be located in New York City, taking charge of the eastern district.

The Luverne Automobile Company, Luverne, Minn., has added a four-cylinder, 40 horsepower car to its line of six-cylinder pleasure machines. The company sells direct from the factory only.

GARAGE & DEALER

Jay Livingston and Will L. Crosson have taken possession of the garage at 407 West Second street, Hastings, Neb., formerly conducted by Hiatt & Reader. The new firm will be known as Livingston & Crosson.

John Preston has purchased the Fannin County Garage, located in the World building, Bonham, Tex., of H. Seay and Gern Everheart.

Charles M. King & Son, Sacramento, Cal., located at 1229 Seventh and M streets, has decided to devote its time exclusively to selling of the Gramm motor truck in northern California.

The Jackson Motor Car Company, Nashville, Tenn., has been formed with a capital of $5000, the stockholders being H. C. Gillespie, D. D. Canfield, E. L. Bowne, W. H. Weakley and W. C. Sandifeur. The company has purchased the property of the Volunteer Motor Car Company at 526 Broad street, which is being enlarged for the new business.

The Park Motors Company, 241 West Fourth avenue, Columbus, O., has opened one of the most complete garages and repair shops in the city, to be known as the Neil-Fourth garage. Charles Parkinson and S. Van Etten are in charge. The company will buy and sell used cars and special attention will be given to the rebuilding of old cars. An electric charging station of the latest type has been installed and later the company expects to build cars of its own design.

The Electric Manufacturing Company, 353-355 Minnesota street, St. Paul, Minn., of which L. J. Shields is manager, has secured the services of A. R. Burr and J. E. Olen, former secretary-treasurer and vice president, respectively, of the C. J. Smith Company, and as a result of this amalgamation the company has increased its capital by $50,000 and has added to its big stock of automobile and motorcycle supplies. A new building on West Sixth street will be built in the near future, the contract having been awarded.

F. W. Ramm, proprietor of a garage at St. Petersburg, Fla., which bears his name, has decided to incorporate in order that a larger and more complete establishment can be maintained to care for increasing business. The capital will be $100,000 and many of the leading business men of the South have subscribed for stock.

Dillon Court Garage, at the rear of Dillon Court Hotel, Hartford, Conn., is the latest addition to that city's automobile establishments. Yetter & Morse have the management. The garage is large and modern and in addition to a first class repair department a line of automobile accessories is carried.

Fred Barnum, Waterbury, Conn., has sold his garage at 52 South Main street to Richardson Bros., who will conduct a similar establishment at 70 South Main street. The purchasers state that for the present both plants will be operated.

The Universal Motor Truck Company, Cleveland, O., is a strong addition to the automobile houses of that city. The sales and service departments are located at 2352 Euclid avenue. C. W. Moody is general manager and M. J. O'Connor and J. A. Boyd will have charge of the sales department.

Lamb-Daniel & Co., which has opened offices at 712-718 Union Trust building, Detroit, for the purpose of representing manufacturers of automobile parts and accessories, has started its career with a splendid business. Mr. Daniel was formerly connected with the sales department of the Cartercar Company, maker of Cartercars, and previous to that with the Castle Lamp Company, Battle Creek, Mich. Mr. Lamb was formerly manager of the Franklin Company. Lamb-Daniel & Co. will handle a complete line of automobile accessories.

W. K. Hurd and A. K. McRae of the Florence Auto

Company, Florence, Col., have purchased the business of the Sunville Auto Company and the Overland Auto Company of Pueblo, Col., and will in future devote their attention to the sale of Ford cars, made by the Ford Motor Company, Detroit. The firm will be known as the Arkansas Valley Auto Company and will be located at Sixth and Court streets, Pueblo. Mr. McRae will have charge of the business, while Mr. Hurd will look after the interests of the firm at Florence.

Charles Pendleton, Keota, Ia., has purchased the garage formerly owned by Chester Stewart, for $5750. He is building an addition at the rear, in which he will install a completely equipped repair shop which will have lathe, drill press, milling machine and planer. A high pressure boiler will heat the building and also provide heat for the vulcanizing plant.

City Hall Garage Company, Inc., Paterson, N. J., of which Bernard Katz is proprietor, is to have a large addition, doubling its floor space, and costing $4000. The building now covers 25-29 Union street.

C. E. Miller of Cordele, Ga., has purchased the garage of Dr. A. B. McQueen at Tarpon, Fla.

C. W. Maxim, manager of the Middleboro Auto Exchange, Middleboro, Mass., New England distributor for the McFarlan car, announces the appointment of L. H. Roberts as director of wholesale sales. Mr. Roberts formerly held a similar position with the Studebaker Boston branch, and before that was connected with the Marmon and Lozier forces in various sections of the country. This arrangement leaves C. W. Maxim free to devote his entire attention to the service department. E. L. Maxim retains his position as advertising and publicity manager.

The Southwestern Motor Sales Company, Dallas, Tex., has been formed with a capital of $200,000. L. A. Boll, Jr., is president and associated with him are the following: Vice presidents, C. Charles Jones and Martin A. Seward; secretary, W. L. Marsh, treasurer, N. E. Jones. The firm is located at 1608 Commerce street and will represent the Lozier, Speedwell, Staver, Little and Chevrolet automobiles and the Staver and Speedwell trucks. C. R. Jones will have charge of the truck department.

James Morris, who recently withdrew from the management of the Chalmers repair shop of the Union Supply Company, Toledo, O., has entered business for himself at 109-111 Eleventh street. His plant is equipped for all kinds of repair work.

The Michigan-Georgia Motor Company, Atlanta, Ga., has begun business under auspicious circumstances as agent for the Michigan machines, made by the Michigan Motor Car Company, Kalamazoo, Mich. John D. Wells is president and H. C. Tuggle is vice president. R. M. Northcutt has charge of the sales department and has associated with him many salesmen well known in the automobile field.

The Warsaw Auto Company, Warsaw, Ind., has been incorporated by Allae S. Widaman, Walter Stanley and John E. Armstrong. The new company will operate the Stanley & Armstrong garage at Leesburg, Ind., and the Widaman garage at Warsaw and will act as agent for the Studebaker, Hudson and Overland lines.

G. R. Dillon and Max Wolcott have formed a partnership and will conduct a general automobile business at the garage at Tioga avenue and Pine street, Corning, N. Y. Both men are experienced in the automobile trade.

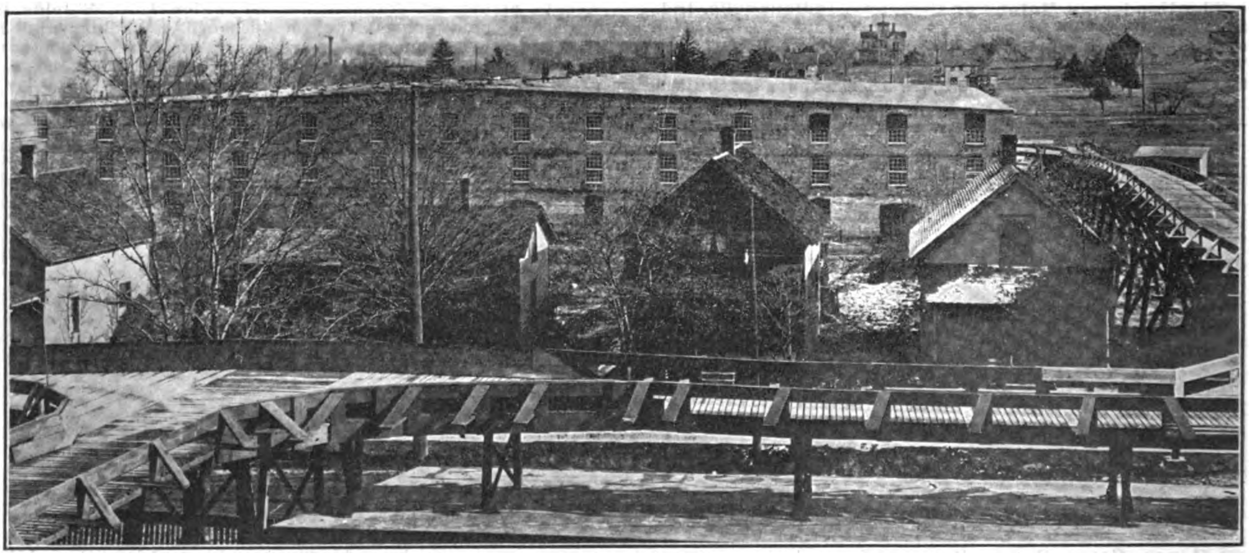
The Michigan Motor Company, Washington, D. C., has been incorporated to handle the product of the Michigan Motor Car Company, Kalamazoo, Mich. The officers of the company are: President, T. Oliver Probey; vice president, J. H. Stuart; secretary and treasurer, George R. Stuart; sales manager, F. C. Sibbald; service department superintendent, E. G. Powell. Salesrooms and a service station have been established at 1230 Wisconsin avenue.

The Dupont Garage Company, Washington, D. C., is a newly organized selling company of which Raymond A. Klock, formerly senior salesman of the United Motor Washington Company, is sales manager. J. E. Connelly, general manager of the Dupont Garage Company, will supervise the business of the new concern. E. W. White, who has been identified with the Hudson interests at Washington, will assist Mr. Klock in the sales department. This branch will be located at 1321 14th street, northwest, and arrangements have been made for prompt and efficient service to Columbia, Hudson and Hupp-Yeats owners at the service station of the Dupont Garage Company, 2020 M street, northwest.

The Petty-Calhoun Company, Macon, Ga., has been dissolved and its garage discontinued. Mr. Petty has retired from the business and R. L. Knight and C. F. Calhoun, the other members of the firm, have merged their interests with the Macon Auto Company, 519 Poplar street.

The Barlow Garage Company, Newark, N. J., recently organized to maintain and repair electric pleasure and commercial vehicles, which at present is operating in the old Lansden factory at 233-235 High street, has leased the building now being erected at 133-135 Washington street. When completed the garage, which is a two-story fireproof structure, will have facilities for charging 60 vehicles daily.

William Pratt, Riverside, Cal., is in charge of a new salesroom and garage at 446-448 Eighth street, in which also will be located the newly acquired agency for Ford cars, made by the Ford Motor Company, Detroit.



New Three-Story Shipping and Assembly Plant of Reo Motor Car Company, Lansing, Mich., and Runway Connecting It with Main Factory.

Lutz & Weaver, Ashland, Ky., has established a new automobile garage on Front avenue. They will handle the Buick cars, made by the Buick Motor Company, Flint, Mich.

The Adirondack Motor Company, Hudson Falls, N. Y., has purchased land at 188 Main street as a site for a new, modern garage. The company distributes Overland machines and maintains branches at Albany, Troy and Saratoga.

William J. Miller and **R. M. Weaver,** who recently purchased the Broad-Oak automobile garage, Columbus, O., have extended the business, securing an additional floor in the building, which has been converted into one of the most completely equipped repair shops in the state. Mr. Miller, former builder of the Frayer-Miller engines, is in personal charge of the repair department.

H. A. Storer, Cambridge, Mass., will erect a new brick garage on West street. He has made application to the city for a permit to erect the building.

Van Winkle Bros. & Weister, San Fernando, Cal., has erected a fine new garage. The company is agent for the Studebaker cars, made by the Studebaker Corporation, Detroit.

The Southern Garage has purchased the store of the Central Auto Company on 13th street and the stock will be moved to garage on Chester avenue, Bakersfield, Cal.

W. S. Sandeman, proprietor of "Sandy's auto garage," 57 Boylston street, Cambridge, Mass., has doubled the floor space of his fireproof building. The garage now has a total floor space of over 7000 square feet. There is a large machine shop, an office and workshop, where a specialty is made of ignition and carburetion repairs.

Hall-Miller Auto Company, Cleveland, O.; $5000; to deal in automobiles; incorporators, Joseph A. Freund, Jr.; A. H. Freund, L. D. Greenfield, Charles Kovanda, J. A. Freund.

WITH THE MANUFACTURERS.

Benjamin Briscoe, a director and secretary of the Automobile Board of Trade since its inception, has resigned, owing to his absence in Europe for several months, and the vacancies have been filled by electing John N. Willys of the Willys-Overland Company a director, and Roy D. Chapin of the Hudson Motor Car Company as secretary.

George H. Lloyd, formerly with the Velie Motor Vehicle Company, Moline, Ill., has joined the sales force of the American Motors Company, Indianapolis, Ind.

The Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires and rims, has found it necessary to increase its production facilities. The photograph reproduced herewith was taken during a recent convention of salesmen at the home office of the company and not only shows the new factory building, but the addition which is now being erected.

N. H. Miniter, who for several years has been sales manager of the Stromberg Motor Devices Company, has resigned, and is now associated with the Findeisen & Kropf Manufacturing Company of Chicago, as factory sales manager. He will in future represent the Rayfield carburetor throughout the country.

The Adams Bros. Company, Findlay, O., maker of Adams trucks, recently delivered to the Kittanning fire department of Kittanning, Penn., a combination hose and ambulance wagon. The company also has an order from the city of Olean, N. Y., for chemical fire apparatus.

The Moon Motor Car Company, St. Louis, Mo., maker of Moon cars, has installed a large amount of new machinery in its rear axle department, this being made necessary by the increased demand for its product.

Orin S. Wilson, formerly manager of Studebaker branches at Denver, Col., and Des Moines, Ia., and a veteran in the Studebaker service, has been assigned to the East and South as district representative of the company's sales department. His headquarters will be at Broadway and 59th street, New York City.

The Southern Auto & Equipment Company, Atlanta, Ga., has leased the entire building at 92 South Forsythe street and has taken possession.

The Ford Motor Company, Detroit, maker of Ford cars, has decided to discontinue building a commercial car during the coming season and is now closing out the few machines of this type it has stored in stock.

John H. Mowe, manager of the Detroit branch of the Firestone Tire & Rubber Company, has tendered his resignation, and Howard A. Coffin, formerly of the Warren Motor Car Company, will succeed him.

The Page Auto Hoist Company, located in the plant of the Potato Sorter Company at Madison square, Grand Rapids, Mich., has acquired the site adjacent to the Michigan Hearse & Carriage Company and will build a large factory of brick and steel.

The Ohio Motor Car Company, Cincinnati, O., has been purchased by a company headed by R. E. Northway as president. The name of the concern has been changed to that of Crescent Motor Company and the manufacture of trucks, light delivery wagons and pleasure cars will be continued.

Henry M. Duncan, formerly general manager of the Westchester Appliance Company, New York City, has been appointed supervisor of the eastern district of the United States Motor Company in place of W. F. Smith, resigned. He will have charge of the following selling companies: United Motor Atlanta Company, United Motor Syracuse Company, United Motor Washington Company, United Motor Pittsburg Company and the Keystone Automobile Company of Pittsburg. Mr. Duncan also will act as manager of the United Motor Philadelphia Company.

C. E. Reddig, chief engineer of the Columbia Motor Car Company, Hartford, Conn., and designer of the Columbia car, has resigned his position to become assistant chief engineer of the Timken-Detroit Axle Company, with headquarters at Detroit.

George R. Willman, sales manager of the Warren Motor Car Company, has resigned to become associated with the advertising department of the Studebaker Corporation, Detroit.

The Joseph Dixon Crucible Company, Jersey City, N. J., maker of the Dixon graphite lubricants, etc., announces that the selling price of its silica-graphite "one quality only" paint has been reduced. This is made possible through a decrease in the price of linseed oil which is used as the vehicle. This well known paint has been recognized as standard for nearly 50 years with leading railroads and manufacturing plants, and as giving a long service protection to all exposed steel and metal surfaces. The announcement is in accordance with the firm's policy to give its customers any benefit possible in the reduction of price on materials.

The Bosch Magneto Company, New York City, has appointed the following distributors for Bosch magnetos: Dallas A. Shager & Co., Richmond, Va.; Fry & McGill Motor Supply Company, Denver, Col.; Johnson-Gewinner Company, Atlanta, Ga.; Pence Automobile Company, Minneapolis, Minn.

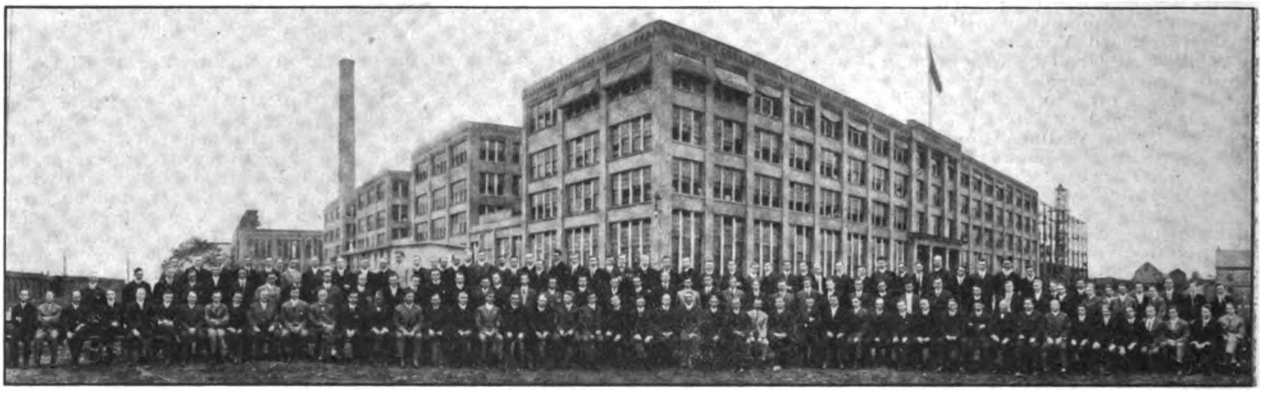
W. A. Buck, a Flanders factory representative, has joined the forces of the E. V. Stratton Company, Inc., Albany, N. Y., distributor for the entire Flanders line for eastern New York, western Massachusetts and Vermont. Mr. Buck is in charge of the Pittsfield branch at Pittsfield, Mass.

B. J. Cline, formerly factory superintendent of the American Motors Company, Indianapolis, Ind., has resigned and has taken a position as general superintendent of the Inter-State Automobile Company, Muncie, Ind., maker of Inter-State machines.

The Empire Automobile Company, Indianapolis, Ind., maker of Empire machines, has appointed the following distributors: Boonville Auto Company, Boonville, Ind.; Ye Motor Shop, Connersville, Ind.; Ralph Temple Automobile Company, Chicago; Wahl Motor Sales Company, Detroit; Jordan-Warneke Motor Car Company, Lewisburg, O.; Oakland Wisconsin Motor Company, Milwaukee, Wis.; Beauchamp & Horton, Mt. Carmel, Ill.; William F. Wagner, Massillon, O.; John R. Opp, Otterbein, Ind.; Williams-Hasley Motor Car Company, Pittsburg, Penn.; H. A. Reese, Severy, Kan.; H. K. Patterson, Timewell, Ill.; W. W. Campbell, Toronto, Can.; C. F. Erb, Youngstown, O.; C. J. Reeve, Cleveland, O.; John J. Gibson Company, Buffalo, N. Y.; Central Machine Works, Sioux City, Ia.; S. W. Schott & Co., Columbus, O.; Yappen & Son, Ashton, Ia.; Stirling Bros., Erie, Penn.; C. R. Baldrige, Braddock, Penn.; C. W. Sahlender, Belleville, Ill.; C. H. Reuber, Schaller, Ia.; Blewitt Auto Company, Ankeny, Ia.; Boone Auto Company, Boone, Ia.; F. B. Glidden Company, Corinth, Ia.; M. B. Pullen, Onawa, Ia.; Moreland Automobile Company, Earlham, Ia.; Bristow Automobile Company, Bristow, Ia.; J. M. Michelwait, Glenwood, Ia.; S. M. & E. R. Painter, Vandergrift, Penn.; Spooner McConnell Motor Car Company, Madison, Wis.; G. E. Eckert, Nevada, O.; Hank Bros., Ottona, O.

The Cole Motor Car Company, Indianapolis, Ind., has appointed distributors for the Cole cars as follows: Central Garage & Machine Shop, Calgary, Alberta, Can.; Boyle & Jaffe, Cheyenne, Wyo.; Columbia Automobile Company, Columbia, Mo.; Cole Sales Company, Dayton, O.; John H. Harris, Durham, N. C.; International Motor Company, Edmonton, Alberta, Can.; W. S. Fleming, Emerald, Wis.; W. T. Hutcheson, Hempstead, N. Y.; Dr. H. C. Miller, Hillside, Mich.; M. E. Reagan, Knightstown, Ind.; Joseph Simon, Lincoln, Neb.; E. M. Elder, Lynnfield, Mass.; Rowlette Auto Company, Maitland, Mo.; J. H. Edwards, Marks, Miss.; G. E. Bowden, Martin, Tenn.; Younger & Progmore, McMinnville, Ore.; Colonial Motor Car Company, Morgantown, W. Va.; H. S. Armstrong, Mt. Auburn, Ill.; H. Evans Sledge, New Bern, N. C.; Newton Motor Car Company, Newton, Ill.; Hearn Auto Company, Pine Bluff, Ark.; Augustus Duryea, Somerville, N. J.; Valentine King garage, Springfield, O.; Motor Truck Company, St. Paul, Minn.; L. Broadfoot and A. J. Manville, Prince Albert, Saskatchewan, Can.; W. L. Simpson, Punxsutawney, Penn.; H. A. Gordon, Regina, Can.; M. Streeter, Tacoma, Wash.; W. J. Hervey, Wellsburg, W. Va.; Corcoran & Foley, York, Neb.

The Marathon Motor Works, Nashville, Tenn., maker of Marathon cars, has appointed the following dealers to handle the sale of Marathon machines during 1918: S. M. Stone, Chicago; Golden Belt Auto Company, Manhattan, Kan.; Manchester Auto Supply Company, Manchester, Mo.; H. E. Carlin, Hickman, Ky.; Arthur Turner & Co., Ltd., London, Eng.; Wichita Marathon Company, Wichita Falls, Tex.; Marathon Motor Sales Company, Memphis, Tenn.; City Garage, Mineral Wells, Tex.; Richardson Orr & Co., New York City; E. P. Kuhl, Gridley, Ill.; Texas Auto Company, Greenville, Tex.; Roeger Bros., Akron, O.; George DeGlopper, Tonawanda, N. Y.; William Fletcher, Eagle Grove, Ia.; J. R. Rardon, Cincinnati, O.; Diffendeffer Buggy & Imp. Co., Springfield, Mo.; D. P. Hart Company, Washington, Penn.; Andalusia Motor Car Company, Goshen, Ala.; Baumgardner & Kibby, Toledo, O.; W. W. Price Auto Company, Wheeling, W. Va.; Blue Ribbon garage, Springfield, Mass.; S. M. Gross, Creston, Ia.; Buckeye Auto Sales Company, Ada, O.; F. L. Massey, Watertown, N. Y.; Buckeye Auto & Repair Company, Canton, O.; Frank Ewright, Conrad, Ia.; J. L. Gooding & Newlin, Kellertown, Ia.; D. W. Pote, Stuart, Ia.; A. R. Hollingsworth, Ellston, Ia.; Charles F. Johnson, Littleton, Mass.; J. R. Croot, Ackley, Ia.; C. P. Lowe & Co., Chapman, Kan.; Thomas W. Parker, Greenville, S. C.; Davis Garage, Danville, Ill.; Frank X. Parker & Co., Portsmouth, Va.; Thomas S. Sedgwick, Knoxville, Tenn.; Peters Bros., Houston, Tex.; Marathon Motor Sales Company, Chicago; George G. McCleary, Mitchellville, Ia.; Brown & Joy, South Farmington, Mass.; Oswald Auto Company, Bay City, Mich.; Thoe-Menzie Auto Company, Belmond, Ia.; W. W. Gibbs, Staunton, Va.; McCondra & Hoeye, Phoenix, Ariz.; F. J. Dragoon, Plattsburg, N. Y.; Fred I. Prew, Clifton, Ill.; B. L. Gintling & Sara K. Gintling, Baltimore, Md.; Edwin Cummins, Durban, South Africa; Gilhousen Bros. Company, Los Angeles, Cal.; Ardery-Halliday Motor Car Company, St. Joseph, Mo.; Fred B. Burton, Janesville, Wis.; Frank S. Dunham, Hutsonville, Ill.; Samuel Hables, San Francisco, Cal.; George E. Bennett, Jr., Fall River, Mass.; Miller & Bloomhart, Beverly, Kan.; Auto Distributing Company, Plainfield, N. J.; B. R. Nowlin, Ames, Ia.; George Parson, Darlington, Wis.; McGovern & McTurk, Traer, Ia.; Blue Ridge Motor Company, Asheville, N. C.; Kauffman & Wise, Van Wert, O.; Harshberger & Jantse, Seward, Neb.; Ketcher & Co., Little Rock, Ark.; Arenz Automobile Company, LaCrosse, Wis.; Miss O. H. Hunter, Shreveport, La.; Todd Auto & Rental Company, St. Louis, Mo.; Enterprise Machine & Garage Company, Franklin, Ky.; Knight Garage, Inc., New Haven, Conn.; Adler Auto Transfer Company, Alexandria, La.; W. P. Kent, Waukee, Ia.; Cozart & Stiman, Clay, Ky.; Ocheyedan Auto Company, Ocheyedan, Ia.; A. F. Workman, Jackson, Miss.; Butler & Berry, Springvale, Minn.; D. B. Turner, Winona, Miss.; Frank H. Hildreth, Longmont, Col.; Kerrigan & Dickman, Minouk, Ill.; W. E. Allen Company, Milwaukee, Wis.; John J. Jungbacker, Jr., Grand Rapids, Mich.; Fetzer & Campbell, Dallas, Tex.; Mutual Motor Car Company, Buffalo, N. Y.; Means Auto Company, Des Moines, Ia.; Marathon Motor Car Company, Muskogee, Okla.; Goss Supply Company, Cleveland, O.; State Automobile Company, Indianapolis, Ind.; Marathon Motor Sales Company, Reading, Penn.; Pausch, Selback Wagon & Auto Company, Columbus, O.; Albee & Baxter, Elkland, Penn.; Flatonia Automobile Company, Flatonia, Tex.; Hansen & Son, San Antonio, Tex.; M. Pyland, Amarillo, Tex.; Livingston Motor Car Company, Bayonne, N. J.; Louis P. Meyer, Austin, Tex.; H. M. Lamphrey, Manchester, N. H.; Ernest Hohenberg, San Marcos, Tex.



Group of Firestone Tire Salesmen in Front of the New Factory Building at Akron, O., During Recent Convention.

GARAGE AND DEALER.

The Kansas City Automobile Supply Company, now at 1504 Grand avenue, Kansas City, Mo., has plans to erect a building on McGhee street, to cost $40,000.

G. B. Gould has sold his interest in the automobile firm of Gould & Woodke, Storm Lake, Ia., to A. D. Woodke.

The Hathorn Auto Company, Mason City, Ia., has moved to new quarters opposite the Federal building on East Fifth street.

Charles W. Loos & Sons, Coshocton, O., has leased quarters on Main street and will conduct an up-to-date automobile salesroom. It will handle the Overland, Rambler and Ford cars.

The Newcomer Auto & Supply Company has established business in the Gore building, Second street, Clarksburg, W. Va. Joseph W. Newcomer is general manager of the concern.

Robert R. Carter and L. H. Goodenberger have purchased the assets of the Tip Top Auto Company, Hood River, Ore., and the business will in future be known as the Columbia Auto & Machine Company.

Clarence Smith has purchased a half interest in the automobile and machine shop business conducted by W. P. Ruth. It is proposed to enlarge the plant and improve the equipment.

The Lozier Automobile Company, Philadelphia, Penn., formerly at 227 North Broad street, will locate at 21st and Market streets. The company will expend $10,000 in converting the building into a modern garage and salesroom.

The Maxwell Motor Sales Company, St. Louis, Mo., has been formed to handle the agency for the Maxwell line in that territory. The company is located at 306 North 12th street.

S. C. Bradford has secured the agency for the Studebaker cars, made by the Studebaker Corporation, Detroit, and will open a thoroughly equipped garage on Erie street, Storm Lake, Ia. Jay Lawton will be in charge.

The Fiat Automobile Company, Chicago, has leased the three-story building at 2289 Michigan avenue, of H. G. and A. L. Howard.

A. L. Maddrell of the North Jackson street garage, Monroe, Wis., has sold his interest to the Hokoson Automobile Company of Madison, Wis., which took immediate possession. The company is capitalized at $100,000 and handles about 500 cars a year.

The B. F. Goodrich Company, Providence, R. I., distributor for Goodrich tires, has announced a joint organization with the Diamond depot, distributor for Diamond tires. The new combination will occupy spacious quarters at 260 Weybosset street, that city.

The Standard Motor Car Company, Scranton, Penn., will erect an addition to its plant in Forest court, to cost $10,000.

Charles Benlen & Sons, 13th and Vineux streets, Cincinnati, O., is to establish a branch garage and storeroom on Rockdale avenue, to cost $10,000.

The Sawyer Auto Specialty Company, Columbus, O., formerly located at East Spring street, has moved to larger quarters at 50 East Long street. The company conducts a repair and manufacturing business.

Fred Waters, formerly of the Red Bank garage, Red Bank, N. J., has purchased Disbow's new garage at Red Bank.

W. L. Scholl, formerly in the automobile business at Hutchinson, Kan., has purchased the M & L garage at Sterling, Kan., and has taken charge.

The Clark Summers Auto Company, Sioux Falls, S. D., has opened a garage at 230 North Main avenue and will handle the Lambert, Cartercar and Metz lines.

Allen Hargrave, Cairo, Ill., has moved his garage and machine shop into the Dewitt building, thereby securing larger quarters.

G. Fischer has had plans prepared for an addition to his garage at 596 South 11th street, Newark, N. J., to be of brick and steel and cost $5000.

The Ford garage on Front street, Turlock, Cal., which has been operated by H. S. Dee, is now under the management of M. S. Henderson and F. A. Hale. A new and modern building will be erected.

The Middlesex County Garage & Sales Company, New Brunswick, N. J., has moved to 88 Albany street and will make improvements to the building. A stock of accessories and supplies will be added.

Bullock's Auto Station, 9-19 Seekonk street, Providence, R. I., of which Richmond B. Bullock is proprietor, has been established about five years and during that time Mr. Bullock has built up an efficient organization. Although no specialty is made of repair work, minor work for patrons is done. The principal features of the business, however, are storage, washing and polishing, for which an efficient and simple system is employed to prevent leaks. The garage shown in an accompanying illustration has a capacity of housing 24 cars and contains in addition 13 private sheds for patrons. It is located in a residential section of the city.

The Central Auto Company, West Sixth street, St. Paul, Minn., will in future handle the Premier cars, made by the Premier Motor Manufacturing Company, Indianapolis, Ind., in addition to its other lines.

The Lafayette Motor Car Company, Easton, Penn., has established new quarters at 233-235 North Third street.

The Queensboro garage at 66 Broadway, Flushing, N. Y., conducted by Jockers & Stack, is to be entirely remodelled. The company intends to start an automobile freight line and will begin operations with three large White trucks, made by the White Company, Cleveland, O.

The Co-Operative Tire & Supply Company, Cleveland, O., has opened a branch at Euclid avenue and East 20th street for the tires made by the Mansfield Tire & Rubber Company, Mansfield, O. The company will establish branches in various parts of the United States.

The Blasier-Sanborn Manufacturing Company, Utica, N. Y., with a capital stock of $150,000, has been formed to make and deal in steam and other pressure devices, machines and automobile supplies. George W. Sanborn of Little Falls, N. Y., is one of the promoters of the concern.

James Whitney, formerly with the garage firm of Bishop & Whitney, Elmira, N. Y., has formed a partnership with his brother, Albert Whitney, and they will conduct an up-to-date garage and repair shop in a building on Dewitt street. They will handle the Ford car, made by the Ford Motor Company, Detroit.

Charles J. Moody has occupied the new garage erected on River street, Elgin, Ill., and is equipped for all kinds of automobile business.

D. S. Wyckoff & Son has secured a building on Third street, White, S. D., and will immediately convert it into a modern garage and repair shop.

A. V. Rothwell, Ann Arbor, Mich., has purchased the garage and business at the corner of South Ashley and Madison streets. This location will be the headquarters for Buick cars, made by the Buick Motor Company, Flint, Mich., and Federal trucks, made by Federal Motor Truck Company, Detroit, Mich.

The Somerville Automobile Company, Somerville, Mass., has changed its name to the F. A. Dutton Motor Company and is now located at 76 Huntington avenue, Boston, where it will have the distribution agency for Abbott-Detroit cars, made by the Abbott Motor Company, Detroit. The company is capitalized for $25,000 and has the following officers: President, Frederick A. Dutton; treasurer, Charles A. Farnsworth; clerk, Jerome Smith. The old location in Somerville is being utilized as a service station.

J. B. Garver of Terra Bella, Cal., is establishing a modern garage and auto hospital on Main street, in which he will sell and care for Studebaker cars, made by the Studebaker Corporation, Detroit.

The Hunter Motor Company, Roanoke, Va., will soon open its automobile salesrooms and garage in the new building at Henry street and Luck avenue.

The Central Avenue garage, 934-936 Rose street, Reading, Penn., has been completed and is now ready for business. Harbster Bros. is the proprietor.

Martin's garage is the name of the old Coalinga garage, Coalinga, Cal., which will be reopened at once under the management of C. C. Kratzer. A complete line of automobile supplies, tires, etc., will be carried.

The Bennett Auto Supply Company, Sioux City, Ia., one of the largest sales organizations in the northwest, has occupied Motor Mart, said to be the largest building devoted exclusively to automobiles in that section of the country. The company has the agency for the Moon cars, made by the Moon Motor Car Company, St. Louis, Mo.

The Frank E. Parmelee Company, 132 Adams street, Chicago, will erect a one-story brick garage at 1117-1145 West Monroe street.

Pearl W. Devendorf, LaFargeville, N. Y., has taken over the Warner garage on Arsenal street, Watertown, N. Y.

Roy Worden and Jay Gould, Yuba City, Cal., have leased the Sutter garage of Frank Schellenger and will conduct it along broadened lines.

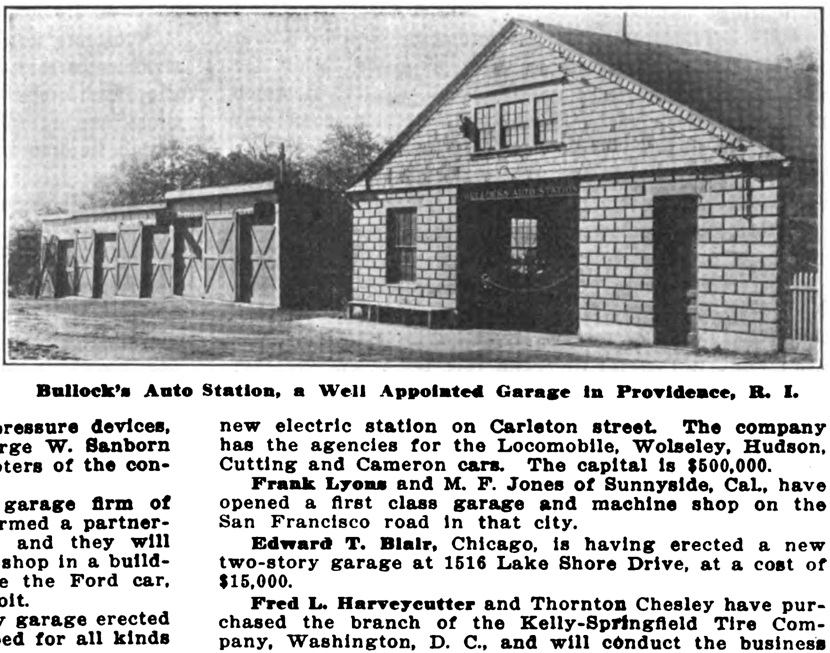
Alpheus Lane has sold his interest in the City garage, Paola, Kan., to J. W. Torrey of Kansas City.

Eric J. Gustafson has moved his garage from North Court street, Rockford, Ill., to the new Stewart building on Waterworks park.

P. F. Leeland and Hampton Mays have opened a modern garage and repair shop on East Conner street, Jacksonville, Fla.

The McKeesport Vulcanizing Company, McKeesport, Penn., of which S. L. Stitler and Harry Lebewitz are proprietors, has occupied a completely equipped plant at 214 Fourth avenue, for the vulcanizing and general repair of rubber tires.

The Canadian Motor Company, Winnipeg, Manitoba, Can., recently formed, has acquired the business recently carried on under the name of Ft. Rouge garage and also will control the City garage on Portage street and the new electric station on Carleton street. The company has the agencies for the Locomobile, Wolseley, Hudson, Cutting and Cameron cars. The capital is $500,000.



Bullock's Auto Station, a Well Appointed Garage in Providence, R. I.

Frank Lyons and M. F. Jones of Sunnyside, Cal., have opened a first class garage and machine shop on the San Francisco road in that city.

Edward T. Blair, Chicago, is having erected a new two-story garage at 1516 Lake Shore Drive, at a cost of $15,000.

Fred L. Harveycutter and Thornton Chesley have purchased the branch of the Kelly-Springfield Tire Company, Washington, D. C., and will conduct the business at the same location, 1730 14th street.

Edgar S. Harrington, proprietor of the Milford garage, will erect a modern garage on East Front street, South Milford, Del.

M. H. Taylor of Elmira, N. Y., has opened a new garage at the corner of Gray and State streets, to be known as Taylor's garage.

The Overland Auto Company, Phoenix, Ariz., has been formed to handle the Overland cars in that territory and an agency has been established at 329 North Central avenue. A. S. Earnhart is the manager.

The Santa Monica Auto Station, Santa Monica, Cal., is undergoing extensive repairs to prepare for an increased business.

J. J. Backus, chief building inspector of Los Angeles, Cal., has completed plans for the proposed municipal garage, machine shop and warehouse.

Bruce Champion, Osage, Ia., is the proprietor of a new garage and automobile repair shop in the William Champion building on Main street.

W. N. Eisenbradt is having a new garage built at a cost of $4000, to be located at 441 Drexel boulevard, Chicago.

Fred Linsy of the firm of Linzy & Selover, Auburn, N. Y., and located in the Empire garage, has purchased the interest of his partner, Floyd Selover, and will control the business himself in future.

DIRECT FROM DEALER TO THE MANUFACTURER.

Free Service Established by the Accessory and Garage Journal to Furnish Confidential Business Intelligence, Relating to Production and Distribution, to the Buying and Selling Interests of the Nation.

The demand by the trade, as represented by the dealers in and agents for both pleasure and commercial vehicles, accessories and supplies, the garage and public service stations and repairmen, for information relative to the qualities and merits of all marketable products in the automobile industries, has attained such proportions as to impel the establishment of a Trade Information Exchange, in connection with the publishing of the Accessory and Garage Journal.

This service, complete and comprehensive in every detail, is absolutely without charge to all concerns listed in the Buyers' Guide in The Automobile Journal, Motor Truck and the Accessory and Garage Journal, and to all automobile dealers, accessory and supply dealers, garage and public service station owners, and repairers, who are regular subscribers to the Accessory and Garage Journal. This service does not extend to manufacturers and selling agents for manufacturers not listed in the Buyers' Guides of the publications named.

This service offers to all manufacturers of power driven vehicles, equipment and supplies, who are entitled to its advantages, the opportunity to reach those interested in selling and distributing in any town, city, state or section of the country.

No business man has always at his command the trade information that might be desirable. Demands made upon the trade are such that no one can compile such reference as will inform him of every industrial fact it may be imperative to know. He has no source available from which this information may be obtained. This Exchange has been established to supply any industrial or trade fact to its members at request. This service economizes the time of the business man and his customer; it minimizes correspondence; it places the dealer in contact with every product in the particular line under consideration and the manufacturers' selling propositions; the dealer purchases that which will best meet his requirement and satisfy his customer, and the dealer has the use of this information in all his future transactions. It gives every interest in the market equal consideration and opportunity.

Thousands of active enterprises, seeking expansion or desirous of making new connections, have in this service the means of conducting their negotiations confidentially and securing information that must be beneficial to all manufacturing and distributing interests.

All trade information passing through the Exchange is of a confidential character. Inquiries received from those in the trade relative to prospective connections or associations are distributed to the manufacturing interests of which information is desired. The replies of the manufacturers or selling agents pass through the Exchange direct to the inquirer, who then conducts his negotiations as his judgment dictates.

Manufacturers through this service will be able to reach desirable trade interests in territory now having no representation, and enabled to complete their organizations.

To illustrate the Trade Information Exchange service:

John Smith of Phoenix, Ariz., desires to secure the agency for a car selling for $1200. He communicates with the Exchange, stating his limitations and that he is desirous of obtaining sales rights for a specified territory. His inquiry is given a number. Its purport is submitted to all makers of cars within the price limit fixed entitled to the service. The replies of the manufacturers to the number are received at the Exchange and are forwarded to John Smith. He considers the facts and propositions submitted and closes the contract.

John Smith has had opportunity to pass upon all the qualities of every car and every proposal. He selects that which he judges will be the best from a business point of view. Every manufacturer has received equal consideration and each has the knowledge that his production has been approved or rejected from its actual qualities and merits.

Thomas Jones, who is to establish a garage, desires a full equipment. In his letter of inquiry to the Exchange he states his exact requirements, and these are submitted to those producing the lines in which he has interest and from which he will make a choice.

Any dealer desiring to expand his business and make new connections can make the fullest inquiry in the market through the Exchange.

This service extends to all branches of the industries. The correspondence is passed and submitted as stated, the negotiations being as confidential as those concerned in them may desire.

To facilitate the interests of the Exchange and those whom it is intended to serve, address all correspondence to the Trade Information Exchange, Accessory and Garage Journal, Times Building, Pawtucket, R. I.

TEMPERING SCREW DRIVERS.

The principal reason for hardening and tempering screw drivers is to make them tough, exceptional hardness not being necessary as they are not called upon to do any cutting. The water bath generally used tends to harden the metal rather than toughen it. If water be employed it should be heated nearly to the boiling point. Oil is superior to the water method.

GALVANIZING CAST IRON.

To galvanize cast iron the casting should be cleansed thoroughly by immersing it for a few hours in a bath of one part muriatic acid and two parts water. After removing the work it should be scrubbed thoroughly with a brush and fine sand, after which it is washed with hot water. When the metal is clean it is dipped in a solution comprising one-half pound of sal ammoniac to a gallon of water. It should be dried quickly and dipped in a zinc bath. If the surface of the metal be oily, the grease may be removed by boiling in caustic soda or lye.

TRADE INFORMATION EXCHANGE
BUSINESS PROPOSITIONS.

Opportunities Are Offered Below for Agents to Secure New Lines, for Manufacturers to Extend Their Representation, and for Producers to Get in Touch with Those Who Are in the Market for Equipment and Supplies. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without Names, Those Interested Desiring the Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for Forwarding.

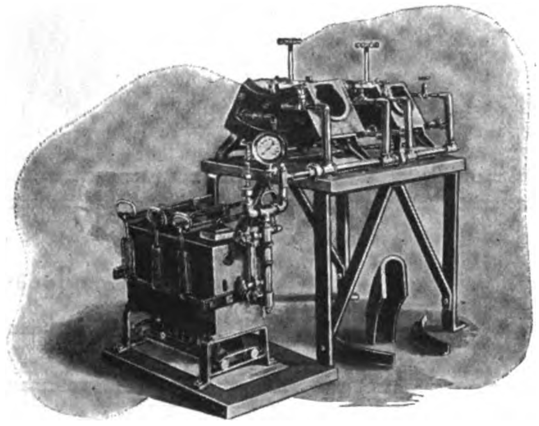
Are You Getting Your Share of The Dollars?



TIRE REPAIR MEN ARE MAKING MONEY. Right now and for the next two months this business will be at its best. Tires that were new in the spring need repairs. Auto owners are repairing tires to make them last out the season. An increasing number of cars will be run all winter.

YOU OUGHT TO SHARE IN THE PROFITS. Install an **AKRON-WILLIAMS** outfit, the kind used and recommended by twenty-seven out of thirty tire makers and by successful repair men everywhere. Ask your tire maker about us.

IT DOESN'T TAKE MUCH MONEY to buy the best plant and you can make more with it than with an investment four times as large in any other line. We have outfits from $40.00 to $1000.00, depending upon how much and what range of work is to be handled. Every outfit is standard.

SWORN CIRCULATION

January Issue

ACCESSORY and GARAGE JOURNAL

15,000

The ACCESSORY and GARAGE JOURNAL is the only paper devoted to the motor vehicle and allied industries published in America.

It is the only publication that guarantees to have 100 per cent. trade circulation and trade circulation value.

Can any advertiser reach the consumer and the trade in any one print? Can he reach all the trade in any one or even a series of magazines other than the ACCESSORY and GARAGE JOURNAL? Can he obtain the same service at 10 times the cost through other publications, or by maintaining his own mailing list?

The manufacturer must reach the trade. The logical medium for publicity is the trade paper that has the trade circulation and can give the trade service. The ACCESSORY and GARAGE JOURNAL has the circulation and gives the service, and both are guaranteed by the management. The advertiser obtains all that he pays for and saves at least 90 per cent. of the cost of publicity that would be equally productive. The mailing list of the ACCESSORY and GARAGE JOURNAL is the only complete record of trade and industrial names and addresses in existence, and it is daily revised and corrected. Its great value is its thorough maintenance.

NATIONAL TRADE INFORMATION EXCHANGE.

Business to the amount of millions of dollars is transacted annually through the NATIONAL TRADE INFORMATION EXCHANGE. It is described on pages 36, 37 and 38 of this issue. It is the most efficient service ever developed for the benefit of advertisers by any publication.

TRADE DIRECTORY LISTS.

The classification by name and product of firms doing a nation-wide business has a value that cannot be over-estimated. The quality of such lists depends entirely upon the care with which they are prepared, and their productiveness is in ratio to their completeness. But the best list would be valueless unless distributed to those who can make use of it.

The average trade directory is available to a few thousands under the most favorable conditions. Occasionally these are revised more than once a year. The majority are published annually. These directories, having limited circulation, are not general references. They are not as dependable and reliable as were they revised more frequently. They do not differentiate the standing and prestige of the firms, nor indicate the quality of their products. The chief value of the trade list to those listed is not the number of names, for this would not specify reputation nor prestige, but in the character of the firms and the quality of their products. The selected list concentrates business and does not dissipate it.

The TRADE DIRECTORY or BUYERS' GUIDE illustrated on the following pages is in every sense select. It is made up of representative, reputable firms, all recognized in the industry and trade, and all promotive and not destructive of business. This list appears in all issues of the AUTOMOBILE JOURNAL, the MOTOR TRUCK and the ACCESSORY and GARAGE JOURNAL, there being 48 separate editions the year, and is also published in the series of STANDARD AUTOMOBILE MECHANICAL HANDBOOKS, 12 books in the series, published by this company.

The DIRECTORY is revised daily and published as revised. It is published in magazines and handbooks that are bought to read, and it is circulated wherever the English language is spoken. It is placed in the hands of those who are buyers. It has a distribution of more than 1,000,000 copies annually.

This service is free to all yearly advertisers in any of the three magazines.

Blue Ribbon Cream Metal Polish

It's a thick cream metal polish—an emulsion. The quickest and best for metals constantly exposed to the weather; best for inside work.

Does not settle; requires no shaking; leaves no sediment in crevices.

Only polish furnished in five or ten-gallon cans for garages, fire departments and other large users which gives perfect satisfaction.

It removes the TARNISH, not the METAL. A household necessity for cleaning and polishing all brass and metal trimmings and fixtures. Regarded by all large users and dealers everywhere as the ideal polish for all-around use and as a trade article.

Blue Ribbon Greaseless Cream Automobile Body Gloss and Furniture Polish

For body of any car. Keeps it like new. Maintains original gloss and finish. Revives and restores lustre adding new life to highly polished surfaces. Absolutely leaves no grease to catch dust. Also valuable for cleaning, preserving and brightening leather trimmings.

VOL. II. PAWTUCKET, R. I., JANUARY, 1913. No. 8

AUTOMOBILE CHAMBER OF COMMERCE.

National Association of Manufacturers and Board of Trade Amalgamate to Form New Body---Interesting News Concerning the Industry and Trade.

The proposed amalgamation of the Automobile Board of Trade and the National Association of Automobile Manufacturers, which has been under discussion practically all of the past year, was brought to a definite head at the annual meeting of the former organization in New York during the progress of the pleasure car show. The report of the consolidation committee was accepted, nearly all of the 65 members of the Automobile Board of Trade being present and the vote being unanimous. It is understood that the executive committee of the National Association of Automobile Manufacturers has accepted the report for the members of that organization.

Under the terms of the report the amalgamated association will be known as the Automobile Chamber of Commerce, and will start its existence with some 110 manufacturers. It does not appear clear whether the two older organizations are to lose their identity, but the new will act in all matters affecting the united industry.

The Automobile Board of Trade has re-elected its old board of officers and directors as follows: President, Charles Clifton; vice president, C. C. Hanch; secretary, R. D. Chapin; treasurer, George Pope; general manager, H. A. Bonnell; directors, Charles Clifton, Pierce-Arrow Motor Car Company; C. C. Hanch, Nordyke & Marmon Company; S. T. Davis, Jr., Locomobile Company of America; Hugh Chalmers, Chalmers Motor Company; S. D. Waldon, Packard Motor Car Company; Wilfred C. Leland, Cadillac Motor Car Company; John N. Willys, Willys-Overland Company.

BECOMES CHIEF ENGINEER.

W. B. Engler Wins Promotion After Studying Truck Conditions in European Cities.

Announcement has been made by W. L. Day, vice president of General Motors Truck Company, Detroit, maker of G. M. C. trucks, of the promotion of W. B. Engler to the post of chief engineer with entire charge of experimental and development work. Preparatory to his new and larger responsibilities, Mr. Engler has passed the last three months abroad studying truck design as well as conditions surrounding motor truck service and operation in various European cities.

For the past three years Mr. Engler has been head of the engineering department of the General Motors Company's heavy duty gasoline truck plant at Owosso and previous to that was associated with the Olds Gas Power Company of Lansing, Mich.

R-C-H OFFICERS ELECTED.

J. F. Hartz Becomes President and R. C. Hupp Is Vice President.

At the annual meeting of the board of directors of the R-C-H Corporation, Detroit, maker of R-C-H cars, held at the plant, the following officers were elected: President and treasurer, J. F. Hartz; vice president, R. C. Hupp; secretary, C. P. Seider. These officers, with G. W. Rogers and J. G. Robertson, Akron, O.; John Kelsey and Joseph H. Clark, Detroit; G. Jahn of New York City and C. G. McCutcheon of Jackson, Mich., comprise the directorate. Mr. Jahn was elected to succeed F. M. Randall of Detroit, resigned.

The new president of the company, J. F. Hartz, is one of the best known and most successful business men of Michigan. He is president of the C. M. Hall Lamp Company, vice president of the Williams Bros. Company, president of the J. F. Hartz Company and interested in many other successful and well known Detroit concerns. Arrangements have been completed for ample financial backing for the R-C-H Corporation and plans made for an energetic sales campaign for the coming season.

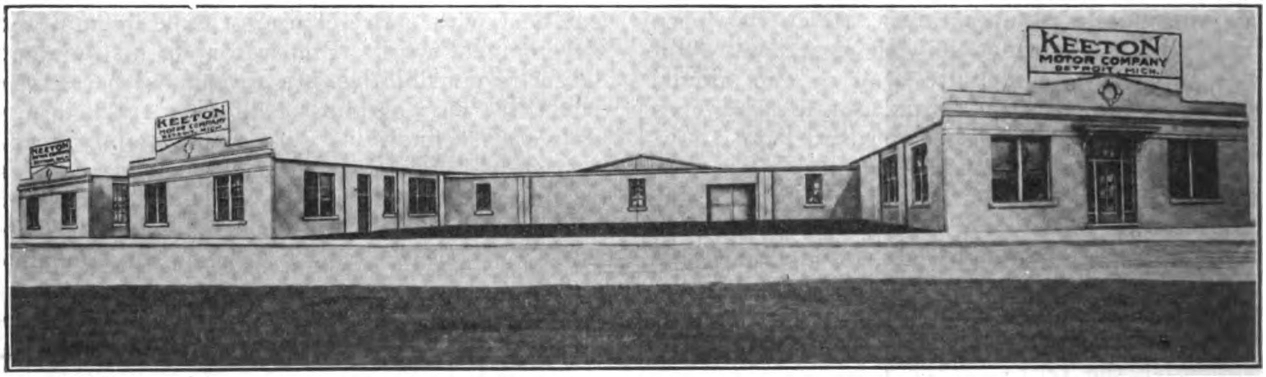
As previously announced, Peyton R. Janney, formerly of the General Motors Company, and with a splendid record both in the manufacturing and sales departments of the automobile business, became general manager of the company Jan. 1. Fred R. Bump continues as assistant general manager.

SECURES NEW FACTORY.

Keeton Motor Company Acquires Oliver Truck Plant in Detroit.

The Keeton Motor Company, Detroit, maker of Keeton cars, has purchased the plant formerly occupied by the Oliver Motor Truck Company at Breckenridge and Lawton avenues. The building affords 40,000 square feet of floor space and is well located for manufacturing and shipping purposes, being on the Michigan Central railroad. An accompanying illustration shows the present structure, which will be augmented in the near future by the erection of several substantial additions.

The officials of the Keeton company are: President, Forrest M. Keeton; vice president and sales director, William G. Houck; directors, C. D. Shaffer, Wilbur Brotherton and Norton Brotherton. F. Ed. Spooner, well known because of his long connection with the automobile industry as a director of publicity, has been appointed advertising manager.



Factory Buildings in Detroit Which Have Just Been Purchased by the Keeton Motor Company of That City.

TO REFINANCE LEXINGTON.

Connersville Company Offers Proposition to Satisfy Creditors and Enable Production.

The Connersville Securities, Connersville, Ind., a corporation composed of local capitalists, has offered the creditors of the Lexington Motor Car Company a proposition to purchase the claims against the company and to refinance it on a sound basis. The proposition is for 25 per cent. in cash 30 days after proper delivery.

The difficulty of the Lexington Motor Car Company arose from the failure to secure new capital after entering into a contract to produce cars worth $1,500,000 a year. A meeting of the creditors was called and a committee appointed. Nominal assets are placed at $134,000 and liabilities at $140,000.

SOMERVELL FOR HERRESHOFF.

Becomes General Manager with Intimate Knowledge of Production and Salesmanship.

The Herreshoff Motor Company has announced the appointment of C. Stuart Somervell as general manager of that company. Mr. Somervell until recently was manager of the Lycoming Foundry & Machine Company of Williamsport, Penn., automobile motor manufacturer, which business he established in those works. Among his other duties he personally attended to the sale of the factory output.

Mr. Somervell for the past three years has been in close touch with the automobile situation. He is a man of energetic personality and has had wide experience in the production and sales departments of various factory organizations. His knowledge has been gained through long years of the very best schooling and knowing, as he does, so intimately and in detail the production and sales departments of the manufacturing business, his appointment is a distinct gain to the organization of the Herreshoff Motor Company.

THE BAUER-LEWIS COMPANY.

Former Member of Oakland Purchasing Department to Manufacture Leather Supplies.

Frank Bauer and P. M. Lewis, both well known in Detroit automobile circles, have purchased the stock formerly held by L. A. Young in the Durable Company. As the Bauer-Lewis Company the concern will continue the manufacturing of automobile top straps, magneto boots, cross-arm boots and a line of other leather supplies.

The new officers of the company are: President, Frank Bauer; vice president, F. O'Brien; secretary-treasurer, P. M. Lewis. Mr. Lewis, under the former management was secretary and general manager of the concern. Mr. Bauer left the purchasing department of the Oakland Motor Car Company, Detroit, maker of Oakland cars, to accept the presidency of the Durable Company.

SECURES ADDITIONAL EQUIPMENT.

Cincinnati Time Recorder Company Proves a Factor in Automobile Industry.

The Cincinnati Time Recorder Company, Cincinnati, O., which has been engaged in the business of producing time recording devices for the past nine years, is proving a decided factor in the automobile industry, through the manufacturing of time clocks and systems which are applicable to the public and private garages. The cost accounting features of these instruments are of decided benefit to the operator of commercial vehicles, as well.

Since taking up this work the demand has been increased by large proportions, until the company recently found itself in a position where it was experiencing difficulty in keeping up with the orders. New equipment, which is expected to enable it to meet with all demands for some time to come, has been installed at an expenditure of $25,000, and with the opening of the new year the company announces it will be able to fill all orders promptly.

MOTOR HAULAGE EXPERT.

C. T. Myers Leaves General Motors Company to Become Special Consulting Engineer.

Cornelius T. Myers, who for the past two years has been mechanical engineer and chief engineer of the General Motors Truck Company, Detroit, maker of G. M. C. trucks, has severed his connection with the company. He is returning to the consulting work which he dropped to assist President Neal in caring for some of the engineering problems then confronting the General Motors Company.

When Mr. Myers completes some special work which he now has on hand, he will be in a position to carry on a consulting engineering practise in all lines of automobile activity, but particularly in the motor truck field. Among other things, he will make a specialty of reports to prospective purchasers on their local conditions with respect to the mechanical transport and on the particulars of the various machines on the market. His office is at present located at 49 Pingree street, Detroit.

BRIGHT SUCCEEDS HESS.

Latter Sells His Interest in Hess-Bright Concern to German Company.

F. E. Bright has become president of the Hess-Bright Manufacturing Company, following the purchase of all the stock owned by Henry Hess, by the Deutsche Waffen and Munitions Fabriken, Berlin, Germany, maker of D. W. F. ball bearings. He was formerly vice president and treasurer and now holds the controlling interest.

A. T. Bruegal is secretary and C. L. McCalla is treasurer of the concern. The German parent factory is being increased and extensive improvements to the American plant are being made.

BECOMES FACTORY MANAGER.

J. M. Smith Takes Charge of Production with Henderson Motor Car Company.

Although organized early last summer, the business of the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, has reached such proportions that it has been found necessary to acquire a new addition, affording 55,000 square feet of floor space. J. M. Smith has been appointed factory production manager.

Mr. Smith is not new in the automobile field, having been employed in one of the large Detroit factories for several years as assistant superintendent in charge of production. He also spent three seasons with the Chatham Motor Car Company of Canada as production manager, and comes to the Henderson company from the Cole Motor Car Company, Indianapolis, where he has been factory manager.

Shortly before the new year the Henderson factory was closed to enable an inventory of the various departments and to rearrange the machinery, etc., in the new addition. An increased force of workmen began operations at the conclusion of this brief respite, and it is announced that the production will be doubled for January and February, and still further increased later in the season.

J. M. Smith, Factory Manager, Henderson Motor Car Company.

The Hartford Automobile Dealers' Association, Hartford, Conn., will hold its sixth annual display of motor cars, parts and accessories in the state armory, Feb. 8-15. This season the dealers will be assisted in the management of the exhibition by the First Infantry, C. N. G.

F. W. Dart, who has been in charge of the arrangements for past shows, will head the dealers' committee again this year. He is now engaged upon trying to find room for all who desire to make display, and even with the space available in the new armory it begins to look like a formidable task.

BRIDGEPORT'S ANNUAL SHOW.

Entire Space Already Allotted to Members of the Automobile Dealers' Association.

The annual automobile and motor boat show to be held March 3-8 at Bridgeport, Conn., will this year be one of the largest held in that state. The event will be staged in the Park City rink, which will furnish about 130,000 square feet of floor space.

At the first meeting of the Bridgeport Automobile Dealers' Association, under whose auspices the display will be held, the entire allotment was made, so anxious were the various exhibitors to secure space before it should be too late. B. B. Steiber is the active manager of the show.

PROMOTE RAMBLER MEN.

Business of the Company Makes Necessary Rearrangement of Executive Force.

With the coming of the new year several important additions have been made to the executive staff of the Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler Cross Country cars. The board of directors includes Charles T. Jeffery, Harold W. Jeffery and George M. Berry, while the officers of the company are: President and general manager, Charles T. Jeffery; vice president, Harold W. Jeffery; second vice president and treasurer, George M. Berry; secretary, Edward S. Jordan; assistant secretary, Edward S. Maddock.

Some of the promotions made at the annual meeting follow: Louis H. Bill of the Pacific Coast branch, assistant general manager; Harry E. Field, formerly in the New York branch, sales manager; J. W. DeCou, factory manager; J. Bjorn, assistant factory manager; G. H. Cox, assistant sales manager. All these men have been active in the selling of Rambler cars for a number of years. The business has grown to such proportions that it was decided to enlarge the executive force to cope with it, and those responsible for the immense growth of the concern were naturally chosen for promotion.

NEW CARBURETOR FACTORY.

Inventor Locates in Los Angeles After Long Distance Test Over the Road.

A new factory for the manufacture of the Jensen carburetor has just been established at Los Angeles, Cal., being located at 2413 South Grand avenue. The inventor is A. Rasmus Jensen of Milwaukee, Wis., who recently, with Mrs. Jensen and Otto S. Nick of Milwaukee, drove from that city to Los Angeles to test the product over the various mountain and valley roads. Although the trip was through eight states, the carburetor was not touched once during the journey.

Mr. Jensen has decided to locate his factory in California, with the result that the present quarters were secured immediately upon his arrival at Los Angeles. Free demonstrations are made to all who are interested in the invention. The carburetor is said to be absolutely automatic in its action, adjusting itself to heat and cold and to all changes of altitude, as well as to low and high speed of the motor. The mixture is controlled entirely by a thermostat, which expands and contracts under varying conditions, controlling automatically the amount of gasoline and air admitted to the intake manifold.

PARKER BECOMES PRESIDENT.

Elected to Head National Gas Engine Association at Its Convention in Indianapolis.

The National Gas Engine Association recently held a three-day convention in Indianapolis, Ind., and various matters of interest to the organization were considered. On the last day the annual election of officers was held and in the evening the convention closed with a banquet.

Following are the officers elected: President, O. C. Parker, La Crosse, Wis.; vice president, R. A. Oglesby, Indianapolis; treasurer, Otto M. Knoblock, South Bend, Ind.; secretary, H. R. Brate, Lakemount, N. Y.; executive committee, Otto M. Knoblock, South Bend; R. A. Oglesby, Indianapolis; M. H. Walker, Chicago; M. A. Loeb, Cincinnati, O.; O. C. Parker, La Crosse; E. J. Perkins, St. Joseph, Mich.; O. B. Isles, Indianapolis; H. W. Bolens, Port Washington, Wis.; C. O. Hamilton, Elyria, O.

FIRST CAR OWNED IN LYNN.

Now on Exhibit Beside Latest Chalmers Model in Whitten's New Salesroom.

Readers of the Accessory and Garage Journal will remember that the gasoline automobile designed by Max Hertel won a prize for starting from the seat at the Chicago Times-Herald race in 1895. This machine was later built as the Oakman by the Oakman Automobile Company, Greenfield, Mass. It appears that one of these was purchased by F. C. Cheever of Lynn, Mass., Nov. 10, 1899, and was the first automobile owned in Lynn. This car was recently on exhibition in the new salesroom of Charles E. Whitten, the Chalmers agent on Central avenue in that city.

Mr. Cheever supplies some interesting data concerning the car while it was in his possession. For instance, it appears that he paid $650 for it Nov. 10, 1899, and sold it July 27, 1901, for $350. That gives a depreciation of $300. He expended $50.24 for repairs, overhaul, new parts and labor; $17.76 for tires; $21.65 for gasoline, oil and batteries, and $25.35 for improvements, etc., making a total running expense of $115. He ran the car a total distance of 1625 miles, and the cost a mile figures out at about 25.5 cents.

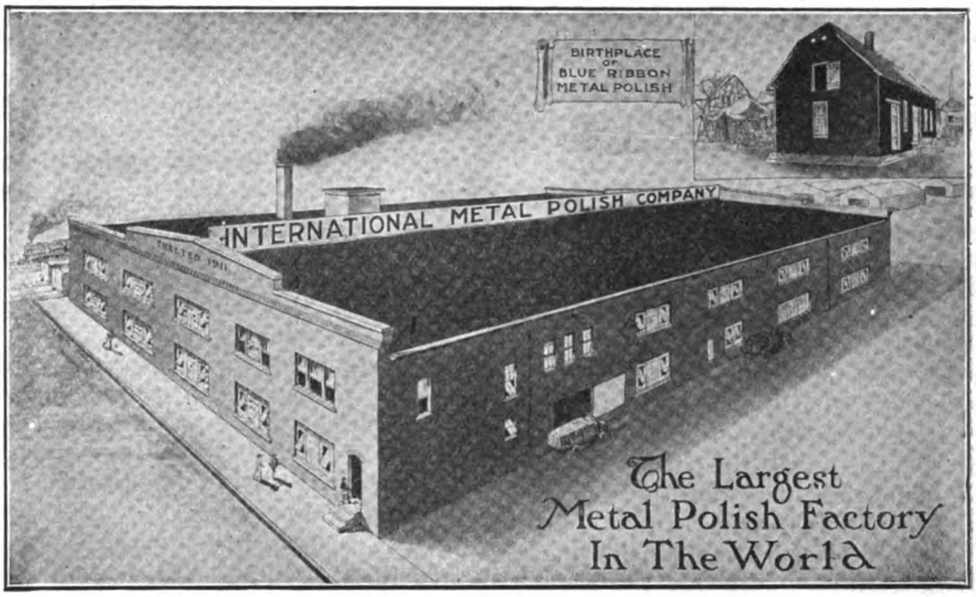
After Mr. Cheever sold the machine it passed to at least two other owners, but he finally bought it again, to retain it as a curiosity and because of the sentiment associated with its original ownership.

EIGHT YEARS OF GROWTH.

What It Has Done for Manufacturer of Blue Ribbon Metal Polishes.

Accompanying illustrations present the two extremes in the business life of the International Metal Polish Company, Indianapolis, Ind., the insert being a view of the building in which R. A. and Eugene Blackburn began the production of Blue Ribbon metal polishes eight years ago, while the main portion of the picture shows the present factory, said to be the largest in the world devoted to this purpose. It may be stated that the original small factory soon proved too small to meet the demand for the product, and for a time some of the work was accomplished under tents.

The new building is of concrete fireproof construction throughout and is well located on Quill street and the Belt railroad. It is of two stories, with 30,000 square feet of floor space, and the shipping facilities are such that the conditions are held to be ideal in this respect. As a further indication of the growth of the company it may be added that branches are located in the Moffalt building, 335 Broadway, New York City, and 1033 La Salle avenue, Chicago, while the Weinstock Nichols Company, San Francisco, acts as branch distributor on the Pacific Coast.



BIRTHPLACE OF BLUE RIBBON METAL POLISH
INTERNATIONAL METAL POLISH COMPANY
The Largest Metal Polish Factory In The World

Indicating Growth of International Metal Polish Company, Indianapolis, Ind., During the Past Eight Years.

Blue Ribbon polishes are made for metal, varnish and other purposes and are handled by leading jobbers in all cities. The company also enjoys a large export business. They will be exhibited at Chicago and Boston.

WILL DISTRIBUTE DRY CELLS.

Halliwell Concern to Take Over Entire Product of Standard Carbon Company.

The Halliwell Company, Los Angeles, Cal., of which C. E. and W. H. Halliwell are proprietors, has closed a big contract with the Standard Carbon Company of the same city, for its entire output of dry cells. The contract calls for the delivery of 3000 dry cells a day and these will be marketed through the different branches of the Halliwell Company.

To take care of this business two electrical specialty salesmen have been added to the Halliwell force. F. E. Overhiser will look after the country business, while A. E. Ravenscroft will handle the city trade.

AJAX TIRES IN GREAT BRITAIN.

Charles Y. Knight Is Perfectly Satisfied with Showing Made on His Car.

British roads with their surfaces of flint over which automobiles are driven much faster than in America, test automobile tires to the limit of severity. Low tire mileages are the rule and British motorists apparently expect nothing better from their native product. How well an American shoe withstands these conditions is shown by a letter written by Charles Y. Knight, inventor of the Knight motor, to Horace De Lisser of the Ajax-Grieb Rubber Company, New York City.

"I have completed 4300 miles on an Ajax tire, which I received from you last spring," he says. "I must say that taken all in all it is the most remarkable tire I have ever had on a car. Our average speed is at least 10 miles an hour greater on these hard roads, which act like sandpaper, than is possible on the average American roads. The remarkable thing about the Ajax tire is that during the 4300 miles that it has been running on the rear wheel it has not received from the road a single cut which penetrated to any great depth, apparently the result of the quality of rubber employed in its construction. The result is that the wear stands uniformly even all round and that it is still in good running condition and no doubt might be retreaded to last considerably longer. I am still using it and shall run it to destruction."

BRITISH ENGINEERS COMING.

Will Return Recent Visit Made by American Society During the Summer.

The invitation of the American Society of Automobile Engineers to the Institution of Automobile Engineers of England, to visit this country next spring has been extended to members of the Society of Motor Manufacturers & Traders, Ltd., and has been accepted by the latter. It is expected that the party visiting the United States from England will be greatly augmented as a result. A joint committee of the two English bodies is at work on the preparation of the programme, which will be full of interest.

A number of automobile factories will be visited, together with works producing steel, springs, tires, bodies and other details of the automobile industry, while three days will be passed on one of the largest passenger steamers of the Great Lakes during the annual summer meeting of the American Society of Automobile Engineers.

BOSTON SHOW IN MARCH.

Plans Perfected for Industry's Largest Exhibit in Two Sections.

Mechanics building, Boston, Mass., which for the past 10 years has housed the big Boston automobile show, will again this year present two separate exhibits. The pleasure car division of the industry will be represented during the week of March 8-15 and following this, from March 19-26, will be held the exhibition of commercial vehicles. The first show will be under the direction of the Boston Automobile Dealers' Association, Inc., while the truck display will be under the management of the Boston Commercial Motor Vehicle Association, Inc.

In the pleasure car division many new body designs will be seen and the show promises to surpass anything of its character ever held in this country. With the whole of Mechanics building at its disposal the Boston Commercial Vehicle Motor Association also will be able to present a thoroughly interesting exhibition. In connection with the truck show this year a special department will be set apart for the machine tool display. It has been impossible to do this industry justice in past years owing to lack of space, but the whole of department C will be devoted to it this year. Manager Chester I. Campbell has prepared an entirely new decorative scheme and is now busy considering applications for space at his office, 5 Park square, Boston.

NEW CARTERCAR MEN.

Several Changes in Personnel of Department Heads in Pontiac Concern.

The Cartercar Company, Pontiac, Mich., maker of Cartercar machines, is said to have made several changes in its factory organization. A. C. Leverton, formerly with the Brush Runabout Company, has become works manager, succeeding J. J. Hartley, who goes to Philadelphia. A. A. Lehr, formerly with the Studebaker Corporation, has succeeded H. D. Evans as purchasing agent, and W. D. Block, recently with the Detroit office of the General Motors Company, becomes comptroller.

Donald M. Ferguson, who was formerly connected with the Studebaker Corporation, has been made chief engineer, E. J. Farkas having resigned to open an office of his own at Detroit. Harry R. Radford, who has been general manager for some time, and who is well known throughout the industry, will continue in that important position.

NEW STUDEBAKER TRUCKS.

Plans Laid for Enlarged Production of Both Gasoline and Electric Vehicles.

The Studebaker Corporation, Detroit, maker of Studebaker pleasure and commercial vehicles, will greatly increase its commercial department for 1913 and will manufacture a complete line of gasoline and electrically propelled motor trucks. During 1912 the company produced more motor driven commercial cars than ever before in its history and the output this year is expected to greatly exceed this.

A complete line of electric trucks and two new gasoline machines were on exhibition at the New York shows and as soon as the company succeeds in completing its truck manufacturing organization, it will market complete lines from light delivery wagons to trucks of six tons capacity, including all the intervening types, both gasoline and electric. The latter vehicles have, to a large extent, been redesigned and one model is equipped with worm drive.

HINDLEY GEAR COMPANY.

Organized to Take Over Manufacture of Worm Gearing of Hindley Type.

The designing and manufacturing of worm gearing of the Hindley type, which has been a branch of the business conducted by the Otis Elevator Company, Philadelphia, Penn., has been discontinued by that company as such and since Jan. 1 has been made by the Hindley Gear Company, a corporation organized under the laws of Pennsylvania.

The increase in this line of work has reached such proportions that the Otis Elevator Company's officials believed their customers would be better served by having a separate concern take care of the Hindley worm gearing, particularly in view of the increased demand for this type in commercial vehicles. It is understood that the Otis Elevator Company is behind the new corporation formed to manufacture these gearings.

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

MORE CAPITAL FOR BAILEY.

Rapidly Increasing Business Makes Necessary Provision for Enlarged Production Facilities.

So rapidly has the business of the S. R. Bailey Company, Inc., Amesbury, Mass., maker of Bailey electric vehicles, grown that to increase the production facilities of the concern it is understood that $100,000 worth of preferred stock has been issued. The company plans to gradually increase its scope and the factory will later be enlarged considerably.

The firm has been successful beyond expectations and many orders for its runabout have been received from electric light companies in various cities. It is planned to increase the working force of the plant as fast as the business warrants.

NEW WAVERLEY YEAR BOOK.

For some time the Waverley Company, Indianapolis, Ind., maker of Waverley electric machines, has occupied a foremost position in the industry with its annual year book. The issue for 1913 carries the innovation one step further removed from the formal catalogue by adding a calendar for each month, the object being to direct the reader's attention the more forcibly to the advantages of a car whose usefulness is circumscribed by no limitations of climate, season or weather conditions.

Carrying out this idea colored illustrations present Waverley cars in use at all seasons of the year, and the page assigned to each month presents hints that will aid the owner in enjoying nature in its varying moods and forms of life. That portion devoted to description of the models themselves is most complete in every detail, the text being supplemented with numerous illustrations of the parts to which attention is called.

As an example of the printer's art the book is in full keeping with the exemplification of the manufacturer's art represented in the various models of the Waverley electric pleasure car. No suggestion that can be of value to the prospective purchaser has been omitted.

BOYER SUSPENSION BEARINGS.

Product of Sandusky Concern Embodies New and Interesting Constructional Features.

A new anti-friction bearing, for which many advantages are claimed, is being marketed by the Suspension Roller Bearing Company, Sandusky, O. It is made both in roller and ball types under the name of Boyer suspension bearing, and the company calls particular attention to the latter, stating that by the suspension system all of the balls are actual load carriers at all times, preventing possible crushing of them.

This is based on the claim that the load is not supported by the balls in one direction at right angles to the load pressure line, but at an acute angle. It is held that the load falls on the side of the ball and not on top or centre. In other words, in supporting the load, the balls rotate with an inclined axis.

The maker points out that the suspension principle logically withstands both radial and thrust pressures, while by distributing the load to all balls, the strain on each member is lessened by about 500 per cent. To effect this movement, the balls are placed between two similar raceways instead of having the customary raceway encircling them, with a companion raceway inside the circle of balls or rollers.

It is stated that the grit nuisance is obviated by the action of the balls, their movement tending to work foreign substances out between the raceways, instead of retaining them along the line of travel of the balls. A quality of the bearings emphasized is that only sufficient lubrication to prevent rusting is necessary. The bearings are made in different sizes for motor car construction, also for line and countershaft hangers and in various other forms.

MAGNETOS IN CARLOAD LOTS.

Remy Electric Company Is Thus Compelled to Fill Orders from Two Customers.

Few persons realize that the volume of business done by one Indiana accessory firm is greater—that it requires more men and a bigger factory—than some well known motor car manufacturing concerns. The Remy Electric Company's plant at Anderson affords several hundred thousand feet of floor space and employs over 1000 men, who work in day and night shifts, in producing ignition, lighting and starting systems.

During October this concern shipped 13,055 magnetos, which is at the rate of 156,660 a year. About 14,000 were shipped in November. The production reaches as high as 875 complete magnetos and coils a day. The instruments are delivered to two firms, the Willys-Overland and Buick, in carload lots.

Two new books relating to the care and operation of motor cars have been issued recently by the American School of Correspondence, Chicago, these being prepared by well known members of the Society of Automobile Engineers, Victor Lougheed and Morris A. Hall. One is entitled "The Gasoline Automobile" and the other, "Care and Operation of Automobiles." Both are well illustrated and are intended to reach a class of motorists who would not be interested in the more technical discussions. "The Gasoline Automobile," by Lougheed and Hall, presents the development and present status of the car, and takes up all the integral components of the machine and their functions. The other book, by Hall, combines the subject of private garages and repairs, with automobile driving.

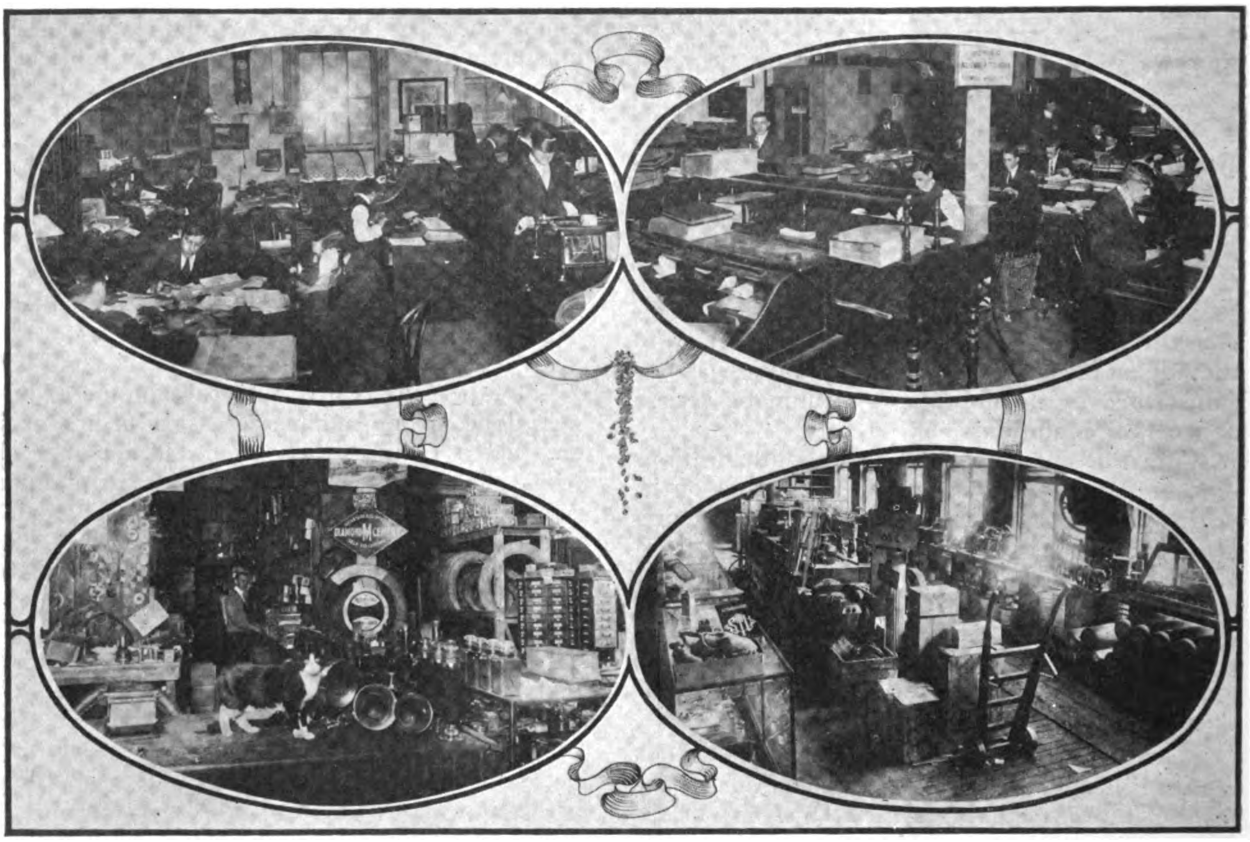
GROWTH OF PIONEER ACCESSORY HOUSE.

ONE of the committee of eight which made the arrangements for the first national automobile show in Madison Square Garden, New York City, 13 years ago, was Chas. E. Miller, pioneer dealer in automobile accessories. Soon after the appearance of the first practical gasoline machines, Mr. Miller, who was at that time and had been for some years engaged in conducting a supply house for bicycle sundries in New York City, became interested in such equipment as his judgment indicated would be suitable for use on the horseless carriage. The industry is indebted in no small measure to his business foresight in this connection.

It was during the annual bicycle show in Madison Square Garden during the fall of 1899, that a few automobiles, loaned by their owners, were displayed as an added attraction. As a result, there arose a demand for more extended exhibition the following year, and inasmuch as Mr. Miller was well established in this location, his advice was eagerly sought and generously given in connection with the plans which led up to this initial show. Moreover, he was the third member elected by the National Association of Automobile Manufacturers.

Mr. Miller began his business with automobile accessories by selecting such bicycle equipment as could be made to apply to the new vehicles, but he was not long content with this plan. He sought out the manufacturers of special fittings, acting first as a general jobber and later as the special representative of different producers. This very naturally brought him into peculiar relations with the trade, and as foreign makers were producing accessories of undoubted value, he soon became an importer as well. Still later, as American inventors began experimentation in this field, Mr. Miller, who by this time had come to be considered more or less of a specialist, was called upon for his judgment relative to the practicability of the devices, and often saw fit to assist in their production. In this manner he became a manufacturer. And as the demand for American fittings and supplies was created abroad he took up the exportation of such as he felt would meet with the approval of foreign motorists.

Such, in brief, is the business history of Chas. E. Miller, jobber, importer, manufacturer and exporter. Accompanying illustrations show the interior of the Miller headquarters at 97-103 Reade street, New York City, where every detail of the business transacted in this main house and the 15 branch houses in nine states receives his personal attention. The branches are located as follows: Three in New York City, and one each in Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.; Philadelphia, Penn.; Newark, N. J.; Detroit, Mich.; Cleveland, O.; Atlanta, Ga., and New Orleans, La.



Headquarters of Chas. E. Miller, New York City: Upper Views Indicate Convenient Appointments in Business Office; Lower, Attractive Arrangement of the Salesrooms, with the Miller Cat in the Foreground at the Left.

In one of the accompanying photographs, Mr. Miller's black and white cat occupies a prominent position, and this is quite appropriate since this cat was brought up among the employees from a kitten, and very naturally has inherited much of the enthusiasm of the office force. It not only can sit up, retrieve and perform a large number of tricks, but the Miller establishment needs no clock to learn when it is lunch time, since it is its chief duty to announce this fact. It also includes the role of office boy, in a measure, as will be borne out by the regular patrons who have been greeted by it for years.

"Try Miller" has become a trade slogan, particularly in its application to any special line of accessories the merits of which have been firmly established, since Mr. Miller makes it a practise not to handle any except those in which he has undoubted confidence. Each of the branches is as well stocked in quality as the main store, though not as heavily in quantity, the purpose being to give the dealers of the section the benefit of the Miller purchasing methods and resources.

MORE SPACE AT CHICAGO.

General Manager Miles Secures Wilson Building for Overflow Department.

Many belated applicants for space at the 1913 Chicago automobile show, who have been greatly disappointed because of the lack of room in the Coliseum, Annex and First Regiment armory during either the first or second week of the display, have been given an unexpected opportunity to make exhibit.. General Manager Samuel A. Miles of the National Association of Automobile Manufacturers, under whose direction the show will be held, announces that he has acquired the Wilson building, adjoining the Annex on the south, and practically the same in size. The floors are free of all obstructions and will make an admirable addition to the display room heretofore secured.

Plans for the decorative scheme for the show have been completed, and the effect will be entirely different from any previous show of this character in America. Cathedral glass and stained windows will play a prominent part in the treatment. The pleasure vehicle section will be held Feb. 1-8 and the commercial car section, Feb. 10-15. The list of exhibitors as reported recently indicates the following: Pleasure cars. 102; business vehicles, 77; accessory concerns, 244.

VAUGHAN COMPANY INCORPORATED.

Expected to Take Over Kingston Plant for Production of Vaughan Cars.

The Vaughan Motor Car Company has been incorporated in New York State and is expected to take over the plant and equipment of the Woods Manufacturing Company, Kingston, N. Y., and to continue the manufacture of the Vaughan cars. The capital of the new concern is $1,000,000. It is proposed to manufacture 500 machines in 1913.

The new company will have $300,000 of cumulative preferred stock and $700,000 of common stock. Thus far no announcement of the personnel of the company has been made, or of the definite plans of the concern beyond the brief statement above outlined. The news of its formation is all the information offered to the public at this time.

SELF-VULCANIZING PATCHES.

Security Company's Product Held to Facilitate Repairs to Inner Tubes.

The Security Company, 14 Shingiss street, Pittsburg, Penn., is marketing the Security self-vulcanizing patches which make it possible to repair punctured or blown-out inner tubes without any equipment other than a little gasoline for cleaning the tube.

The patches are prepared with a self-vulcanizing coating over which is placed a protective cover. When a patch is to be employed the tube is cleaned with gasoline, the cover to the patch displaced and the self-vulcanizing surface moistened with a little of the fuel. The patch is then applied in the usual manner and the company states that the best test of sticking qualities is to try to remove it after a few miles of service.

The patches are made of red Para rubber, molded to a feather edge and coated as stated. Each cover is provided with an improved ear member for making easy the work of removal. The patches come in sets of 15, in a screw top box, and are inexpensive.

The company also manufactures patches for motorcycles and these are put up in a strong, indestructible rope paper, string fastening envelopes, making for convenience in storing on the machine. Full information will be forwarded upon request.

PRESENTED WITH LOVING CUP.

Flint Friends of President Nash of General Motors Company Testify to Their Esteem.

C. W. Nash, the newly elected president of the General Motors Company, to succeed Thomas Neal, resigned, was presented with a loving cup by his friends in Flint, Mich., where he has been general manager of the Buick Motor Company the past two years, at a recent banquet given by the Flint Board of Commerce. The event was attended by 200 men, including guests from New York, Chicago and other metropolitan centres.

The speakers reviewed Mr. Nash's career from the farm to his present position and testified to the esteem in which he is held by his business associates. A few days later Mr. Nash was the guest of honor at a banquet in Detroit, given by the officers of the General Motors Company.

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. JANUARY, 1913. No. 9.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Entered as second class matter Dec. 30, 1911, at the postoffice at Pawtucket, R. I., under the Act of March 3, 1879.

BILL GIVES BROAD POWER.

Among the first bills to be filed with the Massachusetts legislature at the present session was one introduced by Representative Fred P. Greenwood of Everett, which provides that a person convicted of operating an automobile while under the influence of liquor shall be liable to imprisonment for not less than 30 days nor more than one year, and shall forfeit his license forever. There does not appear to be any special provision for the first offense.

Representative Greenwood also has introduced a bill prohibiting the use of a device upon automobiles by which the operator may shut off the tail light without leaving his seat.

CALIFORNIA'S PROPOSED LAW.

The Automobile Club of California is taking deep interest in the bill introduced into the legislature of that state by Assemblyman Milton L. Schmitt of San Francisco, who hopes the commonwealth will benefit to the extent of $500,000 a year in license fees, etc. At present the registration fee in California is merely nominal.

The Schmitt bill provides the following schedule of fees: Cars of 25 horsepower and less, $5; 25-35, $10; 35-50, $15; more than 50, $20; motorcycles, $2; commercial vehicles, $5. Vehicles, other than those used exclusively for commercial purposes, licensed for more than four consecutive fiscal years, are thereafter to be registered at one-half fees.

A similar bill failed to meet the approval of the governor last year. Motorists objected to its provisions because old cars were compelled to pay the same fees as new ones. It would appear that an attempt were made to cover this point in the four-year clause and copies of the bill are being sent to owners in an effort to secure their approval of it.

AMENDMENTS IN TEXAS.

At a recent meeting of the Dallas Automobile Club, Dallas, Tex., all the representatives-elect in the county were present to discuss, with some 75 members of the organization, proposed amendments to the motoring law of that state. The subject of good roads legislation also was brought up. The amendments provide as follows:

1—To make the use of a motor vehicle on a public highway without the consent of the owner a crime punishable by imprisonment for not less than one year nor more than seven years.

2—That vehicles using the public highway after dark shall display a light of sufficient character to make them known at a distance of 200 feet, front and rear.

LIGHTS IN NEW JERSEY.

The statutes of New Jersey provide that "every vehicle drawn by horse, horses or other beasts shall carry during the period of 30 minutes after sunset and 30 minutes before sunrise, and whenever fog renders it impossible to see a long distance, at least one lighted lamp, which said light shall be of such nature and so displayed that it may be seen both from a point at least 250 feet in the direction towards which the vehicle is proceeding and from a point at least 250 feet in the direction from which the vehicle is proceeding." Of course, every automobile is required to carry at least two lighted lamps, similarly visible, during the same period.

A recent decision in the courts of Camden county will prove of interest to motorists and others. The night of March 29, 1912, a motorman of a trolley car ran into a truck wagon, completely demolishing it, killing one of the occupants and injuring the other. In the trial for manslaughter, the motorman and conductor set up that no light was displayed on the rear of the wagon. This defense proved sufficient for the jury, and the car crew was acquitted. Whether or not this interpretation of the law would apply in the case of an automobile which accidentally ran down an unlighted vehicle in New Jersey may be open to question, but the decision is bound to have its effect upon future legal actions in that commonwealth.

Mechanical Pointers *for* Garagemen *and* Repairmen

FIGURING AREAS OF CIRCLES.

In rebuilding cars, such as changing a touring machine into a roadster, for instance, the repairman is required to calculate the areas or circumferences of circles when planning the fuel tank, etc. Usually the tinsmith is called upon to give capacities for given dimensions and after having obtained these the owner decides that he will fit a tank carrying a larger supply of fuel, necessitating another visit to the tinsmith.

To obtain the capacities the area of a cylinder of a tank multiplied by its length gives its volume or capacity. To ascertain the circumference of a circle multiply the diameter by 3.1416. This is the constant which is denoted by the Greek letter π (pronounced "pi" like "pie.") The circumference of a circle 34 inches in diameter is secured as follows: 34x3.1416=106.81 inches. For instance: A car having 34-inch tires will travel 106.81 inches to complete one revolution of the wheel.

To find the area of a circle from its diameter, multiply the square of the diameter by one-quarter of the constant π. One-fourth of 3.1416 is .7854. If D represents the diameter, the area equals D^2x.7854, or area equals DxDx.7854.

The area of the head of a piston five inches in diameter is ascertained as follows: 5x5x.7854=19.635, and the piston displacement of a cylinder of that bore is 19.635xstroke. Assuming that the stroke is five inches the piston displacement would be 19.635x5=98.175 cubic inches for one cylinder.

To obtain the piston displacement of multiple-cylinder motors multiply that of one by the total number of cylinders. For example: The piston displacement of one cylinder having a five-inch bore and stroke is 98.175 cubic inches and that of a four-cylinder motor would be 4x98.175=392.7 cubic inches. Cylinders of different sizes may be figured similarly.

An accompanying table gives the circumferences and areas of circles of varying diameters from .015625 inch to 13.5 inches inclusive. To employ the table: Find in the first, fourth, seventh or 10th columns the diameter in inches of the circle, the circumference or area of which

CIRCUMFERENCES AND AREAS OF CIRCLES

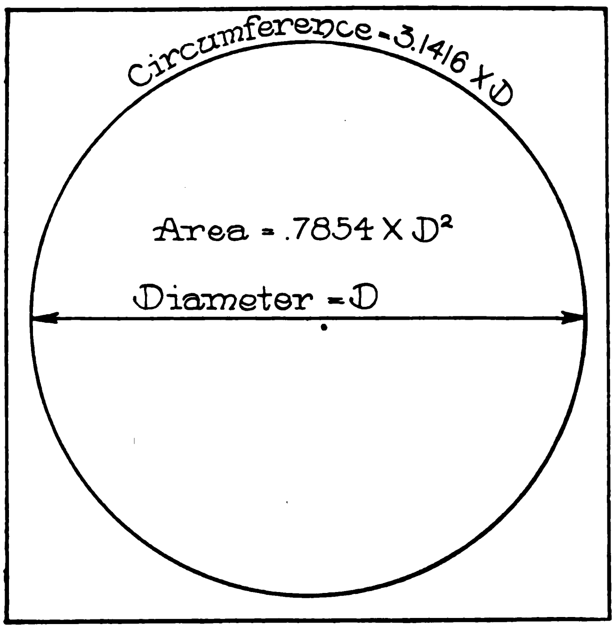
is desired. Opposite the diameter in the next column will be noted the circumference of the circle of that diameter, and in the next column to the right will be found the area of that circle.

For example: It is desired to find the circumference and area of a circle five inches in diameter. The column diameter is located in the table and the figure five found. Opposite it is given in the circumference column the circumference which is 15.708. Another column is marked area and that of a five-inch diameter circle is 19.635, in square inches. Having obtained the area in square inches it is an easy matter to ascertain the piston displacement by multiplying the area by the stroke, five inches. For example, 19.635x5=98.175 cubic inches for one cylinder. For four cylinders it would be 98.175x4=392.7.

It will be noted that circumferences and areas of circles up to 27 inches in diameter may be secured from the table, though only those up to 13.5 inches diameter are given. For circles between 13.5 and 27 inches diameter, divide the diameter by two and multiply the corresponding circumference by two and the corresponding area by four. For instance: The diameter of the circle is 20 inches. This divided by two equals 10, the circumference of which is 31.416. This multiplied by two gives 62.92, the area of which is 78.54. This multiplied by four equals 314.16, the area desired.



Illustrating the Measurement of Circles to Obtain Areas, Etc.

PREVENTING RUBBER HOSE KINKS.

With the modern automobile the repairman does not experience any difficulty in replacng worn rubber water tubing with new as the connections are usually free from serious bends. On some types of old motors, however, the hose must be carried in such manner that a heavy grade tubing, having thick walls, must be employed else the pipe will kink badly and impede the circulation of water. Fitting the hose is a difficult task and to make the connections watertight is also troublesome.

A light tubing may be employed and in addition to being easier to handle is cheaper. It is interesting to note that the rubber manufacturers are marketing a durable light hose for this work and if it has a tendency to kink it may be prevented by using a coil of spring wire, a method which is utilized on locomotives.

It consists of winding and inserting within the hose the coil of wire which is made in the following manner: Take a piece of round metal, a pipe or iron member, about .25 inch smaller in diameter than the inside diameter of the hose. Cut a small slot in the end of the winding member and in the recess secure one end of the wire then wind it by retaining the rod member in the vise. The rubber tubing is then slipped over the wound spring, the latter released and the rod withdrawn. The coils will expand, filling the hose and will prevent its kinking. The gauge of wire employed should be stiff enough to withstand bending, depending upon the service of the rubber hose.

BENT FAN BLADES CAUSE HEAT.

There are a number of conditions which will cause heating of the motor, but a new one is pointed out by a driver of a commercial car who cares for his own machine. The motor became very warm, especially when operating on the low gear, and thinking perhaps that the pump was not working properly or the water pipes were clogged, these members were examined, but found to be in good condition. Various other inspections were made without discovering the cause of trouble. In lifting the hood the operator noted that the volume of air forced back from the fan was very small and an examination of the fan disclosed the fact that the blades were so bent that they were of little service. The pitch of the vanes was changed and after a little experimenting they performed their work properly and the heating symptoms disappeared.

LIGHTING THE WASHSTAND.

The lighting facilities of some garages are very poor insofar as the washstand is concerned and when the latter is installed after the building has been wired for electricity, the washer experiences difficulty in securing sufficient illumination. While lamps of the overhead type are generally satisfactory they do not light up the wheels and sides of the machine and frequently the discriminating owner is heard to complain that his automobile was only half washed.

A proprietor of a garage who installed a washstand on the main floor contrived the lighting board shown at Fig. 1 A. As a result his washer is provided with ample light and has no opportunity to make excuses if complaints are received relative to his work.

The panel was constructed easily, the material being two smooth boards about five feet long, six or seven inches wide and .625 inch thick, although these dimensions may be altered to suit convenience of stock and location. The boards were joined as indicated at B. Lamp sockets were attached and wired and the interior of the panel was coated with white enamel paint, which formed a good reflector.

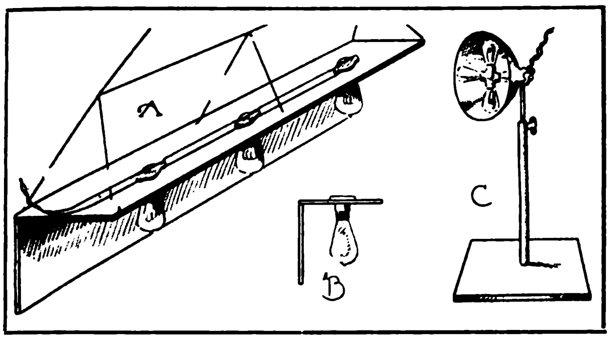


Fig. 1—Inexpensive and Easily Constructed Lighting Panel for the Washstand: A, Showing Method of Suspension; B, End View of Panel; C, Adjustable Stand Constructed from Music Rack.

Two of these panels were made, one for either side of the machine, and they were fitted with suitable rope and pulleys so that they could be raised to the ceiling when not being utilized and lowered when washing was to be done. As the members were adjustable to any desired height the running gear was as well lighted as the body, enabling the workman to perform his work satisfactorily.

At C is presented a suggestion for a lighting stand. It comprises an old music rack, having an adjustable rod to which is secured a reflector which could be of such size as to permit of the use of a group of four lamps. The rack could be mounted upon a wooden base and with a sufficient length of flexible cord and connecting plug, the device could be moved to any desired position. The design is similar to the side lights utilized upon the stage. Such an arrangement should prove of value in the repair shop where considerable overhauling has to be done at night.

BUSHING VALVE GUIDES.

One of the sources of auxiliary air is the valve guides. When provision is not made for replacing the worn bushings with new ones and the guides are integral with the cylinder casting the repairman is called upon to either bush the parts or true the opening, make and fit new valve stems. The amount of wear, cost, etc., would have to be considered, of course.

Steel tubing may be procured in varying inside and outside diameters for bushings and with a four-cylinder car eight bushings will be required, the measurements depending upon the design of the motor. Assuming that the inside diameter of the bushing when finished should be .375 inch, the diameter of the valve stem, the walls of the bushing should be approximately .0625 inch thick, outside diameter totalling .5 inch.

As the opening of the tubing is not always concentric with the outside diameter, before drilling or reaming out the bushings in the cylinders it is advisable to true up the bushings. This may be accomplished by placing on an arbor of the lathe and skimming off a trifle from the outside of the tube.

Previous to fitting the bushings to the cylinders a jig should be constructed so that an accurate hole may be assured when drilling or reaming. The jig may be made fitting a bushing to the opening of the spark plug cap as shown at Fig. 2. The bushing should be threaded to fit the opening as shown in the sketch, and should have an inside diameter equal to that of the hole to be drilled or reamed for the reception of the tube bushing. This will insure that the holes drilled or reamed will be accurate.

When the work of preparing the openings has been completed, the bushings should be inserted, making a drive fit so that the walls of the tubing will be compressed slightly, permitting of reaming or drilling for accuracy and for a close fit of the valve stems.

For drilling the tubes another bushing will be needed and it should fit inside the threaded member as illustrated. Before employing the spark plug cap make sure that its hole is concentrically accurate, and if not a special cap will have to be made if a good job is to be secured.

After the bushings have been drilled and the valve stems fitted properly, the former will have to be secured in place. This may be accomplished by drilling a small hole, .125 or .1875 inch, through the guide and into the bushing. The point of the drill should just enter the wall of the tubing and the recess should be just deep enough so that the screw will grip easily.

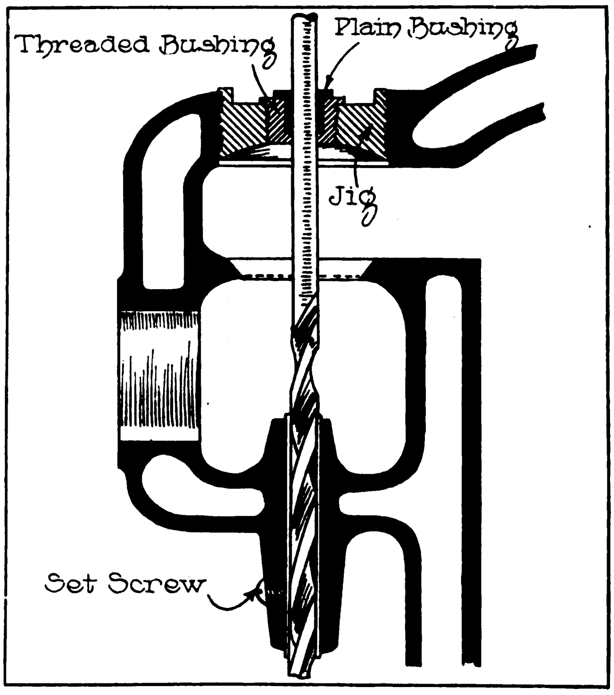

Fig. 2—Rebushing Worn Valve Guides with Standard Steel Tubing.

The thread must be such that it will grip the screw firmly and the latter should have a taper point. Care should be exercised that in screwing up the retaining member its point does not crush the walls of the bushing, which are thin.

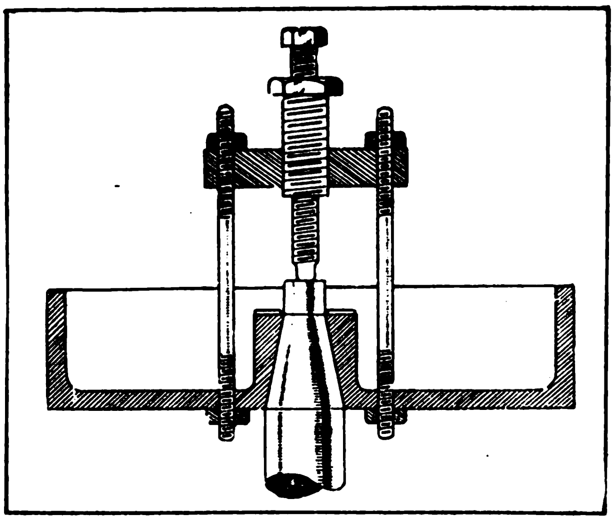

Fig. 3—An Extractor Tool Employing Two Different Pitches of Threads to Exert Leverage.

AN EXTRACTOR TOOL.

An extractor tool, the principle of which is of interest, in that the manner of exerting energy is by a difference in the pitch of the threads of two bolts, is illustrated at Fig. 3, the design being contributed by a mechanic to Motor Traction, a foreign publication. The workman utilized the tool for removing a brake drum which had been driven into position and which resisted the application of ordinary tools.

The tool consists of a plate of mild steel, .75 by two inches, and is tapped out to take a .75-inch bolt about two inches long. The bolt is drilled out and tapped to take a .4375-inch bolt, four inches long. Two holes are drilled in the plate, near its ends, and two pieces of .5-inch mild stud steel, four nuts and a few washers complete the device.

The sketch shows its application, the .4375-inch centre bolt touching the shaft. This is held with a wrench to prevent turning while the smaller member is actuated by another wrench. The difference in the pitch of the two bolts is held responsible for the force exerted.

A CHUCK BUSHING DEVICE.

A device for adapting a three-jaw chuck to take a number of long bushings when the latter are to be ground on the inside is illustrated at Fig. 4. It is serviceable when the grinder must pass through the bushings, calling for a clearance between the end of the work and the face of the chuck.

Three equi-distant spaces are marked off on the chuck and holes drilled through. Three pins are then turned to the shape shown in the sketch. The ends of the pins are threaded to take retaining nuts, and the pins also are drilled and tapped at the other end to take the screw members holding the work.

When these auxiliary jaws are utilized, the bushing is centred in the usual manner, and the steady screws adjusted to the work. If necessary, and where great accuracy is required, lock nuts may be fitted to the set screws. The device may also be utilized in boring long bushings, and extra screws could be made for different work. Jaw chucks having T slots are applicable to this method, but specially shaped T ends would be necessary for the steadying members.

HOME MADE ELECTRO-MAGNET.

While electro-magnets may be purchased for picking up nuts, cotter pins, etc., which fall in places not reached easily by the hand, one of these devices may be made easily by taking the magnets of an old bell and fitting them to a piece of .375-inch iron rod. The free ends of the wires are connected to a six-volt storage battery or a group of dry cells and when the circuit is closed the magnets will attract and hold small pieces of metal that fall into the crankcase, transmission, etc., frequently saving the work of disassembling the part to remove the piece.

BUSHING SPRING SHACKLES.

With the increasing number of commercial cars the progressive proprietor of the repair shop is formulating plans for handling the business vehicle. The spring shackles and bolts are subject to wear, the latter very often wearing oval holes in the shackle and bracket. When such is the case a repair may be completed by fitting a case hardened bushing, provided there is metal enough round the hole, and the new bolt should also be case hardened.

Before hardening, however, a hole should be drilled through the bolt, and another opening made diametrically to meet it. The longitudinal hole should be tapped to take a grease cup, and a flat filed upon the bolt at the point where the other hole is drilled. This will insure proper lubrication of the parts.

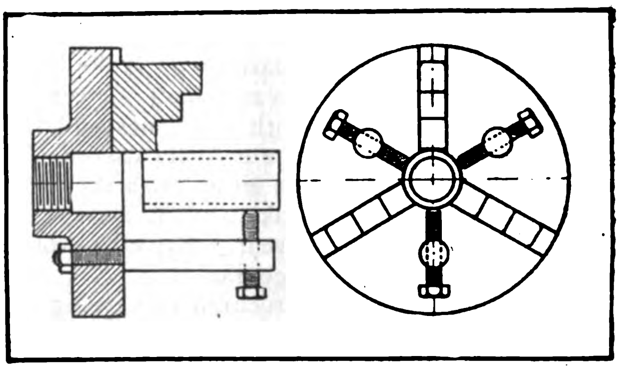

Fig. 4—A Device Applicable to the Chuck When Bushings Are to Be Ground or Bored.

CORRESPONDENCE WITH THE READER.

Cylinder Castings.

(125)—In reading the descriptions of motors in your valuable magazine I notice they state that "the cylinders are of a special gray iron." What is the composition of these cylinders; that is, the materials? CURIOUS.

Richmond, Ind., Jan. 17.

By a special gray iron is meant its characteristics. In the manufacture of cast iron, derived from pig iron, the latter is graded, the most satisfactory method being that of chemical analysis. The following specifications for cylinder castings are those employed by a leading motor car manufacturer:

		Per Cent.
Silicon		1.25 to 1.60
Sulphur	less than	0.11
Phosphorus		0.50 to 0.80
Manganese		0.50 to 0.80
Combined carbon	over	0.40
Graphitic carbon	under	3.00

Kent gives the following formula for automobile cylinders:

	Per Cent.
Total carbon	3.17
Graphitic carbon	2.72
Combined carbon	0.45
Silicon	1.99
Manganese	0.39
Phosphorus	0.65
Sulphur	0.13

Carbon exists in three states in cast iron, namely: Combined carbon, which has the property of making iron white and hard graphitic carbon or graphite, which is not alloyed with the iron, but exists in it as a separate body, since it may be removed from the fractured surface of pig iron by a brush; and a third form, called by Lederbur "tempering graphite carbon," into which combined carbon may be changed by prolonged heating.

Combined carbon increases hardness, brittleness and shrinkage. Up to about 1 per cent. it increases strength, then decreases it. The presence of sulphur tends to increase the combined carbon in a casting, while silicon tends to change combined carbon to graphitic carbon.

Graphitic carbon in a casting causes softness and weakness when above 3 per cent., and softness and strength when added to irons low in graphitic carbon and over 1 per cent. in combined carbons. It increases with the size of the casting, with slow cooling, or rather with holding in the mold a long time at a high temperature.

Silicon acts as a softener, by counteracting the hardening effect of sulphur, by changing combined carbon into graphitic carbon; changes white iron into gray; increases fluidity and lessens shrinkage. The softening effect of silicon is modified by sulphur and manganese.

Sulphur causes the carbon to take the form of combined carbon, increases hardness, brittleness and shrinkage, and also has a weakening effect of its own. Manganese in a small amount, less than .05 per cent., counteracts the hardening influence of sulphur. In larger quantities it changes graphitic carbon into combined carbon, and acts as a hardener. Above 2 per cent. it makes iron very hard. Manganese combines with iron in almost all proportions.

Phosphorus increases fluidity, and is therefore valuable for thin and ornamental castings in which strength is not needed. It increases softness and decreases shrinkage.

Piston Ring Construction.

(126)—I note in your publication that reference is made to the piston rings as being cut concentric and eccentric and that emphasis is laid upon the method of finishing and fitting. What is the difference between the two types and what are the advantages of either, if any?

D. R. W.

Los Angeles, Cal., Dec. 26.

In the early days of motoring the maker did not give the same attention to the manufacture and fitting of piston rings as at present and during recent years these members have been perfected. They are without doubt one of the most important components of the motor, as poorly fitting rings result in the cylinder walls wearing oval, lost compression and heating of the engine, to say nothing of ignition troubles due to the lubricant leaking past the rings and fouling the spark plugs.

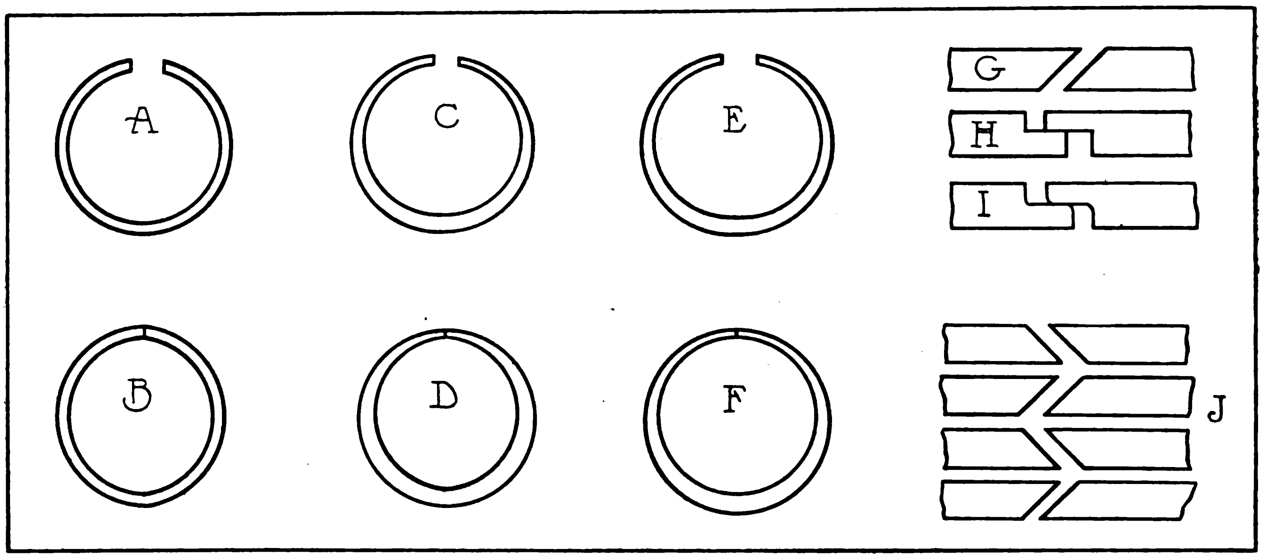
It is a generally accepted idea that if a ring be turned concentric inside and out and then split, the outward pressure on the cylinder walls, when the ring is closed and in its place, will not radiate from the centre. This is demonstrated in the accompanying illustration at A and B, showing the ring open and closed, respectively. It will be noted that with this design there are three bearing points, on either side of the split and at the lowest extremity of the circle.

Such a type would not be practical for service in a cylinder, so the ring is made thicker in the first instance and then turned to a true circle after being closed at the gap, thus giving a full bearing surface all around its circumference. Before doing, this, however, some manufacturers make it a practise to turn out the inner periphery of the ring eccentric to the outer, in order to equalize the pressures at all points of the ring. This is depicted at C and D.

A ring of the eccentric type is shown at E and F and costs but slightly more to manufacture than the type previously described. It is turned to a perfectly true circle inside and out with the gap closed, the outer circle being eccentric to the inner. By referring to F it will be noted that not only are the pressures even on all parts of the ring, but less pressure is required to make it gas tight. It is held that there is less uneven wear of the cylinder walls, less heat developed and greater efficiency of the motor.

Relative to joining the rings there are various methods, some of which are illustrated at G, H and I. That at G consists of a diagonal cut across the face. There is a tendency of this type to rotate in the direction opposite to that in which the lower diagonals point, and some make it a practise to cut every other ring in the opposite direction to its neighbor, as is shown at J.

Another method is to step the rings as indicated at H, while that at I depicts the plan of leaving a radius of metal at the root of the step. An important factor in rings is the accuracy of the fit in the groove. Manufacturers today pay especial attention to the construction and fitting rings, accounting for efficiency of modern motors.



Outlining Piston Ring Construction: A, Concentric Type, Open; B, Closed; C, Eccentric, Open; D, Same Closed; E and F, Eccentric Ring Finished to True Circles Inside and Out; G, H and I, Showing Different Steps; J, Diagonally Cut Rings Arranged Oppositely.

Melting Point of Aluminum.

(127)—Will you please advise me if there is any way of melting aluminum at home? I have tried it on the gas stove with an iron pot. The latter turned red hot, but the aluminum did not melt. PERRY.
Fall River, Mass., Dec. 26.

The melting point of aluminum is 1215 degrees Fahrenheit and this temperature cannot be obtained with an ordinary gas stove. If a casting is desired it should be made in either a dry or "green" sand mold, or in metal "chills." The metal should be melted in plumbago crucibles and not heated beyond its molten point, 1215 degrees Fahrenheit. It also must be poured with care, owing to the absorption of occluded gases and air. Melting aluminum as suggested would involve a furnace capable of developing the proper heat and it is advisable to have the work done at a foundry having equipment for handling the metal. The work would be more satisfactory and less expensive than if it were performed at home.

Fitting Pistons to Cylinders.

(128)—I have a two-cylinder, two-cycle motor and am overhauling it and replacing worn parts. I should like to make a new piston and would like to have your opinion as to how much clearance to allow between the piston and the walls of the cylinder. Also please inform me how strong a motor I would require for a three-ton truck? I want to buy an old automobile with the intention of rebuilding it.

JOSEPH FRANZ.

Brooklyn, N. Y., Dec. 28.

The usual clearance is about .001 inch, although there is a difference of opinion. Much depends upon the cooling efficiency, and as to whether the engine is air or water-cooled. Less than .001 inch has been used with success, but more is common practise. Before fitting a new piston it would be advisable to examine the cylinder to ascertain whether or not it is true. If not it should be rebored as fitting a new piston to a cylinder worn out of true will not warrant the expense involved.

Relative to the proper size motor to employ with a three-ton truck there are a number of conditions to be considered. The list of the three-ton models shows that 40 and 45 horsepowers predominate, although this is not the average, being merely a hasty summary of vehicles listed last season. There are a number of machines equipped with motors rated at from 30 to 40, and it should be borne in mind that the ratings are those given by the manufacturer in the majority of cases, not the S. A. E.

The motor size may be determined from different working conditions, assuming any of the prospective load and tractive resistances as basic in the figuring. The motor should be small enough to render reliable service when the run of the empty vehicle covers good level roads and the desired speed is obtained with the highest ratio in the drive, whereby the engine itself remains within the prescribed economical limits of speed and throttle opening. On the other hand, the motor must be sufficiently strong to propel the loaded machine under average road conditions as expected in service and to maintain the speed found to be most advantageous.

Any increase above a certain limit of tractive resistance, due to changes in the load, the road, etc., will be taken care of by introducing a greater ratio in the drive, retaining the economical motor speed and torque. The greatest ratio ought to be sufficient to make the vehicle negotiate the worst kind of roads to be met in service upon grades at a given slow speed and with a considerable load.

To illustrate the suggested method of selecting the motor for a commercial car, an example is given of a machine of three tons carrying capacity and weighing empty three tons. The tractive resistance when this truck passes empty over a level asphalt road can be assumed at 20 pounds a ton of weight propelled or 60 pounds total. With the driving wheels 36 inches in diameter the combined driving torque is 60x18=1080 lb.-in. For a given type of vehicle the mechanical efficiency in the drive between the motor and the wheels is held to be about 65 per cent. The highest speed ratio in this drive would be found by comparing the desired vehicle speed at this moment with the motor revolutions a minute corresponding to the upper limit set by its fuel consumption requirements with the throttle partially closed.

When the runs are only occasional and for a short time, higher motor revolutions a minute may be selected, followed with increased or reduced ratio in the drive. The latter is held by some to be desirable in that it brings the gear ratio closer to the ratio used for average running conditions, thus reducing the number of gear changes required.

The determined developed torque capacity of the prospective motor should be checked as to the power and speed requirements for average service conditions comprising the most frequent runs with usual loads. When service conditions require great promptness, a more powerful motor may be utilized. As previously stated the nature of the hauls, road conditions, etc., are factors to be considered.

Relative to rebuilding an old automobile into a three-ton truck, it is a question as whether the time and expense involved would warrant the work. Many components would have to be altered and possibly the work would involve the making of special parts which would not only be expensive, but would cause delay in replacement in the event of accident. The writer is of the opinion that it would be far more economical to purchase a machine constructed especially for the work intended. It should also be borne in mind that efficiency and durability are important factors in motor transportation and that the value of a truck depends largely upon reliability in that it is a saver of time.

Wattage of Lamps.

(129)—Will you kindly explain how to find the number of watts consumed in an electrical circuit, such as lamps? ELECTRIC.
Cleveland, O., Jan. 3.

To find the watts consumed in a given electrical circuit, such as a lamp, multiply the volts by the amperes.

Mufflers and Power Loss.

(130)—I noticed in your book that with the use of a cut-out on the muffler, either open or closed, the power of the engine was not affected. Another publication states that there is a loss of power with a muffler closed. Which is right? INFORMATION.
New Haven, Conn., Jan. 16.

The article referred to dealt with a particular test the result of which showed that with a properly designed muffler and with no cut-out open, the loss of energy was very small, so much so that it would appear that no material benefit were derived with the utilization of the cut-out. On the other hand tests conducted by another laboratory developed a loss varying from 1.3 horsepower to 2.5 with 600 to 1300 revolutions.

There is no doubt that there is a slight loss which will be augmented with a poorly designed muffler or one that is choked with carbon, etc. There is a growing tendency to discourage the use of cut-outs and in many cities ordinances are in vogue prohibiting their utilization. There is no reason why the motor should not deliver its maximum efficiency with a muffler, provided the latter is well designed and free from obstructions.

From the Passenger's Viewpoint.

(131)—I frequently see in your publication, remarks especially for chauffeurs, and concluded that through this same channel I could reach the attention of men who are driving just for the weekly stipend without any thought for the comfort of the passengers. They seem to think it a great feat that they have always torn around corners and thus far skillfully (?) avoided an accident. They do not seem to appreciate that it is to their discredit that when a passenger requests them to go slower, they set up the argument that they are not going fast, instead of immediately lowering their speed and saying nothing. While the speed probably is not fast to them, the passenger may be unusually nervous and consequently feels the momentum more than the driver. These chauffeurs are men of excellent habits and fine mechanics, but have not learned the value of self-effacement. AN OLD SUBSCRIBER.
Boston, Jan. 11.

RESTRICTING SLIDING UNIONS.

In the reassembly of the chassis the replacing of the fuel, oil, air and other piping is sometimes annoying because the loose part of the union will slip from the fingers and slide along the pipe to some place difficult of access. A simple kink for preventing this is to solder a ring around the pipe, thus forming a projection against which the union member will strike and stop. Care should be exercised that the ring is so placed that it will not prevent the fitting of the two parts.

TOOL BOARD NEAR LATHE.

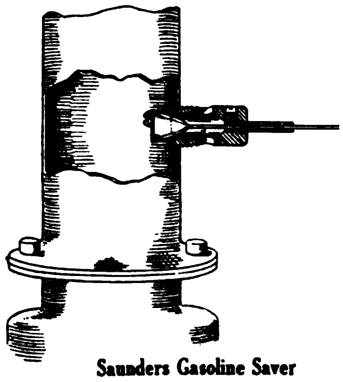
In performing work with the lathe some workmen lose time because the tools required in conjunction with its operation are not handy. In large machine shops boards are employed for keeping the different tools. One of these members is constructed easily of wood, and hangers or studs for supporting the tools may be made from metal pegs. If desired the board may be provided with a list of the tools pasted thereon, making each man responsible for the return of the tools issued him.

Motorists who use the Bergen turnpike in New York State will be able to do so at less cost now, as the public service corporation which controls the road, has reduced the toll fees. There are four gates on the road and the price was formerly five cents at each gate. Hereafter for cars carrying no more than two persons the charge is to be one cent at each gate, and for those with more than two persons two cents.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

The Saunders Gasoline Saver, manufactured by the Leslie R. Saunders Company, Los Angeles, Cal., as the name implies, is designed to make for economy of fuel. The principle involved is that of diluting a rich mixture by introducing auxiliary air into the intake manifold above the carburetor. The pipe is tapped and threaded to take the air regulator valve which is provided with air passages, but these are controlled by a taper plunger actuated by a flexible cable. The latter is led to the steering column where a control switch member is installed, permitting the driver to change the position of the taper plunger, thereby increasing or decreasing the amount of atmosphere admitted. This arrangement, the maker holds, economizes fuel and increases the efficiency of the motor.



Saunders Gasoline Saver

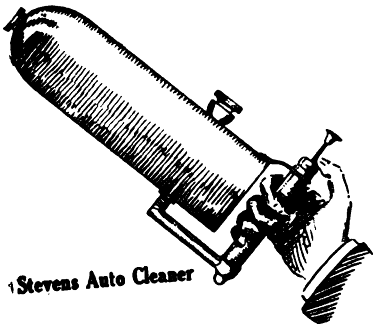
The Stevens Auto Cleaner is the product of the Stevens Manufacturing & Supply Company, 1223 Wabash avenue, Chicago. It is a compact device operated on the compressed air principle and is designed to produce a fine spray or a dynamic stream of gasoline, kerosene or other cleansing fluid. The handle forms the plunger pump, a few strokes of which develops sufficient pressure for the entire contents of the vessel. Although constructed for removing grease and dirt from the automobile, it may be employed for cleansing clothing.



Stevens Auto Cleaner

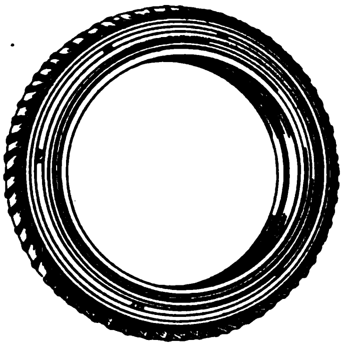
Ferromatic Tires are the product of the Ferromatic Tire & Manufacturing Company, Cleveland, O. They are designed to fit any standard type of wheel utilizing quick detachable or clincher rims, also some designs of demountable rims. A solid rubber tread is fitted over a metal shell and diagonally placed steel springs replace the usual compressed air of the inner tube. The device is secured to the felloe of the automobile wheel by a channel member. The sides of the outer shell lap over those of the channel section and water and dirt are eliminated by leather packing rings. The springs are placed tangently to the felloe of the wheel and are so constructed that they never act in tension.



Ferromatic Tire

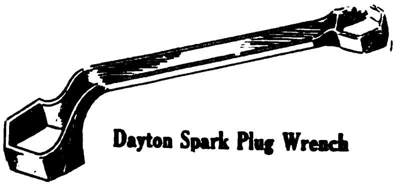
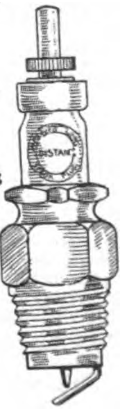
The Dayton Spark Plug Wrench, manufactured by the Dayton Malleable Iron Company, Dayton, O., is designed for service where the ordinary straight handled tool cannot be employed successfully, the shape of the tool being such that it is possible to reach and loosen spark plugs and nuts located in recessed sections. A quality of the wrench is that it will fit either .875 or 1.125-inch plugs and its long handle makes it possible to exert considerable leverage. The tool is made either in nickel or Japan finish.



Dayton Spark Plug Wrench

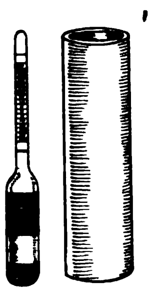
—— ★ ——

The Long Distance Spark Plug, marketed by the Long Distance Spark Plug Company, 212 South Illinois street, Indianapolis, Ind., is designed to withstand severe service and among its qualities is the construction of the porcelain and terminal. The former is provided with a rounded shoulder around which is fitted an expanding metal thimble which is compressed by a bushing, making for a gas tight joint, as well as preventing opportunity of blow-outs. The terminal screws onto the electrode, permitted the use of connections of the closed end type, and the exterior of the plug terminal is recessed, allowing the fitting of the clip connectors. The plug is put upon the market with a very liberal guarantee.



Long Distance Spark Plug

The Kno-Freeze-Meter is marketed by C. J. Tagliabue Instrument Manufacturing Company, 396 Broadway, New York City, and is designed especially for testing anti-freezing solutions in which alcohol is employed. The meter is provided with a graduated scale, indicating the different temperatures of the solution, and to use the device a little fluid is drawn from the radiator in a special glass jar. The meter is then floated and the scale indicates the temperature at which the mixture will freeze. A box is provided for carrying the meter and jar.



Kno-Freeze-Meter

Tirenew is manufactured by the National Rubber Company, Inc., 4414 Papin street, St. Louis, Mo., and is a coating for automobile, motorcycle and bicycle tires. The maker states that the base of the composition is pure Para rubber and that being in liquid form it is applied easily to the exterior of the shoe after the latter has been cleaned. It also is pointed out that not only does the preparation preserve the rubber, but the appearance of the tire is improved by its use.

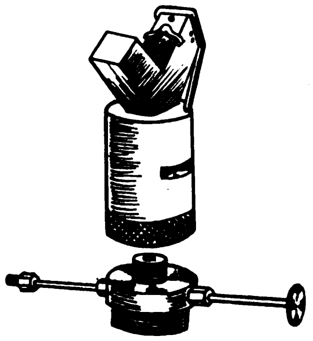
The Advance Adapter and dashboard regulator is a new product of the Advance Motor Specialties Company, 508 South Dearborn street, Chicago. The complete outfit comprises a dashboard regulator of acetylene and adapters for the kerosene lamps. The latter screw into the oil members in place of wicks, which are carried in the tool box for emergency. The company points out that this arrangement provides for kerosene, gas and electric lights in the side and tail lamps. All lamps fitted with the acetylene adapter are lighted by a spark, and gas is conducted to the burners by small tubing with solderless joint connections. Each adapter is fitted with a needle valve for regulating the flame or shutting off the supply of gas which is lighted by pushing a button. The regulator handle of the dashboard equipment is removable, locking the device, and the sparking tips of the burners are so designed that they cannot be injured very easily.



Advance Adapter

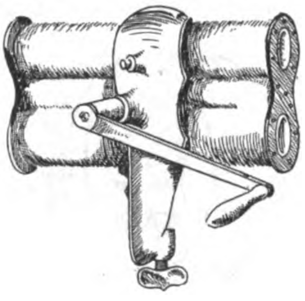
The Hawthorne Tire Pump, made by the Hawthorne Manufacturing Company, 29 Spruce street, Bridgeport, Conn., is a compact, four-cylinder unit which may be carried easily in the tool box or any other convenient place in the car. It may be attached to the running board in a few seconds by a clamp device, and the largest sized tire can be pumped up quickly. The pump is provided with four cylinders which produce a constant flow of air to the inner tube when the handle is rotated. The design of the pump is such that little exertion is required to operate it, and being constructed of high grade material it is very durable. Each equipment is provided with ample hose, enabling the inflating of all four tires without changing the position of the pump.



Hawthorne Pump

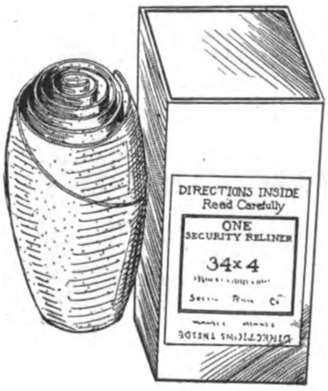
The Security Reliner, as the name implies, is a lining for casings which the maker, the Security Reliner Company, Inc., Montgomery, N. Y., states is two tires for one. It is constructed to conform to the shape of a casing and covers the entire inside, including the bead, preventing blow-outs when the shoe is rim-cut. That portion of the reliner that comes in contact with the tire is covered with a self-vulcanizing compound made by the company, and the device is attached by moistening the surface with a little gasoline. The Security reliner comes wrapped in air-tight wax paper, packed in a neat carton and may be carried easily in the car.



Security Reliner

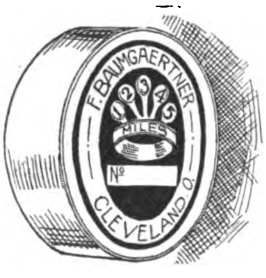
The Coronet Recorder, manufactured by F. Baumgaertner, 2344 East 105th street, Cleveland, O., is a recording device constructed in the form of a hub cap, which member it replaces upon the automobile.

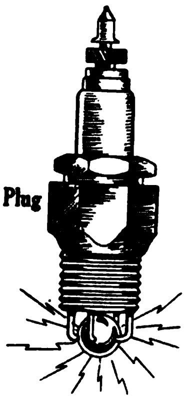
The device is self-contained, is not attached to the axle and operates on the gravity principle. The maker states that it will register the mileage covered both forward and backward up to 100,000 miles, or up to 10,000 miles, showing 10ths. It is dust and weather proof and is designed so as not to be tampered with by the operator. Its accuracy is guaranteed for two years.



Coronet Recorder

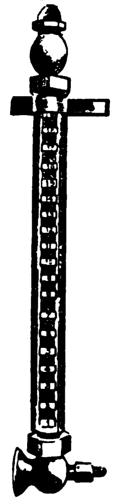
—— ★ ——

The Flash Ball Spark Plug, manufactured by the Toledo Auto Devices Company, Gardner building, Toledo, O., is novel in its design in that the central electrode terminates in a sphere or ball. The maker points out that this member acts as an accumulator of current and that the spark developed between it and the four contact points of the shell is of greater intensity than other forms of plugs. It is also stated that the ball deflects the sparks into the mixture, increasing the efficiency of the motor because a larger amount of the vapor is converted into useful energy. The plug is made in .5-inch standard, A. L. A. M. and metric threads and is moderately priced.



Flash Ball Spark Plug

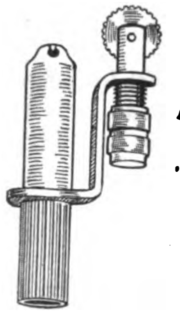
The Imperial Fuel Gauge, manufactured by the Imperial Fluid Gauge Company, Dayton, O., possesses among other qualities that of indicating the amount of gasoline in the tank, the registering device being so constructed that it may be attached on the dash in plain view of the operator or at any other convenient place. A substantial glass tube, graduated to correspond to the capacity of the fuel tank, is mounted in a metal frame. The fluid is led to the bottom of the tube through a valve, which may be closed if desired, and a float in the tube rises with the gasoline, indicating the quantity on hand. The gauge is adaptable for either gravity or compression feed systems and throughout solderless connections are utilized. Among the advantages claimed for the device are: It indicates the amount of fuel in the tank, quantity consumed by the motor, detects loss of gasoline by leaks or flooding of the carburetor and indicates the amount received when purchasing. The gauge and equipment is inexpensive.



Imperial Fluid Gauge

—— ★ ——

The Auto Gas Lighter is produced by the Auto Gas Lighting Company, Fountain City, Ind., and is used for lighting lamps employing acetylene. It comprises the burner and lighting device as a unit and replaces the ordinary member. An arm or extension of the burner carries a small wheel, which when rotated by the thumb or finger, gives off a shower of sparks in the path of the escaping gas. The igniting member is adjustable, does not interfere with the reflected light, and may be renewed from time to time. There is but one gas outlet in the burner proper. It is made both for automobile and motorcycle lamps.



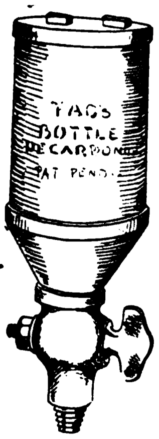
Auto Gas Lighter

—— ★ ——

Bottle Decarbonizer is the product of the Toledo Auto Devices Company, Cleveland, O., and the container holds about four ounces of a special liquid decarbonizer which is utilized when the motor is running warm. The bottle is provided with a gas tight valve, at the end of which is an adapter for screwing into the spark plug opening. The decarbonizing material is inexpensive and the maker claims that by using it regularly about every 500 miles the disassembling of the motor will not be necessary. The device is of brass, highly polished and compact.

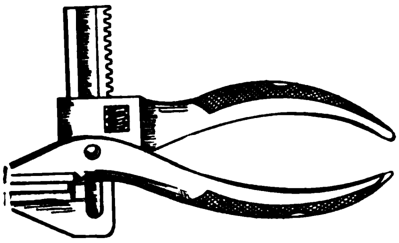
—— ★ ——

Starrett's Expansion Pliers, manufactured by the L. S. Starrett Company, Athol, Mass., will appeal to motorists who desire a tool that will perform the function of a monkey wrench and pliers when either of these tools is not practical for the work to be



Bottle Decarbonizer

performed. The Starrett device may be employed to start and loosen rusted nuts or bolts, and the jaws may be expanded to fit large sized parts. The pliers are constructed of the same high grade material for which the maker is noted.



Starrett Expansion Pliers

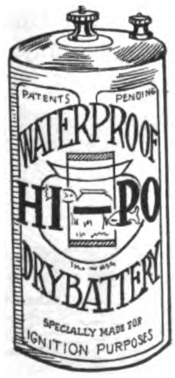
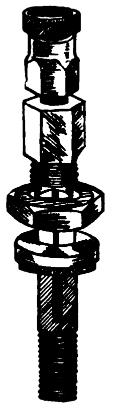
The Hi-Po Dry Cell, manufactured by the Lincoln Electric Company, 1007 Atlantic avenue, Brooklyn, N. Y., is an improvement over ordinary batteries in that it is water proof. This quality is obtained through a patented process of manufacture and one it is said that absolutely protects the cell against all outside influences, such as moisture, heat, etc. Each unit is sealed in an insulated case and the maker points out that it may be left standing in water without danger of short circuiting. Because of its construction greater efficiency and longer life is assured.

* * *

Ford Injector Bolts, produced by the Home Light Manufacturing Company, 2108 Dayton street, Chicago, are specially drilled bolts for the Model T Ford motor. They replace the four bolts which retain the cylinder head and permit the utilization of priming cups without alteration of the water jacket. They also may be employed for equipping the motor with an acetylene starting system. To install the bolts it is only necessary to drill four .375-inch holes through the inner wall of the cylinder head. The bolts are so marked that the installation is an easy matter. Lock nuts having concave washers and asbestos packings are employed, making the device gas tight. The bolts and priming cups are moderately priced.



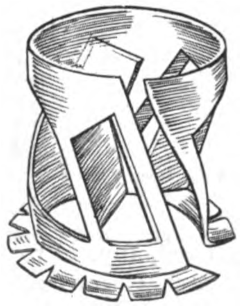
Hi-Po Dry Cell



Ford Injector Bolts

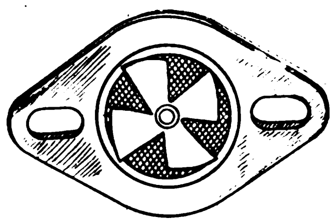
* * *

The Egyptian Mixer, is manufactured by the R. D. Loose Mixing Chamber Company, 110 North Fifth street, Springfield, Ill., and is a patented device for completing the vaporization of fuel after leaving the carburetor. It is inserted in the intake pipe between the vaporizer and the cylinders and any particles of gasoline not aerated are broken up and converted into useful vapor by the mixer. The maker claims that greater mileage is obtained upon a gallon of fuel and that the design is such that it may be attached easily to any type of induction pipe, etc.



Egyptian Mixer

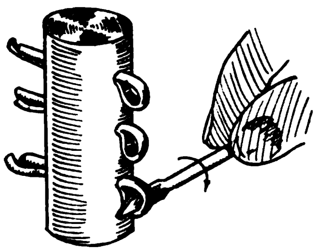
The Automizer is the product of the Automizer Manufacturing Company, Canton, O., and is designed for insertion in the intake pipe or manifold between the carburetor and the cylinders. The object of the device is to break up and convert into useful vapor any particles of fuel which have not been aerated by the vaporizer. The Automizer has no moving parts, being constructed of thin sheet metal having an aperture of the same diameter as the intake pipe which is fitted with a wire gauze. Four stationary blades are secured to the screen member and the mixture striking these projections is converted into a fine mist.



THE AUTOMIZER

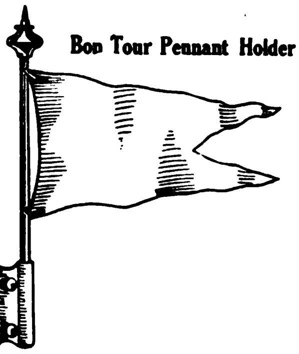
* * *

The Campbell Cotter Pin, which is being manufactured by the inventor, A. C. Campbell, Waterbury, Conn., possesses features which will appeal to the motorist and repairman as it is easily fitted and removed and may be used over again as many times as desired. It is constructed of half-round wire, but is bent in a different manner than the ordinary pins. The Campbell pin is constructed with two limbs of unequal length and has an offset eye. The tip of the long portion is bent at an angle across that of the short member so that when the pin is inserted and the eye given a blow with a hammer the tips will engage as shown in the il-



Campbell Cotter Pin

lustration, causing them to separate. The pin may be removed easily with a screw driver as twisting the eye section returns the pin to its original shape. The Campbell pins come in a nickel screw top box containing 125 assorted sizes.



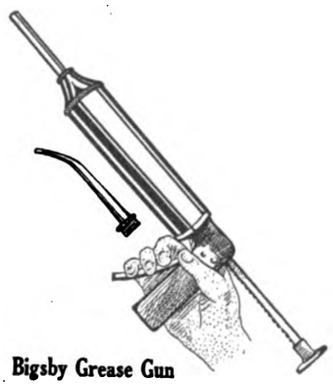
Bon Tour Pennant Holder

—— ★ ——

The Bon Tour Pennant Holder is produced by the Bon Tour Manufacturing Company, Cobleskill, N. Y., and is designed for attachment to the frame of the windshield. The retaining member is a two-part clamp adjusted by means of locking screws, a design facilitating attachment and removal. It is provided with an 18-inch rod having two rings, to which is secured the pennant, etc. The holders come in pairs and are finished in brass, nickel or oxidized.

—— ★ ——

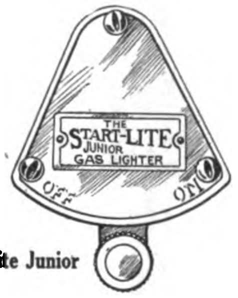
The Bigsby Grease Gun, marketed by the Bigsby Manufacturing Company, Cleveland, O., differs from the usual member in that its operation is automatic and only one hand is essential in its employment. The plunger or rod is provided with teeth which register with similar members of the actuating mechanism enclosed in a handle having a lever. Compressing this lever operates the rod, which forces the grease to the parts to be lubricated. The design of the gun is such that gasoline, oil or grease may be used. The usual washer is replaced by a metal piston ring. When desired the gun may be employed as a syringe by giving a half-turn to the rod.



Bigsby Grease Gun

—— ★ ——

The Start-Lite Junior is a new lighting device brought out by the Start-Lite Company, 1502 Michigan avenue, Chicago, maker of the Start-Lite lighter. The new device operates on the same principle as the original lighter, controlling the flow of acetylene from the tank to the headlights, and enables the lighting of these members without the driver leaving the seat. It operates on the same principle as a switch and is easily installed.



Start-Lite Junior

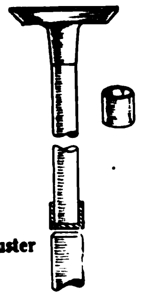
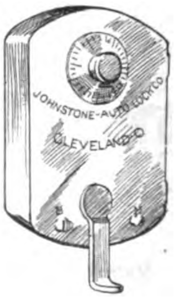
The Apco Valve Stem Adjuster is marketed by the Auto Parts Company, Providence, R. I., and is constructed for model T Ford cars. It comprises a thimble like cap of hardened Jessops steel and a number of very thin hardened discs. It is designed for attachment to the valve stems when these members have become worn and do not provide the proper lift to the valves. They are made in three sizes, that for the Ford motor being .4375 inch.



Apco Valve Stem Adjuster

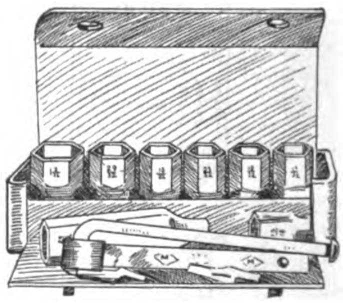
The Johnstone Auto Lock, manufactured by the Johnstone Auto Lock Company, 874 Rockefeller building, Cleveland, O., is a device for locking the ignition system, preventing thereby the operation of the car or its loss by theft. It comprises a pressed steel box which is secured over the coil on the dash, by screws inside. It is fitted with a combination lock to open which a dial is rotated to certain numbers. The combination may be changed from time to time as desired. The lock is neat and compact and can be attached in a few minutes.



Johnstone Auto Lock

—— ★ ——

The Mossberg Wrench outfit, manufactured by the Frank Mossberg Company, Attleboro, Mass., is a valuable addition to the tool equipment of the cars as well as the garage. It comprises a number of socket members, varying in sizes adapted to the components of the motor car, and a folding operating member adapted to fit the sockets. An extra long socket member is provided, also screw driver attachments. The construction of the socket holders is such that considerable leverage may be exerted upon frozen or rusted nuts. The material and workmanship are of the best and the tools come in a neat, folding case. It is moderate in price.



Mossberg Box Wrenches.

Recent Patents of Interest

Hubert Portable Electric Light.

Conrad Hubert, New York City, has been granted a patent for a portable electric light comprising a casing into which is placed the battery, and means for making proper connection to the positive and negative poles. The casing is provided with an aperture for securing the electric bulb, contact with the lamp being made by a finger member. The other casing terminal is exposed. The circuit is closed through this terminal, a movable finger device being fitted to the exterior of the casing. Means are also provided for locking the switch mechanism.

Bassett Radiator Shield.

The patent granted Frank F. Bassett for a radiator shield is a reminder of the approach of cold weather when the radiator will require protection from the freezing winds. The Bassett device does not differ from those of the usual form, but means are provided for securing the shield through the openings of the cooler and without injury to the metal. Bolts and flexible washers are utilized to retain the shield and the bolts are covered with a sleeve of soft material to prevent chafing due to vibration. The device is constructed so that it may be detached and replaced easily, catches being provided for this purpose.

Moran Fuel Reservoir.

One of the troubles experienced with fuel tanks supplying gasoline to the carburetor by gravity is that when the car is ascending a steep grade and the vaporizer is higher than the level of the fluid in the vessel, the motor is starved of mixture. William H. Moran, New York City, has patented a fuel reservoir which device is claimed to overcome the trouble. The design is such that it is stated in his claims that when the tank is tilted the fuel will be discharged through the proper channels to the carburetor. The vessel is constructed in two parts, a main and an auxiliary chamber. A pivotally weighted valve is incorporated, its function being to allow the flow of fluid from the main into the auxiliary chamber, but to obstruct its return. This operation is performed automatically when the tank is tilted or when the discharge head of liquid in the large chamber is greater than that of the other compartment.

Barry-Murphy Safety Stop Device.

Richard P. Barry and John W. Murphy, Brooklyn, N. Y., have patented a safety stop device for motor cars which presents novel features in that the vehicle is checked by means of a pair of shoes. These members are pivotally connected to the rear axle of the machine so that they may be dropped to the ground when desired. They are connected to operating mechanism and actuated by a pair of arms having a ratchet wheel

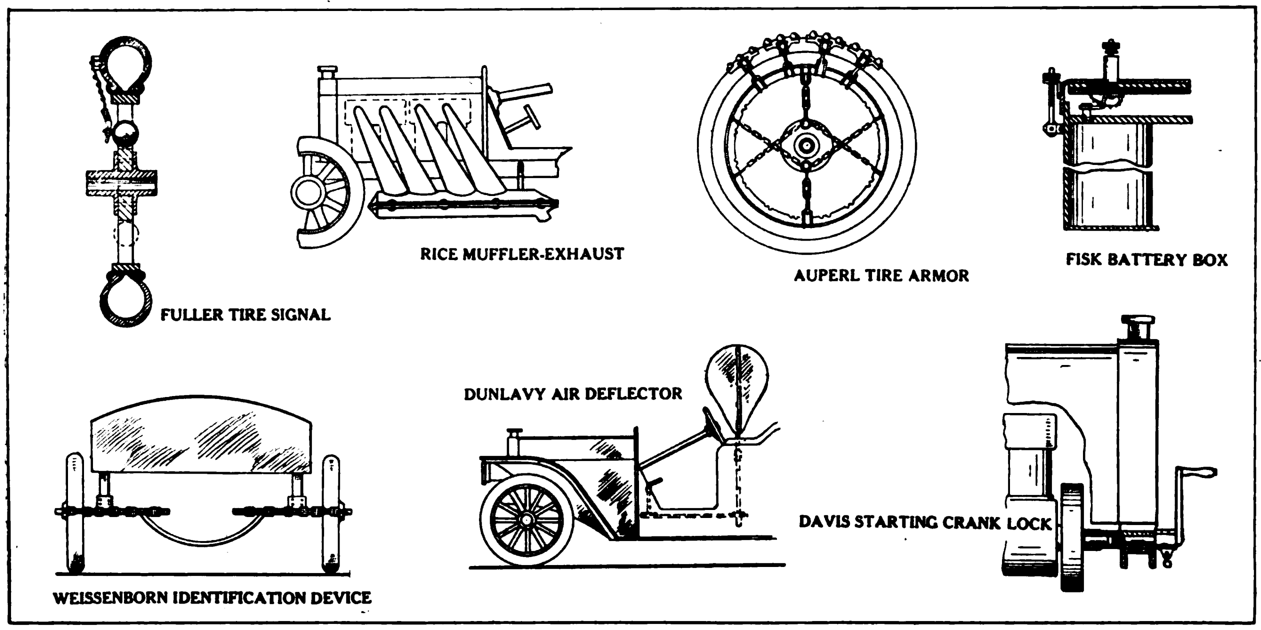
rigid with said arms. A pawl co-operating with the ratchet member maintains the arms and shoes in a raised position when the service of the latter is not desired. Upon releasing the pawl mechanism, the shoes drop to the ground, restraining the movement of the vehicle.



Illustrating Some of the Recent Patents Applicable to the Motor Car.

Jackson Air Compressor and Shock Absorber.

Joseph D. Jackson, Jr., Washington, D. C., has been granted a patent for a combined air compressor and shock absorber applicable to motor vehicles. It is designed to store a quantity of fresh air for the purpose of inflating pneumatic tires, operating a motor starter or other device employing compressed air. The atmosphere thus stored is also utilized as a shock absorber. The air is pumped by the action of the vehicle springs. A cylinder is attached to the body of the machine and the piston of the compressor is so designed that it completes its stroke before it reverses, compressing the air which is conducted by suitable means to a storage tank. Check valves are provided, also a flexible tubing to compensate for the movement of the cylinder. Motion is imparted to the piston by the movement of the frame when the car is traversing rough roads. The construction and operation of the shock absorbing device is as follows: A crank disc is mounted on a shaft, a component of the bracket securing the device to the frame, and the shaft is journaled in bearings in the depending portion of the bracket. In the opposite end of the shaft is a pinion which meshes with a gear wheel on the shaft. This gear wheel carries a ratchet member. Two arms are mounted upon the shaft and carry pawls which engage with the teeth of the ratchet member, are actuated by springs and are always held in engagement with the ratchet. The pawls are reversed so that when one is turning the ratchet and gear wheel in one direction, the other is slipping over the teeth of the ratchet. Lever arms are connected to the other arms, the former members being pivotally secured. One of the lever arms is connected to a bolt in the bracket arm which is secured to the axle by clamping bolts. Through the bifurcated end of the bracket extend screws which are concaved at their inner ends to partly embrace the bolt. This construction, the inventor claims, permits the lever arms to swing on the bolt member as well as on the screws, giving a universal movement. When the axle and chassis frame move up or down the piston completes its stroke before it reverses, or in other words, the crank disc will always rotate in the same direction. This is due to the movement of the arms which rotate the gear wheel in the same direction, whether said arms move up or down, as the pawl on one will be moved over the teeth of the ratchet while the teeth of the other pawl rotate the gear wheel. By this construction the piston is always cushioned.

De Clairmont Motor Cleaning Device.

Adolfo De Clairmont, Toledo, O., has been granted a patent for a device for cleansing the cylinders of an explosive type motor while it is operating under its own power. Mounted on the dash of the automobile or other convenient place, of the carburetor and a valve is incorporated in the reservoir to control the flow of the liquid. The nature of the cleansing material to be employed is not given by the inventor, but it is presumed that any liquid decarbonizing preparation may be utilized.

Lindhorst Pennant Holder.

The growing tendency to mount flags and pennants upon the automobile has been productive of a number of ingenious devices for securing these members. Edward H. B. Lindhorst, Butte, Mont., has patented a flag holder that differs from those of ordinary construction in that five flags may be carried in one device if desired. The support comprises an arched base having a depending foot at either end, said base being formed integral with the socket members. The clamp consists of a vertical arm and bottom plate, and one of the feet of the base carries a bolt having a clamping nut, the bolt extending through the slot of the vertical arm of the clamp, providing means for adjusting the device to different conditions of service. The bottom part of the clamp has a depression adjacent to the vertical arm, having its outer free end offset and carrying a clamp screw.

Fuller Tire Signal.

A patent has been granted to Fred Leo Fuller, Sacramento, Cal., for a signalling device for pneumatic tires, and the invention presents novel features in that it appears to be attached easily and is designed to give the operator of the automobile warning when a shoe becomes deflated through a puncture, etc. The device includes a bell, which is clamped to the spokes of the wheel, and a projecting operating lever. Attached to this lever is a chain having a closed coil spring the tension of which is greater than the spring within the bell. The chain member is secured to the tire in such manner that when the latter becomes deflated the tension of the coil spring relaxes, releasing the lever of the bell, causing it to ring.

Rice Muffler and Exhaust Pipe.

Walter T. Rice, Chicago, has patented a combined muffler and exhaust pipe for internal combustion motors and the device is so designed that the usual exhaust manifold is dispensed with, being replaced by flaring funnels, the number of these corresponding to the number of cylinders of the motor. The ends secured to the motor have openings corresponding to the diameter of the exhaust port and the flare is increased to about three times the diameter of the port at the place of attachment to the muffler. The latter is cylindrical in form and is constructed in two sections secured by bolts. The outlet for the exhaust gases is located beneath the muffler. By this arrangement the muffler is positioned near the forward part of the chassis and the usual exhaust pipe is eliminated.

Auperl Tire Armor.

Of late several inventions are noted for providing tires with traction devices and among the more recent is that of Harry Auperl, New York City. The inventor claims that it not only prevents skidding, but it is puncture proof. It comprises rings of less diameter than the wheel, these being placed on either side. The ring on the outer side is composed of separately disconnected parts. Both are provided with detachable cross chains and turnbuckles connect these members. The tread of the tire is covered with armor plates having a number of balls which provide anti-skidding qualities. The plates are retained by chain devices which are secured to the rings.

Fisk Battery Box.

In connecting dry cells in series or multiple series with ordinary wires, the connectors are liable to work loose, causing considerable annoyance when employed for ignition purposes. Henry M. Fisk, Watseka, Ill., has been granted a patent for a battery box which is claimed to eliminate wiring, as all necessary connections are contained within the device. The box or container is of sheet metal and is provided with a cover of similar material which fits over the container. The inner portion of the cover is suitably insulated and is provided with spring contactors which make the necessary connections from the positive of one cell to the negative of the next. These connectors consist of strips of metal so bent at the end as to present the two lateral edges downwardly for the purpose of causing said lateral edges to enter between the threads on the binding screws. Means are also provided for vertically adjusting the cover so as to increase or decrease the pressure of the connectors on the battery terminals.

Weissenborn Identification Device.

Oscar A. Weissenborn, Jersey City, N. J., has been granted a patent for an identification device which presents original features. It comprises a fender secured to the front of the automobile by brackets and a large number of brass discs or identification checks are contained in the fender. A thin brass wire, in two sections, is included in the device and when the wire comes in contact with any solid material it releases the discs. The object of the invention is to provide means of identifying automobiles the operators of which seek to escape after an accident.

Dunlavy Air Deflector.

Harry Craft Dunlavy, Fresno, Cal., has been granted a patent for an air deflector for attachment to motor cars or other vehicles. It comprises a vane member which is mounted at the top of a vertical shaft. A second vertical shaft carries a sprocket at its lower end. A chain connects the sprocket to a similar member located conveniently to the operator's foot, and a lever is fitted for actuating the chain and controlling mechanism. By it the vane may be placed in any desired vertical position for deflecting air currents.

Davis Starting Crank Lock.

The increasing number of cars reported stolen has stimulated the efforts of inventors to design locking devices and among those recorded is the Davis starting crank lock, patented by William J. N. Davis, Chicago. It comprises a two-part sleeve adapted to be removably fitted upon the crankshaft, to extend between the crank of the shaft and the support through which the shaft is mounted, and to serve as an abutment for holding the shaft against longitudinal movement. Means are also incorporated for holding the parts of the sleeve assembled. The sleeve has apertured ears and a lock having a hasp engages through said apertures, providing means for locking.

Many repairmen have a special piece of oil stone which they have used for a number of years. If the member is placed in a cloth after use it will be found that the material will absorb the oil, preventing the lubricant from filling up the pores of the stone and reducing its efficiency because of the gum like surface.

LOCATES IN WASHINGTON.

South Dakota Concern Will Manufacture and Operate Trucks in District of Columbia.

The American Motor Traffic Company, incorporated under the laws of South Dakota, was formally organized at Washington, D. C., Dec. 18, where it will occupy the fourth floor of the new Citizens' Bank building at 1421 G street. The directors of the company are: President, E. S. Alvord, president of the Littlefield & Alvord Express Company; first vice president and acting manager, S. J. MacFarren, manager of the Engineer Searching Company; second vice president, W. J. Moore, president of the Moore Company; secretary, A. L. Kley of New York City; directors, the above and J. C. Muncaster of Washington and J. C. Menocher of Pittsburg.

The company will specialize in heavy duty commercial motor vehicles of the pivoted spindle, multi-wheel drive and steer type, with flexible load suspension and balance, also in liquid fuel combustion engines and vehicle accessories. Many other claims for improvement in vehicle construction are controlled by the company under patents granted to MacFarren, Thomas and others, and further protected by special trade marks. The concern is empowered to operate, as well as manufacture, motor vehicles for all uses and proposes to establish freight, express and passenger services in response to demand, through its exclusive state agencies or auxiliary companies.

RESIGNS FROM REMY COMPANY.

Deupree Becomes Associated with Sourbier in Indianapolis Real Estate Firm.

H. G. Deupree, for the past two years assistant sales and advertising manager of the Remy Electric Company, Anderson, Ind., maker of Remy magnetos, has resigned to become vice president and active executive of the Sourbier-Emrick Reality Company in Indianapolis. The president of this concern is E. G. Sourbier, another well known automobile man.

Mr. Deupree has been associated with a number of motor car and accessory companies since graduating from a newspaper desk. He joined the Remy company at the same time F. E. Moskovics became sales manager. It is understood that he will remain with this concern until the first of the year, and may be retained in an advisory capacity for some weeks.

Mr. Sourbier was one of the organizers of the Marion Motor Car Company, Indianapolis, and was associated with J. N. Willys in the development of the Willys-Overland Company. Later he was connected with the Ideal Motor Car Company, which he helped Henry Campbell and Harry Stutz to organize. He is now regarded as one of the most successful real estate men in the Hoosier state.

TO SUPPLY DETROIT'S LEATHER.

Organization of Company Expected to Affect Local Market in Material Degree.

With the knowledge that Detroit automobile manufacturers use annually $7,500,000 worth of leather, most of which comes from eastern tanneries, Walter S. Gurd of the Hammond building, E. S. Barbour and R. B. Gillespie of the Michigan Stove Company, and Edwin Armitage, an expert tanner, have organized the Armitage Leather Company, with a capital of $35,000 and have opened a plant at 87 West Congress street, Detroit.

The company has already filled its first order and hopes to so increase its business as to warrant the construction of a tannery and the organization of a $250,000 corporation within a year. Mr. Armitage is said to have discovered a secret process of treating leather which it is believed will revolutionize the industry and produce a better material. Mr. Gurd hopes the company can manufacture all the leather Detroit concerns use and at the coming Detroit show, Jan. 27-Feb. 1, some of the company's work will be exhibited in gray, navy blue, black and fancy colors, and suitable for various purposes.

ENTERS ADVERTISING FIELD.

Gleeson Murphy Leaves General Motors Company Under Particularly Favorable Auspices.

Gleeson Murphy, who for the last two years has been assistant to President Neal of General Motors Company, has opened a branch at Detroit for the H. K. McCann Company of New York, one of the strongest and best known advertising agencies in the United States. Mr. Murphy, who is a student of big organizations, leaves the General Motors Company with the asset of having materially assisted in the reorganization of that company and his present purpose is to establish a complete advertising agency in Detroit, backed by the best experts in the merchandising line.

The McCann company is composed of general advertising experts of national reputation, including H. K. McCann, former advertising manager of the Standard Oil Company; Herbert W. Casson, well known writer, orator and efficiency expert; Thomas Nast, president of Nast Art School; Gerald B. Wadsworth, author of "Principles and Practises of Advertising;" R. M. St. Hill, A. E. Foot and H. Atwood.

Mr. Murphy, besides having the advice of these men, will be assisted by a local corps of experienced writers and artists. He begins his new enterprise with a high degree of fitness for his work, his experience in handling large sales problems being a strong asset. The offices of the company will be located in the Boyer building, Detroit.

WARREN SECURES MORE CAPITAL.

Plans Inaugurated to Care for Increased Business During the Coming Year.

At a recent meeting of the stockholders and others interested in the Warren Motor Car Company, Detroit, Mich., maker of Warren cars, steps were taken to increase the working capital of the organization. Plans also were inaugurated looking toward a largely increased business during the 1913 season.

The following board of directors was elected: F. H. Lewis, Jackson and Detroit; S. G. Jenks, Port Huron; H. H. Bassett, Flint; J. V. Mowe, Akron, O.; G. John, New York City; C. R. Wilson, C. Haines Wilson and Homer Warren. The last three are Detroit men and have been connected with the Warren company for some time past.

ADDS THREE BUILDINGS.

Increase in Packard Plant Makes Possible Production Throughout the Entire Year.

Aiming at production all the year round, the Packard Motor Car Company, Detroit, maker of Packard cars, has added three new buildings, providing an additional acre of floor space. The policy of the Packard company is to bring out two models annually, the big six in the spring and the little six in the autumn, although the production of each is to continue through a whole year.

This will bring something new from the plant each half year. This year the Packard 48 made its debut about June and the 38 in November. The latter will appear in every type but the seven-passenger touring car, which is only fitted to the 48. Both models are sixes and the production will be about equal in number.

RESPONSIBLE FOR COLBY SALES.

F. P. Steinhauer Leaves Abbott Motor Company to Becomes General Sales Manager.

F. P. Steinhauer, for the past two years district sales manager of the Abbott-Detroit cars, made by the Abbott Motor Car Company, Detroit, covering the states of Iowa, Nebraska and part of Illinois, has resigned his position to become general sales manager of the Colby Motor Company, Mason City, Ia., maker of Colby cars. The appointment took effect Dec. 2.

Although not yet 30 years of age, Mr. Steinhauer has attained an enviable reputation and is conceded to be one of the most successful automobile salesmen in the Middle West. He is a man of large ideas and works with an enthusiasm that has invariably brought him big results. Prior to joining the sales force of the Buck Auto Company of Davenport, Ia., a number of years ago, Mr. Steinhauer was a public school teacher. Several other companies also engaged his services before he joined the Abbott Motor Company, and his experience in the retail selling field has been of particular value in this connection.

JOINS REO TRUCK FORCE.

R. E. Paris, Formerly of Olds Motor Works, to Aid in Marketing New Model.

Rupert E. Paris has joined the executive staff of the Reo Motor Truck Company, Lansing, Mich., maker of Reo trucks, as the result of negotiations which have been carried on quietly for some time. Until recently Mr. Paris was sales manager and assistant treasurer of the Olds Motor Works, having gone to Lansing when the Oldsmobile was taken over by the General Motors Company.

His addition to the Reo company is for the purpose of strengthening the managerial staff of the organization to keep pace with the wonderful growth of the business, which was founded only two years ago. The concern has added to its line a truck of two tons capacity and the new vehicle, which has been particularly well received, will be exhibited at the principal motor car shows the coming season.

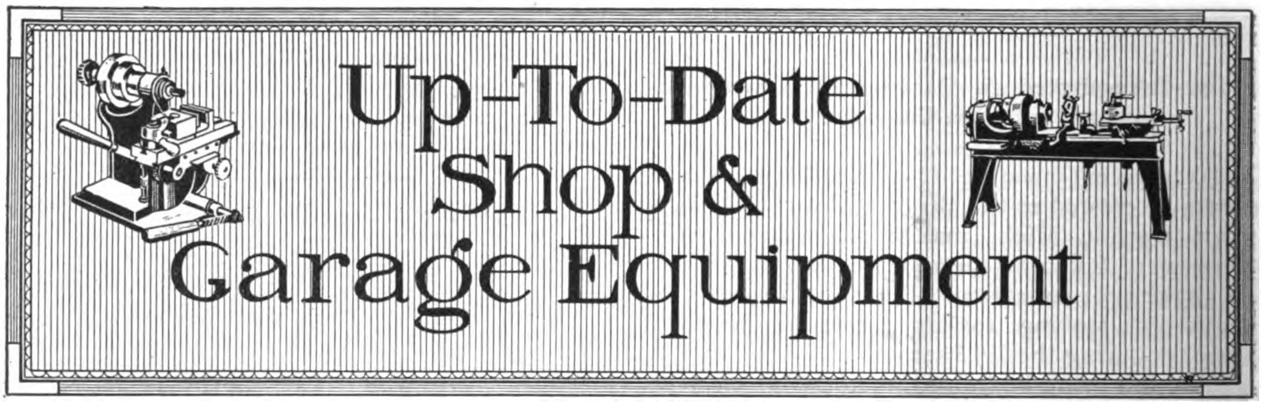
MOTOR PLOWS IN CALIFORNIA.

Union Tool Company Erecting Factory for Production of Industrial Vehicles.

Ground has been broken for the erection of a factory to cost $100,000 to be built by the Union Tool Company at Torrance, Cal., near Los Angeles. The new plant will lie directly east of the Union Tool Company's $1,000,000 institution and between it and the $100,000 plant of the Pacific Metal Products Company, and will be used for the construction of traction plows and motor trucks. The building will occupy a space 82 wide by 240 feet long and it will be two stories in height.

The traction plow, which will be constructed on the lower floor, will be of 80 horsepower and will be capable of throwing four furrows at one time. The wheels will be six feet in height and the engine is placed directly over the forward axle. The construction of the new machine is really an innovation in the automobile business as far as the West is concerned and is planned for export trade, as well as for use in the southwest.

R. M. Owen & Co., 19 West 62nd street, New York City, has issued the annual Christmas number of the Reo Echo, a handsome 48-page brochure. Besides the 1913 Reo announcement well known automobile writers, all of which are illustrated. A copy will be mailed to those interested upon request.



Up-To-Date Shop & Garage Equipment

WHY THE TURNTABLE.

It is surprising the number of stables, etc., which have been converted into garages and many of these are not suited to the convenient storage of automobiles in that the building has either a long, narrow entrance to the main floor or the shape of the latter precludes easy entrance and exit when the majority of the spaces are occupied.

Under such conditions the customer is obliged to change speeds repeatedly in running his machine into its space, imposing unnecessary wear upon the mechanism, to say nothing of the possible damage to the other cars. Besides this is decidedly inconvenient to an owner who desires his machine in a hurry, especially if another customer is taking out his car.

These conditions are overcome by the turntable, which permits of swinging the machine to any desired angle. Another quality of the device is that considerable time is saved by the night washer, who is enabled to roll the machine upon the table, rotate it, and push the car to the washstand without unnecessarily straining the steering mechanism.

In order to meet the demand for a turntable which may be installed without making alterations to the garage floor, the T. C. Beach Company, Inc., St. Johns, Mich., is manufacturing a pitless table. The design is such that the use of tracks, trucks or wheels is eliminated and its installation does not require the services of an expert. It comes complete and the only work required is to bolt it to the floor.

The standard type steel table is shown at Fig. 1, the drawings illustrating the top and sectional views, and the table is made in five diameters, ranging from 10 feet to 16, with wheelbase limits of 92 to 170 inches. The table is counter balanced and rotates on high grade ball bearings of ample size, as will be noted in the illustration.

The same principle is utilized with the pitless table. The rigid steel frame revolves just above the floor and is provided with two steel runways fitted with automatic approaches at the ends, allowing the car to be run on or off at any point as with the standard type. This design eliminates the pit, and is easily installed. It is made in five sizes, with table diameters ranging from 10 to 15 feet and wheelbase limits of 92 to 156 inches.

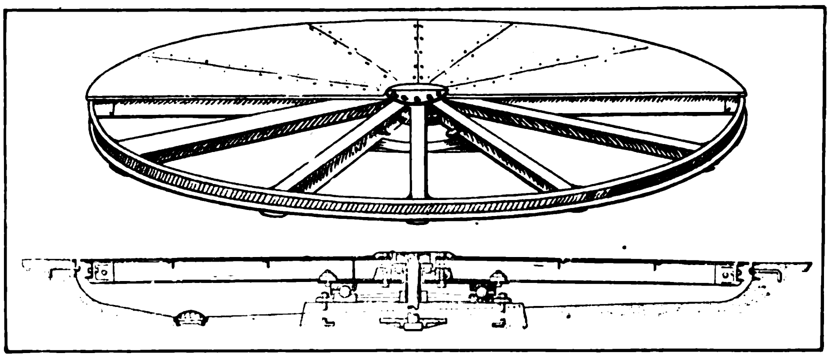


Fig. 1—The Beach Ball Bearing Automobile Turntable.

HISEY ELECTRIC TOOL POST GRINDER.

The Hisey portable electric tool post grinder, manufactured by the Hisey-Wolf Machine Company, Cincinnati, O., is designed for a variety of work, such as grinding lathe centres, cutters, reamers, dies, rolls, etc., and for surface, parallel and internal work of all kinds. It is made in two types, A and B, operated by a 110 and 220-volt direct current and comes complete with wheels, cord and attachment plug. With the 110-volt grinder the following parts are furnished: One emery wheel, 4.5 by .375 inches with a .5-inch hole; one extension mandrel, 4.5 inches long by .75 inch diameter, with wheel 1.5 by .375 inches with .375-inch hole, and one tool rest.

The extension mandrel is utilized for internal grinding by removing the regular wheel and screwing the mandrel to the spindle. The latter is equipped with special bronze bearings, adjustable to wear, and provided with dust proof caps, these preventing foreign elements from reaching the working parts. The brush holders are also enclosed protecting the operator, and may be renewed easily without disturbing the leads.

The motor is air-cooled by means of a fan attached to the armature spindle. A quality claimed for the tool is that rotation of the emery wheel may be reversed by simply changing the position of the two wires on top of the motor housing, the operation requiring no tools.

The V slide has a three-inch travel by means of a worm, through the handle, and is fitted with a gib to take up any wear. It is held in position with a screw clamp, so that different sized shanks may be employed. The tooth rest is an attachment and serves as an index for grinding cutters, reamers, etc. Each attachment plug has a fusible cap protecting the motor from overload. The speed of the type A grinder under load is 4200 revolutions a minute. The dimensions are 4.25 by 7.75 inches, and the weight 16 pounds.

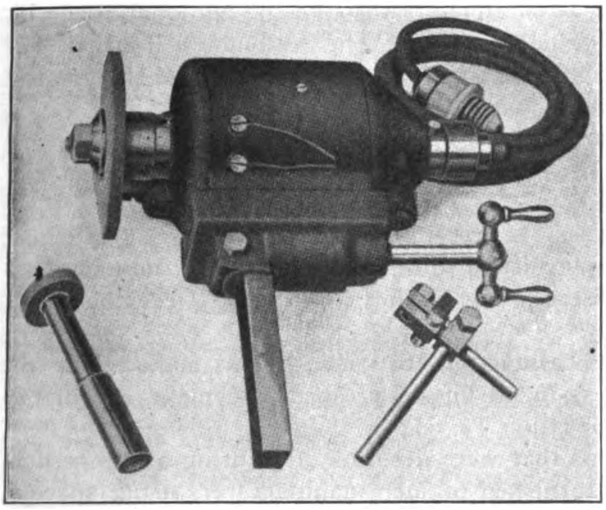

Fig. 2—The Hisey Direct Current Portable Electric Tool Post Grinder.

AIR COMPRESSOR LUBRICATION.

The lubrication of air compressors deserves careful attention, says Graphite, and a common fault is to use too much oil or a lubricant having too low a flash point. An air compressor does not require as much lubrication as a steam cylinder and too much tends to cause the valves to stick, thereby necessitating frequent cleaning. The use of kerosene for removing the deposits is not recommended as it is likely to produce an explosion.

A practical method of lubricating the cylinders of air compressors is with a mixture of soapy water and flake graphite. Such a combination is not only safe to utilize, but keeps the valves clean. The use of a little oil is recommended when shutting down the compressor to prevent any tendency of the soap suds to cause rusting. The Joseph Dixon Crucible Company, Jersey City, N. J., publishes a booklet upon the subject which will be mailed free upon request.

TIRE PUMP HINTS.

Many times the tire pump is condemned as faulty and thrown away when a little work would place the member in good operating condition. It should be borne in mind that the pump has to overcome the pressure of the inner tube valve and as the tube becomes inflated the pressure is increased.

When the pump packing or washer on the plunger becomes dry, air will escape past these members, a condition usually denoted by a hissing sound. The remedy is to unscrew the cap on the pump cylinder, pull out the plunger and soften the packing with a little hard grease. It is advisable to allow the grease to soak in thoroughly over night before reassembling the parts. If a leather washer is fitted, and it has become compressed, open the material as an umbrella.

If caught upon the road with a pump that cannot apparently overcome the pressure in the tube, loosen the valve by unscrewing and it is surprising how easily the tire may be inflated. The valve should be readjusted after the work and tested for leaks.

NEW BEARING METAL.

A new bearing metal is being marketed abroad, called phosforum, and it is particularly adapted for plain bearings. One of the difficulties encountered in the selection of a suitable metal for this purpose has always been in regard to the homogeneity of the cast material; in which segregation occurs. The new metal is cast in stick and bushing form and it is said to eliminate entirely the troubles experienced through occasional variations in metalling and casting temperatures.

VISO SPARK PLUG.

Provision Is Made for Noting the Condition of the Points at All Times.

When a cylinder misses the usual practise is to remove and test the plug. This involves disconnecting the wiring, etc. The Rapp Manufacturing Company, Toledo, O., is marketing a plug known as the Viso. Among the features of the plug is a window through which the action of the spark may be seen. If a flame is noted at the gap and ignition fails, it indicates that the points of the plug are fouled. The gap is adjustable by setting a nut which permits of increasing the space for the high-tension current to jump. This is held to intensify the spark and break down all oil or carbon between the points.

VISO
TOLEDO, OHIO

Viso Spark Plug.

Announcement is made by the company to the effect that it is to move into new and more commodious quarters. The new building will provide 2000 square feet of floor space, which will permit doubling the present output. The company has been in business but four months. The officers of the growing concern are: President, H. A. Nummell; vice president, J. R. Schackne; secretary, C. D. Few; treasurer, Clifford Stone.

A Service That Earns Millions

Business aggregating millions of dollars is transacted annually through the National Trade Information Exchange conducted in connection with the publication of The Automobile Journal, The Motor Truck and The Accessory and Garage Journal. Without question, this is one of the greatest buying and selling channels in the whole automobile industry.

Only yearly advertisers in The Automobile Journal, The Motor Truck or the Accessory and Garage Journal are entitled to enjoy the rights and benefits of this Exchange—the only exchange of its kind in existence.

Actual proof of the services rendered—not promises—is presented in the following list of names of individuals and concerns. This list is one of many furnished to our patrons and all the names appearing thereon were received and mailed to advertisers in our publications during December, 1912, and all have been acted upon by them.

Products wanted are shown under proper classifications and to some extent make clear the scope of this service and the opportunities for business in all lines for those who make use of this Exchange. Full details will be forwarded upon application.

More than 300 names of individuals and concerns that were desirous of securing a line or lines of pleasure cars and commercial vehicles have been furnished to such manufacturers using space in our magazines during the past three months. The conditions under which this service is supplied do not permit this list to be published.

Service is what you want; service is what you pay for. We have the service to sell.

GAS TUBING WILL CLOG.

Where copper or brass tubing is utilized to convey acetylene gas from tank or generator to lamps, it should be removed and cleaned at regular intervals. A carbon like deposit forms in the tubing and a number of tanks and generators that have been condemned as faulty were not able to force the gas through the clogged pipes. To clean the tubing it should be struck smartly against a flat board which will loosen the foreign matter.

FACE LOTION FOR MECHANICS.

A good lotion for removing grease and dirt from the face and hands can be made according to the following formula, says a contributor to Popular Mechanics. To seven ounces of pure alcohol add one ounce of glycerine and a drop or two of camphor. This preparation not only dissolves the grease, but reduces the size of the pores in the skin, thus preventing the muddy appearance of some mechanics. The solution is quite harmless, and in cold weather will prevent cracked hands if used after washing.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Pontiac Motor Castings Company, Pontiac, Mich.; $8000; to manufacture steel and brass castings; incorporators, William J. Brown, T. E. Lyons, Peter J. Donnelly.

Northwestern Tire Company, Minneapolis, Minn.; $50,000; to deal in tires; incorporators, J. C. Roney, Frank J. Kerner, A. A. Kerner.

Jones Pneumatic Tire Spring Company, Hartford, Conn.; $100,000; incorporators, Lyman D. Jones, Etta E. Brandeau, Clarence R. Hall.

Superior Motor Company, Detroit, Mich.; $100,000; to manufacture and sell combustion engines and accessories; incorporators, Henry Fraser, Walter G. Schmeider, Gaylor C. Brimmer.

The Rutzen Power Company, Cleveland, O.; $100,000; to control patents of and to manufacture the Rutzen motor; incorporators, D. W. Corbin, Francis J. Peck, D. H. Tilden, Alonzo M. Snyder, N. I. Young.

R. M. Allen Motor Sales Company, Cleveland, O.; $10,000; to deal in automobiles and automobile trucks; incorporators, Blanche M. Allen, R. M. Allen, H. W. Wiebush, T. B. Logan, H. C. Kagy.

Foreman Motor & Machine Company, Toronto, Can.; $40,000 to manufacture engines; incorporators, W. J. Brown, G. H. Foreman, T. H. Sharp.

Premier Agency Company, Indianapolis, Ind.; $30,000; to deal in automobiles; incorporators, T. H. Adams, W. H. Foreman, J. W. Cowper, V. C. Vette, D. E. Sherrick, H. B. Wilson.

General Oil Manufacturing Company, Jersey City, N. J.; $50,000; to manufacture oil products; incorporators, G. E. Bennett, F. R. Jacobson, W. Perlis.

WITH THE MANUFACTURER

The B. F. Goodrich Company's branch on Boylston street, Boston, Mass., was visited recently by the students of the Boston Y. M. C. A. Automobile School. This was the second tour of inspection of plants in that city in connection with the course of study outlined by the association. The large stock of Goodrich tires and the methods used in the different departments were fully explained by several guides from the Goodrich staff, and much valuable information was gained concerning the care and repair of pneumatic tires. Of special interest was the demonstration of the necessary work in fitting motor truck wheels with solid rubber demountable equipment.

The Cartercar Company, Pontiac, Mich., maker of the Cartercar line, has found it necessary to open a factory branch at 242-244 Peachtree street, Atlanta, Ga., to look after its rapidly growing business in the South. W. C. Mahoney, who has been the special representative of the company in this district for some time has been appointed manager.

The Buick Motor Company, Flint, Mich., maker of Buick machines, at a recent meeting elected the following officers for the coming year: President, C. W. Nash, Flint; vice president, Thomas Neal, Detroit; treasurer, James T. Shaw, Detroit; secretary, Standish Backus, Detroit; assistant secretary and treasurer, F. A. Allen, Flint; comptroller, L. F. Ohland, Flint.

The Peerless Motor Car Company, Cleveland, O., maker of Peerless trucks and pleasure cars, has been authorized by its stockholders to increase its capital from $3,000,000 to $10,000,000. Present holders will get a 40 per cent. stock dividend and may exchange half of their enlarged holdings for an equal amount of preferred stock.

W. H. Barger, a pioneer automobile dealer in Cleveland, O., has been secured by the Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler Cross Country cars, as exclusive representative for this line in Cleveland and northwestern Ohio.

The Motz Tire & Rubber Company, maker of Motz tires, has just established a factory branch at 4436 Olive street, St. Louis, Mo., equipped to give service to all users of Motz tires and to care for Motz distribution in the St. Louis field. E. G. Seibel has been appointed manager.

Charles Y. Knight, inventor of the sliding sleeve valve motor, was in New York to attend the automobile shows. He came to this country direct from his home at Coventry, Eng., and will remain here until after the Chicago shows in February.

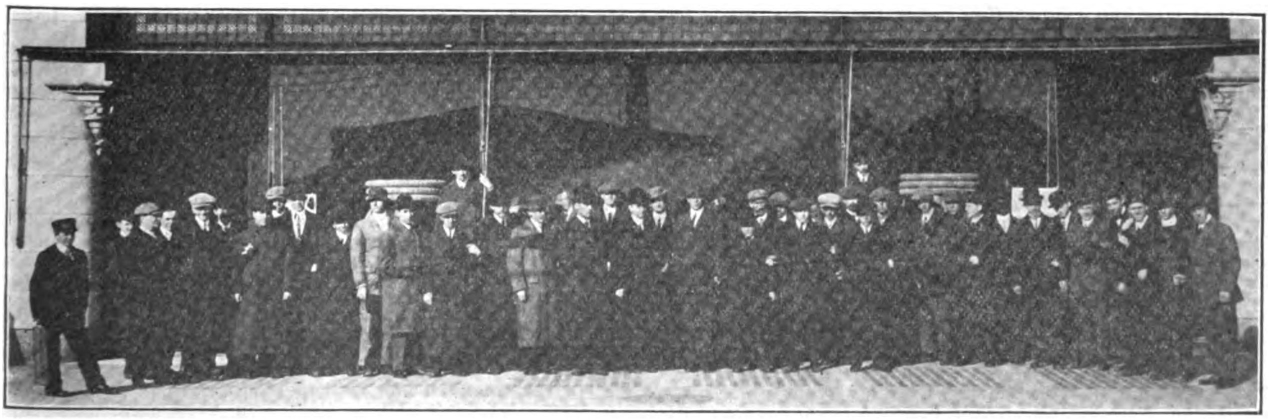
The King Motor Car Company, Detroit, maker of King cars, has announced the appointment of Ray B. Warman as export sales manager. Mr. Warman was export manager of the Scripps Motor Company and since taking that position has increased that company's export business to 52 per cent. of the total sales.

The Buick Motor Company, Flint, Mich., maker of Buick machines, is erecting a building at Peachtree and Harris streets, Atlanta, Ga., which is said to be one of the largest buildings of its kind in the world. It has 26,000 square feet. One entire floor will be given over to a complete stock of parts and another will comprise the service department. R. H. Losey is manager.

The Pope Manufacturing Company, Hartford, Conn., maker of Pope-Hartford machines, has voted to incorporate under the laws of Massachusetts. Stockholders will be offered the privilege of exchanging their Connecticut stock for shares of the Massachusetts corporation on a share-for-share basis.

G. D. Cairns sailed from New York, Dec. 28, for Buenos Aires, Argentine, to assume the management of the technical department of the Buick branch of the General Motors Export Company. Mr. Cairns was formerly associated with the Buick Motor Company of Philadelphia in a similar capacity.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole machines, has appointed the following distributors: Seanor & Williams Company, Beaver Falls, Penn.; L. A. Reynolds, Brockton, Mass.; Connellsville Garage, Connellsville, Penn.; Columbia Motor & Implement Company, Columbia, Tenn.; J. A. Vought, Charlevoix, Mich.; Doty Motor Company, David City, Neb.; Adam Eldam, Hazelton, Penn.; W. P. Marshall, Muskegon, Mich.; F. J. Robinson, Rochester, Vt.; Chamberlin Bros.,



Boston Y. M. C. A. Students on a Recent Tour of Inspection of the Local Branch of the B. F. Goodrich Company.

Salem, Ore.; Jacob Hinden, Strong City, Kan.; West Coast Auto Company, Tampa, Fla.; William Goode, Traverse City, Mich.; Vesper & Evans, Topeka, Kan.; E. L. Shefer, Williamsport, Penn.; Aaron Bricker, Berlin, Ont., Can.; Robert McIntosh, Saskatoon, Sask., Can.; Frank Campbell, Quebec, Can.; Moore & Pauline, Victoria, B. C.

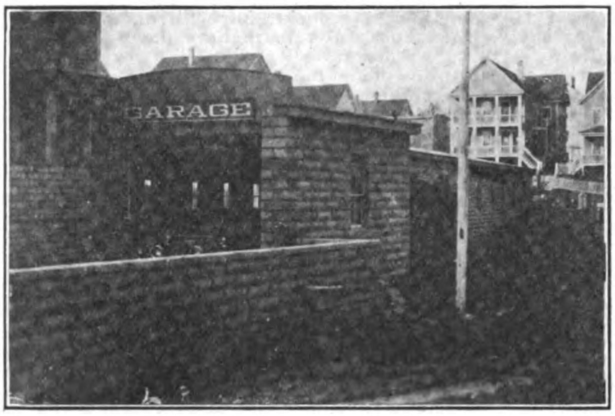
The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has established branch offices in the following cities: Atlanta, Ga.; Albany, N. Y.; Birmingham, Ala.; Baltimore, Md.; Boston; Brooklyn; Buffalo, N. Y.; Chicago; Charlotte, N. C.; Cincinnati, O.; Cleveland, O.; Columbus, O.; Detroit; Dayton, O.; Des Moines, Ia.; Denver, Col.; Grand Rapids, Mich.; Hartford, Conn.; Indianapolis, Ind.; Jacksonville, Fla.; Kansas City, Mo.; Louisville, Ky.; Los Angeles, Cal.; Minneapolis, Minn.; Milwaukee, Wis.; Memphis, Tenn.; New York City; New Orleans, La.; Newark, N. J.; Omaha, Neb.; Oakland, Cal.; Philadelphia; Providence, R. I.; Portland, Me.; Portland, Ore.; Pittsburg, Penn.; Rochester, N. Y.; San Francisco; St. Louis, Mo.; St. Paul, Minn.; Seattle, Wash.; Spokane, Wash.; Springfield, Mass.; Salt Lake City, Utah; San Diego, Cal.; Syracuse, N. Y.; Toledo, O.; Washington, D. C.; Worcester, Mass.; Mexico City, Mexico.

GARAGE & DEALER

The Munger Auto Company, Dallas, Tex., has occupied its new three-story building at 2213-15 Commerce street. The establishment is equipped with the latest facilities for the transaction of its business.

Otto J. Heimann of Chicago is planning to erect a 1.5-story garage on North Robey street, that city.

The Birmingham Motor Company, Birmingham, Ala., is to erect a new building to be used as a salesroom and garage, to cost $10,000. Leo Loeb, manager of the company, stated that the new establishment will be modern in every particular.



Horton's Garage, Fall River, Mass., Headquarters for K-R-I-T and Crow Elkhart Models.

S. E. Drake, Lexington, Ky., has leased quarters at 234 East Main street and will carry in stock a full equipment of all models of Overland cars, made by the Willys-Overland Company, Toledo, O., and also a complete line of accessories.

The Swarts Automobile Company, St. Louis, Mo., which has the St. Louis territory for the Velie machines, made by the Velie Motor Vehicle Company, Moline, Ill., has moved to larger quarters at 5143 Delmar avenue.

Horton's Garage, Fall River, Mass., is headquarters for that city and vicinity for the K-R-I-T cars, made by the K-R-I-T Motor Car Company, Detroit, and the Crow Elkhart line, produced by the Crow Motor Car Company, Elkhart, Ind. The main garage is 80 by 27 feet, and it and the repair shop in the rear are of concrete construction and well lighted throughout. Two entrances, one at the front and the other at the rear, make the building particularly easy of access. H. A. Horton is manager, and aside from the cars represented, a full line of accessories and supplies is carried.

The Hood Auto Filling Station has been established at 119 Eighth avenue, Nashville, Tenn. The concern will carry a complete line of automobile oils, greases and gasoline.

The Barton Motor Car Company, Cedar Rapids, Ia., has been formed by L. M. Barton, who is president of the concern. The capital stock is $10,000 and the company will conduct a garage and repair shop, in addition to doing a wholesale and retail automobile business.

H. G. Martin, proprietor of the Oriental Rubber & Supply Company, 1170 Bedford avenue, Brooklyn, N. Y., has leased the building at 1166 Bedford avenue, corner of Madison street, and will locate his company there.

The Campell-Collins Company, San Jose, Cal., has opened a new automobile supply house at 241 South First street.

The Kendall Auto Company, Pasadena, Cal., has opened a new garage and salesroom on Broadway. The company is distributor for the Regal, Firestone-Columbus and Columbus electric lines.

Charles Day has taken over the garage on West Union street, Athens, O., and plans to make extensive additions to the present building.

The Buick Motor Car Company, Admiral boulevard, Kansas City, Mo., is to erect a large addition to its plant at an expenditure of $20,000.

Frank Waterhouse & Co., Inc., Seattle, Wash., has erected a large building at 1512 Broadway, which will be the headquarters in the Northwest for the Garford trucks and pleasure cars, made by the Garford Company, Elyria, O. P. E. Sands, for the past four years manager of the Seattle branch of the Studebaker Corporation, is in charge.

Charles H. Thompson, Los Angeles, Cal., has moved to his new garage on South Olive street, where he has facilities to extend the scope of his business.

The W. L. Nolan Company, Rochester, Minn., has taken possession of the garage of W. H. Brown and the building will be entirely remodelled.

George Middleton and C. C. Wilson have formed a partnership and have purchased the Algona Auto Garage at Emmetsburg, Ia., which they will conduct on an enlarged scale.

The Buckeye Garage has been opened on Monument avenue, Hamilton, O. John Leever will conduct a general motor car repair and supply shop business.

John Wenick, who owns the Mt. Diablo garage building on McDonald avenue, Richmond, Cal., is erecting an addition to the establishment, which is conducted by the Mt. Diablo Garage Company, Inc.

The Manley Hardware Company, Harvard, Wis., has had plans made for the erection of a substantial addition to its garage.

Jeremiah Coughlin & Son, Fort Dodge, Ia., has leased the Newberry livery stable, which will be converted into a modern garage.

The Hanover Garage, of which Andrew D. Baird is manager, is occupying its new, modern quarters, recently completed, at 20 Keap street, Brooklyn, N. Y.

Huestis & Knoche, Montgomery, N. Y., is establishing the Montgomery Garage & Machine Works and the Bull building is being remodelled for this purpose.

Daniel R. Schnabel, Johnstown, Penn., is to open a new automobile salesroom and repair shop on Main street, to be of modern construction.

Blackman & Follansbee, East Whitman, Mass., has built an addition to its garage to care for increasing business.

J. L. Bell and Ralph Wilson, Salt Lake City, Utah, have opened a garage on State street.

A. A. True and N. Levering, Highland, Cal., have purchased the Highland garage and will install a modern machine shop.

E. L. Clauss & Son has established a new fireproof garage at 6450 Selma avenue, Hollywood, Cal. It will be known as the Baker garage.

Arthur A. Bond has sold his interest in the Glasgow garage, Glasgow, Mo., to his partner, Charles J. Himmelberg, who in turn has disposed of a half interest to M. R. Cochran. The company will occupy space in the Fuller building.

Edward Dobschuts has moved into his new garage, the Eddie Motor Works, Pasadena, Cal., at Fair Oaks avenue and Center street.

L. C. Dale and O. G. Baker are occupying their recently completed garage on Stanton avenue, near Pacific electric station,, Stanton Cal.

Mrs. L. M. John, Inglewood, Cal., has purchased the rights, title and interest in the Inglewood garage of T. J. Myers and T. G. Stevens.

Laven & Halstrom, Mankato, Minn., has taken possession of its new repair shop and garage at 126 Washington street.

John Thompson of the Avon garage, Asbury Park, N. J., has taken a long lease of the McCabe building, Lake avenue, and opened a salesroom for the automobiles for which he is agent in that territory.

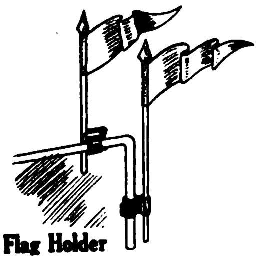
Taft's Queen's Plaza Auto Supply, Long Island City, L. I., in addition to its present location will establish other quarters at 65 Prospect street, for an annex garage. All modern appliances will be installed in the building. In addition to handling the Ford and Buick cars, the company carries a full line of tires, greases, oils and supplies.

The Turnbull Auto Company, Willimantic, Conn., has purchased property on Chestnut street and will remodel the building for a modern garage and general repair shop, with F. J. Wood in charge.

The Hartford Motor Car Company, Riverside, Cal., will establish a garage at Eighth and Hemon streets. The company handles the Buick cars, made by the Buick Motor Company, Flint, Mich., and a complete line of accessories. E. K. Hartford of San Diego, Cal., is manager.

Oliver Onsgard has retired from the firm of Onsgard & Foss, Caledonia, Minn., dealer in Ford cars, made by the Ford Motor Company, Detroit, and the business will be continued by his former partner, Edward Foss.

Universal Flag Holder.

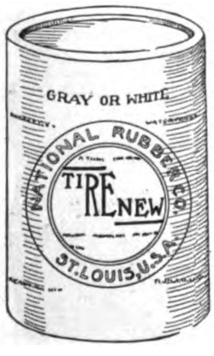


Universal Flag Holder

The Universal flag holder, made by the J. & J. Manufacturing Company, 192 Piquette avenue, Detroit, is a neat contrivance which supplies a pronounced demand felt by the automobile trade. The device appeals to touring motorists, as it is designed to fit on almost any part of a car, including guards, running board, windshield, etc., and will accommodate two pennants. It is small, neat and strong, and is constructed of a high grade spring steel, finely enamelled.

The flag holder is so simple that no adjustment is necessary and it can be placed on an automobile in a few seconds. It does not mar or deface the metal as the parts that come in contact with the machine are padded with rubber or felt. In the descriptive circular first sent out by the J. & J. Manufacturing Company the price for the windshield pennant holder was given as 50 cents, but this should have been stated as 25 cents. The price given for the fender holder as 75 cents was correct.

Narco and Tirenew.



GRAY OR WHITE
NATIONAL RUBBER CO.
TIRENEW
ST. LOUIS, U.S.A.

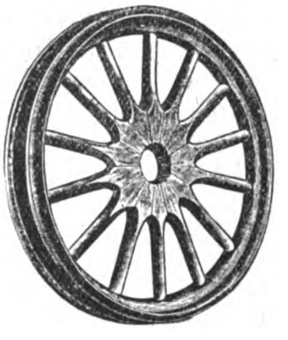
Tirenew

Narco tire cut filler is manufactured by the National Rubber Company, 4433 Narco building, St. Louis, Mo., and is a liquid, unvulcanized rubber compound which water proofs and protects the inner fabric from decay. By its use tire resistance to decay is said to be increased at least 30 per cent. and the tires are made to look like new. Cuts may be filled without the need for vulcanization, as the material heals completely over night. It is described briefly as a self-vulcanizing, combination rubber cement which has proved durable in service.

Another feature of the line made by this company is Tirenew, a coating for automobile, motorcycle and bicycle tires. The firm states that the base of the composition is pure Para rubber and being in liquid form is easily applied to the exterior of the shoe after the latter has been cleaned. The preparation not only preserves the rubber, but adds to the appearance of the tire. The company also is maker of Leaknot, a liquid, water proof rubber dressing, adaptable for coating leather, such as tops or upholstery. It is said to be colorless, odorless and not to injure the material, which it rubberizes. A quality emphasized is that it softens the leather.

Motor Car Wheels.

The Eberly & Orris Manufacturing Company, Mechanicsburg, Penn., specializes in wood wheels both for pleasure and commercial cars and is prepared to make to any specification and in any quantity as desired. The wheels are constructed of carefully selected bone-dry timber and the concern is equipped with the most modern machinery and facilities for this class of work. In addition the company makes a specialty of repairing both pleasure and commercial car wheels and will complete and return the work on the same day. A catalogue and price list will be mailed upon request.



Eberly & Orris Wheel

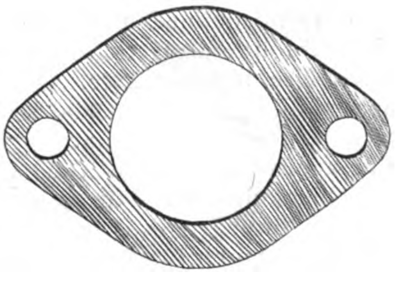
Vellumoid Gasket Stock.

Vellumoid gasket stock, sold through Charles D. Brown & Co., Inc., 49 Federal street, Boston, Mass., is a product, the process for which was patented in 1908. As the name suggests, it resembles genuine vellum, is extremely tough and is held to be impervious to animal, vegetable and mineral oils, as well as cold and luke warm water, brine, etc.

Vellumoid is used by the Knox Automobile Company, maker of Knox cars; American Locomotive Company, Alco cars; Port Huron Construction Company, automobile motors; Mast-Foos & Co., force pumps; F. E. Meyers & Bro., pumps; Clement, Restein Company, New York City, dealer in packing; Rix Compressed Air & Drill Company, San Francisco, compressed air engines; Wire & Craig Manufacturing Company, Chicago, engineer and machinist; Ira F. Wever, Portsmouth, N. H., agent for Ford cars, and a large number of others.

Heinze Spark Plugs.

The Heinze Electric Company, Detroit, and Lowell, Mass., is manufacturing a line of high grade spark plugs the non-sooting and non-fouling qualities of which are emphasized. The company has had an extended experience in ignition devices and the plugs are the result of many years of experimentation. The discounts to the jobber and dealer are very liberal, making the cost of these plugs very low and profits large.



Vellumoid Gasket

Cataract Tires and Tubes.

Producing a full line of tires and tubes for both pleasure and commercial cars, the Cataract Rubber Company, with main office in Boston, Mass., factory in Wooster, O., and branches in New York City, Buffalo, N. Y., Providence, R. I., and other cities, is presenting an extremely liberal proposition to prospective dealers. The tires are guaranteed for 4000 miles and the tubes are held to possess distinct advantages resulting in long life.

Pleasure car tires are produced with plain and break skid treads, the latter being on the vacuum principle, in either the quick detachable or clincher types, and in all sizes, both regular and oversize. The material is the finest grade of pure Para rubber, which is compounded to secure the highest degree of resistance to wear, strength, resilience and endurance. The fabric is the best quality of Sea Island cotton, woven with special reference to the use to be made of it. The tires are of the hand made wrapped tread type.

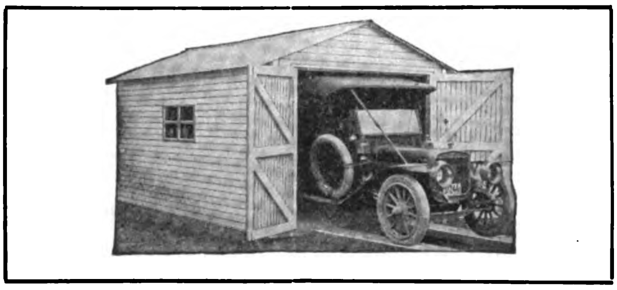
The truck tires are of the diagonal block type, and these are made for either single or dual service. The blocks are so constructed as to be removed quickly from the rim. Flanged on both sides and fitting snugly to the rim they are fastened by a cross sectional steel strip with three bolts inserted through the strip and the wheels, and tightened by nuts on the inside. Inasmuch as each section has a steel trellised base molded in the rubber and extending to the extreme of the flange it is maintained that all chance of base spreading is thereby effectually eliminated.

Two types of tubes are produced, the one being made from a high grade of Para rubber and known as the Selector, and the other being the Cataract gray tube. The former is extremely heavy, red in color and guaranteed for hard service, while the latter is of less expensive material, although it is claimed to be of unusual quality.

EDWARDS PORTABLE GARAGE.

Maker Has Attractive Proposition for Dealers Interested in Co-Operating in Meeting Demand.

Within the past few years there has arisen a demand for a neat, attractive garage which the owner may locate on a small plot of ground near his residence. The Edwards Manufacturing Company, 714-764 Eggleston avenue, Cincinnati, O., claims to be in a position to satisfy this demand with the Edwards private portable steel garage. Just now it is making an attractive offer to dealers, whereby the latter are invited to co-operate with this company in interesting the purchasers of new cars.



The Edwards Portable Garage, Fire, Water and Weather Proof, Easily Put Together and Constructed of High Grade Material.

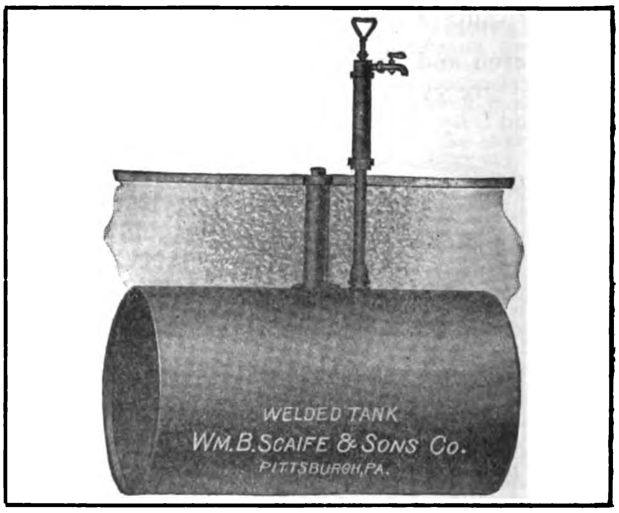
It is maintained that the Edwards garage gives absolute protection from sneak thieves, joy riders, fire, lightning, etc. It comes ready to set up and all parts are cut and fitted. Complete directions for assembling are furnished with each. The appearance is held to be artistic and attractive, blending well with the surroundings of the home. Ample room is provided for the car and sufficient equipment to care for it in an economical and efficient manner.

The material being of steel, it is held that the garage is practically indestructible. The exterior is so treated as to be rust proof, and all joints and seams are permanently tight. Provision is made for locking the doors and windows securely. The portable feature is one which will make its individual appeal. Complete details may be learned by addressing the company.

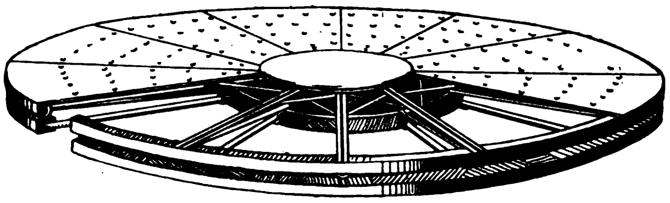
GASOLINE STORAGE OUTFITS.

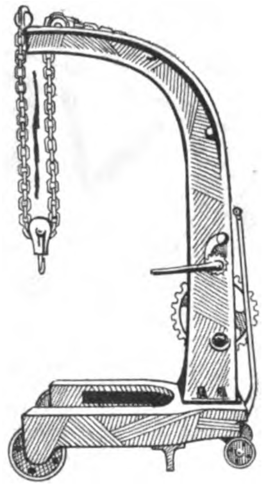
Scaife Line Will Assist Dealer in Marketing Fuel Without Waste.

With the constantly increasing price of motor fuel it is economy to equip the garage or service station with a high grade storage outfit and one that will prevent loss of the fluid through evaporation or handling. The William B. Scaife & Sons Company, Pittsburg, Penn., specializes in gasoline storage outfits and manufactures a large variety to meet individual requirements and installations. A feature of the storage tanks is their simplicity and durability. The company also makes welded, brazed and riveted tanks for the storing of gasoline, oil, water or air. Catalogues will be forwarded free upon request. The company also maintains a New York office at 26 Cortlandt street.



One of Several Gasoline Storage Outfits Manufactured by William B. Scaife & Sons Co.





For the Public and Private Garage
UP-TO-DATE

The most important question is that of handling your cars in the shortest time at least expense possible and with all chance of accidents done away with.

With the "UNIVERSAL" Automobile Turntable in your garage, you can drive both in and out "front end first"—no more backing out. Just run in on the Table, one little push making a half revolution, and your car is ready to start out.

These Tables are made in four sizes—one for every use—with capacity for supporting from the lightest runabout to the heaviest truck.

Better write today for full particulars, getting our Catalog "C-8."

The Indispensable "Handiest Tool in the Shop"

Does your lifting and tugging at one-fifth the expense you are now paying for this. No matter if you do have stationary chain hoists, you will find this "Handiest Tool" indispensable in your garage.

Write for our catalog "EE-7," and full information how to lessen cost.

Blue Ribbon Cream Metal Polish

It's a thick cream metal polish—an emulsion. The quickest and best for metals constantly exposed to the weather; best for inside work.

Does not settle; requires no shaking; leaves no sediment in crevices.

Only polish furnished in five or ten-gallon cans for garages, fire departments and other large users which gives perfect satisfaction.

It removes the TARNISH, not the METAL. A household necessity for cleaning and polishing all brass and metal trimmings and fixtures. Regarded by all large users and dealers everywhere as the ideal polish for all-around use and as a trade article.

Blue Ribbon Greaseless Cream Automobile Body Gloss and Furniture Polish

For body of any car. Keeps it like new. Maintains original gloss and finish. Revives and restores lustre adding new life to highly polished surfaces. Absolutely leaves no grease to catch dust. Also valuable for cleaning, preserving and brightening leather trimmings.

VOL. II. PAWTUCKET, R. I., FEBRUARY, 1913. No. 10

STUDYING THE FUEL PROBLEM.

National Association of Automobile Manufacturers to Investigate Price Situation—Standard Oil Takes Action—International Body Will Offer Substantial Price in Effort to Reduce Prices—Other News.

The National Association of Automobile Manufacturers, composed of a large number of motor car makers, has decided to appoint a committee to confer with the Standard Oil Company on the question of fuel. Alfred Reeves has been selected as chairman, and will be assisted in this action by several of the most prominent men in the automobile industry.

That the increased cost of motor fuel has caused much apprehension among motorists generally is recognized by automobile makers. With this situation in view they appear to have taken action which is expected to result either in a reduction in price or adoption of a plan whereby a substitute may be placed in general use.

SEEKING NEW FUEL.

International Association Will Offer Substantial Prize in Effort to Lower Prices.

The International Association of Recognized Automobile Clubs, at its recent meeting in Paris, France, approved the proposal of Rene de Knyff to raise a prize fund of $100,000 for the best alternative fuel for use in existing internal combustion motors. The regulations have not been drawn up and will not be made public until the government of the interested countries will agree to impose no tax upon the fuel, or at least to admit it at a low fixed rate.

The action was taken because of serious alarm at the increasing cost of gasoline and a stipulation in connection with finding a substitute is that it must be available in large quantities and be of such nature that it cannot be controlled by trusts. The countries represented at the meeting were: France, Great Britain, America, Germany, Austria, Belgium, Denmark, Holland, Hungary, Italy, Russia, Switzerland, Sweden, Egypt, Roumania.

NEW MOTOR FUEL COMING.

Standard Oil Company Said to Be Prepared to Introduce Motor Spirit.

According to information from Chicago, the Standard Oil Company is prepared to market a new fuel for automobiles to be known as motor spirit. This is said to be a by-product of petroleum, with a gravity of 52-55 degrees, Baume, as compared with 58-60 for the present grades of gasoline. It is expected to sell for three cents a gallon less and to give 25 per cent. more mileage.

Motor spirit is said to have existed for some time, but with a color and odor which made it unsuitable for use. W. M. Burton is held to have perfected a process of refinement upon which patents only recently were granted. Experiments are said to have shown that a slight adjustment of the carburetor becomes necessary because of the need for more air.

ORGANIZE TO FIGHT BILL.

Massachusetts Truck Interests Take Decisive Action Against Weight Limitation.

Representatives of the motor truck and kindred industries, including users of mechanical transports, in Massachusetts, met in Boston early in the month to take decisive action on the bill now pending for the limitation of the weight of vehicles using the highways. It is generally conceded that the bill, which has the approval of the Massachusetts Highway Commission, is aimed at motor vehicles, the reason for the proposed legislation being that heavily loaded trucks damage bridges throughout the commonwealth.

The following committee was appointed to take up the fight in earnest: J. S. Hathaway, James T. Sullivan, J. B. Sullivan, Jr., James Fortesque, William H. Bain, John H. Duffell and J. Porter Russell.

MANAGES PREST-O-LITE BRANCH.

Well Known Boston Man Heads New England Organization in That City.

A. N. Dodge, who on Feb. 1 took charge of the Boston branch of the Prest-O-Lite Company, Indianapolis, Ind., is one of the best known men in the motor car industry in and around Boston. He first became identified with the business in March, 1907, connecting himself with Chester I. Campbell in the management of the Boston Automobile Dealers' Association shows. He continued in this position until September, 1908, when he resigned to become New England manager for the Truscott Boat Manufacturing Company.

In 1911 he resumed his work with Mr. Campbell, with whom he remained until he assumed charge of the Prest-O-Lite Company's Boston branch Feb. 1. Mr. Dodge's many friends in the industry in Boston and vicinity have given him their warmest congratulations, while hundreds of well known motorists have called at his office to wish him the best of success in his new venture. His experience has been such as to warrant the prediction that the business done by this branch will show a marked increase under his management.

Arthur N. Dodge, Manager, Prest-O-Lite Boston Branch.

MILLER ADOPTS PARCEL POST.

Pioneer Accessory Dealer First to Announce Free Delivery by This Method.

Chas. E. Miller, 97-103 Reade street, New York City, the pioneer accessory house in America, is the first to make announcement of the intention to utilize parcel post for making free delivery of the products handled anywhere in the United States. This is strictly in line with the Miller policy, and in effect places a Miller branch in every locality in the country.

In addition to the New York headquarters, which has built up a splendid business during the past 15 years, branch houses are located in New York City, Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.; Philadelphia, Penn.; Newark, N. J.; Detroit, Mich.; Cleveland, O.; Atlanta, Ga., and New Orleans, La. The big Miller catalogue, which is free to anyone at request, places the individual motorist, no matter where located, in direct touch with any of these stores, and parcel post makes it possible to take advantage of New York prices or special quotations.

SPLITDORF'S FOREIGN POLICY.

Will Locate Branch and Service Station in London for European Users.

Another step in the Splitdorf policy to secure absolute service for users of its ignition devices was taken when O. J. Rohde, treasurer and general manager of the Splitdorf Electrical Company, Newark, N. J., sailed for Europe on the Kaiserin Augusta Victoria, taking with him a corps of experts on magnetos, coils and ignition in general. They will be established in London to attend to the wants of users of American cars.

Mr. Rohde has systematized the New York service station of the company to such a degree of perfection that his ideas will prevail in the working out of the details for the accommodation of Europeans and visitors alike. He will establish the service stations abroad with practical men in charge and when the system is thoroughly organized he will return to New York.

FORM CREDIT ASSOCIATION.

Omaha Jobbers and Dealers Organize to Further Their Mutual Interests.

A meeting of the jobbers of automobile supplies and the local representatives of tire factories was held in Omaha, Neb., during the recent show to perfect arrangements for forming a credit association and a constitution and bylaws were adopted. The name of the new organization will be the Automobile Supply Jobbers' Credit Association of Omaha.

This association was formed for the protection of its members in matters of credit and for the betterment of trade conditions in its territory. The following officers were elected: President, C. G. Powell; vice president, Arthur Storz; secretary and treasurer, L. C. Cohen. These three officers, together with T. V. Graves of the Goodyear Tire & Rubber Company, and F. H. Waldman of the Omaha Rubber Company, will conduct the affairs of the organization.

Death of President Cowham—Announcement is made by the Cutting Motor Car Company, Jackson, Mich., of the death in that city, Jan. 13, of William F. Cowham, president of the company. Mr. Cowham had been for a number of years a prominent figure in the automobile industry, and the loss to the Cutting company is one which will be felt personally by a large number of friends and acquaintances in all sections of the country.

REFEREE WILL HOLD SALE.

Property of the Niagara Lead & Battery Company to Be Offered at Auction.

Notice has been given to the creditors of the Niagara Lead & Battery Company, Niagara Falls, N. Y., which is now in bankruptcy, that the property will be offered for sale at auction Feb. 25. The property includes the brick factory and land, also engines, boilers, machinery and apparatus of all kinds within the factory, all of which is subject to a mortgage held by the Niagara Falls Power Company.

The sale will be made subject to the lien on said mortgage by the power company. All of the property will first be offered for sale by parcel and then by bulk and the bid which realizes the largest amount therefor will be accepted by the trustee. If a bid made in good faith and for cash, amounting to $3000, is received, the property will be struck off to the highest bidder, but if no bid is made subject to the encumbrances, such as liens and mortgage, the entire property will be offered free of all encumbrances, the lien of the mortgage to be attached to the funds realized and the validity of the lien then to be determined by the court. The sale will be made subject to the confirmation of the referee.

NEW BOSTON CORPORATION.

Ultra Motor Car Company, in Process of Organization, Tests Sample Car.

The Ultra Motor Car Company is a Boston corporation, not yet actively engaged in the manufacture of automobiles, but in the process of organization. Only one car has been built as yet, this being a sample machine which has been under test on the road for the past six months.

In a recent issue, the address of the concern was given as Amesbury, Mass., with a suggestion that it was soon to locate in Taunton. R. H. Randall, president and chief engineer, is authority for the statement that this information was incorrect. The other officers of the concern at present are: Vice president and treasurer, E. A. Bagg; clerk, C. A. Parker.

BRISCOE FRERES ORGANIZED.

Former Head of United States Motor Company Forms New Concern at Billancourt, France.

Benjamin Briscoe, formerly president of the United States Motor Company, has opened an automobile factory at Billancourt, France, the home of the Renault and in the heart of the French automobile manufacturing district. The company is registered under the name of Briscoe Freres.

It is understood that this factory is at work on the production of a new car to be placed on the American market in ample time for the 1914 season. It is claimed that the new machine will be a five-passenger vehicle to sell at less than $1000. When the car is completed it is said that it will be manufactured at Detroit and that an assembly plant will be erected in England for supplying the European market.

NEW R-C-H MANAGER.

Something About the Man Who Has Been Selected to Head Well Known Concern.

It was announced some few weeks since that Peyton R. Janney would soon become general manager of the R-C-H Corporation, Detroit, maker of R-C-H cars. The story of his rise from machinist's apprentice to his present position is one which has few counterparts outside of the automobile industry. In other words, Mr. Janney is one of those men to whom the title of self-made may be applied with much truth.

When he was 10 years of age he entered the agricultural implement business as a machinist's apprentice, and he worked his way to the position of superintendent when most boys are just beginning to think of their life work. His knowledge of automobile affairs has been gathered during 12 years of connection with the industry. Mr. Janney has been in every division of the trade, retail sales as well as factory sales and production. For two years before joining the R-C-H forces he was associated with the General Motors Company as manager of various truck and pleasure car companies subsidiary to that concern.

Peyton R. Janney, General Manager, R-C-H Corporation.

He is a big man physically, as well as in a business way, for standing over six feet tall, he weighs more than 220 pounds.

STUTZ CREATES NEW RECORDS.

Unofficial Figures Give Earl Cooper Marks for Seventy and Two Hundred Miles.

Earl Cooper in a Stutz car created new world's record for 75 and 200 miles on a circular mile dirt track at Fresno, Cal., Feb. 10. He failed to meet the 100-mile record by 1:23. Cooper's time for the 75 miles was 1:17:05 and for the 200 miles, 3:28:05.8.

These records are not official until passed upon by the contest board of the American Automobile Association. Each official that acted at the race must be sworn and a surveyor must take oath that the track is one mile in length. When this information reaches New York action will be taken by the A. A. A.

DETROIT BRANCH FACTORY.

Philadelphia Body Building Concern Locates Additional Plant in the Heart of the Industry.

The Edward G. Budd Manufacturing Company, Philadelphia, Penn., maker of automobile bodies, has decided to establish a branch factory in Detroit. The advantages of being in the heart of the automobile industry became apparent when an opportunity presented itself to purchase the buildings formerly occupied by the Grabowsky Power Wagon Company, which recently went into bankruptcy, and the Budd company has taken possession of this plant.

The property consists of 8.5 acres of land with buildings and the price paid was $110,000. The appraised valuation of the property is said to be $140,000. Contained in the purchase is a modern reinforced concrete building, four stories high, with 72,000 square feet of floor area, and a modern power building. There are also several sheds which the Grabowsky company utilized for storage purposes.

The Budd plant in Philadelphia will be operated to supply the trade in the East and south of Toledo, O., while the Detroit branch will handle the Michigan business and part of the West. By next May it is anticipated the production will total 30 completed bodies a day. The Edward G. Budd company was organized in June, 1912, with capital of $500,000 all paid in, and manufactures pressed steel bodies for commercial and pleasure cars.

JOINS LOZIER COMPANY.

Paul H. Smith Will Head Sales Department in Charge of Dealers and Agents.

President Harry M. Jewett of the Lozier Motor Company, Detroit, maker of Lozier cars, who has been building up his organization since he assumed the presidency of the company four months ago, has completed what he believes to be one of the most efficient executive forces in the industry. The latest addition to the Lozier staff is Paul Smith, who becomes sales manager with full charge of all branches, dealers and agents.

The association of Mr. Smith with the Lozier company will no doubt largely increase the distribution of Lozier cars. Four years ago he became assistant sales manager and for the past three years has headed the sales force of a company where he made an exceedingly strong reputation for doing business in a large way. During this time the production of this concern increased from 12,000 cars a year to 50,000. Mr. Smith has been identified with both high and medium priced machines and his knowledge of and personal acquaintance with over 4000 dealers will be of decided value to the Lozier company.

THE CHANDLER ORGANIZATION.

Additional Details Concerning Company Which Will Produce New Six-Cylinder Car.

Following the announcement of the Chandler six-cylinder car during the progress of the Chicago pleasure vehicle show, comes the information that the Chandler Motor Car Company is located temporarily at 982 Woodward avenue, Detroit, although it is not anticipated that the machine will be produced commercially in that city. The officials of the company are: President, F. C. Chandler; vice president and sales manager, Charles A. Emise; treasurer, Samuel Regar; secretary, M. S. Mead; designer, J. V. Whitbeck; superintendent, J. R. Hall.

It is learned that in August of last year Mr. Chandler resigned as general manager and Mr. Regar as treasurer of the Lozier Motor Company, Detroit. They employed Mr. Whitbeck, who severed his connection with the Lozier engineering department at the same time, to design the new car. The other officials of the Chandler concern tendered their resignation with the Lozier company about the same time, but continued in their connections until released. In the meantime work has been underway on the new model in a temporary shop and it was given its first road trials several weeks ago.

NEW STEEL CONCERN.

Pittsburg Men to Locate Plant to Produce Automobile Material in Canal Dover, O.

A new concern, capitalized at $1,200,000, to be known as the Dover Superior Steel Company, has closed negotiations to locate its plant at Canal Dover, O., and will employ 600 men. The promoters of the company are all well known and practical steel men of Pittsburg, Penn., including W. M. Parkin, H. T. Myer, Archie Smith and M. S. Young.

The firm is to manufacture steel bar for automobile chassis and steel furniture. The metal will be received at its plant direct from the Canal Dover furnace and in its molten state. Thirty-five acres of ground adjoining the furnaces have been secured for the erection of the plant.

A good idea of the magnitude of the automobile industry for 1913 can be obtained from the figures of the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf magnetos, and one of the oldest ignition houses in the country. The company has taken one order for 50,000 magnetos from the Willys-Overland Company, Toledo, O., while the orders from the Maxwell Motor Company, the Abbott Motor Company and the Chalmers Motor Car Company will total its production to 100,000 instruments.

OPENS DETROIT BRANCH.

Manufacturers' Traffic Department to Be Located in Ford Building.

Carrying out the plan recently inaugurated by the National Association of Automobile Manufacturers in an effort to assist the railroads of the country in supplying the industry with available freight cars, J. S. Marvin, the association's general traffic manager, has opened a branch office in Detroit.

The object is to keep the railroads closely advised concerning the movements of freight cars carrying automobile shipments from that centre and to assist them in making prompt return of the cars to the Detroit factories. The plan is expected to obviate many of the difficulties which presented themselves during the past season, as a result of which shipments to various sections of the country were considerably delayed.

Mr. Marvin has selected L. A. Gardner, formerly with the traffic department of the United States Motor Company, as manager of the new Detroit branch. His experience in this field is held to be such that there is every reason to believe that the new plan will meet with decided approval from the first.

NEW HENDERSON SIX.

Announcement Coincident with Resignation of C. S. Ricker as Chief Engineer.

Chester S. Ricker has resigned as chief engineer of the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars. In connection with the announcement is the interesting news that a new Henderson six-cylinder model will make its appearance in the near future, carrying a motor of special design, largely the handiwork of Mr. Ricker. Hitherto the Henderson company has manufactured only a four-cylinder car.

In commenting upon his proposed change Mr. Ricker explains that his connection with the Henderson company was largely due to his intimacy with the Henderson brothers, and the opportunity afforded to design a popular priced car embodying the features that in his judgment would represent the trend of the automobile trade. Mr. Ricker will continue as a stockholder of the firm and also remains a member of the board of engineers in an advisory capacity.

TO INCREASE ITS OUTPUT.

Lord Baltimore Truck Company Expected to Erect a Large Factory Building.

The Lord Baltimore Motor Car Company, Baltimore, Md., has announced its intention of greatly increasing its output of commercial vehicles during the present year. John Luntz, Jr., president and general manager of the concern, also is quoted as saying that the firm contemplates the immediate erection of a large factory to produce and market the number of cars it has contracted for.

For several years the Lord Baltimore company has been making commercial cars in a somewhat limited way. The officers of the company are: President, John Luntz, Jr.; vice president and treasurer, John Luntz, Sr.; secretary, J. Elmer Stryker; engineer and designer, Otto R. Bieler.

TWO NEW FIRESTONE MEN.

Bates Heads Pneumatic Tire Sales and Harris Joins Advertising Force.

The Firestone Tire & Rubber Company, Akron, O., announces the appointment of two new men to important places in its official family. George J. Bates has assumed charge of the sales in the pneumatic tire department and Roy C. Harris becomes assistant advertising manager. Both will reside in Akron.

Mr. Bates has a wide circle of friends in the industry, having been connected with the production and sale of tires for a long period. He goes to the Firestone company from the Diamond Rubber Company of Akron, with which concern he has been a department manager for the past five years.

George J. Bates, Sales Manager, Firestone Tire & Rubber Company.

Mr. Harris has been in charge of sales and publicity for the Vreeland Chemical Company of New York City for the past three years, and previous to that connection he was with the Crasselli Chemical Company of Cleveland, O. Although not quite as well known in the industry as Mr. Bates, Mr. Harris comes to his new duties with a thorough knowledge of advertising and business methods.

Twenty-nine governors have named delegates to represent their states in the second federal aid good roads convention called by the American Automobile Association to take place at Washington, D. C., March 6-7. Correspondence with the executives in the remaining states indicates that the representation may eventually cover the entire 48 commonwealths.

GARAGE ACCOUNTING SYSTEM.

Practical Method That Eliminates Waste and Provides Accurate Knowledge of Gross and Net Revenue and Expense in Four-Department Station.

THAT any business can be operated successfully without an adequate method of account keeping seems impossible, but it is a fact that many public service stations and garages have done so for several years. That their owners were able to show a profit is indication that dividends were possible despite slipshod methods. The proprietors in many cases realized that their business had grown from a small beginning to such proportions as necessitated additional investment to provide suitable buildings and equipment. They believed their plants possessed much greater earning power than was evidenced by their balance sheets, but to locate the shrinkage appeared almost a hopeless task.

The income of the plant was known to be much greater than at the start, yet the owner knew also that his profits were no more, if as great as in the days when the business was in its infancy. Clearly, something was wrong, but how to provide a remedy? System was found to be the only cure for this condition and consequently the task of selecting one applicable to the garage business proved to be imperative. Leaks must be stopped wherever found and a system sufficient to cover all phases of the business must be adopted.

The first requisite of a successful system is its simplicity, for an unwieldy and complicated set of books will more than likely lead to the hopeless entanglement of one making no pretensions to being an expert bookkeeper. Therefore, only systems at once simple and effective, which have been in use a sufficient length of time to recommend them, are sought. Many first class, practical garage mechanics have entered business for themselves and while they understand their line thoroughly, their knowledge of bookkeeping is of such indefinite proportions that the mere suggestion creates an impression of additional complications. However, it is possible to adopt a method of keeping accounts that will be simple and at the same time answer the purpose efficiently.

The system described herein has been utilized in a garage service of moderate proportions for some time and has proved its usefulness. In order to fix responsibility absolutely and keep an expense account of each department, this system was devised, after the business had been divided into four departments—sales, supplies, garage and repair.

Each department is apportioned its share of fixed charges, such as rent, interest, light, power, water, heat, advertising, office expense and salaries. This is based on the expense of the previous year, averaged for each month and each item. This permits comparison with any previous or corresponding month or with the average month. In the bookkeeping there is a ledger account for each department, in which is charged all the expense for each division. To the credit is placed all the earnings, the balance indicating the profit or loss. The sales for each day are posted to the credit of the department, but in the sales department the total cost and total sales are the principal items of record.

The stock is so arranged that attention is attracted to every department, and is grouped according to its make and size. Most of it is placed in locked compartments and on shelves and bins to prevent indiscriminate handling by the curious, to the detriment of the goods. The show cases are also closed in such manner that the stock carried on display cannot be reached except by those who have rightful access. Thus an undue depreciation of stock is prevented. System also prevents a shrinkage in the stock room.

A summary is made each month which includes 13 totals of items, as illustrated in the accompanying blank, a glance at which is sufficient to indicate the expense, cost or revenue of any

	Cash Sales	Charge Sales	Total Sales	Cost	Net Receipts	Sales		Supplies		Garage		Repairs	
						Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.
Storage	$100	$150	$200	$50	$200					$250	$50

Net Profit							$785		$105		$70		$80

Summary Sheet for Combination Agency and Garage, Showing Transactions of Each Department, with Cost, Gross and Net Receipts, the Fixed Charges and Net Profits of the Entire Business.

of the several departments. The first column is that of the cash revenue from storage of cars, labor, battery charging, and sale of gasoline, oil, tires, parts accessories and cars; the second, of charges made of similar transactions; the third, the total income from each source, which should equal the totals of the first two columns. The fourth column shows the expenditure charged against each item; the fifth, the difference between the receipts as shown in the third column and the expense as shown in the fourth. The third, fourth and fifth totals show gross and net revenue and expense. The sales, supplies, garage and repair departments are each shown in four additional columns by receipts and expenditures, as taken from the items of revenue in the first five columns, the footings giving the total receipts and expenses of each department. Thus a complete and separate account of the entire business is maintained which is a source of ready reference.

The sale of oil, gasoline, waste, carbide, grease and the like, and the storage, washing and polishing are sources of revenue in the garage, while the labor and the parts sold are credited to the repair department; the sale of tires and accessories to the supplies department, and the sale of cars to the sales department. The advantage of having each supply locked up, with the keys in charge of the foreman is at once apparent.

During Day Yes		50
Over Night Yes	1	00
Washing Yes Polishing Yes	1	50
Gas 10 gal. Oil 1 gal.	3	00
	6	00

Form 1, Storage Tag.

As in many garages it had been the custom for amateur mechanics to enter and work upon their own cars, using wrenches and other tools. At the conclusion of their work, if they returned the tools in as good condition as when they borrowed them, which was quite unlikely, they borrowed a small quantity of gasoline to cleanse their hands. This was freely given, but upon figuring that several such incidents occurred daily, a gallon of gasoline quickly disappeared in this manner for which there was no return. The garage was thus deprived of a certain revenue to which it was entitled.

With tools, oils and all materials under lock and key, this loose practise is stopped, and as the business of the garage is doing repair work of all kinds, the customer now is forced to appear at the office and state his needs. A man is assigned to the job and although it may be a simple one requiring a few minutes, the garage profits by a rightful nominal charge. If the job is of such nature that no charge is made, it still has gained by a saving of its tools in the hands of an experienced workman, and of gasoline which the customer would have used to clean his hands. The patron is quick to realize this and the fact that he is not charged unless the job is of sufficient magnitude is proof that he is being treated fairly.

REPAIR TAG

Adjust brake-bands; adjust universal joint; change carburetor; straighten mudguard; repair speedometer shaft.

Form 2, Repair Tag, Reverse of Storage Tag.

In the garage all sales are recorded by sales slips with carbon copies so as to indicate both cash and charge transactions. In the service records, in the event of a transient customer, the storage tag as shown at form 1 is filled out and attached to the car. This specifies the kind of service, with charges against each item, and a total is made. When the car is delivered the tag is re-

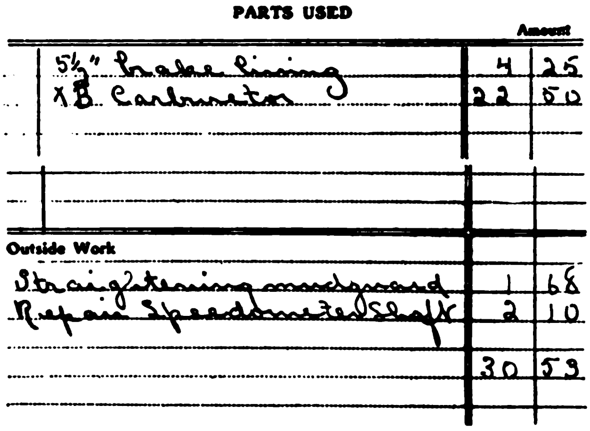
moved and a copy or receipt is given to the owner or driver. In case of repair, the reverse of the storage tag is filled in with necessary instruction. This tag is designated as form 2. When the car is received by the repair department a record is kept through the different stages of the work. This is on a form shown as 3. Upon it is noted the name of the mechanic, the dates and the number of hours of work each day. On the reverse of this form the record is continued under a summary which includes every component supplied from the stock room under "parts used," and "outside work," which defines whatever may not have been within the facilities of the garage shop. This is shown at form 4, and completes a record of the entire job which is returned to the office by the foreman with the notification that the car is ready for service.

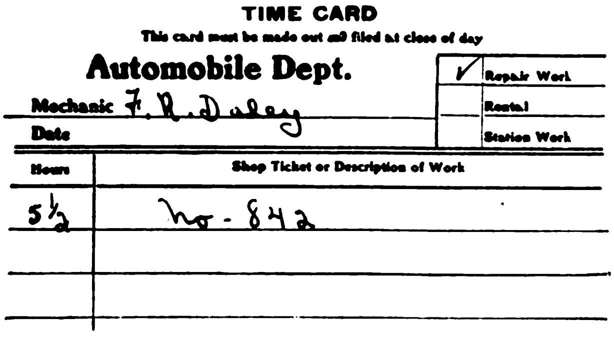


PARTS USED

	Amount	
5½" brake lining	4	25
X B. Carburetor	22	50
Outside Work		
Straightening mudguard	1	68
Repair Speedometer Shaft	2	10
	30	53

Form 4, Reverse of Form 3.

The owners of cars stored in the garage are required to keep their property in lockers, so that no responsibility for private property is incurred. Responsibility is imperative for the garage business and the cars of transients are kept under lock and key, so that access cannot be gained even by the owner or driver without the knowledge of the garage management. It cannot be too strongly emphasized that care should be exercised in the selection of employees. Good wages should be paid, thereby insuring a class of workmen who will value their employment. There will be less possibility of visitations by their friends, who may be attracted by unprotected property of the establishment.



TIME CARD

This card must be made out and filed at close of day

Form 5, Time Card for Workmen.

In the matter of keeping the time of the workmen each man keeps an account of his time under the direction of the foreman and the cards are each day collected and sent to the office. They are grouped with reference to each job of work and they must coincide with the records of the foreman. The time card is shown as form 5. The repair blank is a bill in itself, from which the outgoing bill is made up and passed upon before being sent to the customer. If the account is paid immediately it is recorded by a sales slip, a copy of which is given as a voucher with the receipted bill, there being two records for the customer and the office instead of one. The sales slip is shown as form 6.

	28	25

Form 6, Sales Slip.

A gasoline and oil schedule with account for every day of the month is made out for every car in live storage and entry is made whenever the tanks are filled. This is original and is kept on file, being a check against sales. A copy is sent to the owner of the car for verification of the items entered on the bill. This shows gasoline in gallons, cylinder, high speed and gearcase oil in quarts, with incidentals and total value. From these slips the charges are made monthly. This slip is shown as form 7.

A feature of the business is found in the fact that the stock is carefully kept and wherever possible stock is tagged and when a sale is made these tags are turned into the cash register. This gives information which permits of frequent ordering and the maintenance of stock to the required volume.

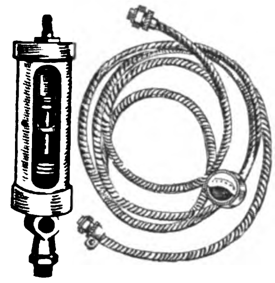
Dewey Power Tire Pump.

The Dewey power tire pump, which is made by the Dewey-Anderson Company, Toledo, O., is actuated by the energy of the motor and is inserted in the spark plug opening. The pump itself is constructed of brass and is designed so that fresh air is taken into a special chamber from the outside and then forced to the tire through 12 feet of rubber hose.



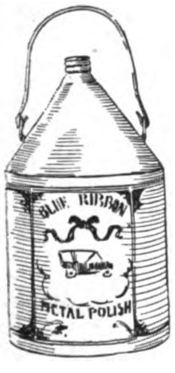
Dewey Tire Pump

The hose is equipped with self-opening connections and is fitted with adapters for any car. A pressure gauge is supplied for determining the desired number of pounds. This pump has given splendid satisfaction and is extensively used. The company will mail full descriptive matter on request.

★

Blue Ribbon Metal Polish.

The International Metal Polish Company, Quill street and Belt railroad, Indianapolis, Ind., manufactures the Blue Ribbon cream metal polish which has, among its other excellent qualities, the ability to remove quickly and easily all tarnish from metal. It is held to be especially adapted for inside metal trimmings and not to soil fabric. This polish does not require any shaking, the ingredients being carefully blended and in the form of an emulsion. It is commonly put up in five and 10-gallon cans for garage and service stations.



Blue Ribbon Metal Polish

In addition, the company produces the Blue Ribbon greaseless cream, an automobile and furniture body gloss and polish. By its use the lustre and gloss of the paint are restored and in addition to leaving a highly polished surface, it does not attract the dust. It is also adaptable for cleaning, preserving and brightening leather trimmings. Catalogues will be mailed on request.

★

The Texas Company.

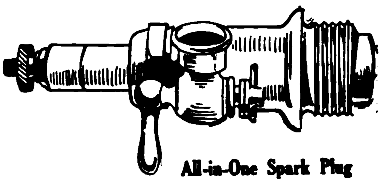
Texaco is an oil made by the Texas Oil Company, New York City, and is guaranteed not to congeal at any temperature down to zero. The Texas company has large oil fields in many parts of the country and its line is complete in every respect. The Texaco engine oils are held to be remarkably free of carbon, thus eliminating all depositing features, and are refined to obtain perfect combustion in engine cylinders at high temperature and also to remain fluid in zero weather. Owing to the special filtration methods it is maintained that the oil will burn up cleanly after performing its legitimate function.

★

All-in-One Spark Plug.

Aside from the installation of a compression relief and priming cock at the top of the shell, the All-in-One spark plug, made by the Frontier Specialty Company, Buffalo, N. Y., is of conventional design. The plugs are of differing shapes and lengths to permit of the installation in motors of various types, whether conventional, horizontal or with recessed plugs.

These are especially adapted for engines which are not equipped with compression release cocks, either for automobile or marine purposes. By priming the motor at the spark plugs starting is facilitated under any circumstances, while cleaning the electrodes, etc., may be accomplished without difficulty by use of gasoline. Kerosene may also be used for freeing the rings, piston, etc., of carbon deposits.



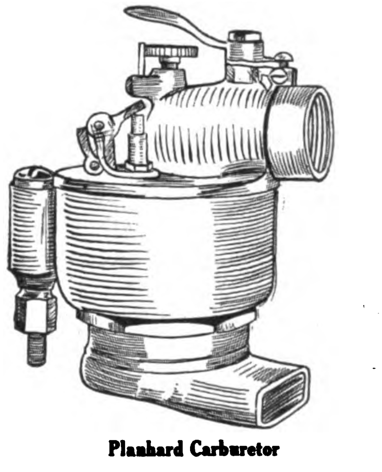
All-in-One Spark Plug

★

Planhard Carburetor.

Planhard carburetors are the product of the Planhard Manufacturing Company, Kokomo, Ind., which has its general sales offices at Philadelphia. These carburetors make for simplicity, as they have no springs and but one spraying nozzle, which is located in the centre of a cup shaped member and surrounded by a constant air opening.

Air is admitted through this opening at low and intermediate speeds, but at the increase of speed of the piston, its suction lifts one or more balls in a plate surrounding the fixed air passages, increasing the amount of air admitted. This plate is adjustable and is fitted with six balls. A concentric float is utilized, enclosing the upper fixed air passage. This is equipped with a priming device and controlled in the usual manner. The needle valve proper is adjusted underneath and locked by a wing nut. It is claimed that with the Planhard carburetor a perfect mixture is obtainable and that economy of fuel is secured. Dealers are invited to write for descriptive matter and price list.



Planhard Carburetor

REGISTRATION INDICATES A MILLION CARS.

WHILE it is impossible to secure complete figures regarding the registration of automobiles and motorcycles in all of the 48 states of the Union, as some commonwealths have no registration law and the licensing of cars in others is by local ordinance or with county officials, statistics from 37 states and the District of Columbia show that there were listed 970,327 vehicles at the close of 1912. It will be admitted that in certain instances these figures will include some duplication of cars, but when the number of machines in use in the other 11 states is taken into consideration, this will be more than offset. The conclusion must be that there are now in use in the United States more than 1,000,000 motor vehicles.

Photo Copyrighted, Underwood & Underwood, New York.

Motor Traffic on Fifth Avenue, New York City.

The information contained in accompanying table was secured by the Accessory and Garage Journal from state officials, with two exceptions. In one instance the figures are the statement made by the manager of a leading commercial body in a state which does not require registration by law. The classification is as it appears on the books of the state officials, and it will be noted that in some instances this is with all types of vehicles in one list, while in others there has been distinct attempt to keep a separate listing.

It will be seen that there are no entries for the states of Arizona, Colorado, Florida, Idaho, Kansas, Louisiana, Nevada, Oklahoma, South Carolina, Texas or Wyoming. The District of Alaska and the Insular possessions also are omitted. Local ordinances exist in Colorado, Louisiana and Wyoming, but only in a few cities. In Texas registration is with the county clerks and in South Carolina with the clerks of the county courts. There are no registration laws in the other states named, save Florida and Oklahoma, from which no returns were received. The figures for Montana are those supplied by the manager of the Commercial Club of Helena, and are regarded as conservative.

While it is true that some machines have been registered in two states, these comprise a comparatively small percentage. Taking Massachusetts as an example, there were 881 licenses issued to non-residents in 1912, or about 1.51 per cent. It may be stated that this number is not included in the accompanying tabulation for that state, but if the same ratio were to hold throughout the country the total result would not be affected materially.

There is one other point which must be taken into consideration. In some states perpetual registration is still in vogue, while in others the life of a registration is three years instead of one. It would be impossible to arrive at an exact determination of the cars in use in these commonwealths without analysis of each state law. There seems little doubt, however, that when allowance is made for all duplications, the number in serv-

ice in the 11 states not included in the tabulation will not be equalled. The conclusion that there are at present 1,000,000 motor vehicles in use in the United States must be regarded as conservative. Incidentally, the figures presented offer opportunity of possibilities for future business.

MERCER'S YEAR BOOK.

Work of Beck Engraving Company Reflects Characteristics of New Series.

Among the many very pleasing catalogues calling attention to the products of various manufacturers in the automobile industry, the year book issued by the Mercer Automobile Company, Trenton, N. J., is particularly appropriate. It is the product of the Beck Engraving Company and the illustrations and typographical work are worthy of special mention.

The reputation gained by Mercer cars in road and track contests during 1912 is reflected in both text and illustrations, scenes depicting some of the most notable events in which Mercers contended with honor being reproduced. The main portion of the book is devoted to a detailed description of the new series with photographs of the cars in settings bringing out their features in a pleasing manner. The various components of the chassis are similarly treated.

NEW TIRE CONCERN.

Capitalized for $250,000 and Will Erect Factory in Louisville, Ky.

A new concern, to be known as the Speedway Tire Company and composed of business men in Louisville, Ky., Atlanta, Ga., and other cities, is to establish a factory at Louisville for the manufacture of pneumatic and solid tires for motor vehicles of all types. A repair department will be one of the features of the plant. The capitalization of the new company is announced to be $250,000.

Harry L. Lewman, president of the Lewman-Cox Realty Company and chairman of the board of directors of the Falls City Construction Company of Louisville, has been elected president of the new concern, while L. D. Lewman of Atlanta, president of the Manhattan Construction Company of New York City, is first vice president. Other officers are: Second vice president is Fred Haupt of Louisville; treasurer, W. N. Cox, president of the Louisville Public Warehouse Company; secretary, Dr. Fred L. Koontz.

G. W. Greens, one of the most experienced rubber men in the country, who has been in charge of a large plant in the East, has been engaged as manager and has begun his active work, orders having been placed for the necessary machinery to begin operations. As soon as a site can be selected the company intends to build its own plant. About 200 men will be employed at first.

LION PROPERTY SOLD.

Chicago Concern Files Bid Which Proves Acceptable After Week's Delay.

According to advices from Adrian, Mich., the property of the Lion Motor Car Company of that city, which met with reverses shortly after the destruction of its plant by fire early last year, has been sold to Samuel Winternitz & Co., Chicago, for $13,000. The appraised value is understood to have been $33,000..

The bids were opened by Lee E. Joslyn, referee in bankruptcy, the largest being $7000, and the sale was postponed one week, in view of the discrepancy between the highest bid and the appraised valuation. In the meantime the Strong, Carlisle & Hammond Company of Cleveland, O., entered the lists, with the result that the price was advanced to $13,000.

EMPIRE TIRE REORGANIZATION.

Two Older Concerns Combine with Increased Capital and Facilities for Production.

The Empire Tire Company and the Empire Rubber Manufacturing Company, both of Trenton, N. J., and controlled practically by the same individuals, have been combined under a new organization to be known as the Empire Tire & Rubber Company. The capitalization of the new concern is $1,000,000, of which $500,000 is preferred stock and the other half common. This represents an increase of $450,000 over the capitalization of the former companies.

There has been no material change in the official personnel of the concern. C. Edward Murphy will continue to direct the affairs as treasurer and general manager. The other officers are: President, Charles H. Baker; vice president, J. Cornell Murray; secretary, A. Boyd Cornell.

TO MANUFACTURE BODIES.

Los Angeles Concern Increases Facilities to Meet Additional Demand for Product.

The Kribs Auto Works, Los Angeles, Cal., has just installed several of the largest and most modern machines used in building automobile bodies and this department has been put in charge of a corps of experts. The company is now established in its new place of business on 10th street and is prepared to handle all kinds of automobile work.

The heaviest demand recently has been for painting and the building of fore doors on old models. A large number of orders are also being received for truck and delivery car bodies. Many of the trucks sold in Los Angeles and vicinity are without bodies, the merchants preferring to have special designs built to order, a practise which has resulted in increased business for the Kribs Auto Works.

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS:
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.
Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Entered as second class matter Dec. 30, 1911, at the post-office at Pawtucket, R. I., under the Act of March 3, 1879.

PRICE OF GASOLINE.

The price of gasoline has advanced from 50 to 80 per cent. since about the first of the year and there does not appear to be any immediate suggestion that this fuel will be produced in such quantity as to warrant a reduction in cost. Contrary to popular belief, the difficulty does not rest with the refineries, which are found to be totally incapable of supplying at a reasonable figure the enormous demand created during the past few years by the immense growth of the automobile industry. There appears, however, to be no satisfactory solution of the problem save the adoption of a suitable substitute for gasoline.

Logically, this should be kerosene, which is less costly and more plentiful. It is more or less well known that engineers have been at work along this line for the past year, at least, but probably the reason the kerosene carburetor has not been introduced is because the public has been very well satisfied with gasoline. With the continued rise in price, however, this satisfaction promises to be short lived and an insistent demand for a substitute fuel may soon be expected to call forth an efficient kerosene carburetor.

TIRE MILEAGE GUARANTEES.

The action of the tire section of the Motor & Accessory Manufacturers in adopting a new form of tire guarantee in which the stipulated mileage feature was eliminated, has occasioned much discussion among producers, dealers and users. There has been some disposition to feel that the step was decidedly radical, and no doubt dealers will be called upon to interpret its effect upon the product handled by them.

The consensus of opinion among manufacturers appears to be that each company is left free to make adjustments upon such basis as it sees fit. It seems logical that every effort will be made to protect the dealer and user, as heretofore, but the very apparent desire is to enable the producer to protect himself against what he believes to have been a questionable practise on the part of certain interests.

NATIONAL VS. LOCAL SHOWS.

Shortly after the close of the recent New York show, President Albert L. Pope of the Pope Manufacturing Company, Hartford, Conn., addressed a letter to the various car manufacturers throughout the country suggesting the advisability of abandoning the national shows in New York and Chicago. The resulting discussion has resolved itself into a question of the relative merits of the national and the local display.

Many makers appear to favor a proposition involving the support of local dealers in holding annual shows in the various centres throughout the country, instead of concentrating time, effort and money upon a national display in one or two of the largest cities. The question becomes one of reaching the largest number of prospective purchasers and in the most advantageous manner. It is pointed out that the Boston show, which always has been a dealers' display, is the largest and best business exhibition of the year. There seems to be no reason why similar results could not be secured under like conditions in New York and Chicago, for example. The problem is being given serious consideration and the resulting decision will be based entirely upon the best interests of the industry as a whole.

To foster trade and correct alleged abuses the garage owners of Brooklyn, N. Y., have incorporated a board of trade. Organized co-operation seems to be necessary, for although the maintenance of public garages is of comparatively recent origin, it has developed into immense proportions and attracted men of standing, who have too frequently been the victims of unfair measures.

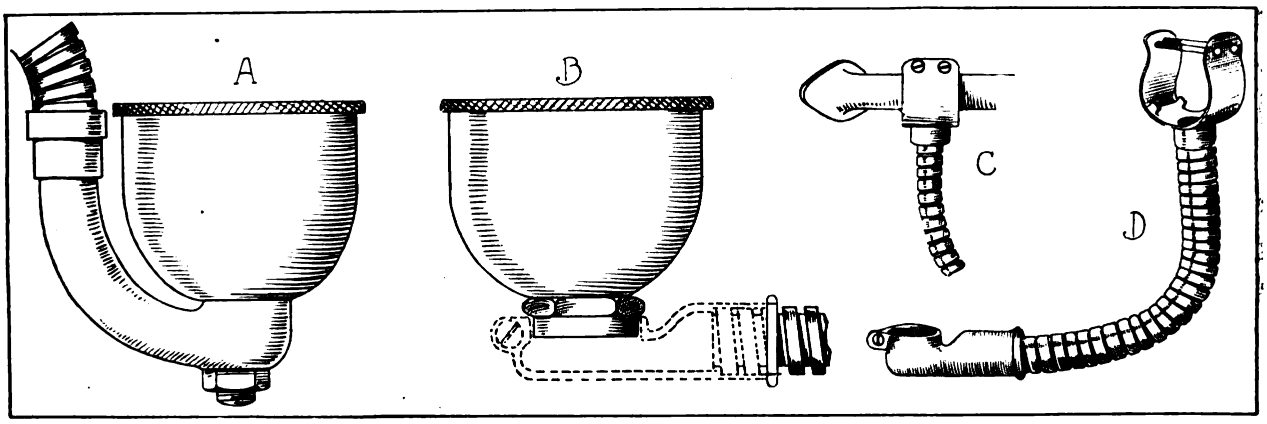
Mechanical Pointers for Garagemen and Repairmen

HOT AIR IN CARBURETION.

Carburetion is an important factor with the gasoline automobile, and motorists are continually experiencing more and more difficulty in obtaining a mixture making for easy starting and successful operation. When it is considered that the function of the carburetor is to blend certain proportions of vapor and air, and to maintain the proper values at varying motor speeds, it may be said truthfully that the manufacturer has made considerable progress towards perfecting the vaporizer. With motor fuel becoming heavier and heavier, the problem of carburetion is receiving greater attention from motorists than formerly when a more volatile fluid was utilized.

During the past year the fitting of carburetors with chambers for utilizing heated water or hot air to facilitate vaporization has become more noticeable, and many car makers also are employing a flexible tubing for conveying the heated air of the exhaust pipe to the air inlet of the vaporizer.

To understand the function of the heated air and its proper application it should be borne in mind that the air drawn into the carburetor by the suction of the piston, passes over the spraying nozzle and the vapor is mixed with it, creating what is termed the mixture. The more perfect the mixture the quicker it burns and the more complete is the combustion. Rapid evaporization of the fuel is desirable and it is important that the mixture reach the combustion chamber without the value being changed.



Utilizing Heated Air Makes for More Efficient Carburetion in Cold Weather: A, Application of Col-Mac Hot Air Pipe to Schebler Vaporizer Having Elbow Bend; B, Showing Clamp for Attachment to Another Design; C, Method of Attaching to Exhaust Pipe; D, Flexible Tubing, Hood and Clamp.

It is held by one maker that air should be taken as free from atmospheric moisture as possible. He maintains that dried air will absorb moisture, that of the vapor, much more quickly and more perfect carburetion is obtained as a result. It is held that air should be taken into the cylinders as nearly as possible to atmospheric pressure and that expanded air is not desirable. Taking in dried, warmed air results in a slight expansion, but not to a harmful degree as the cold of the vacuum in the mixing chamber absorbs the heat and contracts the air quickly to less than its original volume.

Using heated air from the exhaust is not new, but considerable improvement has been made in its application. The adoption of flexible metal tubing makes for compactness and ease of installation. This is noticeable in the Col-Mac, manufactured by the Breeze Carburetor Company, Newark, N. J., various applications of which are shown in accompanying illustrations. It comprises a hood for attachment to the exhaust pipe, a suitable length of flexible tubing and means for securing the pipe to the main air port of the carburetor.

The size of the tubing conducting the heated air is important and while flexible piping could be attached by anyone familiar with it, the desired results might not be secured. The Breeze company conducted a series of tests before marketing its product, the experimentations including all types of motors and carburetors, and by giving the make of vaporizer, size, model and year of car, proper size is assured the purchaser.

The hood device is easily attached, being equipped with threaded bolts, which when removed permit of slipping the hood over the exhaust pipe. The hood is kept away from the exhaust member by upset brass pieces. This space permits the drawing in of primary air which is heated before it passes to the air intake of the carburetor. It is held that greater suction is possible because of the tubing.

Where there are two air intakes, an auxiliary and a main, and the latter contains the gasoline jet, the hot air pipe is attached to the main air permanently by a suitable fitting. Where the main and auxiliary air are taken through one port a larger tubing is required, for example, with the Schebler shown at A. On the 1.25-inch model D, and where the main and auxiliary air ports have been combined, tubing of 1.25-inch size is utilized.

A quality of the hot air intake device, in addition to making for successful carburetion, is that the entrance of dust or dirt is prevented. Some early designs of cars do not include a pan or undershield, the absence of which exposes the carburetor to foreign elements, allowing raw air to be drawn in and affecting vaporization. It is held that starting is aided in that a greater suction of air is made possible by the use of the tubing and that after the first few explosions hot air is drawn over the spraying nozzle.

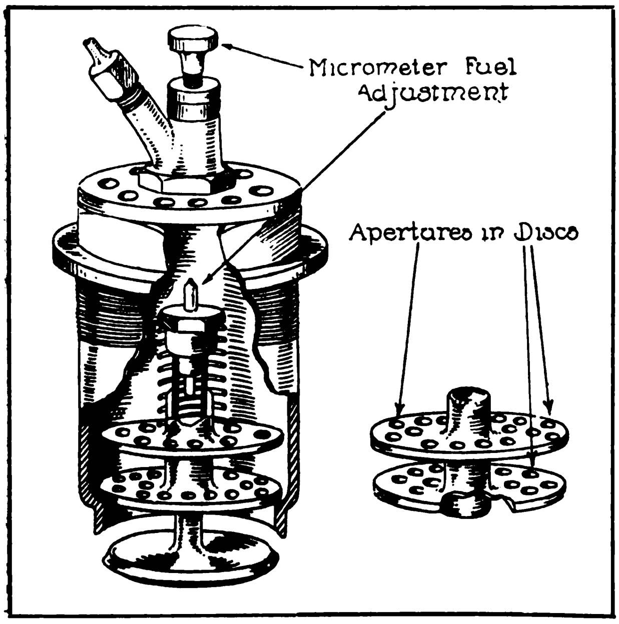


Fig. 1—The Carlton All-Fuel Carburetor, a Valve Type of Vaporizer Having Double Discs.

CARLTON ALL-FUEL CARBURETOR.

Some time ago attention was called in these columns to the development of the heavy fuel vaporizer abroad and to the compactness of one design, that of the Durr. A device that is claimed to be even smaller than the Durr is the Carlton all-fuel carburetor, an English design, mention of which was made in the recent issue of the Commercial Motor.

A quality of the Carlton emphasized is that gasoline, benzol or kerosene may be successfully vaporized, although starting is not possible with the heavier fuel without resorting to heating. As will be noted by the drawing presented at Fig. 1, the vaporizer is of the valve controlled type and the principle of operation is said to be such that the several fuels may be successively employed without any alteration or adjustment, and with a clean exhaust.

It will be noted that the feed may be regulated by a screw arrangement and that the needle, which is spring mounted in the top of the induction valve itself, sits directly into the bottom orifice of the fuel pipe. The feed arrangement is therefore extremely simple, and as ample means of adjustment are provided, there is practically nothing to do after the first setting.

One of the interesting features of the vaporizer is the double-disc baffle plate, in which a large number of holes are so drilled relatively as to be in no sense opposite to each other. This results, it is stated, in a high degree of atomization of the fuel as it is drawn past the discs and onwards into the induction pipe.

PISTON RING CLAMP.

While it is an easy matter for the workman to replace a cylinder over the piston rings when aided by his helper, it is sometimes troublesome when the work is attempted alone. There are various methods employed, also clamping devices, but that illustrated at Fig. 2 E is of particular value in that it may be operated easily and individually.

It is made from sheet metal, rolled to the form shown at D and provided with two wings or extensions to take a threaded bolt carrying a wing nut. The clamp is slipped over the piston and rings, and the nut screwed up, compressing the rings into place. The cylinder is then slid over the piston, and the tension of the clamp relieved. As the cylinder moves downward, it will slide the clamp along. The piston should be well lubricated before the device is secured to prevent binding.

RENEWING TEETH IN FIBRE WHEEL.

The repairman is often called upon to exercise his ingenuity in making repairs, especially when the owner cannot wait for a new part to be shipped from the factory. An instance of this kind occurred recently when a fibre timing gear became damaged through a small piece of metal getting between its teeth when the motor was operating.

A piece of square fibre was secured, this being slightly wider than the thickness of the wheel. The latter was then sawed as shown at Fig. 2 B and the surfaces smoothed up with a file. The block of fibre was cut to make a driving fit, after which a template was made from the good teeth, for marking off the required members on the insertion. These were cut with a hacksaw, smoothed and trued with a file, after which two circular brass plates were turned up and placed in the position shown at C. The plates were then secured by rivets.

MORGAN TOOL HOLDER.

A handy tool holder, in that it combines the function of a number of similar devices, is the Morgan, manufactured by B. Morgan of Newport, R. I., and shown at Fig. 2 F. It is made in three sizes, A, B and C, respectively, A and B being designed for service with tool post holders on 12-14 and 10-12 inch lathes.

The holder is constructed from hardened steel, accurately machined, and will hold securely round, flat, square, hexagon and shaped tools in the tool post from the largest size of tool to a No. 60 drill. The two machined parts are held together by a slotted link, keeping them parallel as regards side motion, but allowing the two parts of the holder to swing around to a straight line and to reverse their position.

The heavy portion of the holder has a deep V slot on one side and a hair line on the opposite, while the smaller or lighter bar has a V slot on one side and is plain on the other. The V slot in the lighter portion registers with the deep V slot in the heavy section, which enables large tools to be held. When the tool is reversed the small or hair line slot has a plain or blank bar opposed to it, enabling the clamping of the lightest of drills. A complete set of tools is manufactured, there being 11 in all, and the sizes vary according to the equipment. At G is shown the holder on the square and with a diamond point inserted.

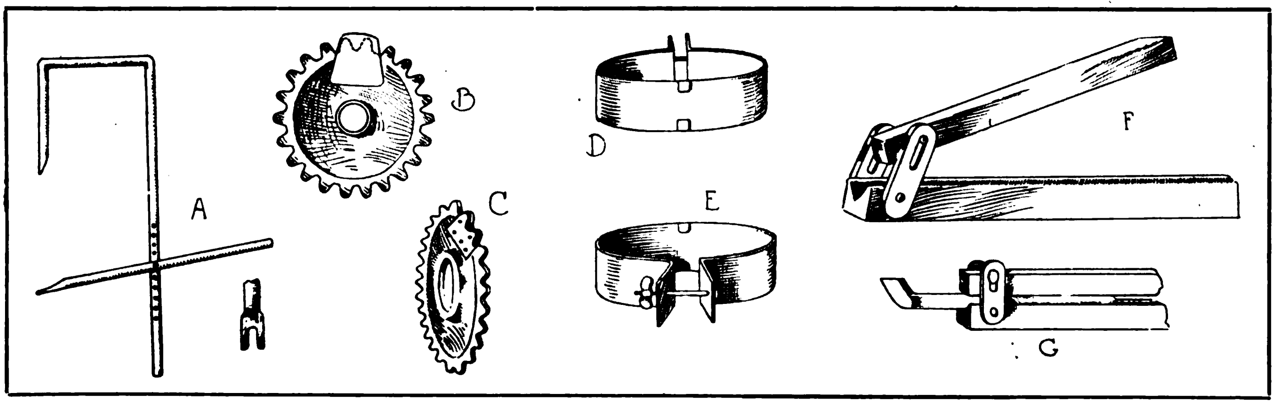

Fig. 2—Tool Equipment for the Repair Shop: A, Easily Constructed Valve Lifter; B and C, Replacing Broken Teeth in Fibre Gear; D and E, Piston Ring Holder; F, Morgan Tool Holder; G, Holding a Diamond Point Tool.

MAKING A VALVE LIFTER.

The average repairman has in his tool kit a valve lifter which he prizes, in that it is suitable for the majority of motors. Occasionally, however, a car will come into the shop to be overhauled and upon disassembling the motor it will be found that the regular valve lifter does not accomplish the work easily.

A simple form of tool for compressing valve springs while retaining key is withdrawn, is presented at Fig. 2 A. It is a common type, but as it is easily made it may be of service to some workman who encounters an engine not adapted to the regular lifter. It will be noted that the fulcrum member is provided with a number of holes for adjusting the lever to varying heights of the cylinders. The retaining bolt is threaded at one end to take a wing nut. The material can usually be secured from the scrap heap.

TRUING GRINDING WHEELS.

It is important that grinding wheels be kept true if satisfactory work is to be expected. Provision should be made for truing the wheel with a diamond, rigidly supported in a most convenient holder, which is the best methed. This produces a true and smooth surface on the periphery of the wheel and enables it to cut smoothly. It is a fundamental principle in grinding that a smoother surface than that of the wheel cannot be produced on the work, and if the wheel is to cut smoothly its surface must be true.

Dressing is not truing, but sharpening the wheel, and a dresser should never be used on wheels that grind round work. When truing a wheel the diamond should be held in a rigid tool post on the table of the machine. Truing by hand with a piece of emery brick is unsatisfactory for producing good work.

HARDENING CAST IRON.

Many times it is convenient to make an article of cast iron that needs to be finished, and which should be very hard. Cast iron can be hardened as easily as steel, and to such a degree that a file will not touch it. Take one-half pint of vitriol, one peck of common salt, one-half pound of saltpetre, two pounds of alum, one-quarter pound prussic potash, one-quarter pound of cyanide of potash, all to be dissolved in 10 gallons of soft water. Heat the iron to a cherry red and dip it into the solution. If the article needs to be very hard, heat and dip the second or even the third time.

CORRESPONDENCE WITH THE READER.

Function of Spiral Springs.

(132)—To settle a debate in regard to the use of two spiral springs situated at the base of the steering gear tubing, one on the lead rod and the other on the throttle rod on a model T Ford, I would like to have your opinion as to the purpose of these two springs and the duties they perform. C. R. H.

Somerville, Mass., Jan. 28.

The members referred to are employed for preventing the movement of the levers except when desired by the driver, or in other words, the springs retain them in the position in which they are placed by the driver.

The spark and throttle levers are a part of the rod extending through the tubing housing to the steering column, being bent at the top to form the control members. Each lever has a tooth or sharp edge which meshes with similar teeth on the stationary ratchet plate affixed to the tube member.

At the bottom of each rod is placed the spring referred to and its function is to restrict the upward movement of the rod, yet at the same time permit the lever to be moved over the teeth. The tension of the spring is sufficient to hold the lever in the position set. If these springs or a similar arrangement were not employed the lever would move freely, resulting in the increasing or decreasing of the lead or the opening and closing of the throttle when not desired.

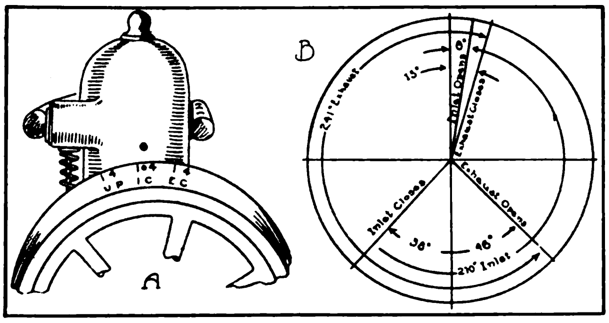

Fig. 1—Valve Timing with Unmarked Flywheel: A, Showing How Cylinder May Be Prick Punched and Flywheel Marked After Degrees Are Laid Out by Diagram Indicated at B.

The design has been employed by the maker of Ford cars for some time, it having been fitted to the early models, and it may be stated that it is distinctive of the Ford product. It rarely gives trouble and is easily operated and adjusted as to wear.

Valve Timing.

(133)—I have an old car and in overhauling the motor removed the camshaft without marking the gears for remeshing and these were not marked at the factory. I wrote the maker for the timing plan and received it, but the flywheel is not marked with the valve openings and the plan sent me is for degrees. The diameter is 17 inches. How should I go about it to put back the camshaft? READER.

Louisville, Ky., Feb. 8.

To replace the camshaft and remesh the gears it should be borne in mind that having the timing order and the diameter of the flywheel the gears should be meshed so that the cam actuating the intake valve of the first cylinder should begin to move and lift the valve when the flywheel is rotated a certain number of degrees.

Assume that the motor is a four-cylinder unit and the valve timing is as follows: Intake opens eight degrees past upper dead centre and closes when it is 38 degrees past lower dead centre. The exhaust opens 46 degrees before the lower dead centre and closes 15 degrees past upper dead centre. This indicates that the inlet opens and closes late and that the exhaust opens early and closes late.

The flywheel being 17 inches in diameter it is a simple matter to lay out the degrees on its periphery or lay the latter out by inches. The figures will be as follows: Inlet valve opens late 1.1875 inches, closes late 5.65625. Exhaust valve opens early 6.84375 and closes late 2.234275. Top and lower dead centres are essential and these may be secured by turning the flywheel until the pistons of the first and fourth cylinders are at the top. Mark the flywheel for these positions and make a prick punch mark on the rear cylinder as indicated at Fig. 1, A.

Next measure off 1.1875 inches on the periphery of the flywheel to the right and the inlet valve opens late. Turn the flywheel to the left until the mark registers with that on the cylinder and replace camshaft, meshing the gears in such manner that the inlet valve of the first cylinder will begin to lift. After fitting the camshaft rotate the flywheel in the direction opposite to which it travels and then move it to the left to make sure that the inlet valve of the first cylinder starts to lift when the mark on the flywheel coincides with that in the cylinder.

The timing may be checked up for each valve to make sure the setting is correct by measuring off the distances on the flywheel and marking these with a prick punch. Assuming that the firing order of the motor is 1, 3, 4, 2, the marks on the flywheel will be as follows:

1-4, I-O ....inlet valves 1 or 4 open
1-4, I-C. ....inlet valves 1 or 4 close
1-4, E-O ....exhaust valves 1 or 4 open
1-4, E-C ....exhaust valves 1 or 4 close
2-3, I-O ....inlet valves 2 or 3 open
2-3, I-C ....inlet valves 2 or 3 close
2-3, E-O ....exhaust valves 2 or 3 open
2-3, E-C ....exhaust valves 2 or 3 close

The setting of each valve may be tested by rotating the flywheel in the normal direction until the mark on the flywheel for the inlet valve of the first cylinder registers with that on the cylinder and the balance of the valves are checked in a similar manner. If the valve lifting mechanism is adjustable, it can be changed to correspond with the marks on the flywheel.

Functions of Charts.

(134)—I notice from time to time a chart or diagram used in some of the articles appearing in your magazine, especially in connection with stories on electric lighting. The application is not clear to me. Why and what are they for? PUZZLED.

Sumter, N. C., Jan. 12.

The charts or diagrams referred to are utilized to illustrate the performance of the dynamo, for instance, and provide a compact and clear method of showing the characteristics of the machine. The lines or curves represent the actual performance at varying speeds, loads, etc., and any number of lines may be employed, depending upon what is to be shown.

A chart utilized in connection with a dynamo and for illustrating its output and the variation of the voltage of the battery, is depicted at Fig. 2, and an explanation of the curves will best illustrate the function of the particular chart. It will be noted that at the extreme left of the squares is a vertical row of figures with zero at the bottom and 13 at the top. These are marked amperes. At the right is another series of vertical figures, from zero to eight, and marked volts. The horizontal line of figures, starting with zero and ending with 3000, denotes the revolutions a minute of the dynamo. At the top of the chart, running from left to right, starting with zero and ending with 66.7, is the line representing the car speeds.

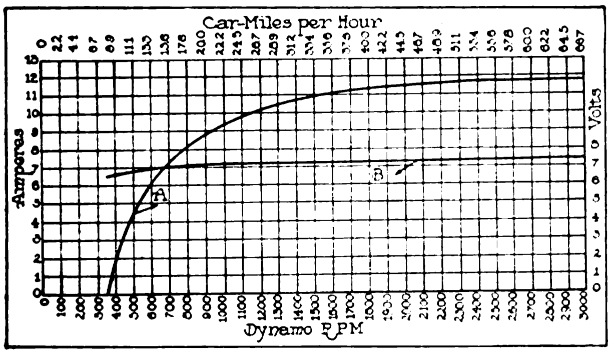

Fig. 2—Chart Utilized to Show Volume and Current Curves of Dynamo Wound for 12 Amperes, Also Voltage Variation of Battery.

This chart is intended to show the voltage and current curves of a dynamo wound for 12 amperes. connected to a six-volt battery which is fully charged and not supplying current to the lamps, for example. It will be noted that there are two curves, one marked A and the second B. The former represents the current and speed characteristics of the dynamo with no current being drawn from the battery, although the cells are being charged by the generator.

This curve starts at the bottom of the chart between the figures 300 and 400. As these represent the speed of the dynamo, it is obvious that the current is cut-in at 350 revolutions a minute. As the output or amount of current of a generator increases proportionately to the speed, the number of amperes will increase correspondingly. The line shows a gradual curve beginning at 350 and moving upward and to the right until the dynamo attains its maximum output of nearly 12 amperes at the highest point of the curve which is at about 2500 revolutions.

It is an easy matter to ascertain the number of amperes at any stated revolution above 375. For example: The output in amperes of the dynamo at 1000 revolutions a minute is desired; the 1000 mark on the lower horizontal line is located and followed upward vertically until the line intersects the curve, which in this instance would be slightly over nine. This shows the ampere output, and that for any speed may be determined similarly.

The upper horizontal row of figures shows the car speed corresponding to that of the dynamo. For example: If the output is 11 amperes and at 1500 revolutions a minute of the dynamo and the car speed is desired, find 1500 on the lower horizontal row and follow the vertical line to the top, where it will be seen that the car speed for this ratio is 33.4 miles an hour.

In this chart the engineer desires to show the voltage variation at the battery when the latter is being charged and the dynamo is operating over a range of from 350 revolutions a minute to 3000. This is represented by the curve lettered B and the volt column is at the right of the chart. At 350 revolutions, when the current is cut-in to the battery, the voltage is 6.5. This is seen by following the vertical row of figures at the left of chart. Beginning at 6.5 volts the rise of the curve is very gradual and slight, being but one volt from 350 to 3000 revolutions a minute. This demonstrates that the voltage is held steady, a point the engineer wishes to emphasize.

The chart shown at Fig. 3 is similar with the exception that it explains the action of a dynamo wound to generate 16 amperes. In connection with this drawing it will be noted that curve A represents the current and speed characteristics, while B shows the voltage at the battery as with the chart depicted at Fig. 2. Curve A of the second chart shows that the maximum output of the dynamo is attained at 2000 revolutions a minute and that it is held constant at higher and excessive ratios.

Charts are usually employed by engineers as they give essential information in a very compact and comprehensive manner.

Fitting Lighting Dynamo.

(135)—Am seriously considering fitting a lighting dynamo to my car and wish to locate it on the transmission housing as there is not room on the motor because of several accessories such as the power tire pump, etc. Cannot the generator be driven off the clutchshaft by chain, belt or gears and how would the dynamo have to be geared? SUBSCRIBER.
Pensacola, Fla., Jan. 26.

The dynamo could be located as stated, although the majority of generators are mounted near the power plant and drive is taken from the crankshaft or camshaft. The method of installation and ratio of drive would depend upon the machine, the make of which was not given, and the dynamo. They are driven at varying speeds according to the design.

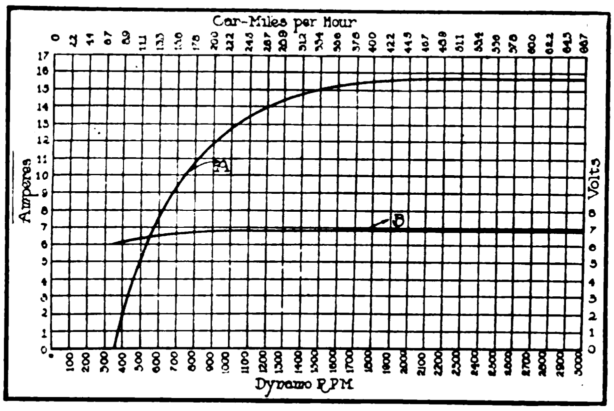

Fig. 3—This Chart Differs from That Presented at Fig. 1 in That the Output of the Generator Is 16 Amperes.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

The Security Ford License Holder, made by the Security Company, 14 Shingiss street, Pittsburg, Penn., is designed for model T Ford cars and a feature emphasized by the maker is that it permits of attaching the license plate to the right hand light bracket instead of the radiator. The holder comprises a split clamp member for securing it to the lamp iron while the lower part of the device is adjustable, permitting of the use of several sized plates.

Security Ford License Holder

Takoff is produced by Hopewell Bros., Newton, Mass., and is a pumice hand soap paste, made especially for mechanics and those desiring a mixture which will remove all grease and grime from the hands without injury to the skin. It lathers easily and only a small quantity is necessary. It contains no acids or injurious chemicals, and is held to be aseptic. It comes in a neat can and is inexpensive.

—— ★ ——

The Dewey Power Tire Pump is manufactured by the Dewey Anderson Company, 420 Knapp street, Toledo, O. It is very light and compact, is but 12 inches in length, and being of brass cannot rust or corrode. All working parts are accurately machined and the pump may be installed permanently on the motor by the utilization of a special connection made by the company. This is accomplished by using a priming cock opening. The Dewey may also be used by removing a spark plug and screwing the pump into the opening by hand. Another method is to tap one of the valve plugs, connecting a tubing with the pump which may be located as convenient. Pure air is taken into the pump and forced to the tire through an ample length of hose having a woven cloth covering, the proper pressure being indicated by a dial pressure gauge.

Wall's Perfect Valve Grinder, made by J. H. Wall, 290 Hope street, Bristol, R. I., will appeal to owners of model T Ford cars, in that the valves may be ground without removing them or displacing the cylinder head. The grinder is so designed that the rotating member engages with the pin securing the valve spring collar, the tool being fitted by lifting the valve spring slightly. A little kerosene is applied to the valve which cuts the carbon, and by working the handle of the grinder back and forth, a rotating movement is imparted. This loosens all carbon and cleans the seat perfectly, insuring proper compression and maximum power. If the valves have been neglected for any great length of time, and are in bad condition, an abrasive may be employed and the tool utilized without removing the valves or head. The grinder is constructed of high grade material, will endure indefinitely and simplifies the work of keeping the valves and seats in proper condition. Each tool is guaranteed.

Wall's Perfect Valve Grinder

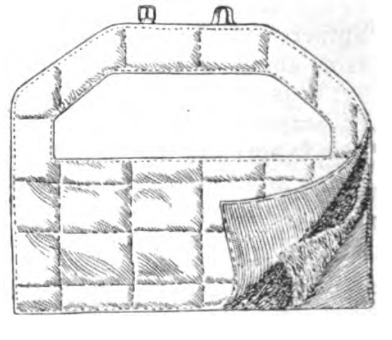
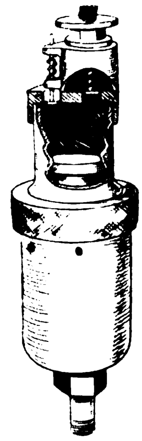
The J-M Keystone Radiator Shield is marketed by the H. W. Johns-Manville Company, New York City, and is constructed for attachment over the front surface of the cooler, keeping the water and motor warm when the machine is left exposed to the cold. It consists of a thick layer of cleansed cattle hair neatly quilted between two layers of water proof imitation leather, and nicely stitched. A flap is provided for exposing the upper part of the radiator when the car is being operated and for closing when the machine is standing.

J-M Keystone Radiator Shield



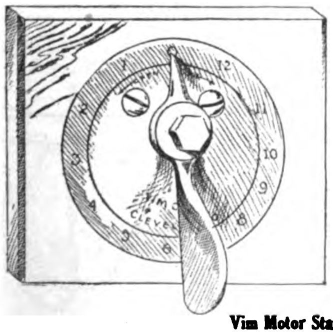
The National Power Tire Pump, manufactured by the National Motor Supply Company, Cleveland, O., is a compact unit and is fitted in the spark plug opening of the cylinder. The design is such that it will operate equally well on small or large motors and will inflate the largest tire in a very short time. The National takes in and pumps fresh air to the shoes, by means of an inlet and outlet valve, these being actuated by a leak proof piston. An air receiving chamber is located between the outlet valve and tubing for the purpose of storing the compressed air and allowing it to flow gradually during the downward stroke of the piston. The rubber tubing is 12 feet long, covered with woven cloth, and a pressure indicator is fitted. Special connections are utilized. High grade material and workmanship are incorporated.



National Power Tire Pump

*

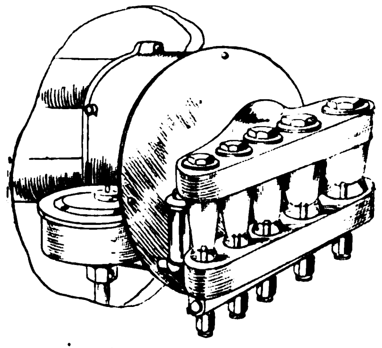
The Vim Motor Starter, marketed by the Vim Manufacturing Company, Cleveland, O., is of the acetylene type, priming the cylinders with a proper mixture of the gas and air, the explosive vapor being fired by the ignition spark. The acetylene is led from the tank to the dash, thence to the intake manifold of the motor and the control unit is of special construction. This not only is operated easily from the seat, but it is held by the maker that it is impossible for the acetylene to leak. The dash device is very neat, comprising a numbered dial and a lever. By moving the latter to the proper number the desired mixture is secured. The Vim motor starter is very compact, weighs slightly over a pound, and the maker states it may be fitted in 30 minutes.



Vim Motor Starter

*

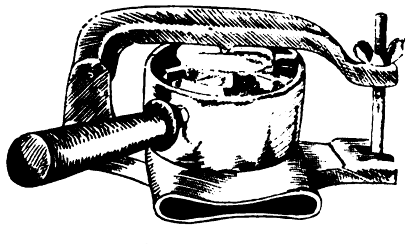
The Gardner Visible Carburetor is the product of the Gardner Carburetor & Brass Works, Shreveport, La., and differs from those of ordinary construction in that springs are eliminated. A feature of the device is that its action is visible, the mixing taking place in a row of graduated glass tubes on the dash in plain view of the driver. Each mixing tube has a separate nozzle and needle valve for controlling the flow of gasoline, and the effect of the adjustment is indicated. By utilizing several mixing tubes it is held that greater flexibility is possible, as well as economy of fuel. Heated air is utilized and a fluid gauge is part of the equipment.



Gardner Visible Carburetor

*

The Shaler Vul-Kit has been brought out by C. A. Shaler, Waupun, Wis., to meet the demand for an efficient, low priced vulcanizer of the automatic type. Its simplicity of operation will appeal to motorists not familiar with repairing inner tubes as all that is necessary is to fill the puncture with new rubber, clamp down the vulcanizer, fill and light the generator. The latter is supplied with gasoline which when ignited, automatically produces the proper temperature for curing the rubber. A universal clamp insures proper pressure and a special handle permits of removing the vulcanizer when hot without danger of injury to the operator.



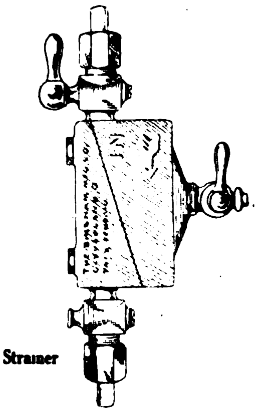
Shaler Vul-Kit

*

The Phinney-Walker Keyless Clocks, marketed by the Coward Auto Supply Company, Boston, are made in several styles and finish to match the trimmings of the car. A feature of the clocks is that they may be wound by rotating the rim. The construction is designed to prevent theft. They are neat in appearance, reliable time keepers and adapted for hard usage.

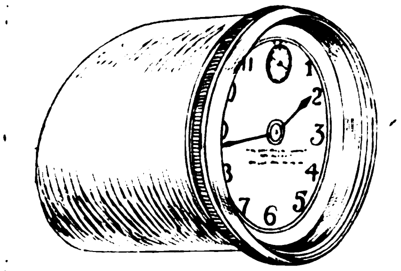
*

The Shurecleen Strainer is produced by the Bingham Manufacturing Company, Cleveland, O., and is a compact device for separating water and foreign elements from the fuel. It is designed for attachment in the main line between the supply tank and the carburetor and differs from those of conventional practise in that three petcocks are fitted. One controls the flow of liquid to the filter, the second



Shurecleen Strainer

shuts off the fuel to the carburetor and the third is utilized for removing all accumulations or for drawing off gasoline if desired. The device is moderately priced.



Phinney-Walker Keyless Clocks

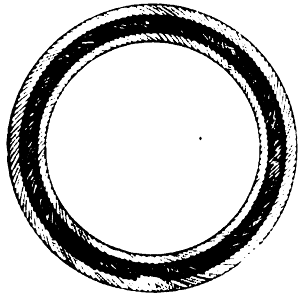
★

The Miller Self-Vulcanizing Tube, marketed by Chas. E. Miller, Anderson Rubber Works, Anderson, Ind., is designed to automatically seal any openings or punctures. It comprises a layer of plastic rubber between two walls of cured rubber and when the tube is punctured the opening is filled by the plastic material which forms into a solid mass. It is constructed for both motorcycles and automobiles and the maker points out that it contains about four times as much rubber as the ordinary tube. It is also held that the plastic material will not dry out or lose its efficiency under severe service.

★

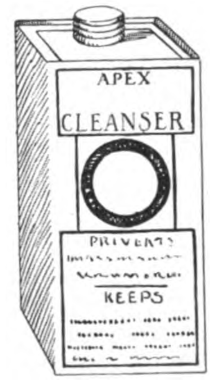
The Apex Radiator Cleanser is produced by the United States Compound Company, Buffalo, N. Y., and by placing a small quantity in the cooler and allowing it to remain about a week, all scale, etc., is dissolved. The water is drawn off to remove the foreign elements and a slight amount of the cleanser added to the fresh supply. This keeps the radiator in a clean and efficient condition and prevents injury through the use of hard water.

Miller Self-Vulcanizing Tube

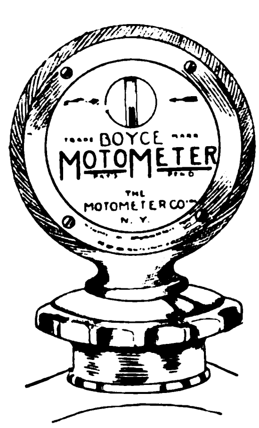


★

The Motometer, marketed by the Motometer Company, Inc., 1784 Broadway, New York City, is a compact device for mounting on the radiator cap and its function is to register the temperature of the water, thereby preventing damage to the motor through overheating or by freezing. Between two crystals retained in a casing, is a silvered dial, indicating the temperature readings. A special red fluid is actuated by the heated air between the water level and roof of the cap and its height is plainly discernible on the dial, being read easily from the seat even in the night time. The Motometer will register from zero to the boiling point of water, is very compact and attractive, and is easily installed. It is gold or nickel plated as desired.



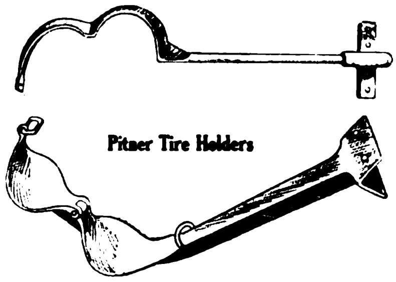
Apex Radiator Cleanser



Motometer

★

The Pitner Tire Holders, manufactured by the Pitner Pump Company, Chicago, are designed for cars using platform springs. They carry one or two spare shoes and being constructed of malleable iron will withstand severe service. They come complete with straps and all fittings, are nicely finished in black and are inexpensive.



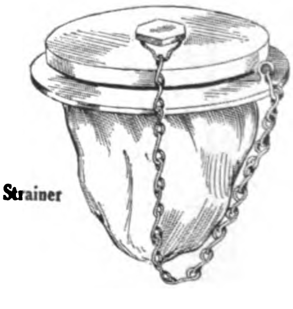
Pitner Tire Holders

★

The Liggett Tank Strainer is manufactured by the Liggett Spring & Axle Company, Cleveland, O., and is designed for three purposes, a filling hole for the fuel tank, a funnel and a strainer. A flange is fitted to the tank and the cap is provided with a chain attached to the flange member. The strainer member consists of a chamois and may be removed easily for displacing water or foreign elements when desired. The maker holds that the chamois has as much surface as an eight-inch funnel and that the diameter of the hole, 3.25 inches, permits of cleaning the fuel tank. The strainer is of polished brass, very light and easily attached.

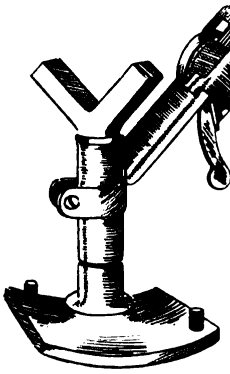
★

The Morgan Friction Igniter is manufactured by B. Morgan, Newport, R. I., and although designed for lighting the acetylene lamps of the motor car, it also may be utilized with the household illuminating gas. It is very compact and is attached to the acetylene burner by a screw actuated clamp which slips over its base. The igniter is operated by a lever



Liggett Tank Strainer

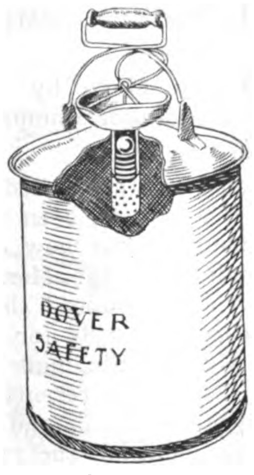
which when lifted and allowed to snap back, produces a shower of sparks in the path of the escaping gas. The friction material is inexpensive and may be replaced when worn.



Morgan Friction Igniter

★

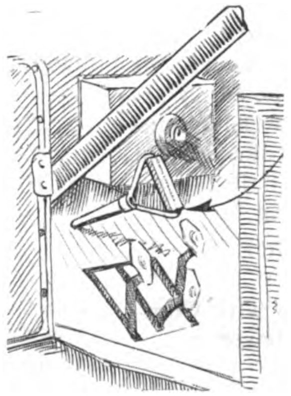
The Dover Safety Gasoline Can is a new product of the Dover Stamping & Manufacturing Company, Cambridge, Mass., and among its practical qualities is a self-closing feature which prevents the evaporation of the fuel, as well as eliminates opportunity of explosions. The device comprises a large brass ball ground into a valve and normally held closed by a spring. The valve member is surrounded by a gauze chamber, preventing fire reaching the vapor or contents of the can when pouring or filling. In the five-gallon size the valve opens and closes automatically when pouring, but cannot open accidentally. On the one-gallon and one-quart sizes the valve is held open by a slight pressure of the thumb, closing when released. The cans are constructed of heavy galvanized steel, painted red and stencilled "Gasoline." Economy of fuel is effected by the air tight qualities. The containers are moderately priced.



Dover Safety Fuel Can

★

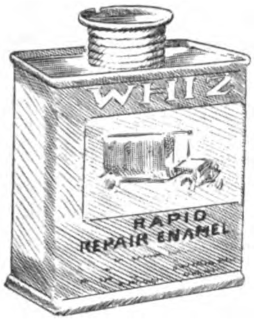
The Triplex Motor Starter is the product of the Bremer-Wilson Manufacturing Company, 1256 Michigan boulevard, Chicago, and is designed especially for model T Ford automobiles. It operates on the mechanical principle, a handle being conveniently located at the base of the dash and within easy reach of the driver. The starting mechanism is secured to the crankshaft of the motor and is actuated by a chain carried in a suitable casing and connected to the handle member. By pulling the latter a quick movement is imparted to the crankshaft and in the same direction as when the engine is rotated by the usual starting crank. The mechanism is such that a back fire breaks the contacts. It is pointed out by the maker that the simplicity of the design is such that the device may be installed in an hour and that no drilling or mechanical work is necessary. The fitting does not interfere with the usual starting handle, which may be employed in the ordinary manner when desired.



Triplex Motor Starter

★

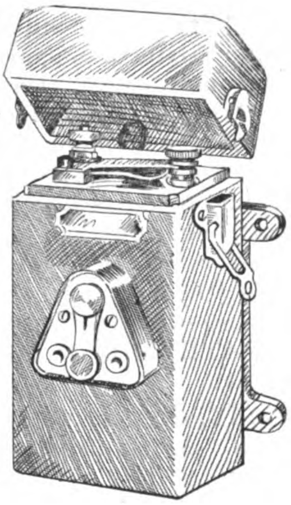
Whiz Rapid Repair Enamel is manufactured by the R. M. Hollingsworth Company, Camden, N. J., expressly for quickly repairing the enamelled parts of automobiles and motorcycles. Its function is to conceal disfigurements which would otherwise detract from the appearance of a car, and when applied to wood, metal or upholstery, dries in five minutes, leaving a hard, smooth and water proof surface. It comes in half-pint cans.



Whiz Rapid Repair Enamel

★

The New York Master Vibrator is manufactured by the New York Coil Company, 338 Pearl street, New York City, and also is designed for model T Ford automobiles. The vibrator is of special construction and the maker states that the condenser is unusually powerful. The vibrator synchronizes the spark and is connected in series with the regular coil, the vibrators of which are short circuited. This eliminates the trouble of adjusting extra units and makes for more power in that accurate timing of the spark is made possible. The contact points are of platinum-iridium, and the maker states that they seldom require attention.



New York Master Vibrator

PEERLESS' EXPANSION PLANS.

With Additional Capital and New Stockholders Decided Growth Is Anticipated.

The Peerless Motor Car Company, Cleveland, O., maker of Peerless pleasure and commercial cars, is planning to increase its truck business in 1913, and has raised its authorized capital from $3,000,000 to $10,000,000. Several new stockholders have taken personal interest in the concern, among whom are: F. S. Terry, H. A. Tremaine, B. G. Tremaine, J. B. Crouse and J. Robert Crouse.

REORGANIZING KNOX COMPANY.

Will Specialize in Six-Cylinder Pleasure Cars, Fire Apparatus and Martin Tractor.

Arrangements for the reorganization of the Knox Automobile Company, Springfield, Mass., maker of Knox pleasure and commercial vehicles, are in progress. The company was recently petitioned into bankruptcy and Edward O. Sutton, Harry G. Fisk and Charles C. Lewis of Springfield were appointed receivers. It is reported the company will standardize the manufacture of six-cylinder pleasure cars, the Martin tractor and fire apparatus.

BUYS FISK RUBBER STOCK.

John N. Willys Purchases Interest in Tire Company Seeking Massachusetts Charter.

John N. Willys, president of the Willys-Overland Company, Toledo, O., maker of Overland cars, has purchased an interest in the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires. It is stated that Mr. Willys' purchase is merely in the nature of an investment in a substantial firm and he will not become an officer or director of the company, taking no active part in its management. Harry T. Dunn, president, and Harry G. Fisk, secretary-treasurer, holding the majority of the stock. The company, which was a Delaware corporation, is being reincorporated under Massachusetts laws and the Massachusetts company will take over the assets of the Delaware concern. The authorized capital is $15,000,000.

PATHFINDER DRIVERS NAMED.

Robert Speigel and Dr. Charles G. Percival Will Act as Cross Country Pilots.

When the Indiana automobile manufacturers hold their third annual tour, which this year will be from Indianapolis to the Pacific Coast, one or more Pathfinder cars, made by the Motor Car Manufacturing Company, Indianapolis, will be entered. These machines will be driven by two well known veteran cross country pilots. One of these is Robert Speigel, who achieved considerable fame in the Los Angeles to Phoenix road race, and the other, Dr. Charles G. Percival of New York City, the pathfinder and traveller, who has just written an account under the title of "The Trail of the Bull Dog," of his famous two years' journey of 50,000 miles, extending from Mexico to the borders of the Arctic Circle.

NEW OIL CONCERN.

Invader Oil Company Acquires Business Heretofore Conducted by Chas. F. Kellom & Co.

The entire business and good will of Chas. F. Kellom & Co., Philadelphia, Penn., maker of Invader oils, has been acquired by a new corporation to be known as the Invader Oil Company. T. E. Tomlinson, one of the first men to study the development of special oils for automobile use and who became known nationally as the creator of Havoline oil, will be vice president and general manager of the new concern. Charles F. Kellom will be president and the Kellom manufacturing and selling organization will remain intact.

LEAVES AUTOMOBILE INDUSTRY.

F. E. Dayton Resigns After Long Record with the Manufacturer of Columbia Cars.

F. E. Dayton, who has been sales manager of the Columbia Motor Car Company, Hartford, Conn., maker of Columbia cars, for about 10 years, or since the time of the Electric Vehicle Company, has resigned coincidentally with the announcement of his appointment as general manager of the National Incinerator Company, with executive offices at New York City, a foundry at Albany, N. Y., and erecting plants all over the country.

MAXWELL MOTOR COMPANY.

Declaration of Policy Made by Reorganized United States Motor Company.

The reorganization of the United States Motor Company appears to have been fully accomplished and the name of the new concern has been decided definitely as the Maxwell Motor Company, Inc. It is announced that the concern will produce four models for the coming year, as follows: Maxwell Six, models 40 and 50, formerly the Everitt and more recently the Flanders, and the Maxwell, models 25 and 35, four-cylinder machines. In addition the regular Maxwell, models 22 and 40, and the Stoddard-Dayton, models 30, 38 and 48, will be continued for the present. Owners of Columbia, Brush, Sampson and the other cars formerly made by the United States Motor Company will be cared for by a plant at Newcastle, Ind.

Recent Patents of Interest

Anklam Lamp.

William F. Anklam, Detroit, assignor to the C. M. Hall Lamp Company of that city, has been granted a patent for an electric lamp having an adjustable parabola mirror. The conventional practise is to secure the desired focus of the light by moving the bulb, but in the Anklam device the reflector member is slid backward or forward as the case may be. A post extends from the lamp casing and is provided with a socket for securing the bulb. The reflector is sleeved upon the post and also has a bearing in the cylindrical flange at the outer end of the reflector. A screw adjustment is incorporated, of a thread and nut type, and means are also provided for securely locking the lamp against the entrance of foreign elements.

Hallgren Valve Lifter.

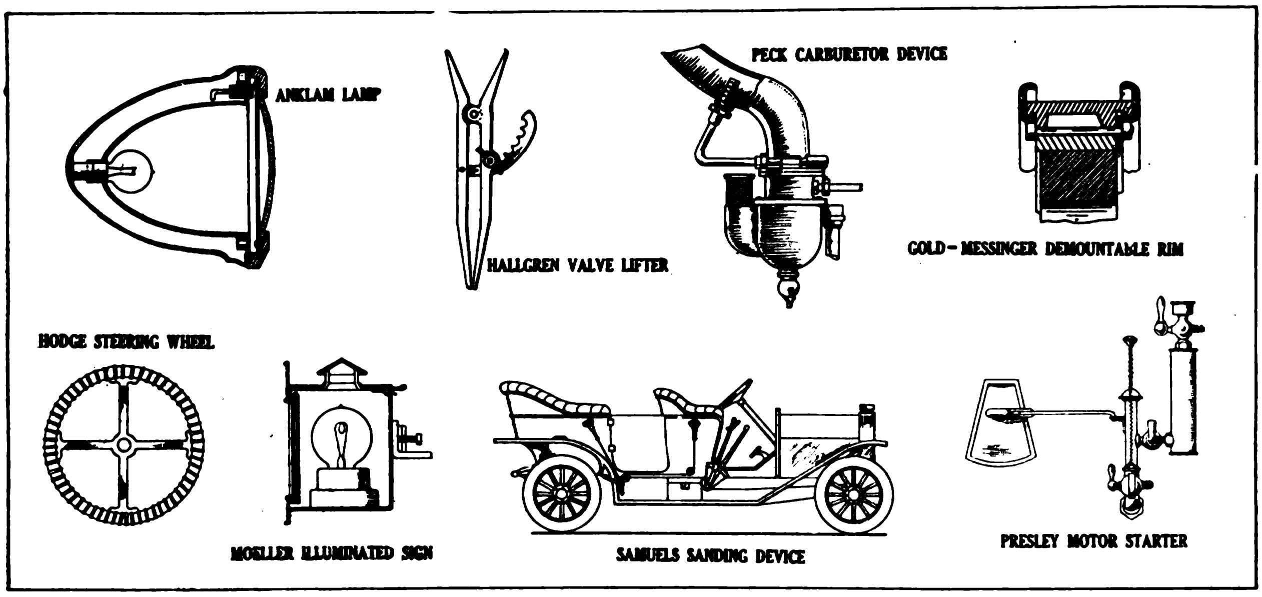
A valve lifting device, in which means are incorporated for locking when desired, has been patented by Bror Cal Ivar Hallgren, Pasadena, Cal. It comprises a pair of levers pivotally connected, and a segmental bar similarly mounted on one of the levers and having a series of recesses. The other lever has a slot through which the segmental bar extends, and a locking pin is pivotally secured to the slotted member. It is adapted in one position of the pin to register with the slot in the lever so as to allow free movement of the segmental bar, and in another position, to enter the slot, engage with one of the recesses and to lock the levers. A handle is provided for locking the pin member. It is held by the inventor that the valve spring may be compressed and the tool locked, permitting the use of the hands in extracting the cotter pin or in working upon the valve mechanism.

Peck Carburetor Device.

Elbert C. Peck, San Bernandino, Cal., has been granted a patent for an air mixing attachment for a carburetor. It comprises a supply duct leading from the vaporizer, a throttle valve rod, a pipe for supplying air to the supply duct and a perforated distributor nozzle. The latter is located at one end of the pipe and is tapped into the supply duct. The other end of the supply duct has an opening therein, a sleeve rotatably mounted, also an opening adapted to register with that of the pipe member. An arm is secured to the throttle valve rod and a similar member on the sleeve, these arms being connected by a link.

Gold-Messinger Demountable Rim.

A patent for a demountable rim has been granted Edgar L. Gold and Jacob H. Messinger, Nazareth, Penn. It comprises a wheel having a demountable rim, the combination with the felloe, and a band around it, whose periphery is flat at one side and flaring at the other and provided with transverse notches. The rim comprises a



Depicting Some of the More Recent Patents Applicable to the Motor Car, Including Valve Lifter, Carburetor Device, Steering Wheel, Sanding Apparatus and Motor Starter.

flat band having an internal bevelled bead at one edge adapted to contact with the flaring portion of the band and a plain bead at the other edge, whose internal diameter is greater than the external diameter of the flat portion of the band. The fastening ring has an axially projecting fin adapted to pass between the plain bead and the flat portion of the band and is pierced with openings registering with the notches. Removable bolts engage the openings and the notches.

Hodge Steering Wheel.

There is a general tendency to employ corrugated steering wheels to provide a better grip. Fred L. Hodge, Middletown, Conn., has been granted a patent for a steering wheel which consists of the conventional web spokes and wooden rim around which are wound coils of wire. The wood is recessed to prevent slipping of the wire which is also passed through apertures in the spokes. Means are provided for locking the ends of the wire.

Moeller Illuminated Sign.

An illuminated sign for motor cars has been patented by Henry A. Moeller, Central Falls, R. I. An electric light is enclosed within a frame member which has an open front. The casing is provided with oppositely arranged perforations and a frame is permanently secured back of the open front of the casing. The latter is also provided with an opening at the top. A transparent sign plate is located within the frame and is fitted with a removable member which secures the plate in position and has pintles which enter the perforations of the casing.

Samuels Sanding Device.

Various methods are employed for preventing the skidding of the car on wet roads, including tire chains and anti-skid shoes, but a novelty is presented in the patent of Lester W. Samuels, New York City, which covers a sanding device for automobiles. The right hand rear fender is constructed hollow and serves as a container for the sand. The lower extremity of the guard is provided with a spout having a valve which is manually controlled. Handles are located convenient to the driver and the occupant of the right hand rear seat, being actuated by a pull rope which opens the valve member, allowing a stream of sand to flow upon the tread of the shoe, providing traction.

Presley Motor Starter.

William J. Presley, Grand Haven, Mich., has patented a motor starter for internal combustion engines. The principle involved is that of priming the cylinders with a combustible fluid when the ignition is cut off and the motor stopped. A reservoir is provided for containing a volatile fluid, such as sulphuric ether, and the top of the container is fitted with a filler member resembling in construction a priming cup. A pump is connected to the reservoir and means are provided for conveying the fluid to the intake pipe or manifold of the engine, as well as a valve for controlling the flow of the liquid. The pump has a projecting plunger rod, spring controlled, also a latch adapted to hold the rod in an outward position with the spring under tension. A rod member connects the pump with the ignition switch and when the plunger is operated, forcing a charge to the cylinders, the ignition is cut off.

OTHER PATENTS GONE TO ISSUE.

Wheel Heater, Earl D. Shannon, Alpena, Mich. The steering wheel is hollow and contains a number of filaments heated by electricity. Means are provided for moving the heating members to concentrate the heat.

Vehicle Headlight, Herman C. Keininger, Pocahontas, Mo. The headlights are actuated by the steering mechanism of the car and move in conjunction with the front wheels.

Sparking Plug, Frederic William Erickson, New York City. The lower extremity of the shell is rounded and the electrode is ball shaped. An opening in the spherical member permits egress of the flame of the ignited mixture.

Electric Lamp Guard, Clarence H. Hunsberger, North Towanda, N. Y. A wire guard for electric lamps designed to be moved. Means are provided for locking the bulbs into position and for removing same when desired.

Carburetor, Charles M. Stroud, Minneapolis, Minn. The carburetor differs from those of conventional practise in that the level of the float chamber is but slightly above the bottom of the mixing chamber. The overflow of the fuel forms a shallow pool for starting purposes.

Igniting Device, Asmus Philippsen, Bridgeport, Conn. A device for igniting acetylene lamps. Sparks are created by a ratchet wheel device contacting with a sparking material.

Cushion Tire, Harrison A. Fry and Guy J. Bruce, Spring Lake, Wis. The interior of the tire is fitted with a holder member in which are located a number of looped springs.

Jack, Le Roy Willour, Ashland, O. The stub shaft is provided with a rotatably mounted wheel having a number of teeth and the operating crank is constructed to engage with the same. Means are provided for securing and reversing direction of the wheel member.

Acetylene Purifier, Albert B. Cobb, Waterbury, Conn. A gas purifier consisting of a casing having an outlet for the gas, a funnel in the top of casing, and a vertically arranged pipe closing the bottom of the funnel and opening into the upper end of the same, and a series of blades swivelled on the pipe below the funnel.

Vehicle Wheel, Charles Whitfield Barrett, San Jose, Cal. A vehicle wheel comprising a pneumatic clincher cushion surrounding a hub and means for securing clincher devices.

Insulating Support, George H. Morris, Glencoe, Ill., assignor to the Electric Storage Battery Company, Philadelphia. An insulating support for storage battery tanks comprising an insulating liquid receptacle having a supporting core of rigid material and a cap provided with yielding material adapted to overlie the core and with a flange or skirt depending around the receptacle.

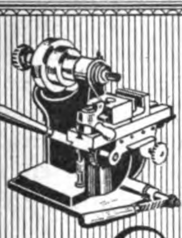
Tire, Heinrich Knoch, Adlershof, near Berlin, Germany. The combination of a felloe and a tire of solid blocks provided with laterally disposed grooves therein, rings sunk in said grooves with their outer faces flush with the outer side faces of said blocks, and means for fitting the flush sides of said blocks and rings for securing the tire to the felloe.

Sheet Metal Cutter, Ephraim L. Schanck, Delaware, O., assignor of one-fourth to M. C. Russell of the same place. A device for cutting holes in sheet metal, comprising a rotary cutting member, a support for same and a handle for actuating the cutter.

Shock Absorber, Thomas J. Mullen and Thomas F. Brennan, New Brighton, N. Y. Comprising an air bag in a reciprocating compression frame with a spring and means for attaching mechanism to the axle and body of vehicle.

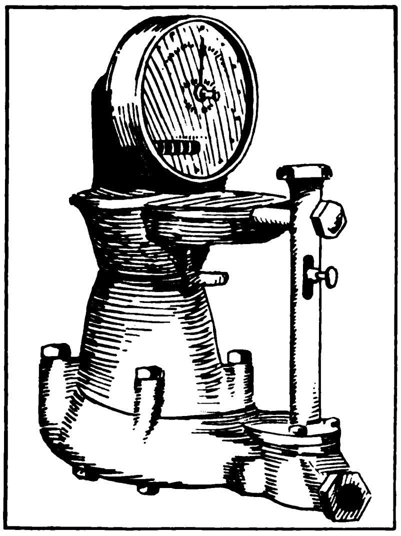
Spring Wheel, George L. Webb, Spencer, N. C., assignor of one-half to Michael L. Kiser, of the same city. The spokes of the wheel are fitted to a socket member and a spring is utilized between the spoke and hub of the wheel. The spring section of the spoke is provided with a packing and the space between it and the hub forms a compression chamber.

Motor Starter, Charles G. Adsit, Detroit, assignor of one-fifth to Sidney B. Winn, one-fifth to George H. Brown, one-fifth to Charles H. Land, Jr., and one-fifth to Nathan H. Jewett, all of the same city. The device comprises a carburetor, a pump and an electric motor to drive the pump. Each cylinder is fitted with tubing having ball check valves, also a solenoid for each valve to lift it from its seat. A rotary selector is connected to the solenoids and means are provided to supply an explosive mixture to each valve casing.



Up-To-Date Shop & Garage Equipment

AMERICAN COMPRESSORS.



Trident Auto-Stop Meter Utilized with Hydraulic System.

The American Steam Pump Company, Battle Creek, Mich., maker of pump machinery, is manufacturing a line of motor and belt driven air compressors for garage and service stations. The design known as size 1 is compact and the entire outfit includes electric motor, compressor, air tank and automatic controller. The last named is mounted upon a slab 14 by 16 inches, with gauge, switch and fuse blocks, and is perfectly automatic in its action, stopping and starting the compressor at adjusted pressure limits, which may be changed readily as desired. The motors are constructed for alternating or direct current, single phase or polyphase and the best of material and workmanship is incorporated.

The compressors have cross heads with adjustable bronze shoes working in bored guides, bronze connecting rods and cranks of forged steel. All bearings are adjustable for wear. The company also manufactures two-stage belted compressors. Special discounts are offered to the trade and a catalogue will be mailed upon request.

LUBRICATING OIL CABINETS.

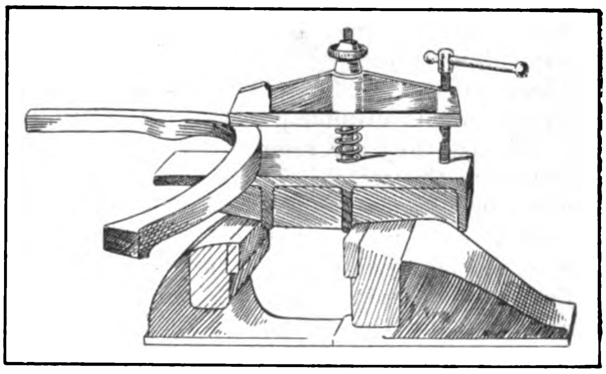
In handling lubricating oil it is important that the fluid be kept free from dirt or dust as the foreign elements act as an abrasive, cutting bearings. The Milwaukee Tank Works, Milwaukee, Wis., is manufacturing a lubricating oil cabinet which is constructed of heavy steel and to withstand severe service. It is provided with a pump of the self-measuring type and pints are handled as accurately as larger quantities. A quality claimed for it is that it will not drip. A lock and keys are fitted if desired. A measuring gauge indicates the quantity of oil on hand. The cabinets are made in barrel sizes, varying from one to five. The smallest member is 17 inches thick, 29 wide and 30 high, and weighs 185 pounds. All cabinets are guaranteed. Catalogue and price list will be forwarded upon application.

SEAMLESS STEEL TANKS.

With the very general adoption of compressed air in the garage and repair shop the use of a tank for storing the air is essential, especially when the compressor outfit does not include one of these members. Janney, Steinmetz & Co., Philadelphia, manufactures a wide variety of seamless tanks for various air installations, as well as for other uses. Catalogue and descriptive matter will be mailed free of charge upon request.

SHAW VISE FOR MACHINE WORK.

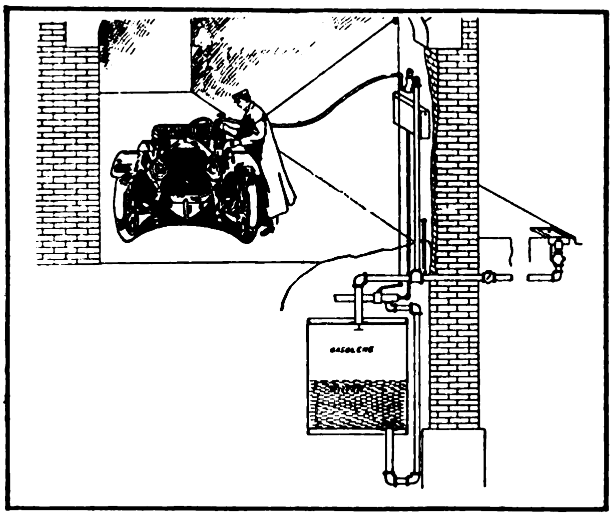
A vise that differs from conventional construction is the Shaw, brought out by an English concern and especially adapted to automobile work. It is a flat vise having a top and bottom grip, comprising a plate having a bolt let into it as shown in an accompanying illustration. A dog plate and a nut are fitted over the bolt member. This device is intended to be held in the jaws of an ordinary bench vise, either of the leg or parallel type, and small finished articles, such as bushings, terminals, small screws, nuts, etc., can be held and worked with ease.



The Shaw Flat Vise, Especially Adapted for Machined Work.

THE HYDRAULIC SYSTEM.

Among the factors of a gasoline storage system to be considered are: Freedom from evaporation, safety and economy of operation. A system presenting interesting features is the Hydraulic, manufactured by the Hydraulic Oil Storage Company, 90 West street, New York City. The principle involved is not new and as the name implies, water plays an important part. It is the difference between the weight of gasoline and water and the fact that these fluids will not mix, that govern the operation of the system.



Showing the Operation of the Hydraulic System and Its Components.

It comprises the storage tank to which is led the water, the fluid being piped to the lower part of the container. The supply or amount fed to the vessel is controlled by a water valve, which member closes the connection between the supply and the gasoline tank. When the lever of the water control valve is lifted, water enters the tank, lifting and forcing the fuel out through the draw-off pipe, thence to the gasoline tank of the car or other receptacle to be filled. A drain is provided for removing the water when the tank is to be refilled with gasoline and this member is automatic in its action, closing when fuel is being drawn from the large tank. The system is operated easily. To draw fuel the lever of the water control valve is lifted as shown in an accompanying illustration.

Clean gasoline is secured through all dirt and foreign elements dropping to the bottom of the tank, whence they are removed when the water is drained as the vessel is being refilled with fuel. The system permits of the use of all the fuel and the container is provided with a gauge member. One of the qualities emphasized by the design is that as the tank is always completely filled evaporation and the formation of combustible gases are prevented. Another feature of the system is that pumps are eliminated and that considerable time is saved as well as fuel.

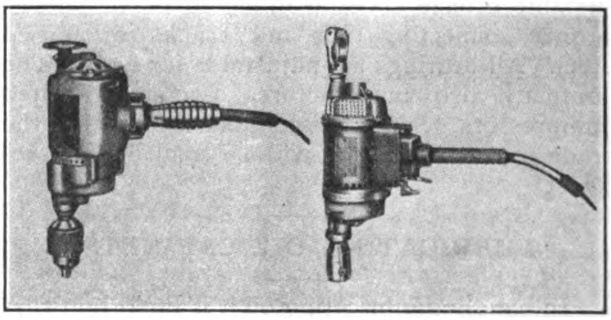
The Trident meter, utilized in connection with the system, is constructed in two forms, that illustrated being designed for garages, service stations, etc., and is particularly adaptable where a large number of cars is to be filled daily. The dial is placed vertically on the meter for convenience in reading and is large enough to be seen for a considerable distance. The main register is known as the straight reading and records continuously up to 100,000 gallons, after which amount is drawn the figures automatically return to zero.

An auxiliary or set-back register is provided, recording in parts of a gallon up to 10. It is so arranged that it can be set back to zero any time by simply turning the hand. For example: If five gallons are desired, when the large hand reaches five, that amount has been drawn. The large pointer can then be turned back to zero. The continuous register denotes the total amount regardless of the number of times this dial hand is utilized. The flow of the fuel after the desired amount is secured is automatically shut off. No gasoline can be drawn without its being recorded and the company holds that this feature enables a check to be kept upon the daily, weekly and monthly sales. Complete descriptive matter will be mailed upon request.

UNIVERSAL ELECTRIC DRILLS.

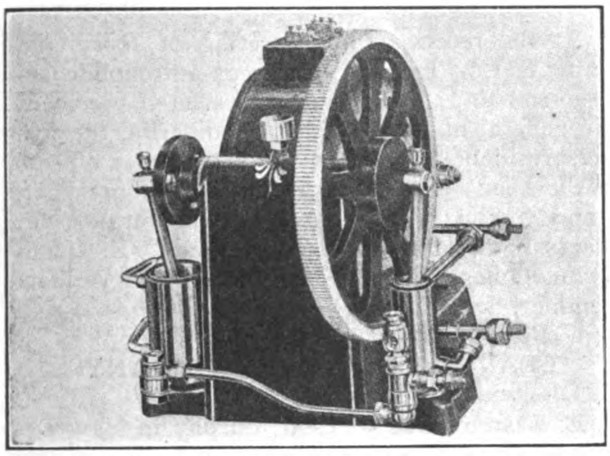
In equipping the repair shop with tools operated by electricity the current, whether direct or alternating, is considered. In the event of a workman being sent to a private garage to overhaul or complete some work on a machine which necessitates the use of a drill, for example, the shop tool may be a direct current instrument and the garage supplied with an alternating current.

The Chicago Pneumatic Tool Company, Chicago, is manufacturing what are termed universal electric drills capable of being operated on direct or alternating current and two types are presented in the accompanying illustration. That shown at the left has a .25-inch capacity for metal work. It is adapted for either 110 or 220 volts, and when operating at its maximum capacity the speed is 600 revolutions a minute. The equipment comprises a breast plate, chuck to take straight shank drills up to .25 inch diameter, and 10 feet of electrical conductor with an Edison connector. The drill weighs about seven pounds, is about 10 inches in height from breast plate to the end of the chuck, and consumes approximately 170 watts at full load.



Universal Electric Drills Operating on Direct or Alternating Current.

That shown at the right in the sketch is adapted for drilling holes in metal up to .5 inch and rotates at 450 revolutions a minute when operating at its maximum capacity. The equipment comprises a spade handle, No. 1 chuck, 10 feet of cord and fused connector, and two extra fuses. A breast plate is supplied in place of the spade handle if desired. The weight of the drill is 22 pounds and the shortest length from breast plate to end of chuck is 13 inches. The approximate energy consumption is 400 watts. It is designed for 110 or 220 volts.



Champion Automatic Compound Electric Air Pump Designed Especially for Garage Service.

AUTOMATIC ELECTRIC AIR PUMP.

A tank of compressed air for inflating tires and for utilization by the customer and workmen, is standard equipment with garages, service stations and tire repair firms. Many of the last named pipe the tank to the street for the benefit of their patrons and this arrangement makes it necessary that the compressor or pump operate automatically to replenish the supply of air whenever it becomes exhausted.

The Cleveland Faucet Company, Cleveland, O., is manufacturing an outfit especially designed for this work and in the accompanying illustration is shown the No. 6 Champion automatic compound electric air pump and automatic switch. It is held that the capacity of the pump is sufficient for the largest garage and that with an 18-gallon tank it will furnish enough air to inflate a large tire every minute and at any pressure. A constant pressure of 100 pounds or less is maintained automatically and the pump operates only when the supply of air is reduced.

The compound pumps are back geared direct to the electric motor, and are constructed entirely of bronze, with valves and connections of the same material. The pistons are water jacketed, maintaining a constant circulation of cool fluid, and a water tank is employed, eliminating the necessity of the continuous city supply. The water tank is substantially constructed and is located approximately 1.5 inches above the return connection.

The automatic switch controlling the pump is simple and the maker emphasizes its durability, also the fact that after installation the equipment requires no other attention than an occasional oiling. It is stated that the pump will automatically fill an 18-gallon air tank at the following pressures: Twenty-five pounds in three minutes, 50 pounds in eight minutes, 75 pounds in 12 minutes and 100 pounds in 16.5 minutes.

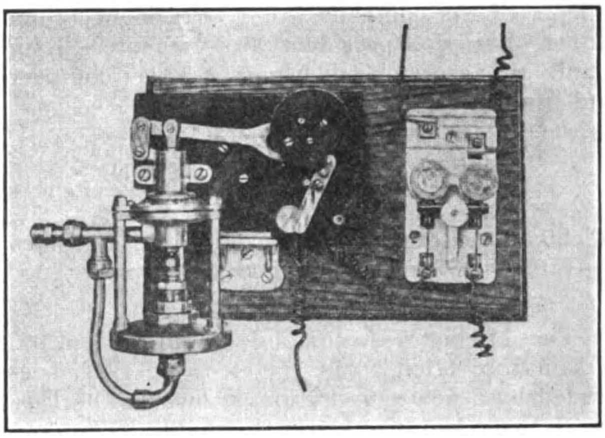
The specifications are as follows: Dimensions of pump, 15 inches wide, 19 inches deep and 18 inches high; switchboard, nine by 14 inches; diameter of large cylinders, 2.25 inches; small, 1.25 inches; stroke of piston, three inches; motor, alternating current, one-third horsepower; direct, .25 horsepower; revolutions, 150 a minute.

COES WRENCHES.

Strength without bulk or clumsiness is a desirable quality of wrenches for the repair shop and the tool must be capable of being handled easily and without bruising or slipping. The all-metal wrench has found favor among workmen owing to its ability to withstand severe usage. The Coes Wrench Company, Worcester, Mass., well known maker of this line, is issuing instructive literature concerning these tools which will be forwarded upon request.

ANNEALING STEEL.

The following formula for annealing steel is given by the D. T. Williams Valve Company, Cincinnati, O.: For small pieces of steel, take a piece of gas pipe two or three inches in diameter and put the pieces in it, first heating one end of the pipe and drawing it together, leaving the other end open to look into. When the pieces are a cherry red, cover the fire with sawdust, and leave the steel over night. A charcoal fire should be employed for this process of annealing.



Illustrating Automatic Switch Utilized with Champion Air Pump Outfit.

The commercial and good roads organizations of Colorado Springs, Col., have started a campaign to have the great ocean-to-ocean highway pass through Colorado.

ADDITION TO PILOT PLANT.

Increased Demand for Product Makes Necessary Securing Large Addition at Once.

The construction of a large addition to the plant of the Pilot Motor Car Company, Richmond, Ind., maker of Pilot cars, has been started and the company will soon be in a position to add to its production in a substantial manner. Large sales of the concern demanded that the capacity of the factory be increased, and according to President George Seidel of the Pilot company, its size will be trebled.

ANNOUNCES NEW DELIVERY CAR.

Baltimore Pleasure Vehicle Manufacturer to Add Commercial Line in Near Future.

Carl Spoerer's Sons Company, Baltimore, Md., maker of Spoerer pleasure cars, will market about May 1 a new 1500-pound delivery wagon, which has been designed by Engineer Morrow. The new wagon has a 30 horsepower, four-cylinder motor and a transmission affording four speeds forward and reverses. The company will continue the manufacture of pleasure cars and will probably enlarge its factory. The officials of the concern are Jacob Spoerer, Charles Spoerer, John F. Reus and B. J. Reus.

TO INCREASE ITS OUTPUT.

Lord Baltimore Truck Company Expected to Erect a Large Factory Building.

The Lord Baltimore Motor Car Company, Baltimore, Md., has announced its intention of greatly increasing its output of commercial vehicles during the present year and contemplates the erection of a large factory to produce and market the number of cars it has contracted for. The officers of the company are: President, John Luntz, Jr.; vice president and treasurer, John Luntz, Sr.; secretary, J. Elmer Stryker; engineer and designer, Otto R. Bieler.

NAMES CAUSE CONFUSION.

Michigan Automobile Company, Ltd., Becomes Fuller & Sons Manufacturing Company.

The Michigan Automobile Company, Ltd., Kalamazoo, Mich., was, on Dec. 31, 1912, succeeded by a new corporation, known as the Fuller & Sons Manufacturing Company. The concern has not made complete cars for a number of years and the recent incorporation of the Michigan Motor Car Company of the same city caused confusion, therefore it was thought desirable to change the name. The Fuller company makes a variety of parts and specializes in selective and planetary transmissions.

ACKERMAN IS PRESIDENT.

Prominent Detroit Accessory Maker Starts New Year Under Satisfactory Auspices.

At the recent annual meeting of Joseph N. Smith & Co., Detroit, maker of automobile accessories, E. L. Ackerman was elected president and general manager, C. E. Chamberlin, the former president, having retired. The other officers are: Vice president and factory manager, James Shand; secretary and treasurer, C. E. Blaesser; directors, E. L. Ackerman, C. E. Chamberlin, James Shand, C. E. Blaesser and William Lemmer, Sr.

LEAVES REO TRUCK COMPANY.

C. E. Easton Joins Gleeson Murphy in New Detroit Advertising Agency.

Charles E. Easton, formerly sales manager of the Reo Motor Truck Company, Lansing, Mich., maker of Reo trucks, has resigned his position to join the Detroit staff of the H. K. McCann Company, advertising agency, of which Gleeson Murphy, formerly with the General Motors Company, is the head. Mr. Easton assumes his new position well fortified with experience gained while occupying several important posts in the advertising field.

SEEKS ANOTHER BUILDING.

Sanford Motor Truck Company Is Preparing for Increased Business During 1913.

The Sanford Motor Truck Company, Syracuse, N. Y., maker of Sanford trucks, has purchased a three-story building of the Syracuse Savings bank and at least 300 trucks, it is expected, will be made this year, more than doubling the output of the plant. The company now has about 50 men on its payroll, but it is anticipated that before the end of the year between 200 and 300 will be employed.

EXTENDS BUSINESS FACILITIES.

Motor Accessories Mart in Chicago Adopts New Plan for Co-Operating with Manufacturers.

The Motor Accessories Mart, Chicago, has made a radical departure from its former line of business, extending its service and placing it on a more practical basis in an endeavor to make its quarters the common meeting place for western buyers and sellers. A salesroom has been opened, devoted exclusively to factory representatives and manufacturers' agents, to whom desk quarters are rented.

Stewart motor trucks, made by the Stewart Motor Corporation, Buffalo, N. Y., are now used as far north as Edmonton, Alberta, Canada, and as far south as Buenos Aires, Argentine.

TIRE PRODUCERS ADOPT NEW GUARANTEE.

DURING the progress of the recent New York show the Motor & Accessory Manufacturers adopted a new form of tire guarantee, the published wording of which is as follows:

> We guarantee all pneumatic motor car tires, bearing our name and serial number, to be free from imperfections in material and workmanship. Tires returned for consideration under this guarantee will be accepted only when all transportation charges are prepaid. If, upon examination, it is our judgment that tires are defective, they will be repaired or replaced at our option.
>
> When tires are replaced by us, charges will be made to owners at the time new tires are delivered, for such amounts as in our judgment will compensate for the service rendered by such replaced tires.
>
> Tires worn out in usual or unusual service, abused knowingly or unknowingly, misused, used on rims not bearing these stamps (———) injured through accident or design, are not covered by this guarantee.
>
> (Name of tire) pneumatic motor car tires are not guaranteed to give any definite miles of service, and any and all guarantees are expressly waived by any purchaser of these tires who uses therein any substitute for air; or who uses them under weights in excess of those for which the various tires are recommended, or who does not keep tires inflated to the pressure recommended by us.

Not all tire producers are members of the Motor & Accessory Manufacturers. Even among those who are members there does not appear to be an agreement with reference to the effect of the action taken. The Accessory and Garage Journal has asked leading makers their opinion concerning the new guarantee and its effect upon the tire industry. Some of these have responded as follows:

You have evidently confused the action of the tire makers in connection with not guaranteeing their tires when any substitute for air is used therein. There is just exactly as good and valuable a guarantee on tires today as there was one week ago. There has been absolutely no change in connection with same.

If you will read the advertising being run by most of the leading tire makers, you will find the guarantee in question therein, and it speaks for itself. It is simply a protective measure of tire makers to do away with the abuses that they have suffered under a guarantee by the use of injurious fillers and attachment of tires to rims not properly inspected, proving them to be suitable for use in connection with tires.

Yours truly,
B. F. GOODRICH COMPANY,
By H. E. RAYMOND, Second Vice President.
Akron, O., Feb. 3.

We do not believe in mileage guarantees for the reason that the properties entering into the use of a tire which determine the mileage that it ultimately gives are not only indefinite, but absolutely beyond the control of tire manufacturers, which necessitates the placing of a mileage guarantee so low to protect against the abused tire, that it is of little value to the careful user.

If a given quality of tire would give a uniform service in miles, a mileage guarantee would be advisable, but let us assume that there are 1000 tires exactly alike placed in service at the same time, the mileage that they give even in the event there are no accidents will vary in accordance with the individual conditions to which they are subjected—several hundred per cent.—which fact is unavoidable and makes impossible a rational mileage guarantee.

A guarantee coupled with the close price competition sets a wrong standard for the direction of the manufacturer's efforts. It offers an incentive to build a tire down in quality that it may be sold at a competitive price until with proper use it will just cover the mileage guarantee, rather than the proper incentive, which is the highest economy and the highest quality which it is physically possible to incorporate in an automobile tire.

Very truly yours,
KNIGHT TIRE & RUBBER COMPANY,
By O. HIBNER, Sales Manager.
Canton, O., Feb. 5.

We understand that this matter was taken up at a recent meeting of the tire manufacturers' section of the Motor & Accessory Manufacturers. We understand that the members present decided to withdraw from the custom which has heretofore prevailed of making adjustments upon a 3500-mile basis. We, however, do not expect to alter our present policy, as we are quite satisfied to maintain the guarantee of 4000 miles for our Vacuum Cup tires and 3500 miles for the plain tread tires.

While we are members of the Motor & Accessory Manufacturers, we are not compelled to adopt the policy which the majority has agreed upon.

Yours truly,
PENNSYLVANIA RUBBER COMPANY,
By H. W. DUPUY, President-Treasurer.
Jeannette, Penn., Feb. 3.

As we understand the guarantee adopted by the Motor & Accessory Manufacturers, each company is left free to make adjustments on such basis as it sees fit. The guarantee adopted is merely an ordinary commercial one. Any reputable manufacturer in any line usually stands ready to make good his product which is actually defective in material or workmanship. The trouble has been that the mileage guarantee on automobile tires has been abused by consumer and dealer alike. The experience of the larger tire companies in this connection has been somewhat expensive, so that it is not surprising that they should attempt to protect themselves against further loss.

Yours very truly,
MARATHON TIRE & RUBBER COMPANY.
By F. KESSER, Sales Manager.
Cuyahoga Falls, O., Feb. 13.

We wish to call your attention to the fact that there has been no change in the guarantee, with the exception that the guarantee does not apply, as in the case of our own tires, when any of the numerous substitutes for air are used, or when our pneumatic tires are applied to rims which do not bear the mark used for the protection mutually of ourselves, the car builder and the car owner.

There has evidently been a misunderstanding on the part of the car owning public as to mileage guarantee. While it is true that some tire manufacturers for their own convenience have taken in the abstract 3500 miles of service as a basis, there has been no guarantee that such a mileage would be given by the majority of manufacturers. It is true that one tire manufacturer openly advertises a guaranteed mileage of much greater than the above mentioned figure. That, however, is the individual policy of that concern, but speaking broadly, there has been no mileage guarantee on the majority of makes of tires, and the action taken was simply for the purpose of disabusing the minds of car owners of the misunderstanding existing on their part.

Yours very truly,
UNITED STATES TIRE COMPANY,
By J. D. ANDERSON, General Sales Manager.
New York City, Feb. 10.

We believe removing the mileage guarantee from pneumatic tires will be a good step in the right direction, as it will protect the manufacturer against misrepresentations which often occur. We believe it would help the user and operator of his car, and eventually mean that the manufacturer would produce a better tire.

Under present conditions it seems to be the aim of the manufacturer to produce a tire that will give a certain amount of mileage at a given value, where on the other hand a tire would have to be made that would stand on its merit alone.

Yours very truly,
FALLS RUBBER COMPANY,
By F. NOLTE, Secretary.

We have for the past eight years given a written guarantee for 5000 miles on Ajax tires and we shall continue to do so.

There is no denying that some of our users have taken advantage of us in making false claims of mileage obtained and thus securing adjustments which probably they may not have been justly entitled to. Yet our experience has convinced us that making a tire of the best materials, compounded scientifically and manufactured with the greatest of care, has justified the liberal guarantee that we have always offered.

Our determination to offer the highest quality tire manufactured, carries with it the further determination on our part to continue our written guarantee of 5000 miles, which accompanies every Ajax tire we sell.

Our claim for existence is quality and our proof of it is our guarantee.

Yours very truly,
AJAX-GRIEB RUBBER COMPANY,
By J. C. MATLACK, Secretary,
New York City, Feb. 17.

HONORS AUTOMOBILE INDUSTRY.

Selection of C. C. Hanch as Head of New Indianapolis Chamber of Commerce.

The election of C. C. Hanch, treasurer of the Nordyke & Marmon Company, Indianapolis, maker of Marmon cars, as the first president of the recently organized Indianapolis Chamber of Commerce, is not only an honor to himself, but to the entire automobile industry. The new association results from the consolidation of six of the commercial and civic bodies in the city.

Mr. Hanch is well known throughout the industry, aside from his connection with the Nordyke & Marmon Company. He is at present vice president and one of the directors of the Automobile Board of Trade and in addition he holds the important position of chairman of the patent committee. He formerly was vice president for Indiana in the National Association of American Manufacturers.

The new chamber of commerce will have charge of all public movements for the bettering of business, civic and social conditions in Indianapolis, and since motor car manufacturing plays such a prominent part in the industrial activity of that city it is eminently fitting that an automobile man should be selected for its first president.

C. C. Hanch, President, Indianapolis Chamber of Commerce.

NEW BOOK OF STANDARDS.

National Tube Company Presents Its 1913 Edition, Which Is Replete with Information.

The National Tube Company, Pittsburg, Penn., manufacturer of tubular goods, is publishing its 1913 edition book of standards containing 559 pages of information and engineering data upon tubing. Several pages are devoted to covering the main process of manufacturing both welded and seamless tubes, also threading, durability and physical properties of both National and Shelby seamless steel tubes. Those specialties of the last named design are described and illustrated and considerable space is given to tables dealing with this material.

The book is unusually replete with tables giving weights, dimensions, strengths, pressures, etc. Considerable attention is given to the mechanical properties of solid and tubular beams, notably those utilized in the motor car industry. Information in regard to water, gas and air is included, as well as tables of measures, etc. A glossary of terms used in the pipe and fitting trade is located in the back of the book. It is very compact, being four by 6.5 inches, printed on Canterbury Bible paper and retails for $2 the copy.

EXTENDS BUSINESS FACILITIES.

Motor Accessories Mart in Chicago Adopts New Plan for Co-Operating with Manufacturers.

The Motor Accessories Mart, Chicago, has made a radical departure from its former line of business and has greatly extended its service and placed it upon a more practical basis. It has opened a salesroom devoted exclusively to the accommodation of factory representatives and manufacturers' agents of automobile accessories, this being located adjacent to the New Southern hotel and to all of Chicago's accessory jobbers.

Ample desk quarters are being furnished to patrons, with heat, light, janitor, telephone and stenographic service and only representatives of reliable and diversified lines are being admitted. The firm endeavors to make its place the common meeting spot of western buyers and sellers. Further service is being rendered in the matter of receiving mail, telegrams, express, etc., to promote the interest of the patrons.

SPEEDWAY ON LONG ISLAND.

Association Incorporated in New York for Holding Automobile and Aeroplane Meetings.

The New York Motor Speedway Association, Inc., of New York City, has been incorporated under the laws of New York State, with a capital of $1,000,000, to hold aeroplane, automobile and motor vehicle races, contests and displays. The directors are: William B. Allen of Seattle, Wash.; Herbert J. Carter of New York City and Alfred B. Casner of Brooklyn, N. Y.

The association has closed a deal for a 650-acre tract of land at Garden City, L. I., which has for some time been used as an aviation field and about March 15 the construction of a two-mile track for automobile races will be begun. The association has a 10 years' lease of the property with the privilege of buying within two years after April 1. The promoters of the association say that for $200,000 they will be able to build the track and put up a grandstand with a capacity of 75,000 persons. There will be parking space for between 15,000 and 20,000 automobiles and it is probable that a long distance race will be held July 4. Another big meet is planned for the autumn, with weekly meets every Saturday during the summer similar to those held on the Brooklands track in England.

The aviation equipment now is under the control of the speedway association.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Maxim Tricar Manufacturing Corporation of Manhatton, New York City; $100,000; automobiles, Otto Kukneman, Charles F. Novothy, A. A. Meschutt.

Williamson Garage Company, Williamson, N. Y.; $20,000; to conduct garage; Alfred F. Raynor and others.

United Garage Company, New York City; $14,000; to operate garage; Samuel Ecker and others.

Suffolk Street Garage, Inc., Lynn, Mass.; $5000; Daniel Lynch, John Buckley, Henry Thomas.

Donovan Motor Car Company, Boston; $50,000; Joseph S. Donovan, A. D. Adams, G. E. Donovan.

Welch & Suthergreen Company, Fitchburg, Mass.; $30,000; to deal in motor cars; H. C. Mayo, E. J. Welch, F. E. Suthergreen.

J. D. Maxwell Motor Corporation, Tarrytown, N. Y.; $10,000; motor vehicles; Jonathan D. Maxwell, James P. McManus, Leander F. Sniffin.

S. J. Wise & Co., Inc., New York City; $20,000; motor vehicles; C. E. Van Vleck, E. M. Dalley, C. M. Kohn.

Bell & Waring Steam Vehicle Company, New York City; $25,000; automobiles; Harry G. Waring, Harvey W. Bell, Howard C. Phillips.

Glide Sales Company, Inc., Buffalo, N. Y.; $10,000; to deal in automobiles; J. Francis Lynch, Louis P. Fuhrmann, Edward T. Danahy.

National Welding Company, Jersey City, N. J.; $25,000; general automobile business and to weld, braze, repair and work with acetylene and oxygen; E. P. Hoyt, S. H. Culver, J. W. Phillips.

Durable Tread & Automobile Sales Company, New York City; $10,000; to deal in tires, tire treads and other accessories; Rose H. Pacobi, Samuel M. Winkler, Henry A. Deimel.

Buffalo Automobile Sales Corporation, Buffalo, N. Y.; $15,000; to manufacture and sell motors, engines, machines, etc.; William J. Harris, William U. Heverly, Maul MacDonald.

Mol Stringer's Garage Corporation, Brooklyn, N. Y.; $10,000; to deal in automobiles and conduct garage; Mol Stringer, James Culleeny, Frederick R. Huntington.

Maxton Auto Company, Maxton, N. C.; $50,000; to deal in and make automobiles; A. J. McKinnon, R. M. Williams, Byron McCallum, Ernest Williams.

Pratt-Hendricks Company, Brooklyn, N. Y.; $1000; to deal in automobiles; William H. Pratt, William J. Hendricks, George L. Robinson.

Miller Tire Sales Company, New York City; $5000; to deal in automobile tires; Harry C. Miller, Harrison C. Mills, Warren A. Schenck.

Co-Operative Used Car Company, New York City; $3000; to deal in automobiles; Joseph B. Bauer, Louis Ezechiel, John Curtis.

Gas Saver Sales Company, New York City; $25,000; to manufacture motor car devices; H. Clarence Fisher, John H. Miller, Eugene Cable.

Auto Buyers' Company of America, Inc., New York City; $1000; to deal in motor cars; Julius Lichtenstein, John P. McClellan, Arthur A. Hill.

Hoyt Garage, Inc., Brooklyn, N. Y.; $1000; to operate garage; Louis C. Brooks, Walter J. Kelly, Charles Blaken.

R. & R. Garage Company, Lansing, Mich.; $5000; to operate garage; E. A. Rounds and others.

D. & H. Auto Company, Kingston, Penn.; $25,000; to deal in electric, steam and gasoline vehicles; John M. Deatrick, J. G. Harris, Lester Harris.

Veerac Motor Truck Company, Inc., New York City; $10,000; Edward L. Whittemore, Harry B. McGinley, George H. Hinnau, 165 Broadway.

Pennypacker Engine Starter Company, Los Angeles, Cal.; $150,000; F. D. Webb, F. C. Morgan, E. J. Pennypacker.

Lathan Auto Supply Company, San Francisco, Cal.; $25,000; J. E. Lathan, A. Lathan, A. S. Lathan.

The Charles S. Johnson Company, New Haven, Conn.; $150,000; to sell automobiles and parts; C. S. Johnson, George D. Atwood, Clarence R. Hooker.

Brown Car Corporation, New York City; $30,000; to manufacture and sell motors, etc.; W. P. Fargo, H. W. Torney, E. E. Beyer.

Chrome Manufacturing Company, Inc., New York City; $25,000; vehicles of all kinds; James E. Marshall and others.

Motor Car Service Station Company, Cleveland, O.; $10,000; to repair automobiles and operate storage business; Paul S. Knight, M. Marquard, D. C. Mills, M. W. Spear, W. P. Godfrey.

Sin-Ti Rubber Company, Washington, D. C.; $25,000; to manufacture automobile accessories, compounds of rubber, etc.; B. R. Walters, J. C. Young, Sidney E. Kent, John Tyscowski, Roswell W. Snow.

Standard Shock Absorber Company, Cleveland, O.; $100,000; to manufacture and deal in shock absorbers; C. D. Sword, William Leary, G. D. Sword, Naomi M. Leary, G. A. McGill.

Logan Square Auto Supply Company, Springfield, Ill.; $10,000; to manufacture automobile supplies; Otto E. Schmidt, August J. Schmidt, Martha Perl.

Rayfield Motor Sales Company of Illinois, Chicago; $41,000; automobiles and accessories; Robert C. Wheeler, Charles L. Cobb, Cecil Barnes.

Tidewater Automobile Association, Inc., Norfolk, Va.; $15,000; D. P. Paul, C. L. Young, M. Levy, J. K. Water.

International Automobile Supply Company, Chicago; $5000; to manufacture and deal in automobile supplies; William L. Loettel, Mark T. Adams, William E. Stephens.

Maitland Rubber Company, Springfield, O.; $10,000; to manufacture rubber and deal in rubber goods, tires, etc.; Frank R. Talbott, Cora P. Coltwell, Frank P. Patrick, Garnett W. Brand, Henry H. Durr.

Simplex Vehicle & Gear Company, Indianapolis, Ind.; $15,000; to manufacture motor car parts; S. S. Helms, Theodore Sanstro, Maurice M. Kiefer.

Quartette Automobile Signal Company, Los Angeles, Cal.; $100,000; E. E. Peck, F. M. Hand, W. L. Clark.

Invincible Tire Company, Providence, R. I.; $25,000; to manufacture and repair rubber tires; Charles H. Graves, Percy W. Gardner, Harold R. Curtis.

Fox-Shyrock Auto Company, Fort Wayne, Ind.; $10,000; automobile sales; Bartlett W. Shyrock, William W. Shyrock, George T. Fox.

Accessories Sales Company, New York City; $50,000; to manufacture and deal in automobiles and accessories; James R. Howe, Jr., Charles Hyman, Forrester A. Gin.

Dayton Top Improvement Company, Dayton, O.; $10,000; R. J. Cantelon, H. E. Randall, William M. Matthews.

Stewart-Toozer Motor Car Company, Omaha, Neb.; $25,000; automobiles and supplies; J. T. Stewart, G. E. Toozer.

Acme Electric Auto Works, Los Angeles, Cal.; $10,000; F. W. Jackman, E. E. Mason, F. C. Morgan.

Eclipse Wheel Company, Camden, N. J.; $300,000; wheels of all kinds for automobiles and wagons; F. R. Hansell, J. A. MacPeak, G. H. R. Martin.

Hamilton Taxicab Company, Hamilton, O.; $5000; J. A. Weigel, Cora A. Weigel, George J. Kalbeir, Louise E. Weigel, Caroline Weigel.

Federation Supply Company, Inc., Oneida, N. Y.; $50,000; automobile exchange; Albert J. Seaton, Timothy Curtin, Howard D. Crim.

Texas Motorway Company of Dallas, Dallas, Tex.; $10,000; to construct private grade, macadamized roadway, 500 miles; G. W. Baker, John B. Christenson, G. L. Cade.

Keystone Motor Supply Company, Pittsburg, Penn.; $12,000; to manufacture, sell, trade and repair motor cars; incorporators, R. V. Campbell, C. H. McDonald, E. H. Biedringhas.

Auto Adjunct Company, Melrose, Mass.; $50,000; incorporators, J. E. Knapp, A. W. Eldredge, E. J. Sanderson.

Universal Truck Company of New England, Boston; $25,000; incorporators, M. Meyers, M. E. Crable, F. L. Hewitt.

Sterling Automobile Company, Mercedes, Hidalgo County, Tex.; $10,000; incorporators, A. G. Crawford, W. D. Chadick, G. E. Simpson.

Ohio Auto Carriage Company, Cleveland, O.; $10,000; incorporators, Alfred A. Bensch, Ralph Goldsworthy, F. A. Federman.

F. P. Miller Motors Corporation, Utica, N. Y.; $5000; incorporators, Henry R. Beebe, William T. Cantwell, Arthur F. Fenner, T. Harvey Ferris, F. P. Miller.

K-W Garage, Inc., South Orange, N. J.; $25,000; general automobile business; incorporators, G. E. Krug, T. R. Were, C. L. Krug.

Gildale Motor Corporation, New York City; to deal in automobiles, etc.; $30,000; incorporators, F. W. Strauch, T. P. Gilman, Jr., E. S. Peck.

United States Tire Filler Company, Camden, N. J.; $125,000; automobiles, tires, etc.; incorporators, R. B. Patton, H. E. Patton, H. R. Gorman.

Autovend Machine Corporation, New York City; $300,000; to deal in automobiles; incorporators, E. Wrigley, A. H. Fenton, C. M. Van Deusen.

Kitto Garage, Muskogee, Okla.; $1000; incorporators, A. L. Kitto, Harry Kitto, S. V. Kitto.

Mohawk Rubber Company, Akron, O.; $350,000; to manufacture rubber goods; incorporators, R. M. Pillmore, J. K. Williams, S. S. Miller.

F. A. M. Auto Supply Company, Buffalo, N. Y.; $20,000; to deal in motor car supplies; incorporators, Frank A. Marburg, John B. Green, Richard H. Templeton.

Alco Motor Supply Company, Cleveland, O.; $10,000; to deal in motor car supplies; incorporators, M. Kluger, C. K. Halle, Frank Butler.

S. & M. Tire & Rubber Company, Akron, O.; $20,000; to deal in automobile tires; incorporators, Alois Michler, Erwin S. Kintz, Charles M. Smith.

Peterman Garage Company, Jamestown, N. Y.; $5000; to operate garage; incorporators, Otto G. Peterman, August Peterman, Myrtle S. Peterman.

Machinery & Motor Company, Quincy, Ill.; $25,000; to operate automobile repair shop; incorporators, F. H. Wilms, B. Kinsey, H. V. C. Tingley.

Ray Harroun Company, Indianapolis, Ind.; $50,000; to deal in motor cars; incorporators, Ray W. Harroun, L. R. Townsley, U. G. Baker.

Model Garage Company, Cincinnati, O.; $10,000; to operate garage; incorporators, Edward Hine, Martin Fette, Carl Reichelman, Clara Heine, Della Cottrell.

Harbor Garage & Machine Company, Indiana Harbor, Ind.; $7500; to operate garage and repair shop; incorporators, Gustave Jernberg, August Jernberg, Charles Saluski.

Park Motors Company, Columbus, O.; $30,000; to deal in automobiles; incorporators, Scott Van Etten, Charles Parkison, A. Van Etten.

Automobile Clearing House Company, Cincinnati, O.; $2500; to deal in motor cars; incorporators, Thomas A. Reilly, Edwin P. Bernardi, Samuel D. Bromley.

Detroit Flash Curtain Company, Detroit; $25,000; to manufacture motor car curtains; incorporators, Fred J. Schaffer, William H. Goodfellow, Harry M. Vaughn.

The Twin City Motor Car Company has been incorporated at Lemon, S. D., with a capital of $60,000 and P. J. Kalman is president. Distributing stores will be established at St. Paul and Minneapolis, Minn. The company has the exclusive agencies for the Flanders electric cars, and the Sauer and Mack trucks for Minnesota, North Dakota and South Dakota.

WITH THE MANUFACTURER

R. M. Hawkins, formerly assistant purchasing agent of the Standard Welding Company, Cleveland, O., maker of Stanweld rims, etc., has resigned his position.

The Pierce-Arrow Motor Car Company, Buffalo, N. Y., maker of Pierce-Arrow cars, announces that the Iowa Auto & Tire Company, Davenport, Ia., which handled the company's product at Davenport up to 1911, no longer represents the company, the present distributor being the Mason Carriage Works of that city.

The Bosch Magneto Company, New York City, announces the appointment of the following new distributors: Doubleday-Hill Electric Company, 719-721 Liberty avenue, Pittsburg, Penn.; Motor Parts Company, 185-187 Columbus avenue, Boston, Mass.; Phoenix Automobile Supply Company, 3974-76 Olive street, St. Louis, Mo.

The Packard Motor Car Company, Detroit, maker of Packard cars, has purchased a plot of land at Locust and 22d streets, St. Louis, Mo., through its local agent, the Halsey Automobile Company. It is understood to be intended for service station purposes.

C. Robert Hoyme, prominent on the Philadelphia automobile row for seven years, has been appointed manager of the Alco branch in that city by the American Locomotive Company, New York City, maker of Alco trucks and pleasure cars. John A. Mills has purchased the Sturges garage on Isaacs street, South Norwalk, Conn., of F. D. Lawton. Mr. Mills will conduct a first class establishment under the name of the John A. Mills garage.

F. E. Moskovics, former sales manager of the Remy Electric Company, Anderson, Ind., maker of Remy magnetos, has resigned, to take effect March 1, and will return to the Wyckoff, Church & Partridge Company, maker of the Vaughan cars.

C. Roy Clough, formerly with the King Motor Car Company, Detroit, maker of King cars, has joined the forces of the Chalmers Motor Company, Detroit, as district sales manager for Ohio, Kentucky, Indiana and Michigan.

J. W. Bully, president of the Mercury Manufacturing Company, Chicago, maker of Mercury trucks, has returned to Chicago after a short trip through eastern territory.

William F. Cowham, president of the Cutting Motor Car Company, Jackson, Mich., maker of Cutting cars, died at his home Monday, Jan. 13.

NEW BUILDINGS AND REMOVALS.

William H. Vogel, Wilmington, Del., is building 10 garages on his property at the corner of Concord avenue and Tatnall street, that city, which he will lease. The tenants will have the privilege of storing all equipment, repair apparatus, etc. Mr. Vogel will also erect a large repair shop in the vicinity for the accommodation of his tenants.

Sherlock & Son, Burbank, Cal., will occupy a new one-story garage being built at Second street and Angeleno avenue. It will be equipped with modern machinery for repair work and will contain a well lighted salesroom.

F. E. Linnell & Son, Roseville, Cal., is having a two-story reinforced concrete garage built on the Wright property.

The Ajax Auto Sales Company, Springfield, Ill., has opened a garage at 315 South Fourth street under the management of J. L. Pickering.

J. B. Romans & Co. has moved into the company's new garage on Main street, Denison, Ia.

E. E. Morris of Wichita, Kan., will erect a brick garage and repair shop at the corner of English street and Lawrence avenue. It will be one story high and later two more stories will be added.

The Knickerbocker Motor Car Company, Binghamton, N. Y., will occupy a new garage at Wall and Henry streets, work on which is well under way. A modern repair shop will be installed and the cost of the new plant will be $40,000.

The Square Deal Auto Company, Baltimore, Md., has opened a new salesroom and service station at 415 West Fayette street. The first floor is given over entirely to salesroom and offices, while the second and third floors will be used for cars, trucks and used vehicles.

Robert J. Guy, Detroit, formerly in charge of the repair department of the Studebaker Corporation, is managing a new garage at 65-69 Congress street, West, in which he is prepared to undertake all kinds of work.

The Fourth Street Garage, at 37-39 Fourth street, Chelsea, Mass., has been completed and is now occupied by Harden & Waugh. The garage is fireproof and contains modern appliances for the trade. The opening was attended by an entertainment.

Fred Hulsebus, manager of the Shelby County Auto Company, Harland, Ia., has contracted for a large addition to be built to the garage of the concern.

Jacob Brown, manager of the Central Vulcanizing Company, Albany, N. Y., has purchased a two-story brick building at 148 Central avenue and it is being remodelled for the concern, which will utilize the entire building. A large garage will be established on Bradford street, to which street the building extends.

V. V. Haldacker, Danville, Penn., has purchased a livery stable and lot on Canal street. He will raze the building and utilize the site for a modern garage.

The Vulcan Motor Service Company, Pittsburg, Penn., has plans for a two-story reinforced garage and salesroom, to cost $100,000.

Walters & Hand, Wheeling, W. Va., has opened a garage and repair shop in the Walters building and is negotiating for several new agencies in addition to the Overland cars, which it now handles.

Kraege & Hinsey, Yorktown, Tex., is building a new garage on Fifth street, which will be fitted with modern machinery.

NEW AGENCIES.

The Providence Auto Equipment Company, 11 Dorrance street, Providence, R. I., has taken the R. I. V. ball bearings for the State of Rhode Island, and as it is carrying a large stock will be able to fill all orders promptly.

The Bosch Magneto Company, New York City, has appointed the Powell Supply Company, 2119 Farnam street, Omaha, Neb., and the Kansas City Automobile Supply Company, 1504 Grand avenue, Kansas City, Mo., distributors of the Bosch products in their respective territories.

The Dillon-Goodwin Company has opened a salesroom at 345 Van Ness avenue, San Francisco, Cal. The Moon car, made by the Moon Motor Car Company, St. Louis, Mo., will be handled.

The Motor Vehicle Sales Company, Kalamazoo, Mich., recently formed, is to open salesrooms at 135-137 Farmers avenue. The company has purchased the Buick agency of David Reid and its territory will embrace Kalamazoo and three other southwestern Michigan counties. The officers of the concern are: President, C. C. Dougherty; secretary and treasurer, H. A. Worthington; sales manager, B. O. McElroy.

Charles S. Marshall, for several years with the branch of the United States Tire Company at Minneapolis, Minn., has gone into business for himself and has established the Marshall-Racine Rubber Company at 911 First avenue, South. He will handle the Northwestern distribution of the Kelly-Racine tires.

Seymour Barr of the Scott County Mercantile Company, Davenport, Ia., has taken the agency for the Paige car, made by the Paige-Detroit Motor Car Company, Detroit, for Scott county in Iowa, and Rock Island and Mercer counties in Illinois. His headquarters are at Davenport.

A. W. Salyers, former Buick commercial car representative at Indianapolis, Ind., and William Small, former Buick dealer at Marion, Ind., have formed the Salyers-Small Company, Indianapolis, to succeed H. C. McVey in the distribution of Little and Chevrolet cars in that city, Mr. McVey having been called to the Chevrolet factory at Detroit.

W. L. Tedford, principal owner of the Tedford Auto Company, Little Rock, Ark., has sold his business with the exception of the new car sales department, which he will continue to operate. He handles the Overland cars, made by Willys-Overland Company, Toledo, O. F. L. Butler, former foreman, has purchased the repair department of the company and it will be known as the Butler Repair Company. The accessories were taken over by J. B. Pearson, treasurer of the Tedford company, and this part of the business will be styled Motor Car Supply Company. All three concerns will remain at the present quarters on Ninth street and Mr. Tedford will store his cars in the garage.

The Holsman Sales Company, recently formed at Des Moines, Ia., is occupying temporary quarters at 919 Locust street. J. A. Holsman, formerly with the United Motor Des Moines Company, is president and has the agency for the King cars.

Dwight I. Holmes and Arthur A. Lee of Los Angeles, Cal., have opened salesrooms at 1231 South Flower street, where they are handling Lancia cars and Speedwell trucks.

The Pan-American Motors Company, San Francisco, Cal., has taken over the newly formed Inter-State Motors Company and will move to the latter's place of business on Golden Gate avenue, near Jones street. The company now has the agencies for Dayton and Piggins trucks and Inter-State and Great Western cars.

TRADE INFORMATION EXCHANGE BUSINESS PROPOSITIONS.

1542—North Dakota Firm, recently changed hands, is interested in a complete line of repair shop and garage supplies and equipment, machine tools, etc.

TO DOUBLE ITS CAPACITY.

Universal Motor Truck Company Secures Additional Capital and Will Increase Plant.

Fred K. Parke, secretary, treasurer and general manager of the Universal Motor Truck Company, Detroit, maker of Universal trucks, has announced that the company has been incorporated under the laws of Delaware, the capital stock being $1,200,000, of which $500,000 is preferred stock and $700,000 is common. All stock has been sold and work will be begun at once on the erection of a factory quite as large as the present plant.

The new building will adjoin the old one, the company having owned the entire square block of property since its organization. It will cost $250,000 without the machinery. According to Mr. Parke the Universal company will soon be one of the largest concerns in the world producing commercial vehicles and as the business increases other additions will be made.

UNDERWRITERS' ORGANIZATION.

Western Insurance Men Meet at Chicago, Formulate Plans and Elect Officers.

The Western Automobile Underwriters' Association was organized at a meeting of companies writing that class of insurance, held at Chicago recently. P. D. McGregor of the Queen Company presided and F. J. Sauter of the A. D. Baker Agency, was elected secretary. William S. Warren, who has been active in the organization work, reported on the previous meetings and the negotiations which have been carried on with the eastern interests, together with the plan for co-operation between the New York and Chicago conferences, providing for an interlocking board of directors.

The constitution, bylaws and rules of practise were submitted and adopted. The following officers were elected: President, P. D. McGregor, Queen; vice president, Thomas E. Gallagher, Aetna; secretary and treasurer, F. J. Sauter, A. D. Baker General Agency; executive committee, T. E. Gallagher, William S. Warren, Liverpool & London & Globe; H. C. Eddy, Commercial Union; C. E. Dox, London & Lancashire & Orient; A. D. Baker, Michigan Commercial & Old Colony; F. H. Osborn, Federal Union; F. R. Bigelow, St. Paul F. & M.; Marshall & McElhone, Fireman's Fund, and S. K. Crawford, American Automobile Company.

AMENDMENTS IN OHIO.

Automobile Clubs Calling Attention of Owners to Necessary Legislation.

The organized motorists of Ohio are urging all automobile owners to aid in the passage of five amendments to the present law, which are claimed to be decidedly necessary. The legal committee is actively engaged in pressing the matter before the legislature. The five amendments provide as follows:

Compelling all vehicles, whether horse drawn or motor propelled, to be equipped with lights both front and rear; emergency placard for use in the event that one of the regularly issued number plates is lost or mislaid; establishing local depots where license tags may be obtained without waiting for return from Columbus; making it clear that no city or town may enact ordinances taxing automobiles in addition to the fee demanded by the state; making it a felony, punishable with penitentiary imprisonment, for any person to steal an automobile.

INCREASES CAPITAL STOCK.

Maker of Midland Cars Prepares for Enlarged Production Facilities in Present Quarters.

The capital stock of the Midland Motor Company, Moline, Ill., maker of Midland cars, has been increased from $100,000 to $300,000. Decision to vote the increase was reached at a special meeting of the stockholders and the entire additional issue of stock has been subscribed.

The purpose of the increase is to enlarge the output of the plant. No additional buildings will be erected at present, the size of the plant being such that it can accommodate a comfortable growth in the Midland production. It was made known at the stockholders' meeting that during the present year 1006 cars will be built and placed on the market.

PUBLISHER'S ANNOUNCEMENT!

MARCH 8th

BOSTON SHOW NUMBER AUTOMOBILE JOURNAL

What AUTOMOBILE, New York, has to say about the Boston Show

"Be ready for this big opportunity."

"Cash in on the Boston Show—the last big show of the year—the selling show."

"Tell your story when interest is at buying heat, tell it big and bold."

The above does not do justice to the Boston Automobile Show.

This will be the largest display of the year, as it has been in the past. Manufacturers and their representatives have always considered it a money maker, not just a display.

Advertisers using the March 8th issue of The Automobile Journal will reach New England buyers. Patronage will not be secured from New York and Chicago.

The Automobile Journal enjoys an exclusive position in this field, is supported by Eastern motorists and it is the only logical medium to use to secure the kind of publicity that will be productive of results. Send your copy today.

Automobile Journal Publishing Co.,
Times Building - - - Pawtucket, R. I.

MOTOR TRUCK

The exhibition of industrial vehicles to be made at Boston the week of March 19-25, inclusive, will be the most complete ever held in America.

It will be distinctly a showing of motor wagons and trucks.

Boston is the commercial centre of New England. It is accessible from every part of these states by comparatively short rides.

The visitors to the Boston Service Wagon Show will be business men, keenly interested and ready to buy.

The show will be productive of enduring returns for all exhibitors. It is the logical opportunity to display a new make of machine, and it is equally desirable to exploit those that have established reputation.

The MOTOR TRUCK is the recognized national authority on highway transportation and haulage economy. It is the best known publication to the business men of New England who are studying and investigating the problems of vehicle use.

Your announcement made in the Boston Service Wagon Show Number, to issue March 15, will reach and be read by men interested in motor wagons identified with the widely diversified lines of New England commercial and industrial enterprises. This will be the largest power wagon show of the year, and New England is the richest and best market for machines in the world.

This Show Number Will Issue March 15

Copy for this issue must be given prompt attention. A wire will secure reservation of space.

Do You Want To Know More About Pleasure Cars and Trucks?

The most instructive and valuable series of automobile mechanical books ever published are named below. These works have within the past year been rewritten and revised and today form the most complete library of automobile mechanical information that can be found. The expositions are as valuable to the engineer as the layman. The series form an encyclopedia of subjects of interest to the student, mechanic, repairer, builder, owner and driver. **One thousand pages of text, more than 1500 specially prepared photographs, drawings, diagrams, charts and designs.**

All discussions are distinct and are given over wholly to the subjects which their titles imply.

For the Public and Private Garage
UP-TO-DATE

The most important question is that of handling your cars in the shortest time at least expense possible and with all chance of accidents done away with.

With the "UNIVERSAL" Automobile Turntable in your garage, you can drive both in and out "front end first"—no more backing out. Just run in on the Table, one little push making a half revolution, and your car is ready to start out.

These Tables are made in four sizes—one for every use—with capacity for supporting from the lightest runabout to the heaviest truck.

Better write today for full particulars, getting our Catalog "C-8."

The Indispensable "Handiest Tool in the Shop"

Does your lifting and tugging at one-fifth the expense you are now paying for this. No matter if you do have stationary chain hoists, you will find this "Handiest Tool" indispensable in your garage.

Write for our catalog "EE-7," and full information how to lessen cost.

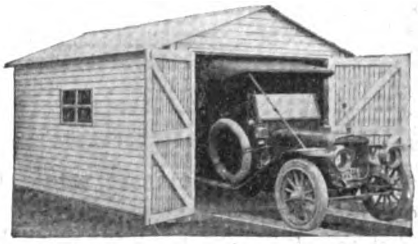
That's all we want you to do—**merely furnish us the name.**

You Invest No Money or Time

It means $9.25 to $20.00 profit **FOR YOU** on each sale. And you've no money or time invested. Send us a list of **all** automobile owners in your locality, and on this plan you'll make a nice, clean profit---perhaps several hundred dollars.

The Edwards is far and away the most popular and widely advertised Private Garage. Our prices are much lower than others'. And we've an excellent system of following up all names received. We won't miss any opportunities to close sales.

Write Us Now Send us your list of local auto owners at once, or we will be glad to answer any questions.



Edwards Fire-Proof Garage

An artistic, fire-proof steel structure for private use. Gives absolute protection from sneak thieves, joy riders, fire, lightning, accidents, carelessness, etc. Saves time, work, worry and trouble. Comes ready to set up. All parts cut and fitted. Simple, complete directions furnished. Absolutely rust-proof. Joints and seams permanently tight. Practically indestructible. Locks securely. Ample room for largest car and all equipment. Made by one of the largest makers of portable fire-proof buildings. Prompt, safe delivery and satisfaction guaranteed.

The Edwards Mfg. Co., 716-766 Eggleston Ave., Cincinnati, Ohio

USE NO ACIDS

"Simplex" Aluminum Solder

WILL DO ALL THIS FOR YOU:

It has the holding grip on all soft metals; is non-corrosive and is a good conductor of electricity. Will solder everything---aluminum to brass, copper, etc. We will give $100 for any aluminum casting brought to us we cannot solder. We solder with an ordinary iron, and what we do solder, "STICKS" because it is in OUR SOLDER.

30 Cents

will bring you a sample to prove it to you.

Special Inducements to the Trade.

Simplex Aluminum Solder Co., Inc.
108 Broadway, Long Island City, N. Y.
Tel. 988 Astoria.

Try the New Aluminum Solder. Ask for "Simplex."

"SIMPLEX" Solder has the stick.

THE "ALL-IN-ONE" SPARK PLUG

All That the Name Implies

Prime your engine and clean your plugs at the same time.

Price $1.50 Each

Powerful
Sootless
Durable

Designed and constructed for use with high or low tension magneto and battery ignition systems.

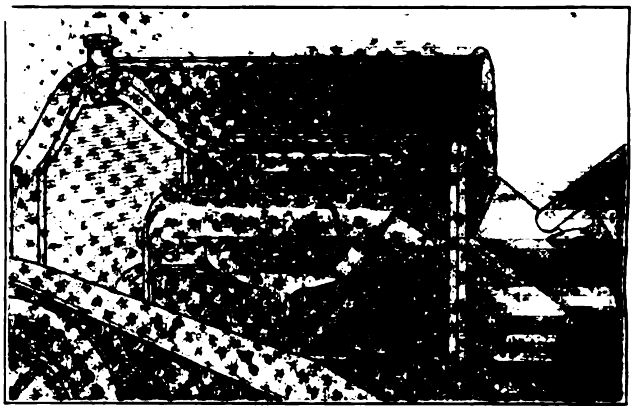
Made to fit any engine

We shall prosecute vigorously all infringements now on the market or any which may spring up in the future

FRONTIER SPECIALTY CO.

732 Main Street
BUFFALO - - - - - NEW YORK

THE GILSON
Starter and Speeder



Efficiency and Economy

Guaranteed to save gasoline, give more power and speed, cut down carbon, and starts your motor on second turn in any temperature. For automobiles, motorcycles and all gasoline engines. Sold on merit, **$10.00.** Cannot get out of order. All users indorse it. Order direct or from your dealer.

Gilson Motor Starting Co.,
1407-1409 North Illinois St. INDIANAPOLIS, IND.

MOTOR TRUCK

A MONTHLY MAGAZINE DEVOTED TO THE INTERESTS OF THE COMMERCIAL VEHICLE FIELD

Gives in Every Issue Information of the Highest Value Bearing Directly Upon the Various Factors Which Enter Into the Systematic Study of Transportation Methods.

ISSUED MONTHLY $1.00 THE YEAR

AUTOMOBILE JOURNAL PUBLISHING COMPANY
TIMES BUILDING, PAWTUCKET, R. I.

HOPEWELL
TIRE CASE

ABSOLUTE TIRE PROTECTION
GIVEN ONLY BY THE
Hopewell Tire Case

It prevents any water entering the spare tire (either from rain or hose used in washing). Water rots the fabric and causes blowouts.

$3.00 to $4.00 according to size

VOL. II. PAWTUCKET, R. I., MARCH, 1913. No. 11

AUTOMOBILE CHAMBER OF COMMERCE.

National Association of Automobile Manufacturers and Automobile Board of Trade Amalgamate in New Organization--Purposes Similar to Old Bodies with Possible Increase of Scope.

THE proposed amalgamation of the National Association of Automobile Manufacturers and the Automobile Board of Trade became an accomplished fact at a meeting of the joint committee representing the two organizations in New York City, March 19, when the charter of the Automobile Chamber of Commerce, Inc., which had previously been approved by the New York courts, was formally adopted. The new association contemplates a membership embracing the entire industry, and virtually marks a return to the situation which prevailed before the organization of the old Association of Licensed Automobile Manufacturers, following the commencement of the so-called Selden patent litigation some 10 years ago.

The officers of the Automobile Chamber of Commerce are: President, Col. Charles Clifton; vice president, W. C. Leland; treasurer, Col. George Pope; secretary, R. D. Chapin. The following compose the board of directors: Charles Clifton, Charles C. Hanch, Hugh Chalmers, Sydney Waldon, Samuel T. Davis, W. C. Leland, Windsor T. White, William E. Metzger, H. O. Smith, Albert L. Pope, L. H. Kittredge, R. D. Chapin, G. W. Bennett and H. H. Rice. These men will hold office until June 4, 1914, after which the annual meetings will be held the first Thursday after the first Wednesday in June. In the distribution of officers, the Board of Trade received the presidency and treasurership, while the N. A. A. M. was given the vice presidency and secretaryship.

Col. Charles Clifton, President, Automobile Chamber of Commerce.

The object of the new organization is somewhat similar to that of the old bodies, although new lines of activity may be taken up later. The interests of the automobile industry will be advanced and harmony will be promoted, while the chamber is empowered "to acquire by grant, gift, purchase, devise or bequest, to hold and to dispose of such property as the purposes of the corporation shall require, subject to such limitations as may be prescribed by law, including inventions, letters patent and processes, or rights thereunder, for the benefit of its members and not for pecuniary profit."

As a result of the amalgamation, the two older organizations will cease to exist as soon as their affairs can be arranged to comply with the aims and purposes of the new Chamber of Commerce, which is to become their successor in every sense of the word. It is anticipated that this will take some months, but in the meantime the new association will take up the work laid down by the older bodies, and seek to interest all manufacturers in the industry. The corporate life of the Chamber of Commerce is fixed at 25 years according to the provisions of the charter secured by it.

In addition to the main object of the organization as stated above, the charter also provides for developing the trade in which the members are engaged in this country and abroad, promoting the construction of better highways, advocating the enactment of just and equitable laws affecting the industry, etc.

GARFORD HEADS NEW CONCERN.

Expected That Plant Will Be Located in Toledo for Manufacturing Aluminum Products.

A. L. Garford of Elyria, O., formerly head of the Garford Company of the same city, maker of Garford pleasure cars and trucks, is at the head of a new company recently incorporated with a capitalization of $100,000. With Mr. Garford in the venture are Walter F. Brown, chairman of the Ohio Progressive state committee, and Attorneys Sigmund Sanger and E. C. Froelich of Toledo.

The new concern is known as the Garford Engineering Company and it will probably locate its plant in Toledo. Its purpose is to develop a new process of producing aluminum with the strength of steel in all forms. Mr. Garford sold his control of the Garford Company to the Willys-Overland Company about two years ago, but is understood to have retained a small financial interest in the Elyria plant.

ANOTHER CAR FROM DETROIT.

L. G. Hupp Interested in the Formation of the Tribune Motor Car Company.

The Tribune Motor Car Company, Detroit, is a new concern which has filed incorporation papers to manufacture a five-passenger, 30 horsepower touring car to sell at a moderate price. Deliveries will begin about May 1 and a deal has already been concluded for a modern factory building to be ready for occupancy in the fall.

At the head of the new concern is Louis G. Hupp and associated with him are several well known Detroit business men. From a modest beginning Mr. Hupp built up a most successful business with the Hupp-Turner Machine Company, the Hupp-James-Geyman Foundry Company and the Hupp-Johnson Forge Company, all of Detroit, he being general manager. The three plants were later merged with the R-C-H Corporation, Detroit, maker of R-C-H cars, of which Mr. Hupp was secretary and treasurer, his brother, R. C. Hupp, being president and general manager.

TO MAKE ENGINE PARTS.

C. A. Goodspeed Organizes New Concern Which Will Locate in Detroit.

A new factory for the making of automobile engine parts, to cost $20,000 on a $4000 site, is to be built and operated by a new company, the Goodspeed-Detroit Manufacturing Company, Ltd., of Detroit. The concern has a paid in capital of $30,000, and the active head of the firm is C. A. Goodspeed, who is secretary, treasurer and general manager.

He was formerly connected with the Packard and Studebaker companies of Detroit, makers of high grade pleasure cars and trucks of the same names. The site of the new factory is on Harper avenue, opposite the plant of the Regal Motor Car Company, maker of Regal cars. The building will be two stories high and will afford a large floor area.

MAY LOCATE IN THE SOUTH.

Understood That the Maker of the Only Car Has Plans for Removal.

According to information from Charleston, S. C., the Only Motor Company, Port Jefferson, N. Y., maker of Only pleasure cars, will soon transfer its plant to Mt. Pleasant, S. C., where a factory having 25,000 square feet of space will be provided. It is stated that a charter has already been applied for and that negotiations have reached an advanced stage. It is understood that southern capital is interested largely in the Only Motor Company and that the present efforts are being made by the Isle of Palms Traction Company of Charleston.

Meetings of the stockholders have been held and favorable action taken, it is said. M. Rutledge Rivers has been engaged as counsel for the company and has applied for a charter under South Carolina laws, under the name of The Only Automobile Motor Company. It is understood that the principal request of the Only company will be that the town of Mt. Pleasant provide a free site for the factory and this matter is expected to be arranged easily.

ADDS ANOTHER BUILDING.

Increasing Demand for Hudson Product Creates Need for Larger Production Facilities.

The Hudson Motor Car Company, Detroit, Mich., has added another building, the third within a year, to its 26-acre plant. The combined floor area of the Hudson factory has been made 363,000 square feet by the addition of the new structure, 578 feet in length by 90 feet in width.

The building supplants the section of the factory grounds which for some time has been used to accommodate large tents in which work was done because of a lack of room. The output of the Hudson shops has increased steadily and this move was made necessary to care for the additional business.

SPONSEL ROTARY VALVE MOTOR.

Company Being Organized to Produce New Design Probably in Detroit.

C. W. Sponsel, formerly superintendent of the General Electric Company's plant in Pittsfield, Mass., is forming a company to be capitalized at $250,000, to manufacture the Sponsel rotary valve motor. Mr. Sponsel is working at present at Racine, Wis., but it is understood that Detroit capitalists are endeavoring to have the company locate in that city.

Mr. Sponsel has worked upon his motor for many years and his first patents were secured in 1903. It is stated that a balanced valve, eliminating about 150 parts found in a poppet valve motor, forms the principle of the new motor. A model is now being made in Detroit.

BRANCH FACTORY IN SAGINAW.

J. P. Beck Will Produce Automobile Tops and Jiffy Side Curtains.

J. P. Beck of Saginaw, Mich., has secured a branch factory of the Rudd Auto Top Company, Detroit, for the former city, and it will locate in Mr. Beck's new building at Germania and Second streets. The plant is now in operation in charge of E. E. Miner.

In addition to the making of automobile tops of every description, the new factory will also manufacture the new Jiffy side curtain for which Mr. Beck has secured certain rights. The output of the new factory will be considerable.

PNEUMATIC TIRES UNNECESSARY.

Kansas City Plant to Produce Cars Equipped with Patented Steel Wheels.

J. North Carnahan of Washington, D. C., representative of the Bernston Steel Wheel Company, Bethlehem, Penn., is quoted as saying that the company will establish a new automobile factory at Kansas City, Mo., which will feature a recently patented steel wheel in an assembled car. The factory is to be one of a chain of six throughout the United States.

According to information from Kansas City, the company only manufactures the steel wheels, the motor cars proper being purchased by contract and assembled at the Bernston shops. The Bernston wheel is made with steel spokes in such manner that it is claimed pneumatic tires are unnecessary.

STREATOR PLANT REOPENED.

Limited Number of Cars Being Made and Halladay Owners Assured of Service.

It is reported that the Streator Motor Company plant, Streator, Ill., in which Halladay cars were made previous to the suspension of operations brought about by bankruptcy proceedings, is again in operation, having been taken over by A. C. Barley, secretary and director of the Rutenber Motor Company of Marion and Logansport, Ind.

Mr. Barley is said to have purchased it of the Merchants Realization Company, Chicago, which concern secured the plant at bankruptcy sale with the intention of dismantling it.

It is understood that cars are being made in a conservative way and that an adequate service department for Halladay owners also has been established. The machines will be manufactured with the idea of meeting the requirements of old agents of Halladay cars and later operations will be conducted on a larger scale.

WITH HOLLY CARBURETOR.

Charles W. Cross Becomes Sales Manager—Concern Is Adding New Buildings.

President George M. Holly of the Holly Bros. Company, Detroit, maker of Holly carburetors, makes public the appointment of Charles W. Cross as sales manager. Mr. Cross has been connected with the industry directly and indirectly for the past 14 years and has a wide circle of friends and acquaintances who will be glad to learn of his latest change.

Soon after graduating from the engineering department of Cornell university he became mechanical engineer for the Diamond Rubber Company, Akron, O., and later joined the executive staff of the Crocker-Wheeler Company as manager of its Detroit office. During recent years Mr. Cross has been associated with the subsidiaries of the General Motors Company and last year he occupied a prominent position in the selling department of the General Motors Truck Company, Pontiac, Mich.

Charles W. Cross, Sales Manager, Holly Bros. Company.

President Holly also announces that additions to the plant are now underway which will enable the company to double its output for the next 12 months. It is understood that the concern has enjoyed a greatly increased business during the past few months, making larger manufacturing facilities decidedly necessary.

FISHER QUICK ACTING VISE.

Fisher & Norris, Trenton, N. J., is manufacturing what is known as the Fisher quick acting lever vise. It is constructed of gun metal with a solid bar and all parts are interchangeable. The work is inserted in the jaws and held securely by a forward movement of the lever. The part cannot be removed until the lever is pushed back. The jaws are faced with steel, file-cut and properly tempered.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Lathan Auto Supply Company, San Francisco, Cal.; $25,000; incorporators, J. E. Lathan, A. Lathan, A. S. Lathan.

Vulcan Manufacturing Company, Paineville, O.; $300,000; to manufacture automobiles, wagons, etc.; incorporators, F. H. Murray, E. H. Heartwell, J. C. Ward, William Truhy, Harry E. Hammar.

Anna Motor Car Company, Anna, Ill.; $2500; general garage business; incorporators, Ernest Lawson, J. J. Corzine.

Tourraine Motors Company, Newark, N. J.; $37,500; general automobile business; incorporators, C. H. Van Vleck, F. N. Kolb, E. M. Dalley.

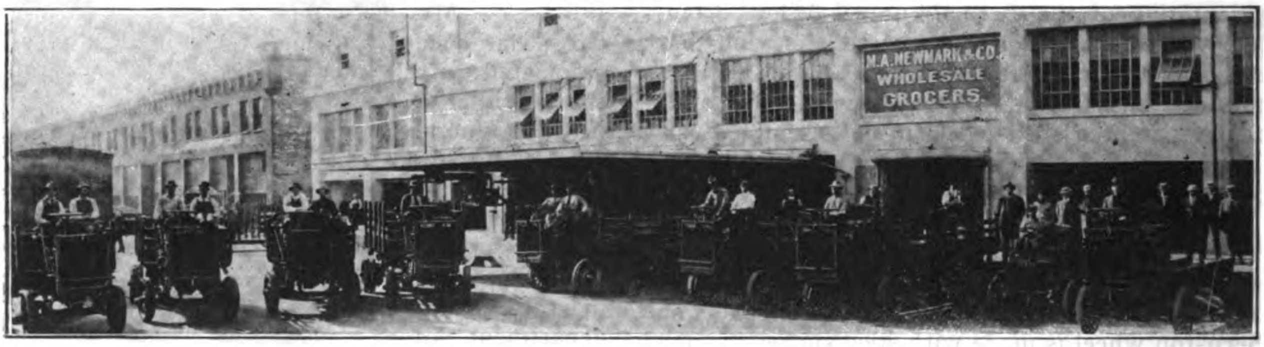
Pilot Car Sales Company, Richmond, Ind.; $50,000; to deal in automobiles; incorporators, T. F. Williams, H. E. Bradford, J. E. Hayes, C. E. Hayes, Arnold Schaer, W. D. Williams, E. F. Goggins.

Montroy Ignition Starter Company, Clarksdale, Miss.; $10,000; incorporators, E. M. Fant, E. Fant, C. L. Montroy, J. M. Montroy.

Collier Rotary Valve Company, Inc., New York City; $100,000; motors and engines; incorporators, John N. Blair, Arthur B. King, Harry D. Johnson.

Chaplin-Dille Motor Car Company, Morgantown, W. Va.; $25,000; incorporators, M. C. Wildman, O. Howard Dille, B. M. Chaplin, Minnie Chaplin, James E. Dille.

Western Auto Supply Company, Tulsa, Okla.; $5000; incorporators, Frank Wolfe, R. J. Myers, F. W. Dye.



G. M. C. Gasoline Truck Equipment of M. A. Newmark & Co., a Los Angeles Wholesale and Importing Firm.

Chico Garage Company, Chico, Cal.; $10,000; general automobile business; incorporators, S. P. McLerran, T. H. Morgan, E. S. Sauber.

Cragg Motor Manufacturing Company, Detroit; $4000; to make motors and accessories; incorporators, E. F. Alleman and others.

South Texas Traction Company, Houston, Tex.; $20,000; to manufacture gasoline motors; incorporators, A. E. Hall, John A. Owen, C. H. Hall.

Adix Automobile Company, Chicago; $2500; general automobile and garage business; incorporators, Percy L. Adix, Jacob Rothschild, George H. Rees.

Hanna Motor Manufacturing Company, Kansas City, Mo.; $60,000; incorporators, John M. Hanna, Frank A. Hanna, Roy J. Hanna.

Harrisonburg Garage, Harrisonburg, Va.; $25,000; incorporators, John N. Garber, J. J. Hawse, H. L. Furr.

Blacklock Tire & Rubber Company, Birmingham, Ala.; $3000; incorporators, H. Blacklock, H. H. Bostick, K. Blacklock.

Starr Garage, Camden, N. J.; $50,000; general automobile business; incorporators, F. L. Starr, H. H. Grace, T. P. Curley.

The Cartercar Sales Company, Youngstown, O.; $10,000; to handle automobiles and trucks in new garage; incorporators, William Beight and others.

Amper Electric Company, Lockport, N. Y.; $25,000; to manufacture automobiles and automobile locks; T. D. Robinson, E. W. Jones, C. L. Nichols.

Millar Supply Company, Jersey City, N. J.; $100,000; general automobile business; incorporators, J. A. Duffy, W. C. Marley, M. E. Thornton.

Usher Automatic Stop Company, Chicopee, Mass.; $15,000; incorporators, Frank D. Howard, Frank H. Page.

Durable Tread & Automobile Sales Company, Inc., New York City; $10,000; incorporators, Henry A. Deimel, Samuel M. Winkler, Rose H. Jacobs.

Carron & Co., Inc., New York City; $20,000; automobiles; incorporators, Arthur L. Carron, Herman Behr, Karl H. Behr.

S & M Motor Company, Inc., New York City; $10,000; to deal in automobiles, etc.; incorporators, Edward E. Strobel, Walter C. Martin, Richard W. Freedman.

Motor Trading Company, New York City; $10,000; incorporators, William A. Shappard and others.

The Foreign & Domestic Automobile Repair Company, New York City; $10,000; to deal in automobiles, aeroplanes, etc.; incorporators, L. O. Rothschild and others.

F. W. Offeldt & Sons, New York City; $20,000; to deal in motor trucks, etc.; incorporators, Edward Y. Eltonheed and others.

Morristown Auto Company, Morristown, N. J.; $25,000; general automobile business; incorporators, J. J. Lyons, I. Van Gaasbeek, A. Newmark.

Electric Coach Corporation, New York City; $500,000; to manufacture and engage in the motor vehicle business; incorporators, John Larkin, Alexander S. Andrews, Ralph S. Hull, Ralph A. Gamble, Richard J. Lynch, A. J. Doty, A. F. Bennett, E. R. Holmes.

Ball, Washburne Motor Company, Inc., Rochester, N. Y.; $25,000; incorporators, Ward H. Ball, Charles H. Washburne, Asa R. Ball.

Norwalk Motor Car Company of New England, Boston; $75,000; automobiles, etc.; incorporators, C. C. Smith, J. W. Briggs, M. A. Beaudet.

Nolan Bros. Motor Truck Company, Memphis, Tenn.; $10,000; incorporators, J. W. Dickson, W. S. Anderson, E. E. Rucker, E. H. Gerber, L. C. Nolan.

T. J. Moss Motor Car Company, 4374 Olive street, St. Louis, Mo.; to place firm on corporate footing; T. J. Moss, J. W. Fristoe, E. J. Dykstra.

John Ehlers & Co., Minden, Ia.; $12,000; John Turk, John F. Reimers, John Ehlers.

Veerac Motor Truck Company, Inc., New York City; $10,000; Harry B. McGinley, Edward L. Whittemore, George H. Hinnau.

New Columbia Automobile Company, Columbus, O.; $30,000; to manufacture motor vehicles; Jesse J. Brown, Lillian M. Brown, William E. McConnon, Charles E. Dennis, Edson E. Dennis.

Peru Tire & Rubber Company, Peru, Ind.; $25,000; to deal in automobile tires; C. E. Miller, Oliver J. Tillett, Ira H. Stanter, J. Miller.

State Motor Car Company, Memphis, Tenn.; $25,000; W. F. Anderson, R. M. Meriges, Jr., John A. Weisdorf, John E. Shelton.

Dufay Tire Filler Company, Chicago; $1000; to make and sell compound for filling tires; Joseph C. Fuhs, W. T. Lostetter, Lebelm Wheeler.

Jarvis-Huntington Automobile Company, Huntington, W. Va.; $100,000; to manufacture and sell automobiles and motor trucks and operate garage; Mrs. R. J. Hoster, G. G. Hoster, R. D. Seaman, T. L. Millard, F. C. Fifer.

Northern Automobile Company, Indianapolis, Ind.; $10,000; to deal in automobiles; J. J. Clements, R. M. Fleming, L. H. Van Briggle.

LaCroix Automobile Company, New Orleans, La.; $7500; to conduct garage and sell automobiles; Samuel J. Wolf, L. J. LaCroix, P. G. LaCroix.

Fitzgibbon & Crisp, Inc., Trenton, N. J.; $100,000; to manufacture carriages, wagons, automobiles, etc.; L. L. Woodward, W. F. Smith, Joseph Williams, Jr.

International Filter Company, Denver, Col.; $100,000; to manufacture gasoline filters for automobiles, motorcycles and gas engines; E. D. Motz, John N. Stewart, H. W. Kirby.

Willets Service Company, Inc., New York City; $50,000; motor vehicles and trucks; William C. Willets, Marius Jurgensen, Estelle M. Naylor.

United Auto Association, Los Angeles, Cal.; $10,000; H. W. Bohrman, Burt Dequine, C. L. Robinson.

Ross Ketchum Company, Inc., Saratoga Springs, N. Y.; $18,400; automobiles and bicycles; J. Arthur P. Ketchum, Norman B. Ross, James W. Northrup.

Hudson-Phillips Motor Car Company, St. Louis, Mo.; $10,000; to manufacture, sell and repair automobiles and trucks; C. F. Phillips, J. H. Phillips, J. E. Stewart.

Overland-Winton Sales Company, Worcester, Mass.; $10,000; George F. Fuller, Harlan T. Pierpont, Jay Clark, Jr.

W. C. Bates Company, Boston; $10,000; William C. Bates, William J. Munday, George A. Kersley.

Kingsbury Motor Sales Company, Inc., Hudson Falls, N. Y.; $10,000; Earle H. Wells, Esther L. Wells, Leonard Wetsell.

K. & K. Motor Car Company, Inc., Richmond, N. Y.; $10,000; Lillian E. Killian, Agnes E. Killian, Frank B. Killian.

Carels Diesel Motor Company of America, Wilmington, Del.; $10,000,000; H. E. Latter, W. J. Maloney, N. P. Coffin.

Capitol Body Company, Indianapolis, Ind.; $10,000; to manufacture and sell automobile tops and fenders; Elmer Hinshaw, Fred W. Heaschen, Elmer W. Hughey.

Brookville Auto Company, Brookville, O.; $10,000; sales, garage and repairs; J. Ward Somers, Edward B. Somers, V. T. Somers, John E. Somers, Anna Somers.

H. M. S. Motor Company, Inc., New York City; $22,500; motors and engines; Charles K. Starr, Joseph J. Myers, George P. Harvey.

Savoie Tire Company, Providence, R. I.; $100,000; Joseph Savoie, Edward C. Clines, Harry D. Reed.

Aquaero Manufacturing Company, New London, Conn.; $60,000; aeroplanes; Henry R. Bond, Jr., Edward C. Hammond, P. Leroy Harwood.

Norwood Garage, East Orange, N. J.; $10,000; Walter C. Jacobs, Dwight R. Davies, Louis Boehme.

National Garage Company, Cleveland, O.; $20,000; John A. Nally, C. A. Gardner, George L. Williams.

Pierce Speed Controller Company, Anderson, Ind.; $25,000; to manufacture and sell speed indicating and speed controlling devices; George W. Pierce, F. E. Mustard, U. M. McCullough.

Automobile Protective Association Company, Columbus, O.; $5000; guarding owners against theft of automobiles or parts thereof; William Lester, Mark A. Caputo, R. M. Switzer, E. L. Richards, A. M. O'Harra.

Chicago Original Auto Polo Company, Chicago; $6000; dealing in automobiles and operating places of amusement; Joseph R. Deahl, Frederick W. Moore, Marie C. Suhr.

Parsons Manufacturing Company, Toledo, O.; $10,000; to manufacture automobile appliances, novelties, etc.; George R. Seney, Irvin E. Austin, Charles W. Parsons, Henry T. Parsons, Helen W. Keler.

Walker-Wells Company, Inc., Amesbury, Mass.; $25,000; to manufacture automobile bodies; H. P. Wells, J. H. Walker, H. Miller.

Franco-American Safety Tire Company, Philadelphia, Penn.; $100,000; Emile LeFevre, Eugene Wolf, Armond Gallard.

Central Motor Supply Company, Inc., Rochester, N. Y.; $20,000; Percy D. Baragoi, Robert F. Close, William Wood.

Craig Transfer & Motor Car Company, Inc., New Castle, Va.; $2000; M. C. Royden, W. W. Johnson, J. P. Jones.

Newkirk Avenue Automobile Company, Inc., Brooklyn, N. Y.; $5000; Jennie Hunton, William Backus, W. D. Maxwell.

The Club Garage, Inc., New York City; $5000; Jerome L. Davis, Thomas A. Kilfoil, Samuel I. Goldberg.

Valley Rapid Motor Company, Wilmerding, Penn.; $5000; John Genre, Dominick Genre, H. F. W. Rentzel.

Waynesboro Automobile Company, Waynesboro, Va.; $5000; B. E. Watson, J. B. Young, H. M. Hanger.

No Shock Wheel Company, Inc., New York City; $400,000; to deal in automobile supplies; J. W. Ebbs, R. H. Waddell, A. A. Kelley.

Par-Kul Wheel Company, Camden, N. J.; $100,000; automobile business; E. S. Muzzey, F. S. Saurman, F. A. Kuntz.

Dawson Automobile Company, Decatur, Ill.; $10,000; taxicab, automobile and baggage delivery business; Earle M. Dawson, Charles E. Dawson, Florence L. Dawson.

Lincoln Motor Sales Company, Los Angeles, Cal.; $30,000; B. F. Taylor, Edmund Locke, J. A. Meeks.

Union Auto Livery Company, Chicago; $2500; Vernon E. Weyght, Walter Grunnet, Charles Perksen.

Gladwell-Crossley Motor Company, Lima, O.; $10,000; A. J. Gladwell, C. C. Crossley, F. A. Holland, H. I. Bland, J. W. Roby.

Auto Center, Inc., New York City; garage business; $25,000; E. W. Forrest, C. H. Fuller, B. C. Thomas.

Ravenna Motor Truck Company, Ravenna, O.; $200,000; manufacture and sale of trucks; W. F. Travos, A. N. Knuth, H. Schwartz, L. N. Mackenzie, C. O. Liggett.

Peabody Square Garage Company, Boston; $5000; John T. Duke, J. J. O'Keefe, M. A. Duke.

George C. Brinkman Motor Car Company, St. Louis, Mo.; $5000; George C. Brinkman, Phyllis M. Brinkman, Benjamin G. Brinkman.

Lillie Garage Company, Chicago; $2500; T. B. Lillie, E. Lillie, Mrs. T. B. Lillie.

Whittlesey Garage & Machine Company, San Benito, Tex.; $25,000; C. W. Whittlesey, James T. Valentine, J. F. Valentine.

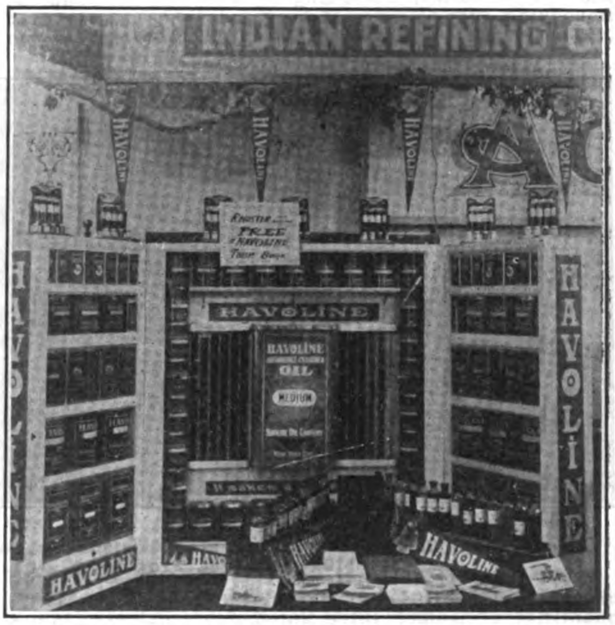
National Tire & Repair Company, Chicago; $3000; William C. Erkert, E. H. Tillson, Paul H. Ringo.

Auto Service Company, Uniontown, Penn.; $5000; C. W. Johnson, Fred A. Close, F. B. Hess, R. M. Campbell, Max Hannan, E. Gadd Snyder, J. C. Donahue, G. T. Love, D. D. Haroder, A. E. Corns.

WITH THE MANUFACTURERS.

The Republic Rubber Company, Youngstown, O., maker of Republic tires, has leased the building at 2018-20 Locust street, St. Louis, Mo., to be used as a branch for the company's product. George M. Hoffman, who has been manager of the solid tire department at St. Louis, is manager of the new branch, which will combine the solid tire with the pneumatic tire business.

The Indian Refining Company, 17 Battery place, New York City, maker of Havoline oils, has taken advantage of the opportunity offered by local shows throughout the country to bring its product more directly to the attention of the motoring public. An accompanying illustration presents the exhibit prepared for this purpose, and it may be added that the large can and the name Havoline in the centre are transparent and illuminated, making a decidedly attractive display.



Havoline Oil Company Utilized by Indian Refining Company at Local Shows Throughout the Country.

The R-C-H Corporation, Detroit, has appointed the following agents to handle R-C-H cars in their respective territory: Cowles Tolman, New Haven, Conn.; D. B. Dalzell, Iliff, Col.; Hood & Currie, Bond, Miss.

M. A. Newmark & Co., a large wholesale and importing firm in Los Angeles, Cal., is utilizing 11 G. M. C. trucks, made by the General Motors Truck Company, Pontiac, Mich., which have replaced a large number of horses and wagons. In order to secure the utmost efficiency from the equipment wheeled bins are used for loading in the warehouse of the company. These bins are transferred from and to the trucks with minimum loss of time, increasing the efficiency of the delivery system by at least 30 per cent., according to the estimate of the company.

The Motometer Company, Inc., 1784 Broadway, New York City, has opened a Chicago branch at 1322 Michigan avenue. R. G. Ames has been made manager.

The Oliver Motor Truck Company, Detroit, maker of Oliver trucks, is occupying the former Carhartt plant and will continue to make the 1500-pound light truck and the 3000-pound vehicle, which has been given a four-cylinder motor. The Oliver Motor Truck Company recently took over the assets of the Oliver Motor Car Company and the factory which it vacated has been sold to the Keeton Motor Car Company, maker of Keeton pleasure cars.

The Gray & Davis Company, Boston, maker of automobile lamps and electric lighting and starting systems, has placed a contract for a five-story reinforced concrete building to be erected in the parkway near the Cottage Farm bridge, on the Cambridge side of the Charles river. It will be ready for occupancy about July 1.

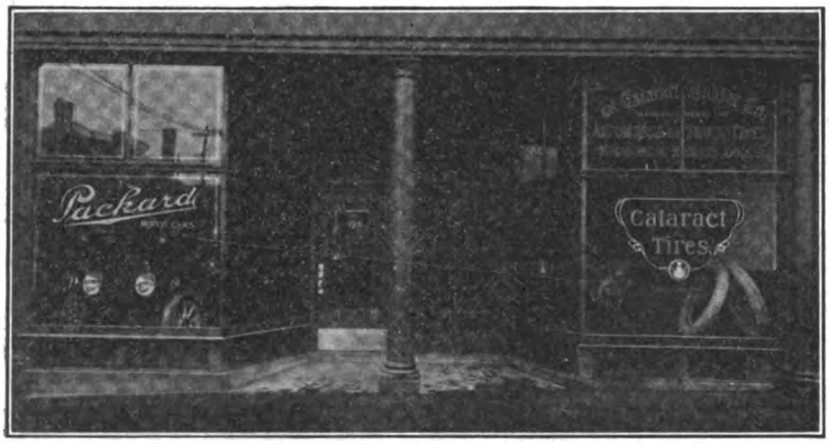
The Willys-Overland Company, Toledo, O., maker of Overland cars, is planning for the erection of a new five-story administration and general office building to cost $150,000.

The Scharf Gearless Motor Company, Richmond, O., recently incorporated, is planning for the erection of a plant for the manufacture of its new motor.

The Garage Equipment Manufacturing Company, Milwaukee, Wis., which recently suffered a setback by reason of a serious fire, has secured a permit to construct an addition to its plant to cost $7500.

The Wilboken Manufacturing Company, Milwaukee, Wis., recently formed, has established its factory and headquarters at 248 Reed street. The company will make air compressors for automobiles, electric air compressors for garages and a line of mechanical specialties.

The Lyons Atlas Company, Indianapolis, Ind., which owns and controls one of the four American Knight licenses and which is now manufacturing the Lyons-Knight sleeve valve engines, has purchased the sample cars, parts, drawings and patterns of the Atlas Motor Car Company, Springfield, Mass., maker of the Knight-Atlas cars, which were designed, developed and thoroughly tested out during the last 18 months by Harry A. Knox of Springfield, who was president of the Atlas company. Mr. Knox has located at Indianapolis and will have charge of the automobile work at the Lyons Atlas plant. The Lyons Atlas Company recently purchased the extensive plant of the former Atlas Engine Works of Indianapolis, embodying over 65 acres of land and 627,000 square feet of floor space. In addition to the Knight engine the company makes Diesel stationary oil engines, also large quantities of poppet valve automobile engines. James W. Lyons, president of the Lyons Atlas Company, states that a large part of its extensive plant will now be utilized for the manufacture of complete Lyons-Knight four and six-cylinder cars.



Rhode Island Branch of Cataract Rubber Company, Wooster, O., at 200 Washington Street, Providence, R. I.

The Rapp Manufacturing Company, Toledo, O., maker of Visco spark plugs, has changed its corporate name to the Toledo Spark Plug Manufacturing Company, and is occupying the new Manufacturers' building. In addition to the well known Visco plug, so constructed as to show at a glance ignition trouble, the company will build a new spark plug to be known as the Ohio, without the visible spark gap seen in the Visco, in large quantities. It is also entering the motorcycle and marine engine field and a number of plugs for these engines has already been turned out.

The Planhard Manufacturing Company, Kokomo, Ind., maker of Planhard carburetors, has appointed through E. H. Stickles, its New York sales manager, the Eisner-Lenk Company of 1074 Boylston street, Boston, distributors for the Planhard carburetor for the entire New England territory. This firm is well known to the trade and will inaugurate an aggressive sales policy.

The United States Tire & Rubber Company has opened a new branch house at Commonwealth avenue and Beacon street, Boston, which is under the management of E. H. Kidder.

The K. & W. Manufacturing Company, maker of tire accessories, has opened a factory branch at 2362 Euclid avenue, Cleveland, O. G. W. Hovey is in charge.

The Willys-Overland Company, Toledo, O., has announced that it will invest an additional $800,000 in the common stock of the Garford Company, Elyria, O., a subsidiary. The capacity of the plant will be increased from six to 15 trucks a day.

J. V. Mowe, well and favorably known among many in the automobile industry, has become a member of the sales force of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires.

The Union Top Manufacturing Company, Pittsburg, Penn., has been granted a charter to manufacture and deal in tops, bodies and accessories for automobiles, boats, etc. The incorporators are: John R. Young, James Milholland and Lyman C. Shreve of Pittsburg.

The Thompson-Breese Auto Plow Company, Wapakoneta, O., has been purchased by John Breese, a member of the firm, and the plant is being enlarged. The firm name has been changed to the Breese Motor Plow Company and will manufacture a self-contained tractor and plow carrying three bottoms. The power will be furnished by a gasoline engine and the tractor and plows can be operated by one man.

Harry J. Galvin, for several years chief accountant and later auditor of the Remy Electric Company, Anderson, Ind., has resigned to become president and general manager of the Galvin Specialty Company, a new concern organized at Anderson, which will manufacture and market gas machines for heating, garment pressing and laundry work. In the new company with Mr. Galvin will be associated W. R. Poland, formerly general manager of the Remy Electric Company, and others. Previous to Mr. Galvin's association with the Remy company he was connected with the plate glass industry at Kittanning, Penn.

The Bosch Magneto Company, New York City, announces that the W. G. Nagel Electric Company, Toledo, O., has been appointed a distributor for the Bosch magnetos. The Nagel company carries a complete stock of Bosch magnetos, spare parts, spark plugs, etc., and maintains a specially equipped shop in charge of trained mechanics for the proper installation and adjustment of Bosch ignition apparatus.

E. J. Samuel, who was in charge of the publicity department of the Goodyear Tire & Rubber Company, Akron, O., has been promoted and will be manager of the advertising department of the Goodyear Tire & Rubber Company, Ltd., of Great Britain, with headquarters at Central House, Kingsway, W. C., corner Kemble street, London, England.

The Cataract Rubber Company, with factory in Wooster, O., has opened a factory branch for Cataract automobile and truck tires at 200 Washington street, Providence, R. I. Patrons in Rhode Island will be served by this office. An illustration of the new salesrooms is presented herewith.

The Fisk Rubber Company, Chicopee Falls, Mass., will on Feb. 1 open a completely equipped branch house at 307 Fort street, Winnipeg, Manitoba, Canada. A full line of Fisk tires and tire accessories will be carried. The increased demand in Canada for Fisk tires made it advisable to open the branch, which will be one of the most completely equipped of any in the Dominion. R. Phillips will be in charge as manager.

John N. Willys, president of the Willys-Overland Company, Indianapolis, Ind., maker of Overland cars, has been elected president of the Gramm Motor Truck Company, Lima, O., builder of Gramm trucks. Mr. Willys announces that the plant will be increased and in addition to the one-ton trucks now being produced a new 1500-pound model will be made. H. H. Doehring, for several years general sales manager of the Ohio Electric Car Company, Toledo, O., has been appointed sales manager of the Gramm Motor Truck Company.

The Schacht Motor Car Company, Cincinnati, O., maker of Schacht cars, recently held an election of directors at a meeting of its stockholders, with the following results: G. A. Schacht, William Schacht, Harry G. Pounsford, A. O. Elzner, John F. Dietz, John H. Miller and Arthur Stem.

The Vanguard Manufacturing Company, which has been building for some time at Detroit, preparatory to removing from Joliet, Ill., is now in its new plant with a capacity for 1000 windshields a day.

The Bowling Green Motor Car Company, Bowling Green, O., maker of light motor trucks, has voted to double its capitalization from $100,000 to $200,000.

The Anderson Electric Car Company, maker of the Detroit electrics, has opened a new factory branch at 903 Boylston street, Boston. A service station is also located in the same building which is equipped with every facility for the maintenance of the high quality of service extended to all Detroit electric owners.

The Cole Motor Car Company, Indianapolis, Ind., maker of the Cole cars, has appointed the following distributors: F. A. Wilson, Amherst, N. S., Canada; J. P. Krall, Avon, S. D.; Davis Sparger Auto Company, Bristol, Tenn.; A. V. Hunt, Clarinda, Ia.; LaFayette Motor Car Company, Easton, Penn.; Serfas Motor Car Company, Lehighton, Penn.; Swanson Bros., Lyons, Neb.; Thomas Mabon, Northfield, Neb.; Pink, McVerty, Blackburn Company, Ottawa, Ont., Canada; G. Williams & Bros., Poplar Bluff, Mo.; Chamberlain Bros., Salem, Ore.; Trenton Motor Car Company, Trenton, N. J.; Baehr Bros., Wadena, Minn.; Morgan & Williams, Warren, O.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has appointed the following managers of newly established branches: J. D. Palmerlee, 548 Peachtree street, Atlanta, Ga.; C. E. Wheeler, 563 Boylston street, Boston; R. W. McMullen, 1225 Main street, Buffalo, N. Y.; H. E. Westerdale, 2021 Michigan avenue, Chicago; A. D. Caldwell, 2122 Euclid avenue, Cleveland, O.; E. W. Swanbrough, 1520 Broadway, Denver, Col.; M. D. Davidson, Jefferson and Lycaste streets, Detroit; E. E. Guthrie, 3501 Main street, Kansas City, Mo.; J. W. McCrea, 1242 Hennepin avenue, Minneapolis, Minn.; W. S. Jewell, 1989 Broadway, New York City; E. N. Stimson, 330 North Broad street, Philadelphia, Penn.; A. E. Morrison, 819 Ellis avenue, San Francisco, Cal.; Don J. Campbell, Walkerville, Ont., Canada.

The Timken Roller Bearing Company, Detroit, is constructing a new factory for the grinding of the cups, cones and rollers used. The plant will be 64 by 120 feet and will cost $100,000.

Herbert Hughes, for the past six years with the Packard Motor Car Company, Detroit, maker of Packard cars, has joined the sales organization of the Buick Motor Company, Flint, Mich., producer of Buick machines. He sailed from New York Jan. 22 for London to assume charge of European sales. Mr. Hughes was manager of Packard sales in Paris for two years and for four years was with the company at Detroit.

The Stromberg Motor Devices Company, Chicago, announces that the Indianapolis branch has been transferred to new quarters at 33 West Michigan street.

Harry C. Tillotson, formerly a director and treasurer of the McDuffy Automobile Company, is now a director and secretary of the Stromberg Motor Devices Company, Chicago, maker of carburetors and motor accessories, and in addition to the active duties of secretary he will have personal supervision of the sales.

W. Haddon Jenkins has resigned as advertising manager of Motor Print to become merchandising expert for the McManus company's advertising agency in Detroit. Mr. Jenkins gained his first experience with the Ireland agency of Philadelphia and was later branch manager for Albert Frank & Co., going from there to the J. Walter Thompson Company, which he left in 1910 to become advertising manager of Motor Print.

Frank E. Smith, for the past three years general manager of the Maxwell-Briscoe Motor Company's plant at Newcastle, Ind., will sever his connection with that plant and with the company as soon as the United States Motor Company, of which the company is a part, is completely reorganized. It is expected that Mr. Smith will announce his plans for the future soon.

The Remy Electric Company, Anderson, Ind., manufacturer of the famous Remy magneto, announces it has discontinued the Indianapolis branch; owing to the proximity of Anderson to that city it has been found more expedient to care for Remy users directly from the service department of the company located at the home office. E. L. Jones, manager of the Indianapolis branch for the past two years, will continue with the company at the Anderson office.

The Metal Body Tank & Fender Company, 414 Canal avenue, Cleveland, O., has been obliged to enlarge its space and manufacturing facilities and is moving to Payne avenue and East 17th street. The company has recently taken a large contract for automobile bodies that cannot be executed in the present quarters.

The Ford Motor Company, Detroit, Mich., maker of Ford cars, recently purchased a piece of property in St. Paul, Minn., on University avenue, upon which to erect a suitable garage and salesroom to handle the retail trade of St. Paul. The property cost $10,000 and as soon as possible a suitable two-story building will be erected. In Minneapolis, Minn., the company is building an extensive assembly plant and warehouse which, when completed, will be occupied also as a salesroom, garage and warehouse for the handling and distributing of Ford cars throughout the Northwest.

H. M. Denyes of the technical department of the Buick Motor Company, Flint, Mich., maker of Buick cars, has become chief engineer of the Jackson, Church, Wilcox Company of Saginaw, Mich. The concern manufactures the Jacox steering gear and is in the General Motors group. Mr. Denyes has been with the Buick company for the past three years.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar and pleasure cars and trucks, has appointed the following agencies: Dominion Motor Machine Company, Medicine Hat, Alberta, Can.; J. L. Maddux, Taft, Cal.; C. C. Eichelberger, Oakland, Cal.; Short's garage, Dwight, Ill.; H. G. Raymond, Fort Wayne, Ind.; Charles H. Lantz, Manhattan, Kan.; Bishop & Chero, Iron River, Mich.; Ball Auto Company, Fargo, N. D.; Alpine Motor Company, Pittsburg, Penn.; J. W. McKee, Sherbrooke, Quebec, Can.; Rydell & Hokenson, White Rock, S. D.; Percival & Silsby, St. Johnsbury, Vt.

Hess & Son, successor to The American Tinol Company, Philadelphia, Penn., has located its offices and salesrooms in the Watkins building, 1031 Chestnut street. A complete stock of Tinol in all forms will be kept on hand.

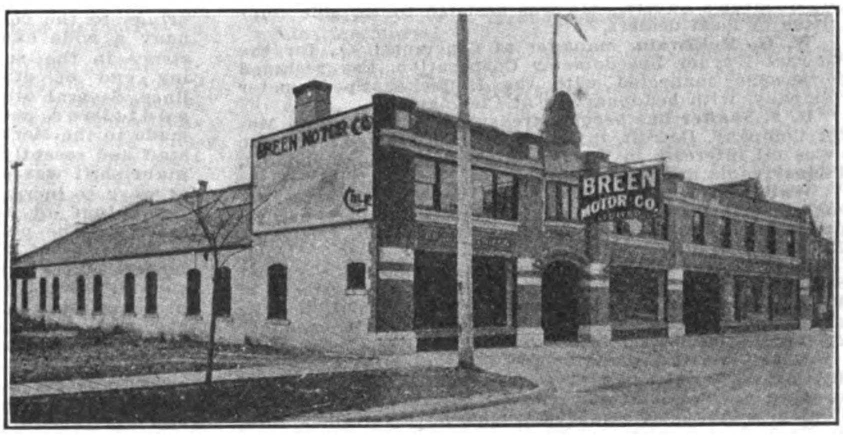
TRADE PERSONALS.

Harry S. Houpt has resigned as general sales manager of the automobile department of the American Locomotive Company, New York City. He has not been in good health for some time and he has left for a trip through the South.

J. J. Cole, president of the Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, is making a trip through the entire West in order to personally familiarize himself with actual trade conditions, repeating a similar trip made through the East last year.

The Breen Motor Company, Broadway and Sherbrooke street, Winnipeg, Manitoba, is agent for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., in that section of Canada. The accompanying illustration indicates the size of the present quarters which are held to be decidedly too small, and arrangements are under way for the erection of a substantial addition.

William L. O'Neil, formerly manager of the New York office of the Stromberg Motor Devices Company, Chicago, has been appointed manager of the Detroit office and will have charge of the business in Michigan, Ohio and Canada. His place at New York has been taken by R. B. Whitman, formerly connected with the Bosch Magneto Company.



Exterior of the Cole Agency in Winnipeg, Manitoba, Held by Breen Motor Company.

Ernest C. Cox, formerly connected with the Texaco Oil Company, as sales manager, has been appointed manager of the eastern sales and service branch of Findeisen & Kropf Manufacturing Company, Chicago, maker of the Rayfield carburetor.

Sales Manager Paul Smith of the Lozier Motor Company, Detroit, maker of Lozier cars, has announced the appointment of H. W. Miller to the sales organization of the company. Mr. Miller was formerly connected with the Studebaker Corporation.

Gerald M. Murphy has severed his connection with the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf magnetos. As assistant treasurer for C. F. Splitdorf, Inc., for seven years Mr. Murphy was well known throughout the executive departments of the automobile industry.

O. R. Wolf has been appointed factory representative and territory manager of the Central States district for the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson machines.

A. J. Diefenderfer has been appointed manager of the New York branch of the Lozier Motor Company, Detroit, succeeding W. J. Mead, whose assistant he formerly was.

C. M. McCreery, manager of the Boston branch of the Goodyear Tire & Rubber Company, announces that Frank B. Sullivan is now in charge of the sales of the motor truck tire department.

Harry L. Bill, former production manager of the Chalmers Motor Company, Detroit, and later general manager of the Metzger Motor Car Company, and then of the Tudhope Motor Car Company of Orilla, Can., Canadian maker of the Metzger cars, has become manager of manufacturing for the Ignition Starter Company, Detroit.

Thomas I. Cochran has achieved an enviable reputation as a show manager, largely because of his success with previous automobile displays at Pittsburg, Penn. This year's recent third annual show of the Pittsburg dealers in the Exposition building far surpassed all previous exhibitions of the kind held in the Smoky City and this was in a large measure due to the hard work of Mr. Cochran, who began his preparation early in the present year. Pittsburg is the centre of a population roughly estimated at 5,000,000, so that the task of arranging a motor exhibition that would appeal to this clientele was no small matter. The attendance this year was the largest in the history of Pittsburg shows and many were the expressions of congratulation at the success of Mr. Cochran's efforts. He was assisted by an able committee of local dealers.

Thomas I. Cochran, Manager, Pittsburg Automobile Show.

W. G. McElwain, manager at Cincinnati, O., for the Stewart-Warner Speedometer Corporation, has resigned to become connected with the Hoffecker Speedometer Company, with headquarters at Cleveland, O.

H. S. Shaffer has become treasurer of the Keeton Motor Company, Detroit, in which he is interested. He also owns oil interests in Texas, Oklahoma, Illinois, Indiana, Pennsylvania and West Virginia.

Walter H. Wood of Chicago, formerly of the advertising department of the Chicago Examiner, has become publicity manager of the Moline Automobile Company, East Moline, Ill.

C. B. Smith, general manager of the Stewart-Warner Speedometer Corporation, announces the appointment of Frank Martin as eastern manager; Berne Nodall to take charge of the engineering staff, and R. Baldwin, manager of the Detroit branch.

J. V. Carr, salesman for the State of Michigan; John R. Carr, city salesman at Detroit, and J. B. Bray, purchasing agent, all of the Alden Sampson Manufacturing Company, maker of Sampson trucks, have resigned.

E. A. Scheu, who was the first agent for Invader oils in Boston, will remain in charge of that branch of the Invader Oil Company, the new name of the old firm of Chas. F. Kellom & Co., Philadelphia, Penn., which has been acquired in part by T. E. Tomlinson, who organized the Havoline Oil Company and who will direct the sales end of the new firm, Mr. Kellom remaining at the head. The company formerly maintained only the Boston branch, but a Chicago branch will soon be opened. Mr. Scheu was from 1903 until he became agent for the oil, connected with the Packard Motor Car Company and the Boston Packard agency. He has developed his oil business greatly and his knowledge of the New England trade is very extensive. He has perfected plans for the better distribution of Invader oils and is now a stockholder in the company. He will travel New England this season by car and will be in close touch with the representatives of the company.

E. A. Scheu, Manager, Boston Branch, Invader Oil Company.

George L. East, formerly director of advertising of the Olds Motor Works, Lansing, Mich., and later with the Amplex Motor Car Company of Mishawaka, Ind., has joined the publicity staff of the Timken Roller Bearing Company and the Timken-Detroit Axle Company, as assistant advertising manager.

William R. McCulla has taken a position as assistant research engineer with the Packard Motor Car Company.

Dr. Charles G. Percival of New York City, well known automobile publicity man, is said to be arranging another trip similar to the 50,000-mile journey he made in the Abbott-Detroit "Bull Dog." Previous to his proposed trip he will go to Havana, Cuba, Yucatan, Mexico and through the southern states.

T. H. McGiehan, who for three years has represented the Goodyear Tire & Rubber Company at New Orleans, La., has become assistant manager with the Motz Tire & Rubber Company, Akron, O.

H. S. Stebbins, formerly general traffic manager for the General Motors Company, and eastern district manager for G. M. C. trucks, is now associated with the S. G. V. Company of Reading, Penn., as vice president and treasurer.

E. W. Arbogast, manager of the commercial car division of the Chicago branch of the Studebaker Corporation, Detroit, has been made manager of the commercial division in the entire territory controlled by the Chicago branch.

H. H. Robinson, chairman of the runs and tours committee of the Wolverine Automobile Club, Detroit, has been appointed assistant to W. G. Houck, general sales manager of the Keeton Motor Company, Detroit.

H. Cameron Forster has been appointed to take charge of the sales department of the Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, and he brings to the company a wide experience in the selling end of other lines. Several other additions were made to the Merkel staff and recently a night shift was put at work to increase the output of the factory. The plant is now one of the busiest in the country and the present demand for the product is such that the company plans to double its capacity. The addition of Mr. Forster is assurance that the sales will greatly increase and the prospects for big business were never brighter.

H. Cameron Forster of the Flying Merkel Sales Department.

Fred W. Ellis has joined the advertising department of the Imperial Wheel Company, Jackson, Mich.

NEW CONCERNS AND PROPRIETORS.

B. D. Springs & Co., a well known firm of Charlotte, N. C., was recently dissolved, when B. D. Springs purchased the holdings of his active partner, E. T. Stenerson, and also of Eli B. Springs, a silent partner. Mr. Stenerson has purchased the Charlotte Motor Car Company and will have entire charge of that concern. E. B. Springs, who also was a silent partner in that company, has retired.

The Holsman Sales Company, Des Moines, Ia., has been organized and closed contracts for the State of Iowa for the King machine, made by the King Motor Car Company, Detroit.

The Union Automobile Company, Wheeling, W. Va., is a new concern organized to handle the Abbott-Detroit cars, made by the Abbott Motor Company, Detroit. William F. Shaffer, secretary and treasurer of the Packers Motor Truck Company of the same city, was one of the organizers. Others were A. C. Shaffer, George P. Folmar, Albert M. Schenk.

The Brookes Auto Company, Steubenvile, O., has purchased the Automobile & Motor Boat Company of that city, which has been placed in charge of O. L. Marquert, who will have the agencies of the Cadillac pleasure car and the Kelly-Springfield and Chase trucks. The new owner will add the Studebaker and Michigan cars, besides the Lippard-Stewart trucks.

The Des Moines Auto Supply Company, a newly organized accessory concern, has leased quarters at 1007 Locust street, Des Moines, Ia. The new firm was organized by A. G. Bigelow, who is president, and B. O. M. Bonebrake, secretary and treasurer.

The Maykel Automobile Company of Worcester, Mass., has been formed with a capital stock of $12,500, and has occupied a garage on Vine street, formerly occupied by the Worcester Automobile Company. The officers are: President and treasurer, Mitchell K. Maykel; clerk, Maurice L. Kats. With Anthony Massad these form the board of directors.

The Hagerstown Garage Company, Hagerstown, Md., has sold to the Maryland Garage Company all its materials and possessions in the building on West Franklin street and has taken an office in another building, where M. I. Patterson will look after the Pullman and Regal agencies. The new company is composed of Dr. R. G. Stevenson, David Stockslager and others.

The Van Brunt Automobile Company, Omaha, Neb., has moved into larger quarters at 2010 Farnam street. The company handles the Overland and Pope-Hartford and the Ohio electric.

Irving Stern of Stern Bros., New York City, has leased the garage at 164 East 77th street of the L. J. Bloomingdale estate.

J. W. Leavitt & Co., Salt Lake City, Utah, agent for the Overland car, made by the Willys-Overland Company, Toledo, O., has moved into its new quarters at 1235 South Olive street. L. V. Starr is local manager for the Leavitt company.

J. Peshkin has leased the three-story garage at 113 East 77th street, New York City, of William Wolff's Sons, acting for the Christian Creamer estate.

Clark G. Powell, who managed the very successful Omaha automobile show at Omaha, Neb., is an enterprising dealer in supplies in that city. He is a recognized authority on all matters pertaining to the automobile industry and it is because of this knowledge that he was honored by his associates with the management of the annual automobile exhibit in his city. That their confidence was not misplaced is shown by the magnificent results obtained. Mr. Powell spent some time in Chicago during the recent national exhibit in that city and as a result manufacturers assisted the local Omaha dealers by sending several of the machines seen there for presentation at the show in the Nebraska metropolis.

Clark G. Powell, Manager, Omaha Automobile Show.

The W. D. Sweet Motor Car Company, a new concern organized at Binghamton, N. Y., has taken over the business of the W. A. Crandall Company of 233-235 Water street, and will make Binghamton the distributing point for Speedwell cars in Pennsylvania and New York territory. Mr. Crandall retains the machine and repair shop.

The Ross Garage Company and the Ketchum Garage Company, Saratoga Springs, N. Y., both large concerns, have been consolidated and the members of the new firm are: Norman B. Ross, J. A. P. Ketchum and J. W. Northup. It will handle the Packard and Hudson and the Detroit electric.

W. B. Hollander, formerly of the Hollander Motor Car Company of Boston, has opened salesrooms and a service station at 170 Fountain street, Providence, R. I., for the distribution and care of Metz cars in Rhode Island and a part of Massachusetts.

The Pueblo Auto Repair Shop & Storage Company, Pueblo, Col., has opened a new establishment at 521 Court street, that city, to be devoted exclusively to the repair and storage of automobiles.

Charles McAninch has rented property known as the Grabe mill at Silver City, N. M., and has opened an automobile repair shop.

Clifford Caley of Bluffton, Ind., has opened a new garage on Main street, Huntington, Ind., equipped to do all kinds of automobile work.

The Taunton Autogenous Welding Company, Taunton, Mass., has started business, making a specialty of automobile welding. Harry Carr is president and James Carr is superintendent.

Karl Winter, a well known automobile mechanic, has opened a repair plant at Eighth, South and State streets, Salt Lake City, Utah.

Stein & Unger of Elizabeth, Ill., has opened a garage on Front street, Warren, Ill. The Ford cars are carried.

E. E. Westman, who has been purchasing agent for the Cole Motor Car Company, Indianapolis, Ind., since October, 1909, has resigned to take a similar position with the Henderson Motor Car Company of that city. As a result of the move he will again be associated with J. M. Smith, formerly factory manager of the Cole company, who is now the Henderson factory manager. Mr. Westman has been regarded as an important factor in the success of the Cole, and before his connection with that company he held a responsible position with the Weston-Mott Company of Flint, Mich., for some time. The Henderson brothers were well informed of his ability through their close connection with the Cole factory organization during the life of the Henderson Motor Sales Company, which acted as Cole distributor for a number of years. His acquirement is another step to strengthen its organization.

E. E. Westman, Purchasing Agent, Henderson Motor Car Company.

Troth & Keen, Millville, Penn., which has conducted a livery stable, has sold its entire livery stock and replaced it with automobiles and motor trucks.

W. S. Jewell, formerly district manager for the R-C-H Company of New York, has been appointed sales manager of the Boston branch of the Kelly-Springfield Motor Truck Company. P. S. Aultman will continue as manager. The Boston branch of the Kelly-Springfield company is located in the Shoe & Leather building, Cambridge.

The Carlock Hardware & Implement Company at Carlock, Ill., has taken the agency for the Staver and Studebaker automobiles and has opened salesrooms and a garage in connection with the implement store.

The Norwalk Motor Sales Company, Chicago, has been organized by H. A. Stevens, who has opened a garage and salesroom at 4005-4007 Washington boulevard, for the exclusive sale of the Norwalk car.

William Blanchard, sales manager of the Lenox Motor Car Company, Boston, maker of Lenox cars, is thoroughly conversant with the construction of automobiles and this knowledge makes him of inestimable value to the company he serves. Mr. Blanchard has been connected with the industry for the past six years. He gained his first knowledge of motor cars with the Easton Machine Company, South Easton, Mass., maker of the Morse line, where he worked in every department, serving his full time at the bench and in the shop. It was while acting as salesman for the Morse cars that he was induced to join with the Lenox company in exploiting that line, and early in 1912 was promoted to become sales manager. In this position he has had much to do with the success of the Lenox Motor Car Company.

William Blanchard, Sales Manager, Lenox Motor Car Company.

The Crescent Garage, Goodsell and High streets, Evansville, Ind., has been opened by J. F. Griese and G.

M. Wilson, who are equipped to undertake all kinds of automobile repair work. They handle the Empire cars, made by the Empire Automobile Company, Indianapolis.

Factory Addition Recently Occupied by Flying Merkel Forces at Middletown, O.

Merley & Bryer has secured a part of the livery stable of Fink & Co., Aurora, Ill., and will convert it into a modern garage.

The Galveston Motor Car Company has entered the field at Galveston, Tex., and plans are being made for incorporation. R. S. Carter is general manager and the company has purchased of Fred M. Lege, Jr., the agency for the Studebaker cars.

W. H. Gilligan, Jr., recently resigned from the Morgan Garage & Supply Company, Rhinelander, Wis., and with Edward Priebe has opened a garage there.

R. S. Chase has opened a new garage at 642 State street, Springfield, Mass., and has a well equipped repair department, including paint room and a full line of supplies. He also has storage space.

The Arenz-Weihaupt Auto Company has been formed at La Crosse, Wis., the Weihaupt blacksmith shops being remodeled into a first class garage and repair shop. The Detroiter and Marathon are the machines for which agencies have been secured. The president and general manager is J. G. Weihaupt; vice president, George W. Weihaupt; secretary and treasurer, J. S. Arenz; head salesman, S. Bovee.

The Auto Accessories Company, Ft. Wayne, Ind., has been formed by J. M. Cramer, formerly manager of the Fort Wayne-Auburn Automobile Company. The new company will operate a wholesale automobile business and also a vulcanizing plant.

G. W. Jones, until recently general manager of the United Motors Des Moines Company, has secured a controlling interest in the Moyer Auto Company, Des Moines, Ia., which has the state agencies for the K-R-I-T and Hudson cars. W. E. Moyer, who went to New Mexico for his health, sold his business only a few days before his death.

J. C. McDonald and Joseph Atherton, proprietors of the M. & A. garage at Macomb, Ill., recently purchased the Stocker garage in the same place. They will continue both, although the M. & A. building will be used principally as a storehouse.

E. B. Grantham has purchased a half interest in the Granite City garage, Granite City, Ill. New machinery will be installed for all kinds of repair work.

The M-S-H Sales & Rubber Company, 660 North Broad street, Philadelphia, and the Meeley Tire House, 1335 Mount Vernon and 702 North Broad streets, and the Meeley branch at Washington, D. C., have been merged and will be conducted under the style of Meeley Rubber Company, Inc., with headquarters at 660 North Broad street. The officers of the new company are: President, George G. Meeley; vice president, John V. Harrigan; secretary and treasurer, Robert J. Skilton.

Arthur Parks has disposed of a half interest in his livery stable at Leland, Ill., to Ingval and Harvey Ericson. The new firm will soon open a garage.

The Peerless Garage, Fairfield avenue and Cannon street, Bridgeport, Conn., conducted by Richard J. Collins, has been fully equipped with a modern machine shop, in which adjusting, repairing and overhauling Ford cars, made by the Ford Motor Company, Detroit, will be made a specialty. The garage is large enough to care for all transient trade, having a storage capacity of 50 cars. Mr. Collins has handled Fords and been connected with Ford agencies since the establishment of the home factory.

The Lyman Dickey Garage, 107-109 Main street, Ottawa, Kan., has been sold to Troup Bros., comprised of motor car experts of Kansas City and Oswego. The members of the firm are Charles Troup, O. M. Troup and E. A. Troup.

Herbert R. Capron has leased a new building on Atwell's avenue, Providence, R. I., for use as a service station for Pope-Hartford cars. It will be used in conjunction with the present office and garage, at 69 Broad street, of the Rhode Island Motor Car Company, of which Mr. Capron is manager.

Arthur Jackson, formerly with the Mott Motor Company, and Guy Ginther of Lemmon, N. D., have purchased the Walter Smith garage at Mott, S. D., and have taken possession.

James M. Greenless, who the past season conducted the Shelburne Falls garage at Shelburne Falls, Mass., has purchased the business of J. W. Thurber.

NEW BUILDINGS AND REMOVALS.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, has made substantial additions to its plant, as shown by the accompanying illustrations. One building is the office structure, which has just been occupied, while the other is the new factory wing. Both are of concrete and steel construction. The office building is said to be one of the most modern of its kind, while the factory addition affords excellent light and ventilation. With the facilities at hand it is now possible to manufacture 100 motorcycles a day.

The H. W. Neuman Machine Company, 308 East Second street, Davenport, Ia., is having a new garage building erected at Third and Ripley streets. The new place will be thoroughly equipped with modern machinery and automobile facilities.

The Packard Kansas City Company, Kansas City, Mo., possesses a new salesroom and service station at Robert Gillham road and McGee street. The company has a lease on the property with a purchase provision.

The Overland-Buffalo Company, Buffalo, N. Y., is now occupying its new headquarters at 1079-1081 Main street. The concern occupies the entire building in connection with the Garford-Buffalo Company and an excellent service department is maintained.

The Gallup Auto Company, Gallup, N. M., of which C. L. Day is proprietor, has started the actual work of construction on a new garage, which will be thoroughly equipped for all kinds of service.

The W. L. Huffman Automobile Company, Omaha, Neb., has purchased the stock and lease of the J. J. Deright Automobile Company at 1816-1818 Farnham street, including the Stoddard-Dayton and Locomobile cars. The building will be completely remodeled to care for the increased business.

Floyd P. Harris and Raleigh L. Harris have made arrangements to open a garage at Galva, Ill., where a building is being remodeled.

C. F. Edick is to manage a new garage at Hubbard, Ia., and plans have been made for the construction of a new brick building.

Edward P. Young, agent at Syracuse, N. Y., for the Maxwell and Regal cars, has occupied a garage building recently completed on Jackson street, and in which are complete salesrooms and a service station.

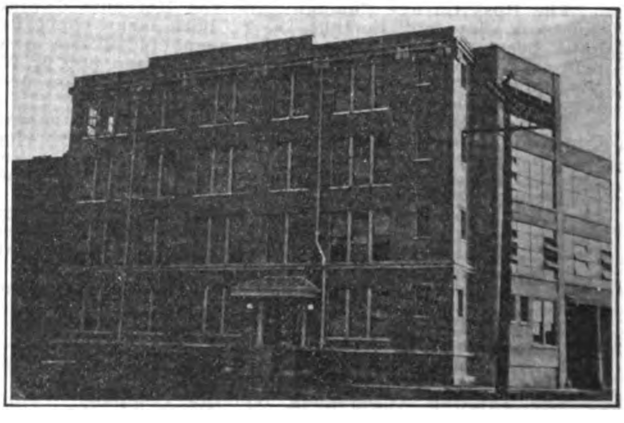
H. L. Cook & Co., Palestine, Tex., has begun work on the erection of a new brick garage.

The Woodburn Auto Company, Woodburn, Ind., is erecting a large addition to its plant.

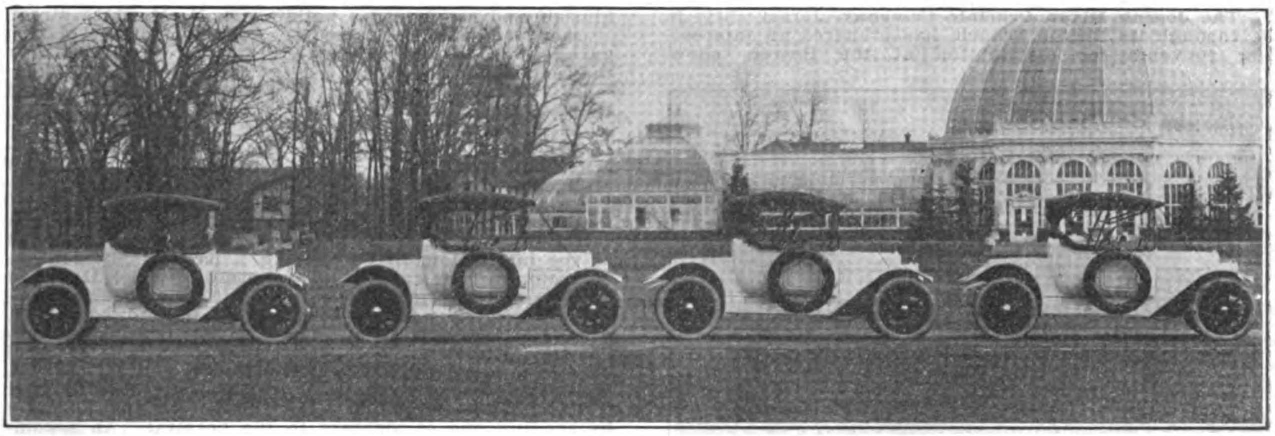
Fred Jensen and Milton Frey of Hancock, Minn., have formed a partnership and will erect a modern garage in that place. They will conduct a general automobile business and will be equipped to do repair work of all kinds.

E. H. Broadwell, vice president of the Hudson Motor Car Company, Detroit, maker of Hudson cars, is reported at New York City as saying he has withdrawn from the company, having sold all his holdings. Mr. Broadwell will leave for Florida, where he will remain for some time. He announced no plans for the immediate future.

The Glenwood Garage Company, which operated the Glenwood garage at Riverside, Cal., under the management of C. A. Dundas, has awarded the contract for a substantial addition to the plant.



New Office Building of the Miami Cycle & Manufacturing Company, Middletown, O.



Fleet of Abbott-Detroit Cars Recently Delivered to the City of Denver, Col., for Use of Assistant Fire Chiefs.

The Central Vulcanizing Company, Albany, N. Y., has purchased a two-story building at 148 Central avenue and after suitable alterations have been made, will move from 357 Central avenue. Jacob Brown is manager of the concern.

O. M. Driscoll has opened a large salesroom and service station at 24 East Front street, Trenton, N. J. He handles the Hupmobile line, made by the Hupp Motor Car Company, Detroit.

The West Virginia Automobile Company, Wheeling, W. Va., has sold its garage on 16th street to a new company, the name of which was not announced. Extensive improvements are to be made it is said.

The Central Iowa Motors Company, Des Moines, Ia., has purchased the interest of the Van Vliet-Bradt Auto Company at 706 Mulberry street, and will make improvements to the garage building.

The Fleming Auto & Tire Company, Montgomery, Ala., has been formed and has leased the garage at 21 Washington street. The company will distribute the Overland line, made by the Willys-Overland Company, Toledo, O.

Perl W. Devendorf, Watertown, N. Y., has purchased the entire interest of the Warner Automobile Company at 155 Arsenal street. Mr. Devendorf will handle the Ford cars.

The Waupaca Garage, owned by F. L. Hoaglin, Waupaca, Wis., has been transferred to Van A. Nelson, who will also take the agencies for three well known makes of cars.

The White Motors Company, New Haven, Conn., is erecting a new service station at 1094 Chapel street, to cost $2000.

The Boonton Auto Garage & Transportation Company, Boonton, N. J., will erect another garage adjoining its present establishment on Washington street.

R. J. Moore, Glasgow, Mont., has sold his interest in the Moore garage on Market street to J. H. Aschliman, formerly of Twin Cities, Mont.

The Abbott Motor Company, Detroit, Mich., recently filled an order for four Abbott-Detroit roadsters, finished in white with gold stripes and red artillery wheels, for the city of Denver, Col. These cars, which are shown in an accompanying illustration, are for the use of the assistant chiefs of the fire department.

W. H. Olds of Crookston, Minn., who conducts a garage and repair shop for automobiles, motorcycles and bicycles, is enlarging his place of business.

Charles E. Preston, Berwick, N. H., has fitted up his garage in the Clark & Davis building at Sullivan square and the business will be conducted under the name of the Preston Auto Garage Company. Mr. Preston will handle the Ford cars, which are made by the Ford Motor Company, Detroit.

Miller & Geiger, Birdsboro, Penn., has completed improvements to a building on Main street, which has been transformed into a modern garage and repair shop.

Yerkes & Pritchard, Paris, Ky., is the name of a new firm which has opened a garage and repair shop in that town.

The Sims-Thomson Garage, Waxahachie, Tex., is to be enlarged to care for growing business.

Thomas Kielty and H. Ryan, DeGraff, Minn., will erect a garage in that town which will be modern and contain an up-to-date repair shop.

Ralph Peltier and Arthur R. Weld have opened an automobile repair shop on Federal street, Greenfield, Mass. They are prepared to undertake work of all kinds.

The National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, has completed another addition to its already large plant in the Indiana metropolis. The latest addition, required by the steady increase in business, is a modern brick and cement building that allows general expansion and at the same time increases efficiency and eliminates any possible lost motion in getting materials from one department to another. The new building, shown in an accompanying illustration, allows 20,000 feet of floor space and there are three floors. The first floor will be a general expansion of the machine shops, the second an enlargement of the paint department and the third an increase of the trimming and upholstery departments.

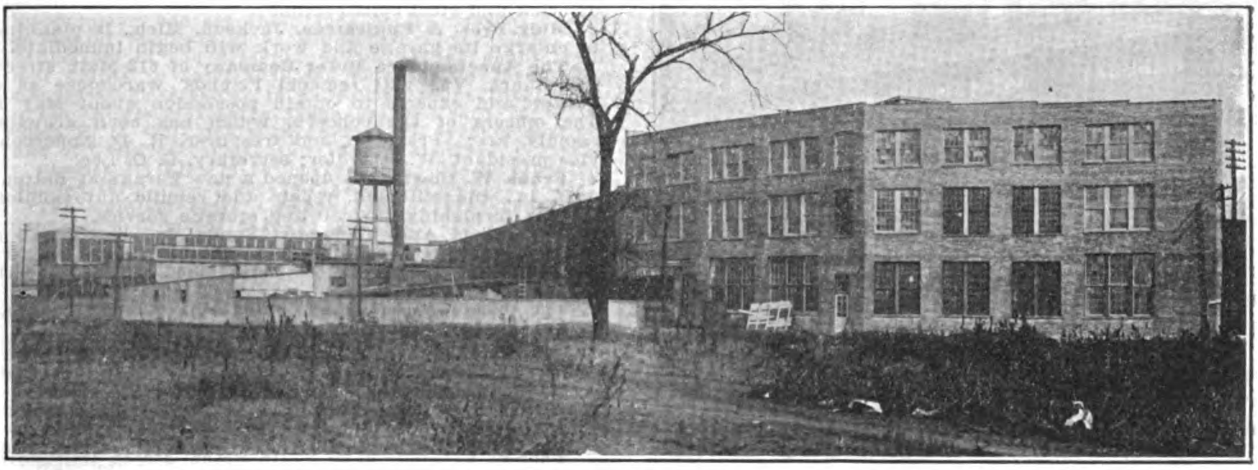
Sanders Nestegard and A. C. Halmsness, Fillmore, N. D., have erected a modern garage in that town.

Abel Mitchell, Madison, S. D., is making repairs to the Tierney building on West Fourth street, to accommodate his garage and automobile business.

Charles C. Collins and Thomas S. Davidson of Denver, Col., have formed a company to handle automobile tire supplies. The concern is located at 1633 Court Place.

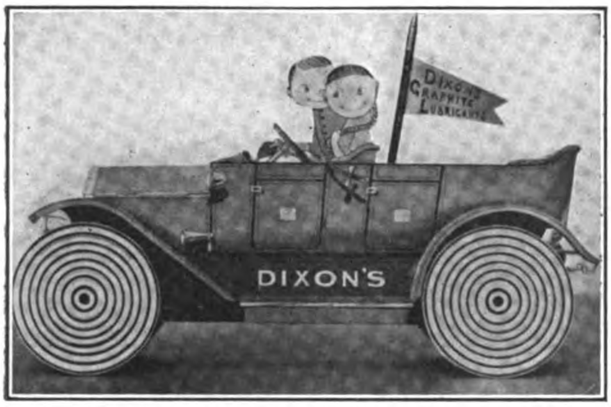
The Landman-Griffith Motor Company, 1010 Madison avenue, Toledo, O., has moved into its new building at 14th street and Madison street. The company features Flanders electric cars.

The Southern Motors Company, Louisville, Ky., has plans for a new garage and service station to be erected at 615 South Third street at a cost of $50,000. The company handles the Packard, Hudson and Detroit electric.



Two-Story Addition Recently Completed for the National Motor Vehicle Company, Maker of National Cars at Indianapolis, Ind.

The Joseph Dixon Crucible Company, Jersey City, N. J., through its Boston branch, has prepared an interesting souvenir for distribution at the Boston show. It is termed a moving picture and is presented in an accompanying illustration. It is expected to prove a unique method of calling attention to the graphite lubricating products made by this concern.



Joseph Dixon Crucible Company's Show Souvenir—Move in a Small Circle and Watch the Wheels Go Around.

The Watts Wagon & Auto Company, Harrisburg, Penn., was recently formed by F. N. Watts, the veteran wagon man, who started business 28 years ago, and the firm will soon occupy a three-story building at 1017-1019 Market street, which is in course of reconstruction.

The Pacific Auto Company, Bellingham, Wash., has occupied its new garage on Washington street, and is equipped to handle all kinds of business.

Stanley Pritchard of Portsmouth, O., has caused to be erected a new garage on Gallia street to accommodate his increasing business.

H. W. Jones, who some time ago purchased the interest of his partner, Frank Vana, in the Montrose garage at Cedar Rapids, Ia., is having erected a new garage and machine shop to be occupied as soon as completed.

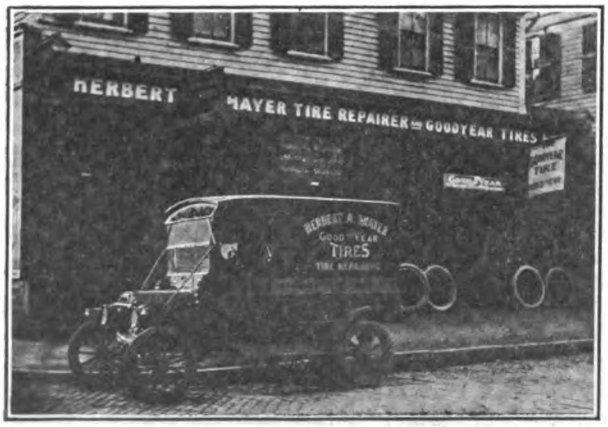
Perkins & Jenkins of Caldwell, Tex., is enlarging and remodelling its garage so as to provide accommodation for the ever increasing number of automobiles being brought to the plant.

The H. E. Ross Electric Company, Davenport, Ia., which handles the Ohio electric cars at 525-527 West Second street, has completed improvements to the garage that cost $3600 and which make it one of the finest equipped and furnished electric garages in that part of the country.

The Plow City Garage on Sixth avenue, Moline, Ill., owned and managed by Fred Young, was recently completed and it is one of the most modern in Moline, being equipped with the most up-to-date equipment.

G. C. Mars, formerly of the Craig-Centre Auto Company, Pittsburg, Penn., is erecting a two-story brick garage at 4610-4612 Center avenue at a cost of $12,000.

Herbert A. Thayer, 400-404 Weybosset street, Providence, R. I., not only is the local agent for Goodyear tires, made by the Goodyear Tire & Rubber Company, Akron, O., but maintains a general business in repairing and vulcanizing casings and tubes. That Mr. Thayer is an enterprising business man is borne out by the fact that he has inaugurated a system of calling for and delivering work, in connection with which he makes use of the Ford car shown in the accompanying illustration.



Herbert A. Thayer's Goodyear Tire Agency in Providence, R. I., and Ford Car Used in His Delivery Service.

Fred Yoho, formerly with the Oliver & Martin Garage at Martins Ferry, W. Va., has entered business for himself and has leased a building on North Sixth street.

M. J. Hubbard has leased the rear part of the Marion garage, Marion, Ia., of J. L. Ingram and has taken over the repair shop.

C. V. Deane, formerly with McCallum & Deane, Grand Rapids, Mich., has completed a new concrete garage, which he has occupied.

Bruce Borland of the Borland-Grannis Company, Chicago, maker of Borland electric cars, is proud of the part his company played recently in a difficult surgical operation at the Children's Memorial Hospital in that city. Dr. Fred Albee of New York City, a noted surgeon, was called to Chicago to assist Dr. E. W. Ryerson, the head of the institution, in performing a particularly delicate operation in bone surgery on two cases in which the front of the spine had been eaten away until the patients were humpbacked to a pitiful degree. It was found on Dr. Albee's arrival that an electric motor controlling a circular saw was required in order to cut away a strip of bone. Dr. Albee's instruments only took a direct current, while the hospital's current was of the alternating. After trying various means Mr. Borland solved the difficulty by sending one of his cars to the hospital. An accompanying illustration shows the car, from which a cord led to the third story hospital window, supplying the necessary direct current for the instruments. Dr. Ryerson has utilized the Borland cars on three similar occasions.

Bonnewits Bros. of Van Wert, O., has completed the foundations for a two-story, fireproof garage and machine shop which will measure 60 by 132 feet. The equipment of the structure will include an electric elevator, private heat and water plants, plate and prism glass, sidewalk lights, etc.

Borland Electric Aids Famous Surgeon in Performing Remarkable Operation.

The Standard Garage Company, Uniontown, Penn., is building a $50,000 garage, the foundation work having been begun. The building will be two stories high and of brick and steel construction.

Muir Bros. & Fuglesteen, Jackson, Mich., is planning to enlarge its garage and work will begin immediately.

The Apperson-Lee Motor Company of 612 Main street, Lynchburg, Va., will remodel Friends' warehouse as a garage and expects to obtain possession about May 1. The officers of the concern, which has been growing rapidly, are: President and treasurer, R. D. Apperson; vice president, W. B. Miller; secretary, G. O. Lee.

Frank W. Downs has opened a new garage at Bettendorf, Ia., and will sell, repair and rebuild automobiles, besides furnishing taxicab and storage service.

The Fonda Auto Company, Fonda, Ia., has leased a building formerly occupied as a moving picture theatre and a new garage will be established, to be modern throughout.

The Oregon Vulcanizing Company, Portland, Ore., has moved into new quarters on Washington street.

PROPOSED NEW GARAGES.

Thomas E. Goode of 23 South Bethel street, Baltimore, Md., has awarded the contract for an extension to a garage on Lombard street. The front portion will be two stories high, while the rear will be one story.

The Ideal Garage Company, Frederick, Md., will build an addition to its plant, for which a contract was recently awarded.

The Ford Motor Company, Detroit, maker of Ford cars, is receiving estimates for a five-story and basement assembling plant and salesroom at Forest Park boulevard and Sarah street, St. Louis, Mo. The estimated cost is $200,000 and the most modern machinery will be installed.

The Tyson & Jones Buggy Company, Aberdeen, N. C., has plans for the erection of a new garage.

N. W. Fox of Statesville, N. C., is planning to build a three-story brick garage.

The Thomasville Auto Works, Thomasvile, N. C., has awarded a contract for a garage and repair shop, which will be equipped with the latest pattern of machinery.

H. L. Cook of Palestine, Tex., is interested in the erection of a new garage on Spring street, that city.

The Whittlesey Garage & Machine Company, San Benito, Tex., has opened bids for a new two-story garage to cost $1800. The machinery, which has been purchased, cost $8000.

The Craig Transfer & Motor Car Company, New Castle, Va., recently incorporated, is erecting a new concrete garage building.

The Peters Wagon & Auto Works, Baltimore, Md., has plans to erect a 100 by 40 foot addition to its building, to be used for the purpose of building commercial motor vehicles.

James B. Haggin of Lexington, Ky., has announced that he will build a modern garage to cost $7500.

W. J. Hefner of El Campo, Tex., is erecting a brick building to be occupied as a garage and repair shop by Woolston Bros. of that place.

The Tyson & Jones Buggy Company, Carthage, N. C., which is building a garage at Aberdeen, N. C., is erecting a building at Carthage to be used as an automobile repair shop.

J. Wheeler McGee, trustee for the Armstrong estate, Louisville, Ky., has awarded the contract to the Alfred Struck Company of Louisville to erect a fireproof garage to cost $45,000.

Guests of the Goodyear Tire & Rubber Company at the $40,000,000 Dinner at Rector's During Show Week.

The Halsey Automobile Company, St. Louis, Mo., will soon erect a five or six-story garage to cost $25,000.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, recently held a banquet at the Hotel Astor, New York City, which was attended by 200 dealers as guests of the company. It was officially termed the $40,000,000 dinner, because of the fact that the company has set that mark to be reached by the amount of business to be transacted during 1913. The enthusiasm of the dealers present left no doubt as to their ability to accomplish the task set for them. The banquet scene is shown in an accompanying illustration.

The Newbern Garage Company, Newbern, N. C., of which E. H. Williams is president, will erect a new garage of fireproof construction to cost $10,000.

Charles W. Ellis of Greenville, S. C., has awarded the contract for a steel frame garage to cost $4000.

The Cadillac Sales Company, Knoxville, Tenn., has plans for a fireproof garage, salesroom and repair shop at Gay street and Main avenue.

C. M. Marshall & Co., Lexington, Ky., will erect a service station at 177 North Upper street to be two stories high and of pressed brick construction. A fully equipped machine and repair shop will be installed.

The Crispen Motor Company, Harrisburg, Penn., will build a $20,000 garage on Cameron street. It will be two stories high and built of steel and tile.

The Stoddard Motor Car Company, Springfield, Mass., has purchased land on Winter street, at the rear of its present garage, and a substantial addition to the plant will be built.

Rundlett & Reynolds, New Rochelle, N. Y., is about to add a third story to its garage building, to be used as a paint shop and for dead storage. This will enable the firm to utilize space on the lower floors for an enlargement of its garage and repair shops. The alterations will cost about $7000.

The Ford Motor Company, Riverside, Cal., will build a new garage on Eighth street, to cost $8000. Glenn A. Calkins, manager of the company, expects to have one of the best automobile show places in that part of California.

The Beckley-Ralston Company, Chicago, dealer in automobile and motorcycle supplies, has leased a six-story building, which is to be erected at Michigan avenue and 18th street. The company will occupy the entire building and the annual rental will be about $22,500.

The City Auto & Machine Company, Latrobe, Penn., will build a big garage on Depot street, which will be modern in every particular.

H. C. Crofoot of Homer, N. Y., is to erect a new garage to be known as the Brighton, on South Salina street, Syracuse, N. Y., at a cost of $6000.

The Cadillac Automobile Agency, Wichita, Kan., is having erected a fine new garage at Lawrence avenue and English street, which it has leased for 10 years of E. E. Morris, owner of the property.

G. O. Robinson, a prominent business man of Bellaire, W. Va., has plans for a new garage to be erected on Belmont street at a cost of $15,000. When completed it will be one of the finest garages in the Ohio valley.

NEW AGENCIES.

The Owen McFarland Auto Company, San Francisco, Cal., has taken the agency for the commercial cars built by the International Harvester Company of America, Chicago.

The United Motor Charlotte Company, Columbia, S. C., of which J. H. Ham is manager, has given up the Maxwell car and has taken the agency for the two Carolinas for the Regal and Marion cars.

H. A. Testard of New Orleans, La., has opened an agency in that city for Alco trucks and pleasure cars, made by the American Locomotive Company, New York City.

F. W. Lintz, president and general manager of the United States Motors San Francisco Company, San Francisco, has closed a contract whereby his concern will distribute the Maxwell line in the Northern California territory.

C. C. Tanner, formerly of the Northwest Auto Company, St. Joseph, Mo., and W. J. Caughey, until recently in charge of the Ford distributing agency at Atchison, Kan., have taken the Marathon car distributing agency in Kansas City, Mo. Mr. Tanner will remain at St. Joseph and look after Marathon interests there, while Mr. Caughey will have charge of the Kansas City branch.

Ehrsman & Rich, Gridley, Ill.; J. A. Murray, Holder, Ill.; C. G. Preble, Lexington, Ill., and Brumme & Fitzgerald of Cooksville, Ill., have taken agencies for the Ford cars. E. C. Bump of Farmington, Me., has also taken a Ford agency in his territory.

The Archey-Atkins Company, Indianapolis, Ind., has been given the agency for Mais trucks, made by the Mais Motor Truck Company, Indianapolis, for the State of Indiana.

W. R. Shaw of Syracuse, N. Y., has taken over the local agency for Alco trucks and pleasure cars.

The Motor Parts Company, 185-187 Columbus avenue, Boston, has been appointed distributor for the products of the Bosch Magneto Company, New York City, maker of Bosch magnetos. A complete stock of magnetos, spare parts, spark plugs and other Bosch products will be carried in stock. F. W. Wilkening will be in charge of the Boston store, which is a branch of the Motor Parts Company of Philadelphia, Penn.

Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.
Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.
Entered as second class matter Dec. 30, 1911, at the post-office at Pawtucket, R. I., under the Act of March 3, 1879.

GARAGE INCOMES.

Proprietors of garages are divided in their opinion concerning the expediency of the action taken recently by a large garage owner in New York City, in raising the storage rate $5 a month and reducing the price of gasoline to a flat rate. His price for fuel is five cents less than that charged in other garages, but his income is balanced by the additional revenue received from storage.

The contention that a garage proprietor is acting unwisely when he relies for his profit upon the sale of an outside product like gasoline, over which he has no control, is not without merit. Because of the storage rates charged, many have been forced to take their profit from the sale of fuel. The New York man claims merely to have transferred his business from an outside to his own control, thereby placing his investment on a stable basis, and not risking failure through the operations of interests dominating a fluctuating product, which is properly a side line to the garage business.

It is maintained by many that the garagemen have erred in making fuel a main source of income and that they should adopt the principle of taking their profit from the business in which they have invested their capital, considering the sale of fuel as an accommodation to customers. Motorists can be depended upon to realize the garageman's position and to co-operate with him for their mutual benefit. Whatever opinion one holds with regard to the matter, it is a subject that will bear much careful consideration.

BENEFITS OF SYSTEM.

The Accessory and Garage Journal has from time to time elaborated upon the advantages of system and presented in more or less concise form numerous systems of proved worth as adapted to various branches of the garage business. System is the balance wheel between success and failure, inasmuch as proper accounting enables the proprietor to keep track of all transactions, compute the cost as against the income and so amend his business as to prevent the leaks discovered by means of an adequate method of recording each business detail.

No garage can afford to be without a system. It need not be complicated, but it should be sufficient to enable the keeping of records so that the owner may place his finger upon the waste which is eating into his profits. Without this safeguard he may realize that his income should be larger, but he cannot locate the trouble. A systematic way of keeping track of labor, materials used and their cost will insure satisfactory returns from the business.

CLEAN SALESMANSHIP.

Much stress is being laid by manufacturers and dealers alike on methods of clean salesmanship and the agitation promises to result in great benefit to the industry as a whole. Some sharp practises have been restorted to in the past by salesmen whose main object has been to effect a sale, but happily these have been rapidly weeded out. Disparaging a competitor's product is no longer popular and this is a sign of healthy progress. Fortunately, instances of this nature are now so uncommon as to attract decided comment when they are brought to light.

The prime requisite for a salesman's success is a complete knowledge of the line represented. When all dealers, as well as the manufacturers, insist upon this qualification and that the competitor's business be allowed to take care of itself, approved sales methods will be an assured fact and business success will be doubly certain. Too much criticism tends to destroy the prospective purchaser's confidence in all lines.

Mechanical Pointers for Garagemen and Repairmen

FILING STEPPED KEYS.

In filing stepped keys for an accurate fit, sometimes it is difficult to obtain correct alignment. At Fig. 1 B is presented a jig for this work and the loose top may be adjusted to guide a file as required.

PISTON RING DEVICE.

Removing and fitting piston rings requires care upon the part of the workmen as the members are fragile and broken easily. Various devices are made for this work and these range from strips of metal to forms of clamps. A piston ring manipulator has been brought out by an English concern, and it is claimed for the device that rings may be removed and fitted easily without liability of damage, and that the work is much simplified. The instrument is manipulated by turning a wing headed screw, illustrated at Fig. 1 A, and expansion is brought about by a similar operation, the screw drawing up a grooved circular disc which in turn bears upon the inner sides of the sloping toggles. The latter are in duplicate and secured, as shown, to the outer plates, so keeping these vertical and parallel.

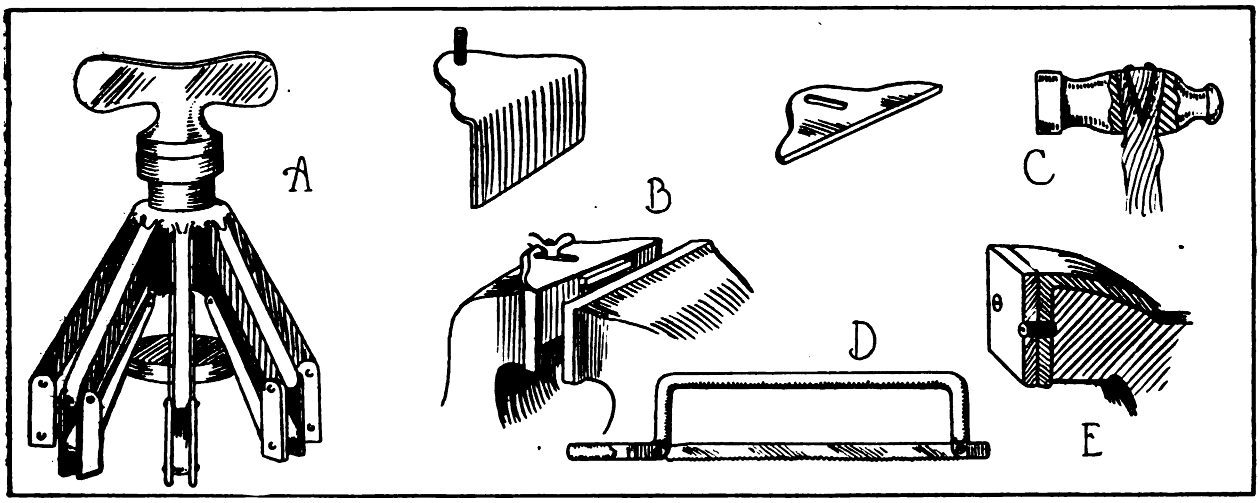

Fig. 1—Some Repair Shop Hints: A, Piston Ring Manipulator; B, Jig for Filing Stepped Keys; C, Wedge for Fitting Handle to Hammer; D, Hacksaw Frame Made of Tubing to Take Short Blades; E, Substantial Vise Clamp.

UTILIZING OLD HACKSAW BLADES.

In the average repair shop broken hacksaw blades are consigned to the scrap heap although the members may be new and may have snapped near the end, frequently at the first cut or two of the tool. While saw frames are adjustable they usually will not take the broken members, and there also is no provision for clamping the blade.

At D is shown an easily made device for utilizing the broken blades. It consists of a frame made of .75-inch brass or copper tube which is bent into shape as shown. The under corners are flattened to hold the blade, and all sharp edges are smoothed up. Two small set screws are placed in convenient positions to hold the blades.

SECURING HAMMER HEADS.

Broken hammer handles are not uncommon, and in fitting a new shaft the following method is employed by a repairman: Turn the end to be inserted to a driving fit, saw a fairly long V slot in it lengthways, and make a wedge that will fit snugly. Next bend a piece of .03125-inch sheet iron to fit over the wedge, and punch a few holes in it with a centre punch, making the outside edges rough as shown at C. Place the sheet iron in the slot, insert wedge and drive both in firmly. It is a good plan to soak the wooden handle in water a few hours before attaching the hammer.

SOLDERING ALUMINUM.

Small surfaces of aluminum may be soldered by the use of zinc and venetian turpentine. Place the solder upon the metal together with the turpentine and heat very gently with a blowpipe until the solder is entirely melted. Large surfaces cannot be soldered easily because the solder will not flow gently.

Another method is to clean the aluminum surfaces by scraping, and cover with a layer of paraffine wax as a flux. Then coat the surfaces by fusion, with a layer of an alloy of zinc, tin and lead, preferably in the following proportions: Zinc five parts, tin two parts, lead one part. The metallic surfaces thus prepared may be soldered together either by means of zinc or cadmium, or alloys of aluminum with these metals. Any good soldering preparation will answer the purpose.

A good solder for low grade work is the following: Tin 95 parts, bismuth five parts. A good flux in all cases is either stearin, vaseline, paraffine, copaiva balsam, or benzine. In the operation of soldering, small tools of aluminum should be used, which facilitate at the same time the fusion of the solder and its adhesion to the previously prepared surfaces. Tools made of copper or brass should be avoided as they form colored alloys with the aluminum and the solder.

NEW TYPE OF MUFFLER.

With the agitation against the use of the cut-out it is interesting to note that manufacturers of mufflers are devoting considerable time to the perfection of this device, striving to reduce back pressure to a minimum as well as to eliminate noise. These members are usually constructed circular in shape but a deviation from this form is noted in the Sharpe muffler which is depicted at Fig. 2 A. It comprises three flanged and ribbed globes bolted together and mounted upon a central partitioned tube. These flanges are directly exposed to the currents of air flowing beneath the car and it is obvious that the muffler is kept at a low temperature, thus aiding the condensation and consequent loss of pressure of the exhaust.

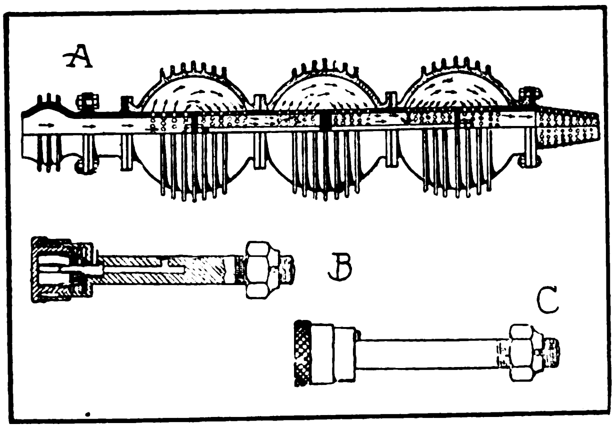

Fig. 2—A, New Type of Muffler Constructed in Two Sections, Which Is Claimed to Obviate Back Pressure; B, Sectional View of New Combined Shackle Bolt and Lubricator; C, Exterior View of Device.

In the drawing the upper half of the muffler is shown in section and it will be noted that the gas in entering is immediately broken up into several streams by passing through the first series of holes in the inlet member. A sudden expansion of gas then takes place in the first globe, where a certain amount of heat is radiated, after which the gases pass on through other apertures into the second globe and succeeding members, and into the open air through the perforated outlet tube. It is claimed of the muffler that smoky exhausts are reduced and that the silencer may be disconnected, cleaned and reassembled easily and in a very short time.

SHACKLE BOLT AND LUBRICATOR.

A combined shackle bolt and lubricator has been brought out by a French parts maker named Faudi, and the device presents many practical features inasmuch as it eliminates the screwing of a lubricator with a small threaded neck into the bolt which is sometimes broken easily. At Fig. 2 B is presented a sectional view of the device and it will be noted that one end of the bolt is made to form the body of the lubricator and has a thread formed within it. The lubricator cap has a coinciding thread cut upon its exterior to permit of its being screwed into the body. The cap's outer edge is spun over a plain sleeve which makes a dust tight fit around the body as the cap is screwed home in practise. The bolt is drilled centrally to take the lubricant and is also grooved to allow the grease to spread over the wearing surfaces. At C is shown the bolt with cap in position.

A PATTERN MAKING HINT.

A repairman of considerable experience suggests the following method of making a pattern when a patch of peculiar shape is required to fit in an awkardly situated position and he states it will obviate the necessity of making templates: Take a piece of gutta percha, large enough to make up the required pattern. The material is placed in very hot water and allowed to remain until it becomes soft and pliable. When in this condition it is pressed hard on the place which is to be fitted with a patch, and allowed to remain until it has cooled down sufficiently to become quite hard, which will take but a short time.

After the impression has been taken, the outside of the gutta percha is trimmed to the required shape and form, and any little tape intended to allow the withdrawal of the pattern from the sand should be put on. The pattern can then be sent to the foundry, and the casting will fit into place quite snugly, with the least possible amount of filing and chipping.

CARE OF GRINDING MACHINES.

The durability of a grinding machine depends largely upon the care of the operator, and will soon become unreliable if not looked after, no matter how well it may have been constructed. All wearing surfaces should be guarded carefully and kept well supplied with oil. The use of a good quality of machine oil is recommended in preference to cheap grades. Oil holes which are closed with screws usually have the words "oil hole" stamped around them, and care should be used when inserting lubricant to prevent dirt and emery grit from entering the oil.

Grinding machines should be kept as clean as possible and care should be taken that the bearings do not gum up. When opened or exposed for any purpose whatever, they should be wiped carefully before being closed again to eliminate any grit that may have lodged upon the surfaces. The spindle boxes should be clean when assembled and before tightening the caps the oil space should be filled with a good lubricant, not lard oil, and the wheel turned slowly while first one cap and then the other is screwed down until quite tight. The felt that supplies the oil to the spindle also should be kept clean.

Water should always be used on such classes of work as are affected by a change of temperature caused by grinding. It also should be used upon work revolving upon centres, as in this instance a slight change in temperature will cause the wheel to cut on one side of the piece after it has been ground apparently round. In very accurate grinding, water is especially useful, for the exactness of the work will be affected by a change in temperature which is not perceptible to the touch. It is well to use the water over and over again, as there is less difference between the temperature of the fluid and the work than if fresh water be used. Work that will grind smooth with water will often develop minute vibrations when ground dry. There is, apparently, a rapid fluctuation of temperature, which causes the work to approach and recede from the wheel very rapidly, thus leaving a rough or mottled surface.

Emery wheels always should be kept true. This can be done easily by using a diamond tool, known as the black diamond or carbon point, held in the hand or in the fixture furnished with the machine. A new emery wheel should be started slowly and trued gradually. In mounting this, elastic washers always should be placed between the wheel and the flanges. Sheet rubber is recommended for this purpose, but soft leather will answer. In some cases manufacturers attach thick, soft paper washers to each side of the wheel. When this is done it is all that is necessary. A satisfactory emery wheel is an important factor in the production of good work. Too much, however, must not be expected of one wheel. A variety of shapes, sizes and grades is necessary for the grinding machine, the same as are necessary to obtain the best results from the lathe or milling machine.

LOCATING CYLINDER CRACKS.

Sometimes a flaw in a cylinder casting will allow a slight amount of water to percolate into the combustion chamber, and when the cracks are not perceptible to the naked eye they may be located by using pressure. The water outlets should be stopped up with one exception, which is coupled to a pipe from the steam vulcanizer and the steam turned on at about 20 pounds or so, when the leak will be detected readily. This may be reached by cutting away the water jacket, and the latter repaired by welding.

GLASS CEMENT.

To cement glass, melt some resin and stir in calcined plaster until reduced to a paste, to which add boiled oil of a sufficient quantity to bring it to the consistency of honey. Apply warm. An alternate method is to mix in the following proportions: Melted resin 180 parts, burnt umber 30 parts, calcined plaster 15 parts, and boiled oil eight parts

INSTALLING STORAGE BATTERIES.

One of the chief causes of injury to storage batteries is the jolting they receive when the car is passing over rough roads. The cases containing the cells frequently become strained or chafed, allowing some of the solution to leak out, or the active material in the plates becomes dislodged. These troubles may be overcome when fitting battery boxes to the machine by making the container larger than the battery and forcing between the latter and the walls of the box smaller air tight rubber balls, such as children play with. These will hold the battery in place firmly and absorb all shocks.

DUAL IGNITION WITH ORDINARY PLUGS.

The advantages of a dual spark in the cylinder of an internal combustion motor have been pointed out from time to time in these columns but the installation of such a system usually necessitates the use of a double pole plug. A method of utilizing single pole or ordinary plugs is outlined at Fig. 3, but the hint can only be employed where dry cells or a storage battery are used and where the coil is equipped with two secondary leads; that is, each unit must have two terminals for the high-tension cables. Usually one of these is employed for grounding or for conveying the ground circuit of the coil to the frame of the car or engine as, for instance, with marine motors.

Where such a coil is in service the ground connection wire is removed from the second terminal and an additional high-tension cable attached, this lead being carried to the second spark plug, screwed to any convenient point in the cylinder head but preferably as shown in the drawing in order to obtain the highest efficiency. It should be borne in mind in locating the extra plug that the further apart the two points of ignition are the better. The diagram depicts a method for wiring the low-tension circuit as well, but this need not necessarily be followed and the existing low-tension circuit need not be changed.

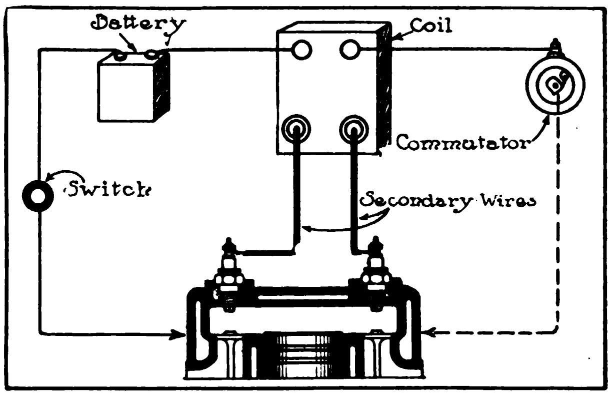

Fig. 3—Depicting Multi-Point Ignition with Single Pole Plugs.

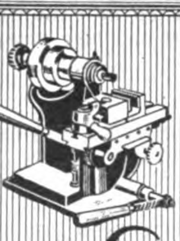
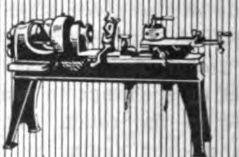
The second terminal, which is taken advantage of for multi-point ignition, is simply the other end of the secondary winding to that connected with the usual high-tension wire, and in coils where it is not exposed in this way the low-tension circuit is made use of to carry the high-tension ground circuit, usually by the way of the timer.

HANDY PISTON CLAMP.

In overhauling the piston of the motor it is sometimes necessary to place the member in the vise to perform certain work. The usual method is to grip the piston between two grooved pieces of wood. While this will hold the parts securely, it leaves but a small portion of the piston accessible without changing its position. A handy clip for holding the piston may be made from a piece of flat .75-inch spring steel about .125-inch thick. This is bent in circular form and two ends left for gripping in the vise.



Up-To-Date Shop & Garage Equipment



TOOLS FOR THE SHOP.

As business increases the proprietor of the small repair shop will add to his equipment from time to time, purchasing small tools as the work requires. There are a number of small tools which are indispensable, such as drills, reamers, taps, etc., and these may be bought singly or in sets, according to the convenience of the owner.

A scriber is a very useful instrument and is made in two forms, one a single point member for ordinary use and the other a double point. The tool depicted at Fig. 1 A, has points made of tool steel, finely tempered, threaded to screw into the holder which is knurled for a finger grip. The holder has long bearings to support the points firmly when in place and is of a suitable size to be held conveniently.

Reamers are made in several forms for different work, and are useful for enlarging holes. At B is shown a type of solid hand reamer while that at F is for roughing and finishing. In fitting taper pins the tool illustrated at E will be required. As the machine equipment of the shop is increased other tools of this nature will be added such as rose, expansion, chucking, shell, etc.

Drills.

With the drill equipment should be included a countersink, and a tool combining a centre drill and countersink is shown at Fig. 2 C. When very true work is required it is preferable to so shape the countersink that the lathe centre will first bear at the smallest part of the cone. This will cause the countersink to wear and keep true with the hole. If the centre drilling is to be done by hand it is important to relax every few seconds the hold upon the work to permit it to make about one-third of a revolution, which may be done while the other hand is supplying oil to the drill. The object and effect of this is to cause the centre drilling to be true, which otherwise it would not be, especially if the work be comparatively heavy, or one side heavier than on another.

Twist drills when utilized with power, come in sets, and with each is a steel socket which fits the drill press spindle at one end, and at the other the recess takes all drills in the set. One of the holders is outlined at Fig. 1 C, and to enable the drill to be extracted easily from the socket, the latter is provided with a slot, which passes entirely through it. The drill end protrudes into this slot, so that if a key or wedge be driven into the opening, the drill will be forced out. Conventional types of drills are shown at Fig. 3, A and B, the former being adapted to the drill holder mentioned above.

Taps.

Machinists' hand taps are made in three different styles, taper, plug and bottoming, and these are depicted at Fig. 3, D, E and F. Tools for use in holes to be tapped deeply should be of slightly larger diameter than those employed for shallow ones, because in deep holes the tap is held steady by its depth in the hole, and whatever variations there may be between the pitch of the threads in the hole and those on the bolt, is experienced to a greater extent as the length of the thread increases. A short hob or master tap is outlined at Fig. 1 D.

CURTIS AIR COMPRESSOR.

The progressive garage or repair shop does not rely upon the manually operated tire pump, the utilization of which means a considerable loss of time. Then again, the member becomes misplaced when most needed. By having a tank of compressed air the garage is in a position to render efficient service to its customers and it really is economy as the attendant is not called upon to hunt for the ordinary member.

With a compressor it is an easy matter to keep the storage tank filled with air, ready for service. The Curtis & Co. Manufacturing Company, St. Louis, Mo., is producing an air-cooled compressor in two sizes, adapted for the public service station and private gar-

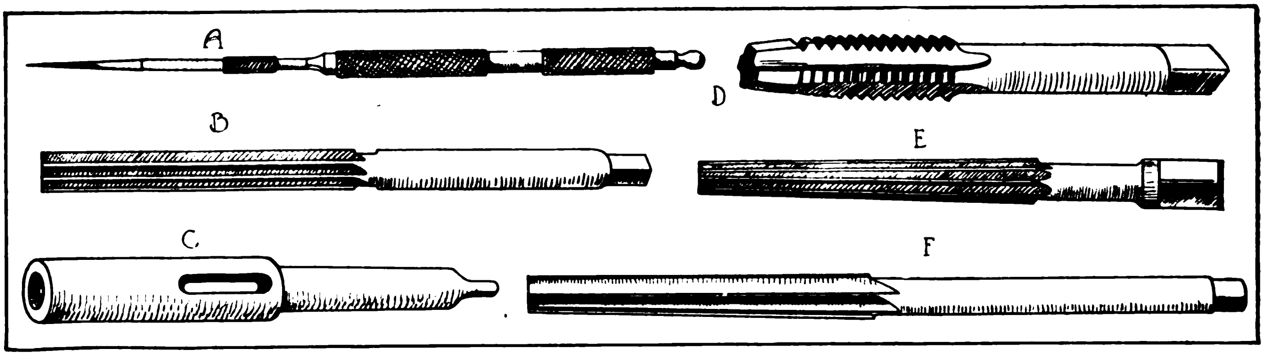


Fig. 1—Depicting Tools for the Shop Equipment: A, Scriber; B, E and F, Reamers; C, Drill Holder; D, Short Hob or Master Tap.

age, these having a bore and stroke of two by 2.5 and three by 3.5 inches, respectively. The device is depicted at Fig. 4, A and B, the latter view outlining its construction. Water-cooled types are also manufactured, these having a bore and stroke of three by 3.5, 3.5 by 3.5 and four by 4.5 inches, respectively. Either design lends itself readily for belting directly to line shaft or motor, according to its installation.

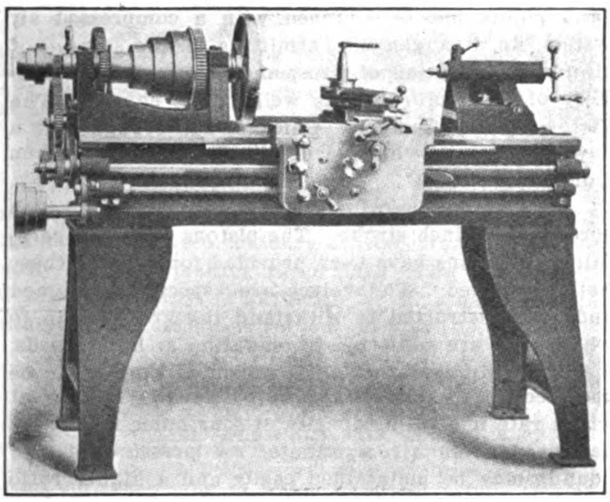

Fig. 2—Sebastian 15-Inch Lathe, Designed Especially for Automobile Work.

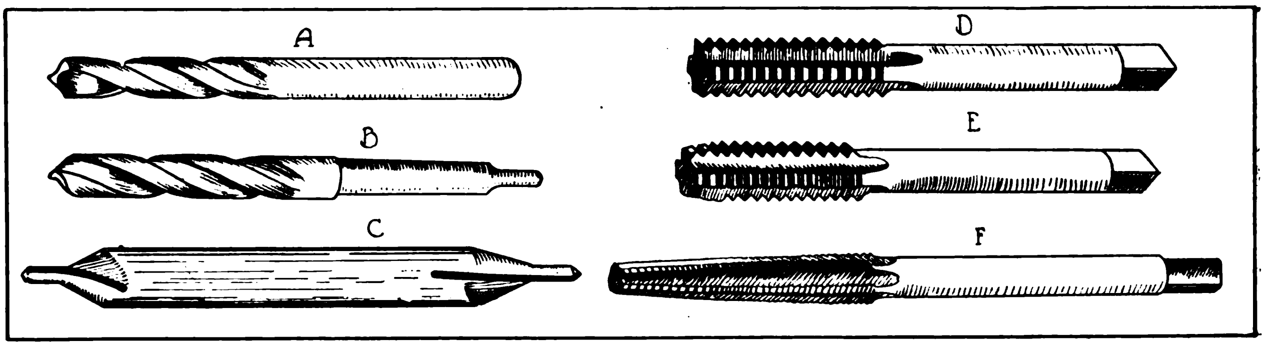

Fig. 3—Tools for the Repair Shop: A and B, Twist Drills; C, Combined Drill and Countersink; D, E and F, Taper, Plug and Machinists' Bottoming Taps.

The vertical, up-plunger type of pump is employed, the maker pointing out that this construction eliminates grease or oil being carried over into the receiver and thence to the tires. Several new features are noticeable in the new compressor, these including a springless inlet valve on the piston head; fan shaped arms on the flywheel, which direct a current of air onto the cooling fins, etc. Lubrication is by a gravity feed oil cup on the side of the cylinder, the device supplying lubricant to the piston and wristpin. The crankshaft is of ample dimensions and throughout the best of material and workmanship are employed.

SEBASTIAN LATHE.

As the increase in business warrants the expenditure the small repair shop adds a lathe to its equipment, a valuable addition as much work formerly sent elsewhere is turned out quicker and economy effected. Many times a job is held up waiting for a small piece of machine work sent outside.

The Sebastian Lathe Company, Cincinnati, O., makes a specialty of lathes and tools and produces a number of the former, one that is specially adapted for the garage being shown at Fig. 2. It is low priced, constructed of high grade material throughout, has screw, rod and power cross feeds, and cuts standard threads with furnished gears from five to 36. The head stocks are sturdily constructed and the spindles are hollow, made of a high grade steel and operate in phosphor bronze boxes.

The cone pulleys have four steps and with the back gear give eight changes of speed. The tail stocks are of the cut-under pattern, allowing the compound rest to swing parallel with the ways and over the base of the tail stock, with room to operate the feed screw handles. They have adjustable side movement for taper turning, heavy spindles and self-discharging centres. The carriages are of the most approved design, rigid and substantial, and T slots are arranged in both front and rear arms.

When it is desired to utilize the cross feeds separately, the carriages may be clamped solidly to the bed by a simple device. The cross feed screws are graduated to .001 inch. Plain or compound rests are supplied and these are interchangeable. The tool posts are cut from a solid bar, and the lead screws are cut carefully from a master screw, insuring accuracy. The countershafts have improved friction clutch pulleys with large surfaces, and ample provision is made for lubrication. The pulleys of the countershaft are nine inches in diameter with three-inch face and are designed to run at 190 revolutions a minute.

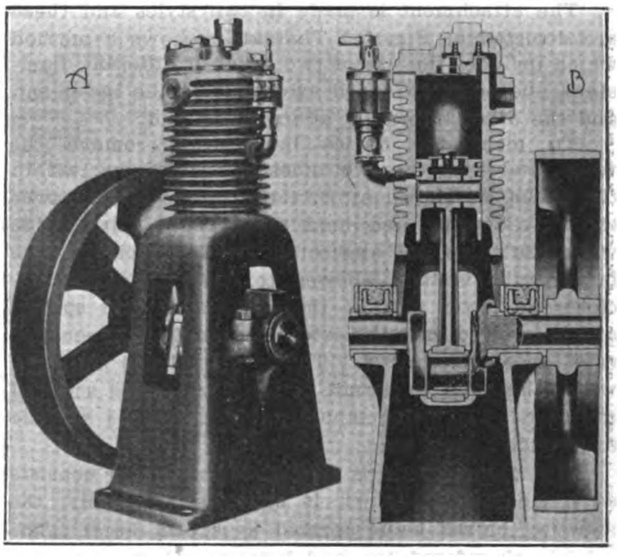

Fig. 4—Curtis Air Compressor, Made in Several Sizes, Both Air and Water-Cooled and Operated by Belt.

The dimensions of the lathe are as follows: Swings over bed, 13 inches; swings over carriage, 7.5 inches; length of bed, six feet; takes between centres, 40 inches; diameter of spindle nose, 2.125 inches; threads of spindle nose, eight inches; hole through spindle, 1.3135 inches; size of tools, .5 and one inch; ratio of back gear, 7.5 to one; diameter of tail spindle, 1.5625 inches; compound rest travels, 4.25 inches; capacity of centre rest, 3.5 inches.

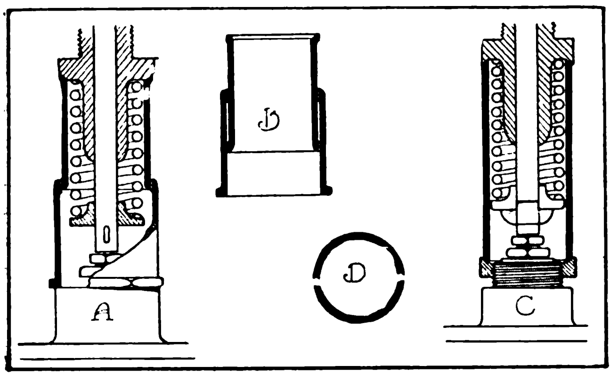

Fig. 5—Methods of Quieting Noisy Valve Action: A, Telescoping Tubes; B, Outlining Operation of Assembly; C, Employing Split Tubes; D, Showing How Tubes Are Constructed.

Hand rest and chuck plate are extra.

A set of 10 tools is provided as equipment with this lathe.

QUIETING NOISY VALVE ACTION.

With the introduction of the sleeve valve motors the manufacturers of engines utilizing the poppet valve have brought out refinements which render the action of the valve mechanism noiseless. Some makers enclose the valves, which not only deadens any existing noise, but protects the parts from wear by excluding dust attracted by the oil.

Many motors, especially those of early designs, are not constructed so that a plate may be fitted without considerable work.

For the purpose of meeting the demand for a valve quieting device, an English concern has brought out what is termed a "silent tappet sock," and its principle is similar to a device which was recently put on the market.

The attachment is made in two styles and these are depicted at Fig. 5. That at A shows a method which includes the use of two tubes of different diameters, one being threaded externally at the lower end and the other internally at its upper end.

To place the device in position remove the valve, and with the two tubes telescoped one within the other, as shown at B, they can be slipped over the valve spring and held against the valve guide while the valve, cap and cotter key are replaced. The larger tube is then allowed to drop down and enclose the lower part of the valve stem and spring, and is screwed onto the external thread of the smaller tube, as outlined at A. The lower tube is equipped with a hexagon to permit of the parts being screwed together. The valve tappet guide is altered slightly to provide a good seat.

The other design is illustrated at C and consists of a single tube which is split longitudinally, the abutting halves being formed as shown at D. The tube is chamfered top and bottom and the latter is held firmly in place by a coned nut, which is intended to be screwed onto the top of the tappet guide. This guide should have sufficient substance to allow a thread to be cut, and will have to be removed for the work.

NEW VICTOR AIR COMPRESSOR.

The up-to-date garage no longer relies upon the hand pump, but is equipped with a compressed air system, an arrangement permitting of the storage of air for the inflation of tires, and cleaning the upholstery of the motor car, as well as the chassis. The Victor Electric Company, Chicago, has brought out a new compressor which is designed to be belt driven from a line shaft

It is a double-cylinder unit, having a 2.5-inch bore and two-inch stroke. The pistons are fitted carefully and means have been provided for keeping these well lubricated. The valves are especially designed and are constructed to withstand the great strain to which they are subjected in operating at high speeds.

The compressor, which is shown at Fig. 6, can be operated safely up to 360 revolutions a minute at which rate it gives a capacity of four cubic feet or 30 gallons of free air a minute. A pressure of 125 pounds may be maintained easily and a higher ratio if desired. The pulley is located between the cylinders and it is claimed that the device operates with the least possible noise, that all parts are interchangeable, and that it is economical in operation.

A SIMPLE VISE KINK.

Frequent use of the vise results in the knobs on the handles becoming roughened and when considerable filing is done the hole fills with chips and dirt. This can be prevented by fitting a couple of rings, such as come on mineral water bottles, and placing them just under the knobs of the vise handle.

STURDY VISE CLAMP.

Vise clamps which present a square edge for holding small work and which wear considerably longer than the usual members, may be made from a piece of .1875-inch sheet iron by hammering them to shape in the tightened vise. Next rivet on the inside face of the clamps a squared piece of brass and copper, and trim off the edges with a file. See E, Fig. 1, Page 19.

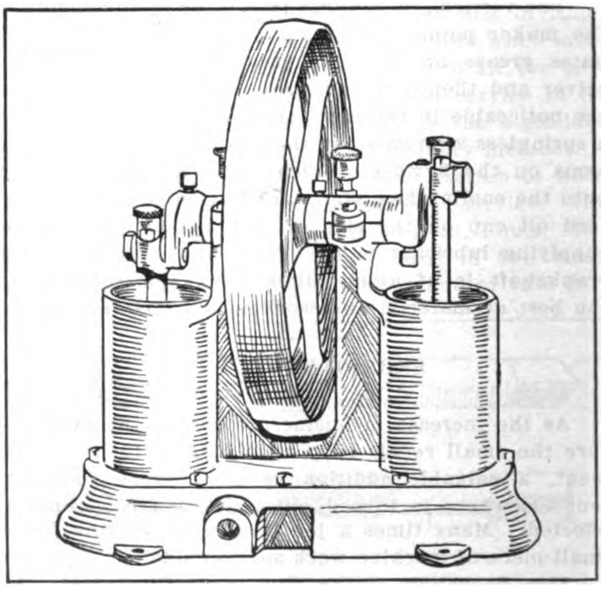

Fig. 6—New Double-Cylinder Compressor Brought Out by the Victor Electric Company.

CORRESPONDENCE WITH THE READER.

Screw Cutting Lathe.

(136)—Can you inform me of any books on the operation of the screw cutting lathe that would be of any benefit to anyone in gas engine construction and repairing? Also, where can I obtain the necessary jigs and dogs to clamp on face plates, etc., to hold engine cranks, shafts, etc., for turning? P. J. FOSTER.
Throckmorton, Tex., March 12.

The Hill Publishing Company, New York City, publishes information of this nature. Regarding the jigs and dogs, these could be secured from any of the many concerns making these tools. The Braunsdorf-Mueller Company, Elizabeth, N. J., manufactures lathe appliances.

Power Tire Pumps.

(137)—I wish to inquire regarding the probable outcome or effect of inflating a tire with a power pump that will pump in gas from a cylinder of an internal combustion engine. I have constructed a power pump out of an old spark plug to which I connect a tube leading to the shoe. In inflating I run the motor on three cylinders and find that I can inflate a tire in a very short time, and the operation does away with the drudgery of pumping. This of course pumps the tire with the gas and by compression from the cylinder. Is there any danger of the gas exploding and will the tire get hot enough to bring about an ignition of the mixture? Will the gas or compressed air injure the tube if no lubricating oil exists? J. R. SPANN.
Anderson, Cal., March 13.

According to a leading tire manufacturer the gasoline in the mixture will cause a rapid deterioration of the inner tubes. Regarding combustion, it is questionable if the car could be driven fast enough to produce friction that would ignite the mixture in the inner tube. If oil finds its way past the rings of the piston and thence into the inner tube it probably would injure the rubber in time.

Mixing Acetylene with Air.

(138)—What is the minimum and maximum amount of acetylene that can be mixed with air which will ignite readily from a spark? About what pressure can a mixture of nine parts air to one part acetylene be compressed without danger of being exploded? Can a mixture of the above proportions be drawn into a pump and forced through a small brass tube without danger of being exploded from the pressure or friction produced? If a mixture of the above proportions were injected into a cylinder just after the motor stopped, would there be any probability of the gas being exploded when the same came in contact with the hot inner walls of the cylinder? G. B. H.
Merkel, Tex., Feb. 28.

According to O. H. Skinner, general superintendent of the Prest-O-Lite Company, Indianapolis, the proportions for perfect combustion are approximately nine parts air and one acetylene. Such a mixture burns with an explosive wave when ignited. It should not be compressed except under those conditions existing in the cylinders of an internal combustion engine running in the usual manner. If such mixtures of gas were compressed in the compressor so that absolutely all heat of compression were removed it might possibly be done with safety. However, it must be borne in mind that the violence of the explosion increases as the pressure increases, and should such a mixture become ignited there might be danger. Such mixtures taken into the engine in the usual manner through the manifold are not subjected to compression so great that there is any danger of injury to any part of the machinery when the gas is ignited.

Regarding the probability of acetylene exploding by coming in contact with the hot inner wall of the cylinder: This would depend upon the temperature of the metal. It is doubtful if the metal would be warm enough at any time to ignite the mixture; that is, no more so than if the gasoline mixture were utilized. When a cylinder becomes so warm that it will explode any gas vapor with the ignition switched off, the motor should not be operated until the cause for overheating has been removed.

Horsepower Formula.

(139)—Can you secure for me or advise where I can get the formula for computing horsepower? For example: What is the horsepower of a motor having a 4.25-inch bore and 5.75-inch stroke? If this is not asking too much, I would like to see it figured out. J. E. BUCKLEY.
Kansas City, Mo., March 1.

The formula adopted by the Society of Automobile Engineers, which is standard, being generally utilized, is based upon a piston speed of 1000 feet a minute. It consists of squaring the bore and multiplying the result by the number of cylinders and dividing by 2.5. The horsepower for a four-cylinder motor of the bore mentioned is 28.9.

Tire Vulcanizing Outfit.

(140)—We desire a vulcanizer for tires as well as inner tubes for our own use and would appreciate very much having you give us from your experience which vulcanizer would be most practical for our purpose. We are not equipped with electricity and will be obliged to utilize gasoline or some other heating means.
WARNECKE & STIEREN LAND COMPANY.
Karnes City, Tex., Feb. 18.

Vulcanizing outfits utilizing steam are employed largely by garages, etc., and the equipment varies in size from the portable device for the motor car to those adapted to the tire repair business. Chas. E. Miller, 97-103 Reade street, New York City; the National Motor Supply Company, 1911 Euclid avenue, Cleveland, O., and the Williams Foundry & Machine Company, Akron, O., are among those who manufacture a wide variety of these vulcanizers and will furnish information upon request.

Cylinder Pressure.

(141)—What is the number of pounds pressure, reckoned according to any standard pressure gauge, of the air in the cylinder of a gas engine like those used on automobiles, when the piston is at its highest point, assuming that there is no leakage? S. O. PITTS.
Archer, Neb., March 5.

The pressure when measured with a standard pressure gauge will vary according to the design of the motor. In some types it may be as high as 75 but this is the exception rather than the rule. From 40 to 75 pounds would be a conservative estimate.

Voltage at Magneto Terminals.

(142)—What is the correct number of dry cells to use with a Bosch double ignition system such as is used on the ——— car and why? What voltage is delivered at the spark plugs by the Bosch step-up transformer with the dry cells reading six volts? What voltage is delivered at the magneto terminals of a Bosch magneto at ordinary engine speed? H. P. LASHER.
Cushing, Ia., March 2.

The Bosch Magneto Company, New York City, advises the use of two sets of five dry cells in series parallel with a dual system. Regarding the voltage delivered at the spark plugs by the Bosch step-up coil with dry cells reading six volts: This is a difficult question to answer, owing to the fact that this being a straight induced current, there are no instruments made for the purpose of measuring the same. The only way that coil voltages and magneto voltages are measured is by the distance the spark will jump across in the open air.

Relative to the Knight Motor.

(143)—Will you kindly inform me what automobiles are equipped with the silent Knight engine? What machines are fitted with the electric starting device, same as is employed on the Cadillac, and what makes, if any, furnish the Edison instead of the Exide battery, for storing the current? HORACE P. TOBEY.
Wareham, Mass., March 1.

The machines licensed in this country to fit the Knight engine consist of the Columbia, Stoddard-Dayton, Stearns, Edwards and Lyons-Atlas. Regarding the machines fitted with the Delco starting and lighting system the Dayton Engineering Laboratories Company, Dayton, O., maker of the device, could supply the necessary information. As to the battery, the Edison Storage Battery Company of Orange, N. J., would be the proper concern to give the information required.

Timing K-W and Remy Magnetos.

(144)—Will you kindly give me the correct method of timing the K-W and Remy magnetos? Do you set the inductors about .0625 inch from the pole pieces as you do a Splitdorf or Bosch, or adjust the cams so that the points begin to separate and the brush just touching the segment? H. W. P.
San Francisco, Cal., Feb. 22.

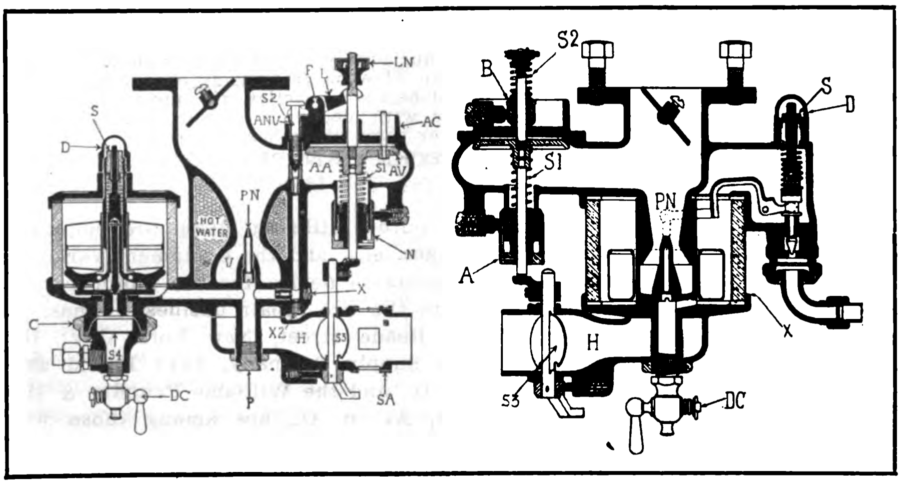

Fig. 1—Depicting the Components of Stromberg Carburetor and Adjusting Mechanism—Model B Is Shown at the Right and C at Left.

The timing of the Remy magnetos is by the break of the contact points, which are separated by the cam. The piston of the cylinder to fire should be placed upon exact dead firing centre and the cam housing should be in a fully retarded position. The platinum points are just separating, but not touching. There is but one adjustment, that of the contact screw, and this should be so set that the maximum break of the points is betwen .025 and .03 inch.

If the motor misses with the spark retarded, and shows indications of skipping more at low than at high speeds, the contact screw should be screwed out a notch at a time until the trouble is overcome. If the engine misses with spark advanced, the contact screw should be screwed in a notch at a time until the motor runs evenly at high speeds.

The K-W true high-tension types of magnetos are timed easily, the operation being similar to the instrument just described. The firing point is when the platinum contact points of the circuit breaker are just beginning to break apart, not when they touch. The location or position of the distributing brush is similar to other type of magnetos.

The Remy Electric Company, Anderson, Ind., maker of the Remy magneto, and the K-W Ignition Company, Cleveland, O., will forward, upon request, complete instructions regarding the installation of their instruments.

Ford Transmissions.

(145)—Can you inform me if the Ford Motor Company ever fitted a transmission other than the planetary to its cars? FORD OWNER.
Cleveland, O., Feb. 26.

The Ford Motor Company always has installed the planetary type of transmission on its cars.

Adjusting Stromberg Carburetor.

(146)—My motor car is fitted with a Stromberg carburetor which became filled with dirt through not straining the gasoline. I took the carburetor down to clean it and since replacing it on the machine, it does not act right. Not having adjusted one of these members and having lost my instruction book am writing for information as to its adjustment. CONSTANT READER.
Stonington, Conn., March 13.

In disassembling the carburetor it is probable that the adjustment of the speeds was changed. As the model was not stated, the method of setting both B and C are given herein. At Fig. 1 is presented the components of both types that of B being the right and C at the left in the drawing.

To adjust model B, turn on the gasoline and note the level of the fluid in the float chamber. It should be about .9375 inch lower than the lower edge of the glass marked X. This level is adjusted properly at the factory and should not require any attention. If wrong remove the dust cap D and turn the adjusting screw S until the proper level is obtained. If the fluid be too high, screw the nut down. If too low screw the nut up.

Next start the motor by closing the valve S 3 in the hot air horn H. The engine should start on the second or third crank. To adjust the low speed turn nut A until the spring S 1, which is the low speed spring, seats the valve lightly. Note that the high speed spring S 2 above B is free and does not come into contact with the nut on top of the auxiliary air valve stem. Next turn the nut A up or down until the motor idles properly.

To set the high speed, advance the spark and open the throttle. If the motor backfires through the carburetor, turn the high speed adjusting nut B up until the backfiring stops. If, however, with this adjustment and running at low speeds the motor operates erratically, the mixture is too rich. The nut B should then be turned down until this trouble is overcome. The spring nut B should always have at least .03125-inch clearance between it and the nut at the top when the motor is at rest.

The type C is provided with two separate gasoline spraying nozzels. The primary member P N is located in the centre of the carburetor and supplies sufficient fuel for all speeds up to 20 or 25 miles an hour. The second or auxiliary nozzle A N, is mounted just beneath the secondary gasoline needle valve A N V in the auxiliary air passage A A. The auxiliary needle is raised by a lever L operating over a fulcrum F by the opening of the auxiliary air valve A V.

To obtain the low speed adjustment, turn the nut N located beneath the auxiliary air valve so that the valve is brought up to seat, then give two full turns to the right for pressure. This valve should not operate when the motor is running idly. Next, turn low speed nut N up or down until the motor operates slowly, then advance the spark and open the throttle. If a backfire follow, turn nut L N down until it ceases. If the mixture be too rich, turn it up. Be sure that nut L N and lever L have some clearance on low speed.

The high speed is regulated by the lock nut L N on top of the auxiliary air valve. Raising or lowering it determines the point at which the auxiliary needle valve A N will be brought into service. It is seated by the high speed spring S 2. The lock nut L N should be about .09375 inch above the lever L for normal adjustment, but this distance can be increased or decreased to suit the motor. Richness of mixture may be determined easily by noting the odor of the exhaust. If rich it will be pungent.

Grades and Gear Ratios.

(147)—Kindly tell me how to calculate grades as to percentage, also how to figure the gear ratio of the transmission? DANA A. LANE.
Hazardville, Conn., Feb. 28.

The most common way of designating a grade is in per cent. This is figured on a given horizontal distance of 100 feet, for example, and the difference there is in the height of the hill at either end of that 100 feet. If the rise be 10 feet, the ratio is 10-100 or 10 per cent. Similarly, any rise as 17 feet, is 17 per cent., always remembering that the horizontal distance is 100 feet. A 100 per cent. grade would be one in which the rise was 100 feet in horizontal distance. Shorter horizontal distances, of course, can be used in figuring, as, for instance, a rise of three feet in 10 equals 3-10, or 30 per cent. Or one foot in 20 equals 1-20, or five per cent. With a rise of five feet in five, 10 feet in 10, 100 feet in 100, or whenever the rise is equal to the horizontal distance, the grade is 100 per cent. or 45 degrees.

In measuring grades in degrees, the foundation is the circle which contains 360 degrees. A line drawn horizontally across the circle through the centre is the level and a point in the circumference is considered as the top of the hill. Then a line drawn from this point to the centre of the circle would form an angle with the horizontal line, and the angle would contain as many degrees as there were degrees in the circumference of the circle between the point considered as the top of the hill and the point where the horizontal line cuts the circumference. The side of a house forms a 90 degree angle with the street level. Cutting this in two would give a slope, as on the roof of a dwelling, an angle of 45 degrees.

No motor car could stand on this grade or climb it, unless some other means besides ordinary roads and tires were used. It has been found that ordinary traction ceases on a slope of about 26 degrees or a 57 per cent. grade. A simple method of measuring grades is to attach a piece of stout string to a top iron or any other convenient place on the automobile, and as near as possible over the edge of the running board. The twine should be long enough to drop a few inches below the board. Next tie a weight to the free end, taking care that the twine moves freely so that the weight will act similarly to a pendulum.

Next drive the machine upon a level space, such as the floor of the garage, and mark the intersection of the string on the edge of the running board. The string now hangs perpendicular from the point where it is suspended. In driving up a hill the twine will move backward and in descending a grade it will move forward. As the car stands upon the grade to be measured, mark the spot on the running board where the string intersects. For convenience call the point where the twine is attached A, the point of intersection on running board B, and location of string when on a grade C. The length of C B is to the length of A B as the per cent. of the grade of the unknown slope is to 100 per cent. For example: If it be eight inches from B to C and 40 from A to B, then the per cent. is equal to eight divided by 40, which results in a fraction of one-fifth or 20, thus determining the grade to be 20 per cent.

A free swinging pendulum and a scale marked on a piece of board to swing either way from zero is made easily and also may be utilized. There are devices called gradometers which are not expensive and these register the grade. They are attached to the dash or any other convenient place.

In figuring the gear ratio of the transmission the gears and pinions of the main and secondary shaft are taken into consideration. Suppose for example that the engine shaft extension carries three gears, beginning at one end, respectively, 19, 32 and 48 teeth, and that the sliding sleeve bears gears of 77, 64 and 48 teeth, respectively. When the 77-tooth gear on the sleeve is slid into mesh with the 19-tooth gear upon the engine shaft, the speed ratio is about four engine turns to one sprocket turn, and the low speed is engaged. When the sleeve is moved until the 64-tooth gear on the sleeve meshes with its 32-tooth mate, the two-to-one or intermediate gear is obtained, and when by a further motion of the sleeve the two 48-tooth gears are meshed, the engine and sprocket shaft are rotating at equal speeds and the car is running on the high. In estimating car speeds the final gear; that is, the ratio between the pinion or driving gear on the shaft and crown gear, should be taken into consideration.

CLEANING OUT RADIATORS.

A repairman of considerable experience recommends the use of sal-ammoniac for cleaning out the circulating system of a motor and states that a pound of this material dissolved in water and poured into the cooler will remove "fur" and incrustations. The fluid should be left in the system and the car operated for two or three days, then removed. If chemical action is going on it will be noted by the odor of ammonia.

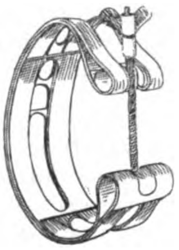
WHEN THE WATER BOILS.

Frequently, in exploring roads unknown to the operator, highways are encountered which preclude the use of anything but the second or low speed, because of their dangerous condition. If the day be warm and the water shows a tendency to heat it is an excellent plan to remove the radiator cap before steam is generated, as by so doing considerable water will be retained in the circulation system that otherwise would boil out through the overflow pipe. When steam is made it displaces a certain amount of water if the cap be on the cooler. By operating with the cap off the steam will escape into the open air and it will be found that the water will not boil nearly as quickly as under normal conditions.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

The Catelain Hose Clamp is produced by the Power Sales Manufacturing Company, 122 South Michigan avenue, Chicago, and is so constructed that it will fit different sized hose from .75 to four inches outside diameters. It is also claimed that it will retain equally well oblong shaped pieces. It comprises a brass band, .75-inch wide, which encircles the hose and is drawn tight with a screw and brass thumb nut.



CATELAIN HOSE CLAMP

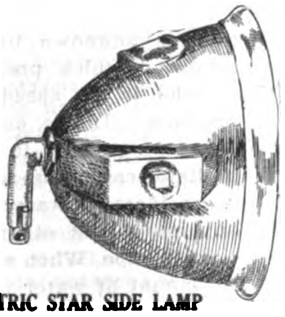
Electric Star, style D side lamps are manufactured by the Milwaukee Bronze Casting Company, 119 Clinton street, Milwaukee, Wis., and a quality is that they are made to fit any type of lamp bracket. They are six inches in diámeter, are free from rivets and solder and have but one essential screw. The lamps are cast of thick, non-corrosive silvered aluminum which takes a very high polish and which maintains its lustre. The metal has a slight bluish tint, which is held to increase the efficiency. Each lamp is equipped with an Ediswan bayonet catch base. The lenses are constructed of plate glass laid in rubber, and the lamps are water, air and dust proof.



ELECTRIC STAR SIDE LAMP

Detroit Fore Doors, manufactured by the Detroit Fore Door Company, Detroit, are designed for attachment to motor cars not provided with these members, and a quality of the construction is that they may be fitted easily by anyone having a knowledge of the use of a screw driver, bit and brace, and a monkey wrench. The doors are of the detachable type and being built of a one-piece aluminum, cannot warp or get out of shape. Each set of doors is upholstered and finished in the standard colors of the car for which it is made and has five coats of paint and two of varnish. The doors are particularly designed for 1911 models of Ford, E-M-F and Hudson machines and are finished in colors to match. In addition to keeping out the cold winds, they add to the appearance of the car, bringing it up to lines of the most modern construction.

DETROIT FORE DOOR

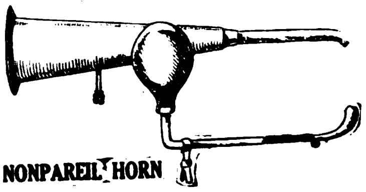
The Nonpareil Auto Horn, marketed by the Nonpareil Horn Manufacturing Company, 73 Wooster street, New York City, is of the concealed type in that it is designed to be located under the hood. It is very compact and is said to produce a considerable volume of deep, penetrating sound. It is operated by air, the bulb being located under the steering wheel.

Texaco is an oil made by the Texas Oil Company, New York City, and is guaranteed not to congeal at any temperature down to zero. The Texas company has large oil fields in many parts of the country and its line is complete in every respect. The Texaco engine oils are held to be remarkably free of carbon, thus eliminating all depositing features, and are refined to obtain perfect combustion in engine cylinders at high temperature and also to remain fluid in zero weather. Owing to the special filtration methods it is maintained that the oil will burn up cleanly.



NONPAREIL HORN

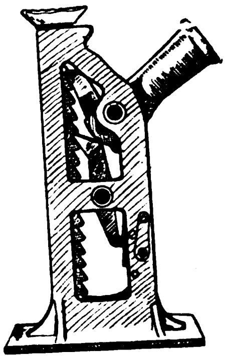
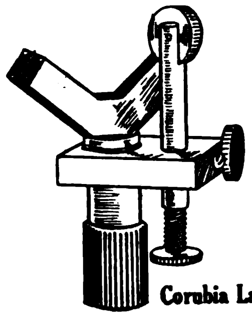
The Pratt Auto Jack is the product of the William E. Pratt Manufacturing Company, 91 Lake street, Chicago, and qualities emphasized are light weight, compactness and ease of operation. They are constructed of galvanized malleable iron and the five parts are secured by two bolts. They may be raised or lowered one notch at the time, on the downward stroke, a small trigger device being moved to bring about the desired movement. J. J. Kelleher, 612 Columbus avenue, Boston, is distributor.



PRATT AUTO JACK

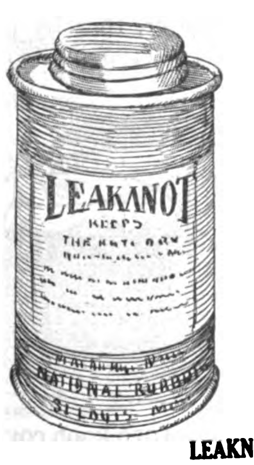


Corubia Lamp Lighter

The Corubia Lamp Lighter, produced by the Corubia Manufacturing Company, 71 Third avenue, New York City, is a lighting device for attachment to acetylene lamps. It comprises the burner to which is clamped a brass pillar mounting a highly tempered file wheel held in contact with a piece of sparking metal by a spiral spring, the tension of which may be regulated by a thumb screw. The wheel is actuated by finger pressure and the operation results in a shower of sparks which ignite the acetylene. The spark metal is said to be very enduring and the lighter is moderate in price.

* * *

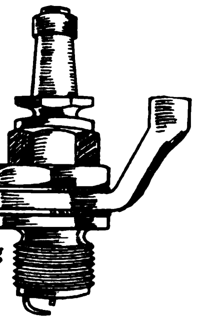
The Rajah Starting Plug was brought out recently by the Rajah Supply Company, Bloomfield, N. J., and the plug proper does not differ from those made by this company except that a device has been added, whereby the cylinder may be charged with gas. The mixture is introduced into the combustion chamber through a hollow yoke which is secured to the shell of the plug by a jam nut. Above and below the yoke are copper asbestos gaskets, which prevent the escape of the gas, which is conducted to the centre of the plug. It is stated that the plug may be taken apart and cleaned without interfering with the gas piping.



LEAKNOT

* * *

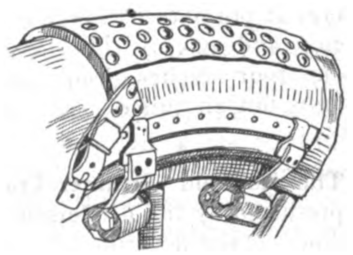
Leaknot is a liquid, water proof rubber dressing manufactured by the National Rubber Company, St. Louis, Mo. It is adaptable for coating leather, such as the top or upholstery, and the maker holds that it is colorless, odorless and will not injure the material, which it rubberizes. One of the qualities emphasized of the preparation is that it softens leather.



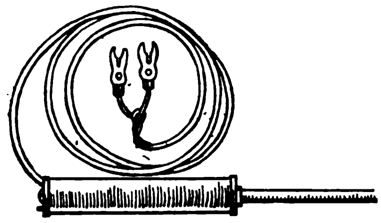
Rajah Starting Plug

* * *

The Universal Tire Protector, manufactured by the Universal Tire Protector Company, Angola, Ind., differs from those of usual form inasmuch as the device is mechanically anchored to the shoe. It is designed for attachment to a tire which presents symptoms of weakness or a shoe which has blown out. The tread is provided with metal studs, making for durability and traction, and the boot also is provided with a rim arrangement to which are secured straps, these being tightened by a locking device. It is pointed out by the maker that the protector may be applied and locked in a very few seconds, as well as drawn tightly over the casing.



Universal Tire Protector

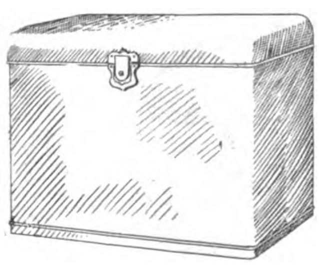


Magnetic Lifting Tool

The Magnetic Lifting Tool, marketed by the Sypher Tool Manufacturing Company, 2208 Warren street, Toledo, O., is a useful device for the repair shop or garage as by it bolts, nuts, cotter pins, tools or small parts, which have been accidentally dropped in inaccessible places and are not reached easily with the hands, may be taken out. The instrument weighs 2.5 pounds, is 12 inches in length and the magnets are operated by electricity supplied by dry cells or a storage battery. It is actuated by a press button on the end of the handle, thus closing the circuit, and as the tool is in service but a short time but little current is consumed. The device is provided with several feet of flexible cord, has a polished brass case surrounding the windings and is inexpensive.

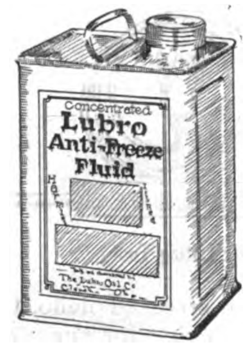
* * *

Mitchell Boxes, manufactured by G. F. Mitchell & Son, Cleveland, O., are made in several different styles and dimensions to meet individual requirements. They are constructed of steel and a quality claimed is neatness of design and fit of covers. Each box is equipped with a Yale lock, the maker holding that it is the best obtainable and that it eliminates duplication of keys. The boxes are neatly finished. Tank members also are supplied.



MITCHELL STEEL BOX

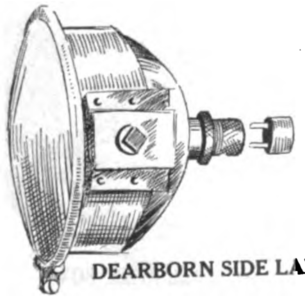
Lubro Anti-Freeze Fluid is manufactured by the Lubro Oil Company, 116 Prospect avenue, N. W., Cleveland, O. It differs from the usual anti-freezing solutions in that it does not require testing from time to time with an instrument to ascertain the freezing temperature. The fluid is red and its strength may be determined by the color which fades as it weakens. Being a bright color it is a simple matter to locate leaks in a radiator, and the garage man is prevented from drawing off the fluid by mistake. The maker also emphasizes the fact that Lubro does not boil or evaporate as easily as water and that it keeps the cooling system free from rust and corrosion. Another quality is that it is of a lubricating nature. One gallon added to 3.5 gallons of water provides sufficient fluid for the ordinary radiator. Lubro comes in gallon cans and is moderately priced.



LUBRO ANTI-FREEZE FLUID.

* * *

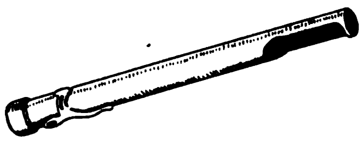
Dearborn Electric Sidelights are produced by the Dearborn Hardware & Lamp Manufacturing Company, 2911 Carroll avenue, Chicago, and it is claimed these lights will withstand hard service and provide good illumination. They are constructed of one-piece heavy brass and the side brackets are securely riveted. The interior is heavily silver plated and highly polished, and a focussing device of solid brass, operated from the outside, is a feature of the design. It is fitted with an Ediswan socket, also a complete connector made of genuine hard rubber. The lamps are six-inch and are moderately priced.



DEARBORN SIDE LAMP

* * *

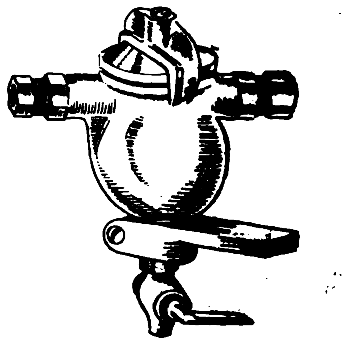
The Matchless Pocket Lighter, marketed by the Schiller Manufacturing Company, Chicago, is a compact, seamless tube, nickel plated and containing gasoline or alcohol, which saturates a wire mounted fireproof wick. The fuel is ignited by a plunger carrying a piece of "Pyrofor," capable of 5000 ignitions. It is used in a manner similar to striking a match and the shower of resulting sparks ignites the wick member. When the plunger is in service a spring with a cap and sponge is compressed, forcing the fluid above the sponge and keeping the wick saturated. The shoulder is tapered, hermetically sealing the receptacle tube, but the knurl makes it possible to remove it evenly and quickly. The lighter is four inches long and weighs but an ounce.



MATCHLESS LIGHTER

* * *

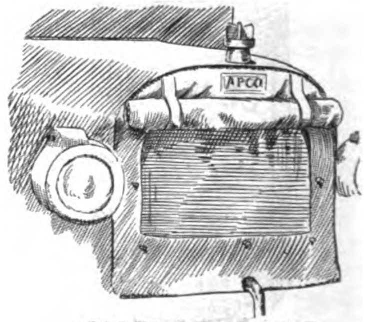
The Rayfield Strainer-Trap is produced by the **Findeisen & Kropf** Manufacturing Company, maker of the Rayfield carburetor, and is installed in the main fuel line between the source of supply and the vaporizer. It is a valuable component of the carburetion system, in that it not only separates water and foreign elements from the fuel, but prevents them from reaching the carburetor and creating trouble. The gasoline enters at one end, flows directly to the bottom of the trap, and in rising to pass out, passes through a very fine metal screen. All accumulations are left in the bottom and may be removed by means of a petcock. A brace is provided with the strainer for attaching to any convenient frame or other car member. The device is five inches high and 2.5 wide, and is constructed to take .25, .3125 or .375-inch outside diameter tubing. It is made of brass, nicely finished and is moderately priced.



RAYFIELD STRAINER-TRAP

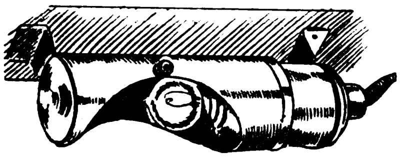
* * *

The Apco Ford Hood Cover is marketed by the Auto Parts Company, Providence, R. I. It is designed to keep the water in the circulation system warm and the motor at the same time. This makes for easy starting when the machine has been exposed to the cold as the cover completely envelopes the hood and radiator, retaining the heat for a considerable period. It is constructed of rubber cloth, well stitched and padded with felt, and is equipped with an adjustable curtain. The cover may be left on all winter, thereby protecting the power plant from rain or sleet, and being neatly constructed does not detract from the appearance of the machine.



APCO FORD HOOD COVER

The curtain may be lowered or raised as desired and is secured by curtain fasteners. The device is moderately priced and replacing the blanket prevents possible theft of that member when the car is left alone.



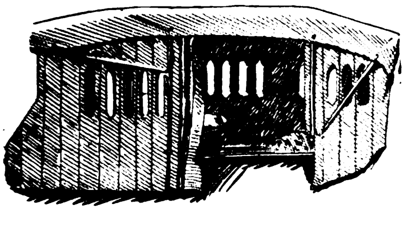
CLEVELAND TOP LIGHT

★

The Cleveland Top Lamp, manufactured by the Cleveland Electric Storage Battery Company, 116 Market street, St. Louis, Mo., is an electric member for lighting the tonneau of the motor car equipped with a canopy top. The bulb is contained within a sturdy metal casing which is secured to the bow of the top. A shutter is provided, affording protection to the bulb when the top is folded. The lamp comes complete with suitable length of flexible cord, and is inexpensive.

★

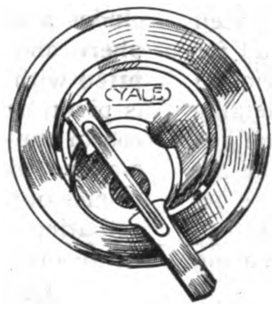
The Applas Inside Curtain is produced by the Applas Curtain Company, 601 Ford building, Detroit, and in addition to being very neat in appearance provides means for completely and quickly enclosing the body, thereby protecting the occupants against the weather. It is accordion pleated and suspended from nickel plated rods which extend from bow to bow. When not in service the curtains are held flatly against the underside of the bow, entirely out of the way, preventing breakage of the celluloid lights. A ring is attached to each pleat, permitting sliding, which operation folds it automatically. Means are provided for securing the curtains when in position, as well as for attaching to the body. A multiplicity of windows make for excellent lighting of the car's interior.



APPLAS INSIDE CURTAIN

★

The Crary Gasoline Lock, manufactured by the Crary Gasoline Lock Company, Detroit, is as the name implies, a device for shutting off the supply of fuel from the main tank to the carburetor, thereby preventing the use or theft of the automobile by others than those in possession of the key. The locking device is similar in appearance to the ignition switch and is located upon the dash or other convenient place. Leading from the lock is a flexible steel shaft, enclosed in a tubing to prevent tampering with the actuating mechanism.

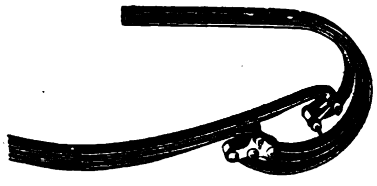


Crary Fuel Lock

The latter is incorporated in the main line between the tank and the carburetor and a simple movement of the lever key closes a valve member, securely locking the fuel. The lock is a Yale and the key is removable. The device not only prevents theft of the car, but enables the owner to shut off the fuel, eliminating loss by flooding of the carburetor. The Crary fuel lock is constructed of high grade material, nicely finished and easily installed. For convenience and practicability the device is recommended by many.

★

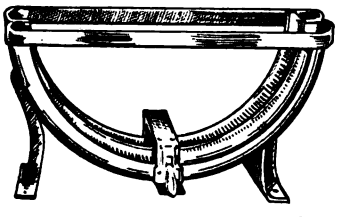
The Huston Multiple C Spring is produced by the Huston Multiple C Spring Company, Philadelphia, and replaces one of the usual members. It comprises a number of proportioned scrolls, and the main member is supported from the top plate of the supporting spring by a pivoted compensator which equalizes the constantly varying strain among the three leaves. The latter are separated from one another and operated independently. It is held that the device not only makes for easier riding qualities of the car, but eliminates opportunity of spring breakage when traversing rough roads. Economy of tires and better traction are also emphasized in the device. Many makes of springs were carefully studied by the designers before placing this latest product on the market.



Huston Multiple C Spring

★

The Sly Perfect Tire Holder will appeal to the discriminating motorist as its design is such that it may be attached to the running board, instead of the body, thereby saving the latter from disfiguring marks by screws or bolts. The device is sturdily constructed, is neat in appearance and the holder proper is so shaped as to retain the shoe in an upright position. The use of straps, etc., is eliminated, the tire being locked by a strong metal hasp provided with a self-locking toggle member. The brackets supporting the holder are neatly constructed and are bolted to the running board. The Sly Perfect tire holder is made in single and dual form and is inexpensive. Smalley Daniels, 247 Jefferson avenue, Detroit, is sales agent.



SLY PERFECT TIRE HOLDER

Recent Patents of Interest

Wainwright Shock Absorber.

A shock absorber which differs from those of the bumper type in that a spring device is incorporated in the rubber, has been patented by Richard T. Wainwright, Rye, N. Y. It is barrel shaped and means are provided for attachment to the body and axle of a vehicle. The resilient rubber member has a longitudinally disposed opening surrounded by a cylindrical spring imbedded in the rubber which is so shaped as to resist tensional and torsional stresses.

Sims Armored Tread.

Bona Sims, Valley Spring, Tex., has been granted a patent for a flexible armored tread for pneumatic tires. It is applied to the exterior of the casing and comprises a number of metallic plates which are diamond shaped and arranged divergently with respect to the plates of the adjacent row. Other plates are employed, these being similar in shape and both types are linked to one another. Means are provided for securing the outer row of plates to the casing.

Currin Dust Cap.

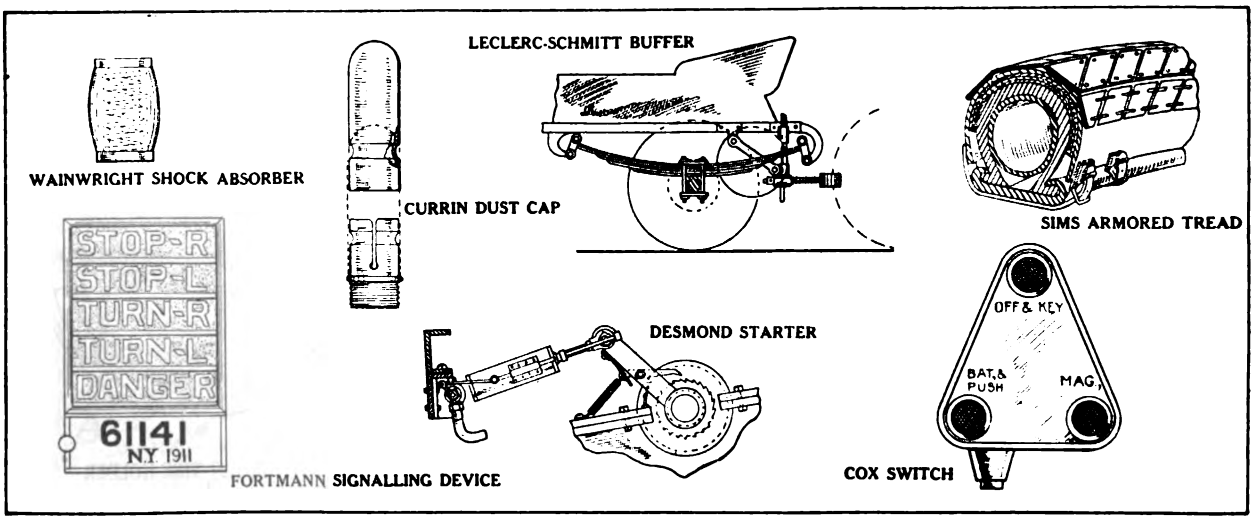
In pumping additional air into the tube of a pneumatic tire and when the valve stem is protected by a dust cap, it is necessary to remove this member, which operation takes more or less time. Sydney Allen Currin, Bristol, England, has patented a dust cap which presents interesting features as it is made in two sections, one of which may be removed quickly when desired. The part that is attached to the felloe of the wheel is threaded and it also has an annular shoulder and a split portion. The upper section has a similar annular shoulder which registers with that on the lower member, securing the portions.

Desmond Motor Starter.

A large number of patents have been granted of late on devices for starting the explosive motor. Among the more recent patents granted is one to John Desmond, Chicago, Ill., assignor to William S. Potwin of the same city. The device operates on the compressed air principle and includes a chamber for the storage of the atmosphere, and actuating means. The motor shaft is fitted with a ratchet and pawl mechanism which is pivotally mounted and operated by the piston rod of the air cylinder. The latter is fitted with a valve which opens and closes at the two extremes of the movement of the piston rod and the actuating lever is returned to its normal position by means of a spring.

Leclerc-Schmitt Rear End Bumper.

Bumpers are generally fitted to the front of a motor car, but a new application of the protecting device is noted in the patent granted Moise L. Leclerc and William Schmitt, New York City, assignors to said Leclerc and Frederick W. Darnstaedt of the same city. The buffer is attached to the rear of the machine and its hanger rods are secured to the frame. Brace links connect the lower portion of the hangers to the frame and



Some of the More Recent Ideas of Inventors Working Along Lines Applicable to the Motor Car, Including an Armored Tire, Shock Absorber, Motor Starter, Rear Bumper, Signalling Devices, Etc.

guide sleeves are fitted through which the buffer rods move. The buffer bar proper is secured to the rods and interposed between the members is a cushioning spring, the movement of which is limited by stop collars.

Fortmann Signalling Device.

Gustave Fortmann, Philadelphia, assignor of one-half to George W. Cook of the same city, has been granted a patent for a signalling device which is a box like member and designed for attachment to the rear of a motor car. The member is divided into a number of horizontal partitions and these are fitted with transparent plates inscribed with suitable words which are illuminated at night. Means are provided for operating the signals as desired as well as for lighting each compartment separately.

Cox Magneto-Battery Switch.

Henry G. Cox, Detroit, has been granted a patent for a magneto-battery switch which comprises two sets of independent circuit terminals, a terminal controlling member, also a flexible support for the latter, and permits a tilting movement into three different positions by movement in the same direction but upon different portions. The controlling member is equipped with means for co-operating with the independent circuit terminals for the opening and closing of each circuit.

Falor Inflating Tube Protector.

Clarence E. Falor, Akron, O., assignor to the Goodyear Tire & Rubber Company of the same city, has been granted a patent for a device to prevent circumferential creeping of tires upon wheel rims, also to protect the inner tube from injury made possible by said creeping. It comprises a tubular member of greater rigidity than the inflating tube positioned around said tube. The intermediate portion of said member where it extends in the wheel rim is exteriorly threaded to receive a clamping nut for connecting it to the rim, one end of said member being provided with a disc shaped lateral flange arranged on the wall of the tire, the opposite end being so designed as to be collapsed against said inflating tube when a valve casing is positioned therein for holding the latter against displacement.

Gray Locking Device.

Emmet P. Gray, Detroit, has patented a locking and releasing device designed for service with signalling apparatus, cut-outs, etc. It comprises a tubular body secured by means of locking nuts and provision is made for the adjustment of these members. The rod operating the lever to which is attached the cable or wire is free to move up or down, and its upper portion is fitted with a head having a recess for engagement with a latch member. The latter is provided with a spring to secure the slidable rod when it is sufficiently depressed.

Regur Motor Starter.

Among the patents granted for starting the internal combustion motor other than by cranking by hand, is the Regur motor starter, patented by Winfield S. Regur, Des Moines, Ia. The device is of the mechanical type, it being operated by a lever located on the outside of the body and occupying a position just back of the gear shifting lever. The end of the starting lever is provided with gear teeth which mesh with similar members upon a ratchet wheel and the latter is mounted upon a sleeve keyed to the power shaft. A casing member is screwed to the disc which is rotably mounted on the sleeve, and a pinion is provided on the casing member and rotably mounted upon the power shaft. The casing also is fitted with a spring actuated pawl which engages the ratchet wheel.

Wear Self-Inflating Tire.

Frank F. Wear, San Francisco, Cal., assignor to himself as trustee, has been granted a patent for a self-inflating and non-collapsible tire that presents novel features. It comprises a wheel having a rim, to which is fitted a pneumatic casing in which is contained sectional inner tubes. Between each pair of tubes is a spring plunger pump. These pumps are mounted on the felloe of the wheel, and comprise an external cylinder, within which reciprocates a small piston controlled by a spring plunger extending into the tire, and bearing upon its lateral interior surface. The plunger is placed between the two sections of inner tube and is so actuated upon by a helical spring as to produce reciprocal movement on the part of the piston of the pump. This action takes place when the tire is displaced in moving over inequalities in the road. Air is admitted to the pump cylinder through a check valve and is discharged on the in-stroke through a small aperture or passage to the tube. In the event of a small puncture in one of the tubes the pump constantly operating would keep it inflated. Provision against over-inflation is not mentioned.

Collard Ignition Apparatus.

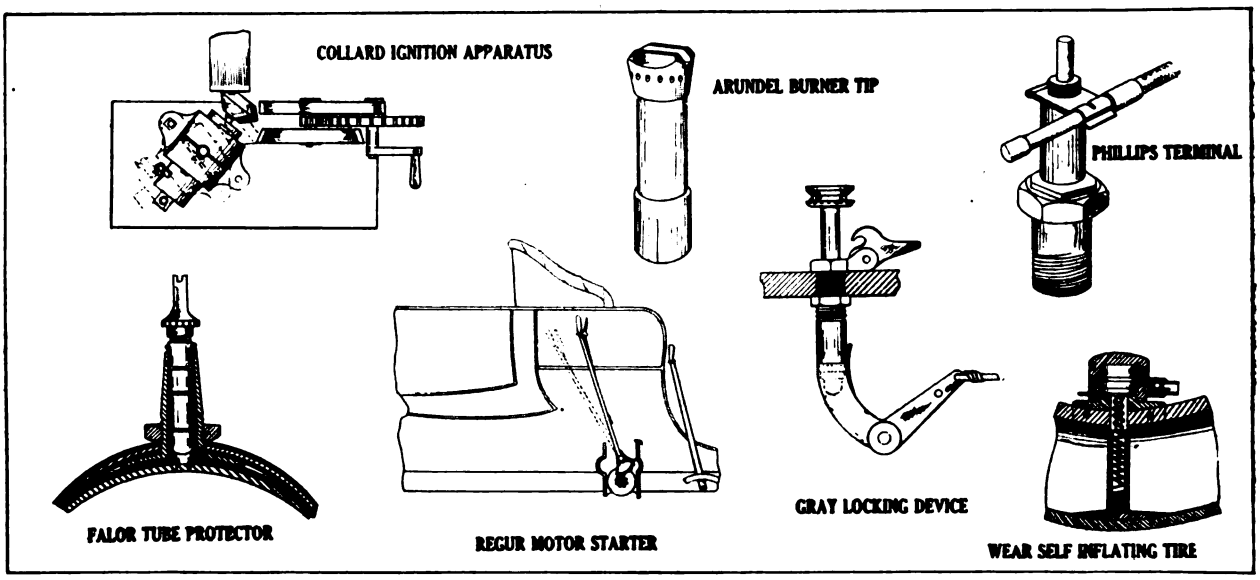
David Edward Collard, Jefferson, Col., has patented an ignition apparatus for explosive motors which differs from those of ordinary construction, inasmuch as the source of current, the magneto, may be utilized when the gas engine is inoperative. The current generator is friction driven off the flywheel of the gasoline motor and is pivotally mounted, and means are incorporated to break the contact as well as to move the dynamo into contact with the manually operated device. The latter includes a wheel member which engages with the bevel of the dynamo pulley and energy is imparted through gears operated by a crank. By it the inventor claims that the gas engine may be started on the dynamo when the motor is idle and that batteries are eliminated. The mechanism provides for a return of the dynamo pulley into engagement with the flywheel upon the engine starting.

Arundel Gas Burner Tip.

Clarence E. Arundel, Washington, D. C., assignor of one-third to William F. Roberts of the same city, has been granted a patent for an acetylene gas burner tip. It resembles the ordinary gas burner in conformation and has oppositely disposed side walls with a floor or recess, said floor having a central orifice elongated transversely of, but remote from, the side walls. Air ducts are incorporated to supply air between the gas exit and the side walls. The streams of gases impinge upon each other and splay longitudinally of the depression and side walls.

Phillips Terminal.

A patent for a spark plug terminal has been granted to Ross M. G. Phillips, Minneapolis, Minn., assignor, by mesne assignments, to Henry Deutsch, trustee. The device is so constructed that the cable or wire carrying the current may be detached from the spark plug when desired. The cable is fitted with an extension of conducting and non-conducting material, the former transmitting the electricity to a metal attachment secured to the terminal of the plug. The clamp is held securely by the spark plug nut and is provided with spring jaws which engage and hold the cable terminal which may be removed or replaced as desired. The inventor points out that the device permits of breaking the circuit and that its testing is made easy and without the use of tools or the operator receiving a shock.



Recent Developments in Motor Car Equipment, Making for Convenience, for Which Patents Have Been Granted.

Miller Tire Puncture Finder.

The customary method of locating small leaks caused by punctures to an inner tube is by immersing the inflated member in a tank of water when the puncture is noted by the air bubbles. Francis Miller, Bellevue, Ky., has invented a tire puncture finder which eliminates the water tank, as the device is so designed that it is clamped about the tube and over the suspected punctured wall. It comprises a ring adapted to completely encircle the tire and is provided with an annular air chamber communicating with a bubble blower detachably secured to the ring. The bubble detector device is fitted with a nipple screw threaded into the ring, the nipple threads being adapted to engage into the air valve of the tube. Leaks from punctures are denoted by the bubbles given off, these being created by the escaping air.

OTHER PATENTS GONE TO ISSUE.

Kraemer Valver Lifter, Edwin N. Kraemer, Cedarburg, Wis. A valve spring lifter comprising a pair of pivotally connected levers which are contracted or extended by means of a threaded rod actuated by a wing nut.

Motor Starter, Wilmur F. Boa and Karl Schoenbauer, Grand Rapids, Mich. Coacting jaw clutch members are utilized having release members and means are provided for breaking the engagement of the starting crank member with that rotating the motor shaft.

Face Protector, Oscar H. McQuary, Jr., Lawrence, Kan. A device for protecting the face comprising a shield for the nose and mouth, also goggles secured in the eye holes. The material is flexible.

Friction Clutch, William J. Hilliard, Elmira, N. Y., assignor to Charles H. Knipp of the same city. A friction clutch, having a number of rings, of inside and outside gripping members, a plurality of cylindrical cams fastened upon the outward side of the outside member, cross bars engaging said cams and revolubly mounted on the hub of the clutch, and means for turning said cross bars.

Motor Starter, Peter W. Kane, Chicago, assignor to the Kane Machinery Company of the same city A mechanical starter comprising a ratchet member mounted upon the shaft of the motor. The actuating arm or lever is fitted with a pivotally mounted pawl one end of which is provided with a similar member. The latter is brought into action in the event of the shaft rotating in a direction opposite to that in which it is intended to move.

Resilient Wheel, August Loock, Hayfield, Ia. Between the rim of the wheel and tire are provided slidable rods having springs, and guide plates are utilized to control the movement of the rod members.

Chock, Thomas J. Moss, St. Louis, Mo. A device for chocking motor car wheels, comprising sheet metal plates so constructed as to be of triangular formation and a brace for securing same. Lugs are provided for the brace member.

Spring Wheel, Frank M. Beydler, Ashland, Kan. Between the felloe of the wheel and solid tire is interposed a series of S shaped springs, these being secured to a facing strip of the traction member by blocks.

Tire, Angelo C. Rovelli, Philadelphia, assignor of one-half to Max Strozzi of the same city. The shoe is constructed of solid material with the exception of a space which is partially filled by two tension members of resilient material, these being bowed toward one another, and engaging the tire at their inner and outer edges only.

Pipe Wrench Attachment, Edward Brahan, Green Bay, Wis. The monkey wrench is provided with a recessed jaw for the purpose of securing a supplementary pipe jaw, and means are provided for the operation of same.

Automobile Horn, Delroy Fifield, Cleveland, O. A horn actuated by the exhaust of the motor and comprising a tube having a partition therein and a valve disc. The latter has spring fingers embracing the partition, and is located at the mouth of the tube. A pipe is employed for conveying the gases toward the side of the disc opposite to the tube.

Fender, Charles G. Wegner, Baltimore, Md., assignor of one-third to Henry F. Sleepack and Amelia C. Wegner of the same city. It comprises a pair of parallel bars having bifurcated portions forming limbs connected to the axle and mudguards and a cross bar interconnecting the limbs, also a flexible covering.

Motor Car Headlight, Edward O. Clark, Spokane, Wash. The headlight is of the movable, swivelling type, being pivotally mounted and actuated by a rod moved by the tiebar of the car.

FLEXIBLE COUPLINGS FOR MAGNETOS.

ANNOUNCEMENT is made by the Bosch Magneto Company, New York City, of a new adjustable flexible coupling which is adaptable for driving magnetos, etc. The device, which is shown assembled at Fig. 1, permits the driven unit to operate both out of centre and out of line, eliminating the need for exact alignment of the magneto and driving shaft as mentioned by the repairman. Another advantage of the Bosch device is that the magneto may be displaced without disturbing the timing or any part of the driving mechanism.

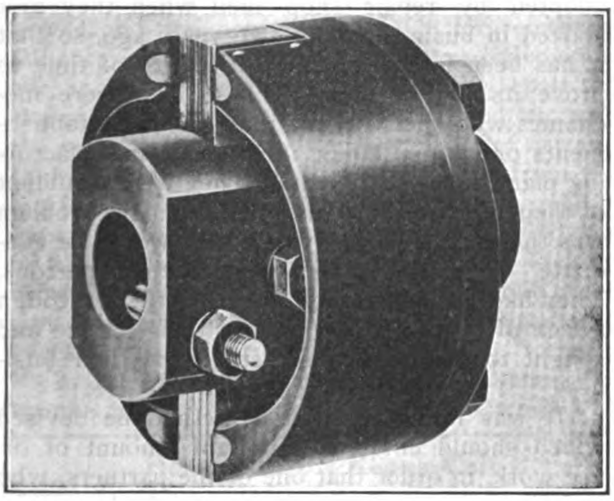


Fig. 1—Bosch Adjustable Flexible Coupling Permitting Driven Unit to Operate Out of Centre or Line, and Change of Timing Without Removing Magneto.

The Bosch coupling comprises a cone shaped piece of steel attached to the armature shaft and terminating in a ring having diametrical fibre lined slots. To the driving shaft is secured a flange that carries a flat crossbar consisting of a large number of fine spring steel leaves or plates. The crossbar fits in the slots or recesses of the cone shaped member, as is shown at Fig. 2.

The laminated crossbar has a marked spring action and permits the two members of the coupling to have a slight relative torsional movement, which is ample to absorb the shock of varying resistance to the rotation of the magneto armature. The spring crossbar also has a slight bending or twisting movement sideways, permitting the two shafts to be slightly out of line. With a rigid coupling the driving and driven shafts must be aligned, and the shock created by the magnetic resistance is transmitted to the driving gears, producing noise. Noisy action is eliminated in the Bosch spring crossbar and ring by lining the cavities with fibre, which in addition, obviates the necessity for lubrication.

The cone shaped member of the coupling is made with proper tapers for various types of Bosch magnetos, a recess being provided for the armature nut. This section is keyed to the armature shaft, while the other member of the coupling may be attached to the driving shaft by a key or the bolt which accompanies the coupling.

Where the adjustable flexible coupling differs particularly from the usual flexible coupling is in the construction of the cone shaped member. In the adjustable type this is made in two parts instead of one, the portion engaging the driving member having a circular groove carrying three bolts with tapered heads, as is shown at Fig. 2, which depicts the disassembled coupling.

The portion which is actually secured to the armature shaft is an ordinary flange having three holes in which the taper headed bolts register. When the nuts on these bolts are set up tight there can be no relative motion between the two portions, due to the binding effect of the taper; so that the sections become as one. Upon loosening the nuts, the magneto armature, together with its portion of the coupling, can be rotated through a complete circle.

A vernier engraved on the stationary portion permits accurate regulation to any degree and on this account the magneto may be mounted on the motor without reference to the timing and the armature set in any position after the entire apparatus is fixed. The construction permits of tests being made to secure the best results from timing without changing keyways, cotter pins, etc.; or in other words, the position of the armature may be altered slightly after installing the magneto, a condition not possible with rigid couplings without considerable labor.

While automobile manufacturers are discussing the advisability of continuing national shows, accessory makers are invited to open a permanent exhibit of their products, to be known as the Auto Centre, in New York City. It is proposed to have each manufacturer in the United States maintain a booth throughout the year, in order to have its product accessible to visitors from every part of the world without the necessity of making a trip to the factory.

John M. Gorham, a New York City attorney, is at the head of the project. He estimates that at least 110 different exhibits will be in place. The idea is considered somewhat novel, but Mr. Gorham is confident that it will accomplish its main purpose to the benefit of producer and consumer.

EXCLUSIVE REPAIR SHOP SYSTEM.

Efficient Method Adopted by Concern Making Specialty of Repair Work for Garages That Do No Repairing for Their Patrons.

THERE is probably no more exacting work in the automobile industry than that connected with the service station and repair shop. Many items are to be considered and to emerge at the end of a month, or any given period, with the business showing a balance on the right side of the ledger requires that close account be kept of each and every item in the various departments. Particular attention should be paid to the matters of stock used, tools required and the labor. These should be checked in a most complete manner, yet with the simplest method possible to avoid confusion.

Much doubt has been expressed as to the wisdom of operating a repair shop only, as the lack of garage and storage facilities might militate against securing patronage. However, this has been overcome to a large extent and there are thousands of repair shops throughout the country doing an excellent business. Fairness of dealing and thorough and reliable workmanship are the main factors that will attract such trade, but another important matter, by no means to be neglected, is the method of rendering such service so that the customer may know he is being treated absolutely fair. This is to be obtained through an adequate system of conducting the service station.

Form No. 1—Repair Tag.

The system herein outlined is one that was adopted by repair shop men when they first started in business about two years ago, so that it has been in use a sufficient length of time to prove its practicability. These men were mechanics who had worked in automobile establishments of various kinds, including a manufacturing plant, for several years. They were confident of their mechanical ability, but the main problem was the evolving of a system that would be adequate to secure satisfaction to their patrons. They had witnessed the failure of others through a lack of proper supervision of their service and sought to eliminate this factor from their business.

It was necessary that a method be devised which should entail a minimum amount of office work, in order that one of the partners, who had the office work in charge, might have part of his time in which to attend to mechanical work, as each man agreed to take personal charge of a department. Good wages were paid to the workmen, thus securing efficient labor, which justified the charging of good prices for the work performed in their shop. It was agreed at the start that no work should be taken by the job, unless it was understood that the estimate was an outside figure. At the conclusion of the work, if it was found that the cost was less than this estimate, the customer was given the benefit. This plan worked admirably in practise, especially when the customer was made to understand that no accurate estimate could be made of a job, when upon overhauling a car it might be found that the necessary work on hidden parts would greatly exceed the first estimates. Therefore, the outside estimate was made with a view of covering such contingencies, and the customers soon realized they were paying for what they received and no more.

It was also planned to economize wherever possible, the only expense that could not be reduced being the advertising appropriation. Accessories were not dealt in by the company, such necessities being secured outside and the patron being given the benefit of the firm's experience in selection. The chief purpose of the company was to attract business and give a thorough and first class service to garages that did no repairing. With these essentials of the business carried out, the shop organization was attended to and this proved the principal task to assure success.

The system developed had the merit of extreme simplicity and efficiency and it may be applied to any repair shop or service station with equal success, regardless of its size. Each workman was required to have his own kit of hand tools, although the toolroom of the shop was well equipped for all kinds of work. These tools were placed at the disposal of the workmen, but as a guarantee of proper usage a checking system was devised, showing the tools loaned and to whom. Thus it was assured that they would be returned and not left carelessly about, with consequent danger of loss by theft or damage by use in the hands of inexperienced persons.

The books kept by the office comprise a cash book, journal and ledger. These are supplemented by the original records, which are preserved and are instantly available for reference. When a job is received it is given an order number, as will be seen by reference to the repair tag shown as Form No. 1. This tag is filled out with the name of car owner, address, make of car and the date received, which is transcribed from the tag to the bill. The tag, which is of heavy manila paper, is sent to the foreman of the shop and he in turn utilizes the reverse side upon which to write the instruction which outlines certain work and whatever incidentally may be considered necessary.

In the case in question, as shown upon the sample forms reproduced, three men work 14.5 hours on the car the first day, using two gallons of machine oil and a gallon of gasoline for washing the parts. The oil and gasoline are secured at the stockroom, for which a receipt is given and the order received by the one in charge. This stock order, shown as Form No. 2, is given the same number as the repair order and this order identity is preserved throughout the shop. Thus each order checks against the other materials used in the work. A slight mistake would be detected instantly before the bill were made out to the owner, thus guarding against injustice either to the shop or the patron. The stock orders and time cards are taken to the office at the end of each day and are examined, compared, checked and filed.

Form No. 2—Stock Room Order.

The time card, indicated as Form No. 3, carries a complete record of each job performed in the shop and can be referred to instantly in the event of any item being questioned. Many repair shops have been too negligent of this feature of their business in the past and often patrons have been lost as a result. When a man brings his car to the shop it is promised for a certain time and a workman assigned to the job.

Form No. 3—Time Card.

Perhaps the customer has occasion to pass the shop and observes the workman engaged upon a car at the door—a transient job. Passing again in an hour he may see the workman still engaged in his temporary repair on the transient job. Later in the day when the customer calls for his machine it is ready, but he thinks he has been charged for time expended upon the other. He complains and a dispute arises, but in the absence of a definite record no satisfactory explanation can be given. The customer may possibly take his work in the future to another shop which works upon a more efficient basis, for he feels that he cannot afford to pay for another's lack of system.

The time card in use by the system under discussion shows that the workman, James Grady, worked nine hours on that particular day, five hours of which were expended on order No. 92, the other four being on another job. To obviate any question the reverse side of this card is arranged to show in detail how the workman expended his time during the day and on what jobs he was engaged. A column is provided to designate the order number, while other columns show the time he started at work and the time he stopped on each job. These figured up at the

All invoices must bear our order number, otherwise they cannot be checked for payment.

Form No. 5—Outside Stock Order.

By comparison of the stockroom order and receipt and the time card it is found that the oil and gasoline were delivered the same day upon which the work was performed on the car. From these cards the customer's bill is filled out each day and brought up to the minute. The stockroom order and receipt is a voucher for the charge on the bill as well as being a record for the delivery of stock.

The second day that the car is in the shop two men are at work on it for 13 hours, the time cards accounting for this. But it is found that the brake bands have to be refaced, for which new lining is necessary. This not being carried in the stock of the shop it is necessary to send outside for the material, which in this instance was secured of a local firm. An order is necessary for this and the blank specifies what is required, the job number being attached. The original order is sent to the firm, while a duplicate is retained in the office for filing purposes. This order form is shown herewith as Form No. 5.

An order is also made upon the stockroom for 32 copper rivets and the following morning the time and stock cards are compared for accuracy and the items are entered on the bill. When the owner calls for his car at the specified time it is ready as promised and his bill is also complete. If there should be any question as to an item the time cards and the stockroom orders are instantly available, and also the record of the order given outside. The bill can be rechecked from the records, if necessary. The bill as completed is itemized and the original is sent and the duplicate retained, this being in loose leaf binding, and indicates each bill remaining unpaid. This bill is shown as Form No. 6. It can readily be seen that few books are necessary as every supply is charged and accounted for in the bills and cards. The records are preserved on file by month and are so arranged alphabetically that they can be consulted instantly. The stock orders also accurately show the stockroom shrinkage, while the outside orders indicate the amounts due by the firm for any reason whatever.

In the case of winter overhauling and general long repairs requiring much work, the order is numbered, and name of owner and address, make of car, car registry number and instructions are written in detail on heavy manila card, in duplicate. The original is retained in the office and the card is attached to the machine, the process being the same as has been outlined heretofore.

This system has been found to give excellent results. It requires but little time and safeguards the customer and the company, and besides giving every desired fact, indicates precisely each transaction, thus meeting every requirement of the business.

THE FULLY EQUIPPED CAR.

Chas. E. Miller Makes Some Pertinent Suggestions for Benefit of Prospective Purchasers.

According to Chas. E. Miller, 97-103 Reade street, New York City, the well known accessory man, a much more insistent query of the motor car buyer this year than ever before is: "What do I get for my dollars?" Commenting upon this, he says: "The year, therefore, becomes more than ever before the year for the accessory dealer, for, after the buyer has selected the car that suits him in material, design and workmanship, he must next consider the equipment, and this for 1913 consists of speedometers, clocks, windshields, starters, electric lights, tire holders, etc.

"Supposing, for a moment, that the buyer has made a list of the equipment that the car he buys must possess, and if he does, he will find himself up against a difficult proposition. One car may

have all these equipment features and another only a part of them. It is just here that the dealer in accessories comes to the front because after the car is bought the selection of extras may be made at the buyer's leisure and convenience that will give him entire satisfaction and allow him to provide the necessities that will be consistent with his idea of a fully equipped car."

OPENS NEW YORK BRANCH.

French Maker of Gaulois Tires to Compete with American Manufacturers.

Formal announcement is made of the opening in New York City of a United States selling branch for the Etablissements Bergougnan of Clermont-Ferrand, France, maker of the well known Gaulois tires, and the first shipment of 5000 casings has been received at the headquarters, 64th street and Broadway. Jean Grenier, representative of the French firm, explains that his house has refrained from marketing its product in this country heretofore because of the duty of 35 per cent., which is held to be sufficient to wipe out all margin of profit. The action is taken at this time in anticipation of a material reduction in duty by the present administration at Washington.

It is stated that Gaulois tires have been in use abroad for 17 years and that their reputation is of the best. The company has exhibited at all international expositions since 1900 and has received highest awards at Paris, Turin, Hanoi, St. Louis, Liege, Milan, London, Saratoga, Quito, Brussels and Buenos Aires. It has refrained from making special racing shoes and this is held to explain the fact that the product may not be as well known on this side as some, but it is added that in last year's reliability trials of the French war department, 11 out of the 12 prize winners were equipped with Gaulois tires.

LE GAULOIS FERRE
BERGOUGNAN & Cie CLERMONT-FERRAND

One of the Non-Skid Gaulois Tires.

The Bergougnan works are said to be the second largest in the world. The number of workmen employed is 3500 and the output is in excess of 1000 tires a day. The concern was encouraged to enter into competition with American makers because of the splendid success achieved in Canada, where Gaulois tires are very much in demand, despite the duty of 35 per cent., which also is in effect there. The popularity of this line in Great Britain, South America, South Africa and other sections where all tires are on an equal footing is held to be a strong point in its favor.

Gaulois tires are in four styles, two smooth and two non-skid treads. The smooth treads come in a perfectly round and a squared surface, while the non-skids are either metal studded or with corrugations made from the word Gaulois in raised letters. Both American and French sizes are furnished by the New York branch.

Rhode Island is considering the advisability of a universal lighting law, and it would appear that the bill is likely to be passed in the near future.

An Automobile Trades Association has been organized at Columbus, O. The constitution is modelled after those governing the chapters founded in many of the eastern cities.

ETABLISSEMENTS BERGOUGNAN

Factory of the Etablissements Bergougnan at Clermont-Ferrand, France, Where the Gaulois Tires Are Produced.

VALUE OF PROPER FOCAL ADJUSTMENT.

WITH electricity replacing other illuminants to a large extent, the automobilist naturally concludes that the work of cleaning burners and mirrors, replacing gas tanks and fussing with leaky tubing and carbide has been eliminated. The pressing of a button or the turning of a switch lever when light is desired, appeals to his sense of convenience. While it is admitted that the newer form of illuminant, insofar as the motor car is concerned, requires less attention than the acetylene system, there are several factors which should be given attention if maximum efficiency is to be secured.

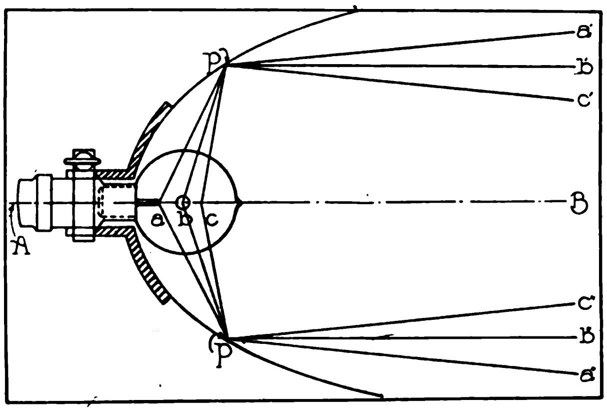

Fig. 1—Depicting Focal Value in Parabolic Automobile Electric Headlight.

The life of a bulb is limited. By this is meant that its candlepower falls off with its length of life and during its latter half, for example, the loss may be 20 to 30 per cent. or more, depending upon the filament. The watts a candlepower are increased proportionately. Variation in voltage, below or above normal, results in less illumination in the former instance and decreased life in the latter. An example of falling off in candlepower is noted in the ordinary incandescent bulbs having carbon filaments. In time the filament loses its brilliancy, becoming dull.

Another factor to be considered is the breaking of a bulb and its replacement. This brings up the subject of focussing the new lamp, a subject that is attracting considerable attention among electrical engineers, some of whom hold that there is still room for improvement in the design of electric headlights. Going a step further, different dimensions of the filament have an important bearing on the character of the beam and this contention is borne out by a series of experiments conducted by the engineering department of the National Electric Lamp Association, Cleveland, O., the results of which are depicted in an accompanying chart at Fig. 3.

The chart shows the distribution curves of a seven-inch parabolic reflector equipped with different types of electric vehicle lamps. Readings were taken 40 feet from the reflector with a Weber photometer. The apparent candlepower of bulbs of varying filaments will be noted by the curves.

The parabola was first fitted with a 52-volt, 15-watt, 12 candlepower Mazda vehicle lamp, a spider wound G 16.5 bulb, .5 by one inch. The test showed that an apparent candlepower of 750 was derived and that the beam was diverging, being in excess of 20 feet.

The second test was made with a 52-volt, eight candlepower, close coil, carbon G 12 bulb, .1875 by .25 inch. In this instance the apparent candlepower was 2750 and the beam 13 feet.

A 70-volt, 15-watt Mazda, 12 candlepower, concentrated type coil filament, G 12 bulb, .25 by .375 inch, showed an appreciable gain over the other forms, in that over 2800 candlepower was secured and that the beam measured 10 feet.

The final test was with a 24-volt, 15-watt Mazda, concentrated type coil filament, G 12 bulb, .25 by .25 inch which gave an apparent candlepower of 6500 and a beam of approximately nine feet. The concentrated filament type is of recent introduction and the distribution curves show that the dimensions of the filament are important factors in electric lighting systems.

When one attempts to alter the distribution of light from a headlight, fitted with the regular six-volt helical coil filament lamp, upon moving the bulb forward or backward along the axis of the reflector, it is found that there is one position at which the nearest approximation to a needle or parallel sided beam is secured. If the lamp be brought nearer the vertex of the reflector a more divergent beam is obtained, while at the same time the field is rendered less uniform. This is made evident from a study of the diagram presented at Fig. 2, which shows three rays of light traced from the lamp, to and from the reflector. It will be noticed that the rays that strike the reflector near the vertex and also those that strike the reflector near the extreme outer edge, are reflected in a direction more nearly parallel to the axis than the rays reaching the reflector at intermediate positions. It is evident that this will result in rings of relatively high and low illumination in the field lighted.

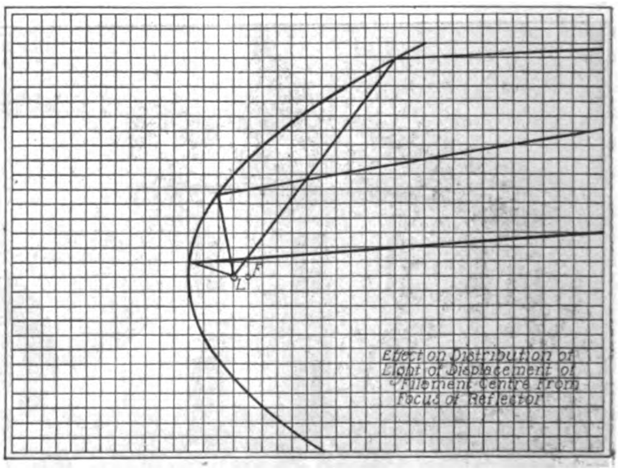

Fig. 2—Showing the Effect of Altering the Distribution of Light from a Headlight.

These diverging and parallel beams, as well as the value of focal adjustment, are shown at Fig. 1. For the benefit of those not familiar with the subject it is stated that upon the proper location of the bulb depends the efficiency of the lamp. The drawing depicts a sectional view of the reflector, lamp and socket. There are three cases to be considered, namely: The filament at the successive positions a, b and c, as denoted. Positions a and c are any two locations behind and ahead, respectively, of the geometrical focus of the deflector, and that at b is at the geometrical focus.

Assume that the centre of the filament is at a. A ray of light emanating from this point and incident upon the reflector at any point as at P will be propagated along the line Pa′. It will be noted then that a system of rays taken through a complete revolution about this point will form a truncated cone of rays. A large amount of light will, therefore, be uselessly dissipated in the air.

In the second case to be considered, a ray of light also striking the reflector at P will assume the direction Pb′. Thus a complete series of rays will form a cylinder parallel to the major axis AB. This is held to be an ideal condition for a long concentrated projection.

Thirdly, a ray coming in contact with the reflecting surface at P will in turn follow the direction Pc′. Concentric zones of light and dark on the illuminated plane will be the result.

From the above it will be seen that in the first case the rays are spread out and that distance projection is sacrificed for a wide display of light on the ground close to the machine. In the second instance, a long projection of light; and in the third case an undesirable collection of light and shadow due to the crossing of the rays are the results. It may be added that there is a certain point at the rear of the focus beyond which the rays are spread out, producing an undesirable illumination. This focal tolerance can easily be ascertained by sliding the socket back and forth in its retaining sleeve and noting the illumination produced. This allowable flexibility makes it possible to adjust to suit a difference of opinion as to the proper driving light. It is very evident that appreciation of the influence of the position of the light source is essential in attaining the best results from the electric headlight, be it a glass or metal reflector.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the Henderson cars, has entered a car in the third annual 500-mile race to be run in that city May 30. William Knipper will be the driver and his mechanic will be Frank Jones, who has ridden with him in many races in the past. The Henderson machine was introduced to the public on the occasion of the second 500-mile race and the entrance of the car in the coming event will be in the nature of a celebration of its first appearance. This will be the first Henderson machine that has taken part in a race meet of this character.

TO PRODUCE HOFF CAR.

Company Organized at La Crosse, Wis., to Promote Design of Hofweber Brothers.

The organization of the Hoff Motor Company, a $1,000,000 corporation, to manufacture automobiles at La Crosse, Wis., is said practically to have been completed. The idea of a factory at La Crosse was proposed by Joseph E. Hofweber of 1606 Jackson street, that city, who has constructed a model car at Detroit, with the aid of his brother, August Hofweber. Should the capital be placed at $1,000,000 eventually, it is understood there will be $250,000 preferred stock and $750,000 of common stock issued.

The tentative plan submitted to the stock subscribers provides for the manufacture of the first 20 cars at Detroit. These will be given a thorough test in various parts of the country before others are made. When the success of the new machine has been demonstrated to the satisfaction of the organizers and stockholders, a plant will be erected at La Crosse and business started on an extensive scale.

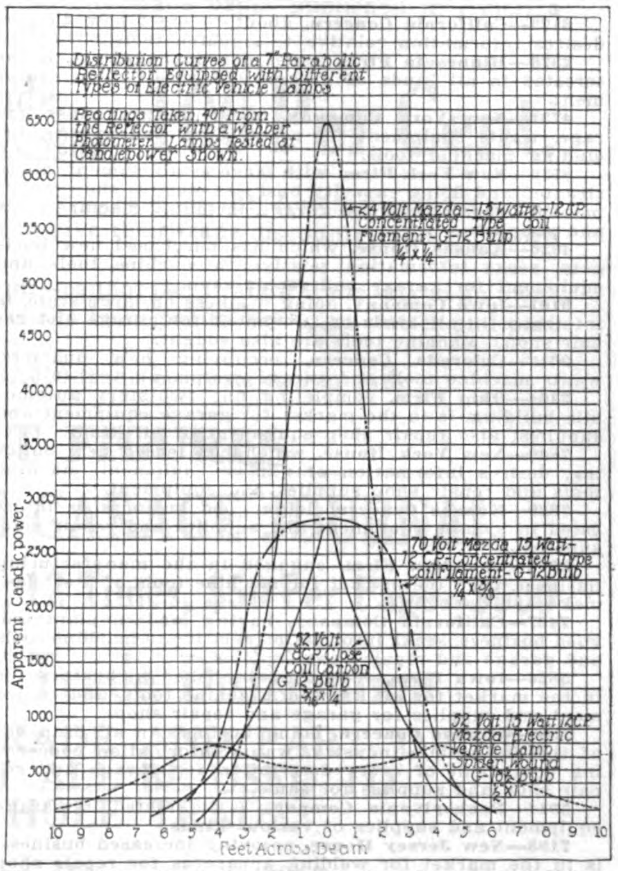

Fig. 3—Chart Depicting Distribution Curves and Effect of Varying the Dimensions of the Lamp Filament—Note the Efficiency of the Concentrated Type Coil Filament.

The Lyons Atlas Company of Indianapolis, Ind., which owns and controls one of the four American Knight engine licenses, has purchased the sample cars, parts, drawings and patterns of the Knight engined cars, which were designed by Harry A. Knox of Springfield, Mass. Mr. Knox has located in Indianapolis.

TRADE INFORMATION EXCHANGE BUSINESS PROPOSITIONS.

Opportunities Are Offered Below for Agents to Secure New Lines, for Manufacturers to Extend Their Representation, and for Producers to Get in Touch with Those Who Are in the Market for Equipment and Supplies. All Are Opportunities for Live Men and Firms Seeking Profitable Relations.

The Following Details of Trade Opportunities Presented by Members of the Trade Information Exchange Are Published Without Names, Those Interested Desiring the Negotiations to Be Strictly Confidential. Replies Should Be Addressed by the Number Given and Sent to the Exchange with Postage for forwarding.

EQUIPMENT NEEDED.

6123—California Concern, about to erect new garage, desires information relative to machine tools.

2376—Minnesota Firm, under new management, is interested in all kinds of garage and repair shop equipment.

4731—New York Company, operating first class garage, wants equipment for repair shop and garage, including machine tools.

8556—New York Firm, with large establishment, finely situated and doing capacity business, desires shop equipment for repair shop and garage, including machine tools and supplies.

4926—Kansas House, which has purchased new business, seeks information relative to machine tools and equipment for garage and repair shop.

9101—Iowa Company, doing business on large scale, is interested in all kinds of equipment for garage and repair shop. Machine tools are also sought.

9613—Colorado Concern, occupying new quarters, wants machine tools and garage equipment.

3404—Ohio Firm, completing fine two-story automobile building, is in the market for garage equipment and supplies; also repair shop equipment of all kinds.

7840—New York House, which has leased new building, desires information of garage equipment, machine tools and repair shop supplies and equipment.

7629—Kansas Concern, doing good business, is interested in garage equipment and supplies and repair shop supplies.

3943—Canadian Firm, engaged in the manufacturing business, is in the market for machine tools of first class make and durability.

7467—California Company, having modern plant and good business, seeks information relative to machine tools and garage and repair shop supplies.

5826—Iowa Firm, recently established in business, is in the market for all kinds of machine tools, and equipment and supplies for garage and repair shop.

7352—Illinois Concern, doing business in all branches of the automobile industry, wants information concerning equipment of every description for garage and repair shop and supplies for same.

5914—Pennsylvania Company is interested in garage equipment and supplies of various kinds.

7193—New Jersey House, enjoying increased business, is in the market for welding apparatus for repair shop and for garage supplies and equipment of every description.

CAR AGENCIES DESIRED.

7091—New York State Garage, recently opened with first class repair shop, in good location on main thoroughfare, would like agency for pleasure cars selling at $500 to $1000.

5293—New York City Concern, extending its business outside of the city, has an option on a desirable garage and is seeking the exclusive rights in Westchester county and adjacent territory that may be open, for two cars, one to sell for about $500 and one from $1200 to $1500.

4003—California Firm, which has opened a new automobile supply house, is also interested in the agencies for pleasure and commercial cars.

6496—Pennsylvania House, recently established with a good line of cars, is desirous of adding a good pleasure vehicle selling between $1425 and $1850.

9371—New Jersey Company, in thriving condition and making additions to its plant, is seeking a line of commercial motor vehicles selling from $800 to $3000; also will take agency for motor fire fighting apparatus selling up to $10,000.

1459—Pennsylvania State Concern, recently changed hands, will take agency for pleasure cars listing from $800 to $1700.

3011—Illinois Firm, formed to conduct automobile agency, supply business and garage, is interested in the agencies for pleasure cars listing from the lowest figure to $3500, and motor trucks listing from a low figure to $2000.

9693—Iowa Electric Concern, formed to handle a standard vehicle, will take agency for electric pleasure cars listing from $1500 to $3500 and electric motor trucks from $1000 to $5000.

7754—Massachusetts Firm desires either a Boston or New England agency for a gasoline pleasure car selling from $500 to $3000; also gasoline motor trucks listing as high as $3500.

ACCESSORY AGENCIES.

6477—Connecticut Concern, which is erecting a new service station, is interested in a complete line of accessories and supplies for pleasure and commercial vehicles.

5087—Pennsylvania Firm, recently changed hands, would take the agencies for good line of automobile accessories and supplies. Also is interested in garage supplies.

5218—Michigan Company, handling service business for five manufacturing concerns making various models of cars, for which it has secured exclusive rights, is interested in the agencies for first class line of garage and automobile supplies and accessories.

4619—Minnesota House, occupying a new garage, is interested in all kinds of garage and repair shop supplies.

1465—Texas Automobile Company, erecting new quarters, in which will be maintained an exclusive accessories department, would take agency for all kinds of accessories and supplies.

3554—California Firm, which has opened a supply house for the trade, is in the market for agencies for first class supplies and accessories, also garage and repair shop supplies.

9103—New York Concern, recently incorporated, is desirous of taking agency for accessories and supplies for steam power wagons.

4966—Pennsylvania Company, recently formed to handle standard make of car, is interested in all kinds of automobile accessories and supplies.

3719—New Jersey Firm, expanding its business, is desirous of securing garage and repair shop supplies, also supplies and accessories of every description for pleasure and commercial vehicles.

4340—Ohio Garage Company desires agency for automobile supplies and accessories and garage supplies.

SPECIAL OPPORTUNITIES.

3261—Long Island Garage Concern, forced to give up business because of a disastrous fire, has large quantity of all kinds of equipment for sale. Plant thoroughly equipped throughout with most modern machinery for all descriptions of repairing and rebuilding. Included in the list of articles to be disposed of is large line of supplies.

3972—Pennsylvania Concern, dealing exclusively in second hand machines, which are rebuilt for the market, announces its readiness to purchase second-hand cars of all makes from dealers anywhere for cash. The concern is building a large addition to its plant.

7827—Holland Company, which handles automobiles and automobile accessories and materials in the Netherlands, is desirous of hearing from American manufacturers of electric pleasure cars, with a view of taking the agency of their cars in Holland. This firm will bear investigation and has American references always at disposal.

2883—Massachusetts Man, who wishes to purchase a vehicle suitable for use in the automobile livery business and also for passenger use, would like to hear from the manufacturers of such vehicles.

12,000

Guaranteed Trade Circulation

ALL TRADE **NO OWNERS**

The Accessory and Garage Journal is the only strictly trade paper published in America that is devoted to the automobile and allied industries.

100 Per Cent. Trade Distribution 100 Per Cent.

Advertisers can use straight trade talk copy in every issue of the Accessory and Garage Journal—can make their trade proposition—can give their trade discounts—can get down to brass tacks in their advertising.

Advertisers cannot do this in any other medium—cannot use straight trade talk in an owner's magazine—cannot secure effective trade results from prints with part owner and part trade distribution.

The Accessory and Garage Journal reaches 12,000 trade interests each month.

A FEW COST FIGURES

THE ACCESSORY and GARAGE JOURNAL

1 Page, One Time, $60 1 Page, 12 Times, $50 Per Page--$600

12,000 Guaranteed Trade Distribution

MAGAZINES WITH PART TRADE AND PART OWNER DISTRIBUTION MUST ALL BE USED TO REACH THE WHOLE TRADE

One Page, 12 Magazines, average $80 per page, $960, against $60 in The Accessory and Garage Journal, the same service.

One Page, 12 Magazines, average $65, 12 times at $65 per page, $780, against $50 in the Accessory and Garage Journal, the same service.

Saving one month, $900, at one time rate.

Saving 12 months, on basis of one year, at 12 time rate, $8,760

Service is necessary and what must be paid for. The Accessory and Garage Journal gives this service, and it is the one medium to use to reach the trade.

Moderate rates permit all interests to be represented and this magazine is as valuable to the small producer as the largest manufacturer in the industry.

The mailing list of the Accessory and Garage Journal is the most authentic compilation of trade names in existence. Use this list and save fully 90 per cent. of all mailing list costs.

Detailed information at request. Next issue mailed April 15th.

To Truck Salesmen!

MOTOR TRUCK'S Editor Says:

"Business Men Want Facts"

Is His Suggestion An Idea For You?

MOTOR TRUCK

Is the Recognized National Authority on Highway Transportation and Haulage Economy.

Devoted to Specialized Information for the Business Man and Reflecting the Experiences of Business Men, Its Contents Are Equally Valuable to the Industry, the Distributor and the Selling Agent.

Those Who Sell Power Vehicles Must Meet and Understand the Problems of Business Men. They Must Know Not Only the Qualities of the Machines They Sell, but the Methods by Which They May Be Used to Yield the Fullest Measure of Economy.

The Quality of Distribution of the MOTOR TRUCK Is at Parity with the Character of Its Contents. It Is the Certain and Dependable Source of the Best Information That Experts Can Compile. Its Entire Value Is the Accuracy of the Facts Reflected in Its Articles.

Its Quality Is Based Entirely on the Dependence Placed in It by Its Readers. Its Quality Is the Influence It Has with Its Readers. Specialization Necessarily Limits Distribution, but It Absolutely Establishes Its Quality.

The Business Men of Today Are Investigating and Studying Haulage Economy. Those Who Sell Power Vehicles, Equipment, Supplies and Service Must Meet Their Demands. They Can Await Experience, or They Can Inform Themselves.

The MOTOR TRUCK Is Devoted to Your Business, Just in the Same Measure That It Specializes the Information That Is Needed by the Progressive Man of Affairs. Its Value to You Is Not in the Number of Persons It Reaches, but in the Number Who Read It Who Own or Are Contemplating Owning Power Wagons.

To Deal With Business Men You Must Understand Their Needs. Theory Is No Argument Against Experience When the Other Fellow Must Pay the Bills. If You Cannot Match Your Knowledge Against His You Cannot Convince Him.

There Are Many Imitators, but Few Originators. There Are Thousands Content to Follow Who Will Not Lead. The Men You Can Reach Can Influence Others by Their Example. There Is Power in Knowledge. You Can Find It in the Experiences Demonstrated in the Articles in the MOTOR TRUCK.

$1.00 THE YEAR SINGLE COPIES, 15c.

For the Public and Private Garage
UP-TO-DATE

The most important question is that of handling your cars in the shortest time at least expense possible and with all chance of accidents done away with.

With the "UNIVERSAL" Automobile Turntable in your garage, you can drive both in and out "front end first"—no more backing out. Just run in on the Table, one little push making a half revolution, and your car is ready to start out.

These Tables are made in four sizes—one for every use—with capacity for supporting from the lightest runabout to the heaviest truck.

Better write today for full particulars, getting our Catalog "C-8."

The Indispensable "Handiest Tool in the Shop"

Does your lifting and tugging at one-fifth the expense you are now paying for this. No matter if you do have stationary chain hoists, you will find this "Handiest Tool" indispensable in your garage.

Write for our catalog "EE-7," and full information how to lessen cost.

The Canton Foundry & Machine Co.
CANTON, OHIO

Let's Get Together

YOU Are looking for good goods which are easy to sell and which stay sold.

WE Manufacture high class, honeycomb, seven-cell RADIATORS—for replacement on FORD, Buick, Chalmers, Hupmobile and other cars—our guarantees are liberal and prices right—We also do repair work.

AIR COSTS LESS THAN RUBBER

The Dewey Power Tire Pump

Makes it easy to keep your tires at economical pressure with pure, untainted air.

Our Price—$10—Is For a Complete Pump Which Has Special Advantages That Will Interest You.

The cost of a pump is literally nothing as compared with the hundreds of dollars it can save you. The Dewey, in addition to advantages not found in other pumps, is the only one that requires no oil. **It can't spray grease into your tires to rot them. It pumps pure air only.** The Dewey isn't simply a lazy man's makeshift. To the saving it makes in your tire bill, you must add the saving to the car itself by the use of tires that are properly inflated at all times.

The Dewey, with high grade Dial and all connections, including 12 feet of Special Hose, tested to 1000 lbs., sold everywhere under a year's rigid guaranty for **$10**

Write us if your dealer cannot promptly supply you with the Dewey.

You ought to share in the profits of TIRE REPAIRING

Forty Million Dollars will be spent during 1913 for tire repairs. Every hundred cars will produce at least $3500.00 worth of this profitable business. Every motorist must have tires repaired. Every motorist in your vicinity is a possible customer.

There are large profits in tire repairing. Requires little capital to equip a shop with the best repairing outfit made. The equipment can be paid for and a good profit earned in a short time.

Get the right kind of equipment—one that produces work you can guarantee—

The Akron-Williams Equipment,

the kind used by nine out of ten such manufacturers as Firestone, Goodyear, Diamond, Republic, Shawmut, Walpole, Federal, Pennsylvania, Kelly-Springfield, Empire, Ajax-Grieb, Swinehart, etc. Ask your tire maker about us.

These people know what is practical. We can equip a repair plant of any desired capacity. Don't delay getting into this profitable business. Write today for catalogue No. 12.

Do You Want To Know More About Pleasure Cars and Trucks?

The most instructive and valuable series of automobile mechanical books ever published are named below. These works have within the past year been rewritten and revised and today form the most complete library of automobile mechanical information that can be found. The expositions are as valuable to the engineer as the layman. The series form an encyclopedia of subjects of interest to the student, mechanic, repairer, builder, owner and driver. **One thousand pages of text, more than 1500 specially prepared photographs, drawings, diagrams, charts and designs.**

All discussions are distinct and are given over wholly to the subjects which their titles imply.

Motor Car Operation	**50c**	**The Motor Car Chassis, Maintenance and Repair**	**25c**
Overhauling, Rebuilding and Repairing the Motor Car	**50c**	**Lighting the Motor Car by Electricity**	**50c**
Internal Combustion Engine, Maintenance and Repair	**35c**	**Maintenance and Repair of Motor Car Tires**	**25c**
Carburetor Construction, Maintenance and Repair	**35c**	**The Motorcycle, Construction, Operation, Care and Repair**	**35c**
Magneto Systems	**35c**	**Battery Ignition Systems**	**35c**

Price for the full set of 10 books..........$3.75

Aerial Navigation, 160 pages, deals with this subject exhaustively, containing full page working diagrams and plans of all successful flying machines, $1.00.

WHEN THE FULL SET OF 10 MECHANICAL HANDBOOKS IS PURCHASED, ONE YEAR'S SUBSCRIPTION TO EITHER THE AUTOMOBILE JOURNAL, THE MOTOR TRUCK OR THE ACCESSORY AND GARAGE JOURNAL, IS GIVEN FREE OF CHARGE.

BLUE RIBBON EVENT

BLUE RIBBON
CREAM
METAL POLISH
FOR
SPEED
DURABILITY
BRILLIANCY

Thousands of Car Owners all over the world are using

BLUE RIBBON POLISHES

for the "SPRING clean-up"—because they have the quality.

BLUE RIBBON
METAL POLISH

BLUE RIBBON METAL POLISH

is the original "CREAM" Metal Polish and it still leads the procession.

BLUE RIBBON
CREAM
NICKEL POLISH

BLUE RIBBON NICKEL POLISH

is the result of 20 years actual experience in manufacturing the finest gold and silver polishes. It is dangerous to use an experiment polish on fine nickel trimmings.

BLUE RIBBON
GREASELESS CREAM
AUTOMOBILE
BODY GLOSS
AND
FURNITURE POLISH

BLUE RIBBON AUTO BODY GLOSS

revives and keeps the original factory finish and gloss on the body of the car—Shines like a mirror—No grease to catch dust—Leaves no coating.

BLUE RIBBON
RADIATOR
LEAK PROOF
CEMENT
MANUFACTURED BY
INTERNATIONAL METAL POLISH
INDIANAPOLIS IND.

BLUE RIBBON RADIATOR LEAK-PROOF CEMENT is a quick and permanent remedy for leaks. Does not clog the circulating system; prevents scale and rust; preserves the metal and increases the cooling capacity.

All BLUE RIBBON products strictly high class and fully guaranteed.
BLUE RIBBON moves quick for the dealer—works fast for the consumer.
Ask for sample, giving us name of Dealer or Jobber.

NO SERIOUS DAMAGE BY FLOODS.

Automobile Industry Escapes Severe Losses and Concerns Affected Recover Rapidly---Dealers Worst Sufferers---Latest News from Ohio and Indiana.

FORTUNATELY, beyond a temporary delay, due more largely to the inability of railroads to offer shipping facilities than to conditions in the factories themselves, the automobile industry has experienced no serious damage as a result of the recent floods in Ohio and Indiana. Dealers lost more heavily than manufacturers, many of them being located in the down-town business districts of the cities and towns reached by the water, and of course, many owners were affected, since thousands of people had all their personal effects destroyed. This latter condition applies as well as a result of the tornado which visited Omaha, Neb., a few days previous to the floods in other sections.

In both emergencies, pleasure and commercial automobiles were impressed into service to aid in the work of rescue and rehabilitation. In many instances these were able to demonstrate their practicability in a thoroughly effective manner, long after other means of transportation were entirely cut off.

While it is impossible to estimate the amount of damage to dealers, the latest reports from the stricken districts are most optimistic for the future. The effect upon the manufacturers is set forth briefly below, it being taken for granted that those not mentioned escaped all loss. So far as the dealers are concerned the situation in Dayton, O., in which these men suffered most largely, is best set forth by the following announcement in one of the salesroom windows: "Hurrah for Greater Dayton. Orders filled promptly here."

The Esterline Plant at Lafayette, Ind., as It Appeared When Under 18 Feet of Water.

Dayton, O.—Dayton Motor Car Company, subsidiary of Maxwell Motor Company; lower floors of three buildings flooded; reports $50,000 damage; delayed about two weeks. Speedwell Motor Car Company, Speedwell cars and trucks, undamaged; delayed through rescue work. Dayton Engineering Laboratories Company, Delco systems; 40 employees caught in flooded building; 12 feet of water in the basement; damage largely to building; not seriously delayed. Apple Electric Company, Aplco systems; machine shop and battery department flooded but no serious damage. American Tank & Pump Company, storage systems; factory badly flooded, but damage is considered comparatively slight.

Indianapolis, Ind.—Marion Motor Car Company, Marion cars; first floor submerged and second utilized as shelter for refugees; resumed in 10 days. Nordyke & Marmon Company, Marmon cars; plant partially submerged; finished stock, etc., out of harm's way; not seriously delayed. Motor Car Manufacturing Company, Pathfinder cars; first floor partially submerged; finished stock and materials moved to second floor before flood reached the building. R. J. Irvin & Co., bodies; slight damage.

Troy, O.—Troy Wagon Works Company, trailers for motor truck installations; considerable damage to factory proper, office badly flooded, records damaged; soon running normally. Troy Carriage Sun Shade Company, windshields; six feet of water; resumed work April 7.

Muncie, Ind.—Inter-State Automobile Company, Inter-State cars; delayed through lack of power. Muncie Gear Works, Muncie Auto Parts Company and Muncie Wheel Works, not seriously affected.

Peru, Ind.—Great Western Automobile Company,

Henderson Car on Its Way to Relieve Householders Just Before Breaking of Levee in West Indianapolis.

Great Western cars; five inches of water in factory; nominal loss. Peru Auto Parts Manufacturing Company; from one to two feet of water; slight damage. Brown Commercial Car Company, Brown trucks; plant under two feet of water; damage to stock very slight.

Anderson, Ind.—Remy Electric Company, Remy ignition; Buckeye Manufacturing Company, Lambert cars, trucks and farm tractors, and Nyberg Automobile Works, Nyberg cars and trucks; delayed through loss of power. No damage.

Akron, O.—Only concern to suffer was Goodyear Tire & Rubber Company; water entered basement of one building and put out fires; nominal loss.

Youngstown, O.—Republic Rubber Company, donated use of private water supply when city supply was shut off. No damage and no other delay.

Connersville, Ind.—Empire Automobile Company, branch of Indianapolis concern, Empire cars; delayed through shortage in coal supply. McFarlan Motor Car Company, McFarlan cars; no loss and only slight delay.

Middletown, O.—Miami Cycle & Manufacturing Company, Merkel motorcycles; factory undamaged; great loss of personal effects among workmen. Crescent Motor Truck Company, Crescent trucks; no damage; delayed but little.

Logansport, Ind.—Rutenber Motor Company, branch of plant in Marion, Ind., Rutenber motors; foundry flooded to average depth of three feet; deliveries made from Marion plant without delay.

Kokomo, Ind.—Apperson Bros. Automobile Company, Apperson cars; badly flooded.

Fort Wayne, Ind.—Ideal Auto Company, Ideal trucks; factory under four feet of water for 10 days; direct loss of materials not as great as at first anticipated. Wayne Oil Tank & Pump Company, storage systems; first floor flooded; several thousand dollars damage to machines, furniture and buildings. S. F. Bowser & Co., storage systems; only slight damage, factory shut down but four hours.

Lafayette, Ind.—Esterline Company, electric lighting and starting systems; factory badly flooded, but practically all material and much of the machinery was removed before the flood arrived; loss will not exceed $10,000. Ross Gear & Tool Company, steering gears; factory shut down for one week.

Hamilton, O.—Republic Motor Car Company, Republic cars; factory undamaged, although at first reported to have suffered serious loss.

Chillicothe, O.—Arbenz Car Company, Arbenz cars; factory partially flooded; deliveries will not be affected seriously.

Columbus, O.—Columbus Buggy Company; Firestone-Columbus and Columbus electric cars; plant flooded to depth of 10 inches, but did not reach electric car department or battery room.

THE NEW TARIFF BILL.

Rates on Automobiles Unchanged but Parts and Tires Are Considerably Reduced.

Coincident with the opening of the extraordinary session of Congress, April 7, the new Underwood tariff measure was introduced and its provisions made public. The automobile industry is very much interested in the effect this would have if the bill were to be enacted into law as presented. It is expected, of course, that numerous amendments will be made before the measure reaches President Wilson for his signature.

The new tariff bill is a voluminous document, and doubtless there are many articles utilized in the production of motor cars and their accessories which do not appear in the summary which has been prepared for more ready reference by those who may be interested. This summary shows that the rate on automobiles, as such, is unchanged, being the same as under the so-called Payne bill, 45 per cent. Automobile parts, excepting tires, however, are listed at 20 per cent. and chassis without bodies are placed at 30, instead of 45. Motorcycles also receive a cut of 5 per cent., the Underwood rate being 40 instead of 45. Aeroplanes are reduced from 45 per cent. to 25.

Schedule N provides for duties on manufactured articles from india rubber, gutta percha, etc., and shows a reduction on this item from 35 per cent. to 10. The item covering rivets, studs, steel points, brightened, and same for automobiles, in schedule C, bears a reduction from 45 per cent. to 20. Tungsten bearing ores are to be admitted free.

Among the articles entering into the manufacture of automobiles or fittings to be affected are: Mica and manufactures of, 10 cents a pound and

Cole Machine Engaged in Rescue Work in West Indianapolis, Indicating the Extent of the Flooded District.

20 per cent., to 30 per cent.; carbon electrodes, brushes and plates, 30 per cent. to 25; lava burner tips, 10 cents a gross and 15 per cent., to 15 per cent.; oils and greases not otherwise provided for, 25 per cent. to 15; aluminum scrap and alloys, seven cents a pound to 25 per cent.; aluminum plates, sheets, bars and rods, 11 cents a pound to 25 per cent.; calcium carbide, 25 per cent to 10.

EXPERIMENTS WITH KEROSENE.

Chief Engineer of National Line Has Been Making Exhaustive Fuel Tests.

Among the many motor car manufacturers making experiments with kerosene as fuel is the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars. Chief Engineer William G. Wall has been supervising exhaustive tests for a number of months, and is quoted as saying that in his opinion it will be only a short time before a majority of automobiles will use kerosene instead of gasoline.

Although Mr. Wall holds that there is some question as to the feasibility of starting on kerosene direct and suggests that it may be necessary to use a little gasoline for this purpose, he believes that the electric motor starter will aid greatly in solving the problem. He adds that the disadvantages of the heavier fuel in winter are not too serious to be overcome easily; in fact, he claims to have accomplished this result in his winter experimenting at the National factory.

MOTORISTS WIN VICTORY.

Troublesome Clause in Michigan Statute Declared Unconstitutional by Supreme Court.

Motorists in Michigan have won a signal victory in the recent decision of the supreme court in the case of Nina L. Dougherty vs. William S. Thomas, in which a clause of the automobile law of 1909 is found to be unconstitutional. Under this act the owner, not the driver, could be held responsible, and the suit in question was brought as the result of an accident which occurred when a garage employee was delivering a machine to its owner. The clause which has been declared unconstitutional, reads as follows:

> The owner of a motor vehicle shall be liable for any injury occasioned by the negligent operation by any person of such motor vehicle, whether such negligence consists in violations of the provisions of the statute of this state or in the failure to observe such ordinary care in such operation as the rules of the common law require, but such owner shall not be liable in case such motor vehicle has been stolen.

Justice Stone in commenting upon this section of the law said:

> To hold sub-division 3 of section 10 constitutional is to hold a party absolutely liable for the negligent conduct of another, a mere stranger or a willful trespasser, no matter how careful or how free from negligence he himself has been. We think that the result of such a holding would be to take the property of defendant, Thomas, to pay for the wrongful and negligent act of another person, not sustaining to him the relation of servant, agent or employee.
>
> Such a doctrine seems unnatural and repugnant to the provisions of the constitution here invoked. We are forced to the conclusion that the provisions of this sub-division are not a necessary regulation in the exercise of the police power; that in and by its terms the plain provisions of the constitution are violated and the sub-division must be held unconstitutional, and the statutory liability therein asserted done away with.

CATARACT TIRE POLICY.

Careful Study of Production Problem Results in Improved Manufacturing Methods.

In view of the rapid development of the automobile industry, it is not surprising that it has taken much time and experimentation to produce equipment that may be regarded as perfected in every respect. This applies particularly to the matter of tires, which have been considered by many motorists as presenting the chief source of expense in the operation of a car. Tire manufacturers have realized this and have devoted a large amount of effort in solving some of the peculiar problems arising in this field. William J. B. Hackett, sales manager of the Cataract Rubber Company, with main office at Boston, factory at Wooster, O., and branches in a number of the larger cities, calls attention to some of the improvements in manufacture adopted by his concern, which should prove of decided interest to the owner. Mr. Hackett calls special attention to the composition of the product as well as the methods used in curing, etc. He writes as follows:

William J. B. Hackett, Sales Manager, Cataract Rubber Company.

> The Cataract Rubber Company is using the highest grade of longest staple Sea Island cotton fabric produced in this country, and under several tests on a fabric testing machine it shows a minimum breaking strength of 430 pounds. Coupled with this fact, the weave is such that the rubber friction adheres to the minute perforations with a grip obtainable in no other way. We use more rubber between our fabric, resulting in more resiliency and prolonging the life of the tire where the strain is the greatest.
>
> The system of mold equipment used by our concern produces a real live steam cured tire, as the mold ring extends about one-third of the way above the bead, exposing the entire tread surface to the steam. This also eliminates all possibility of fabric troubles, such as mold pinching, separation of the plies and buckling of fabrics.
>
> In building up the tire it is carefully calipered at each stage of the construction. Therefore, when our final wrapping of the tread is completed we have a casing ready for insertion in the vulcanizer that is symmetrically perfect. As the mold rings in this system weigh about 40 pounds complete, all possibility of injury from weight during the curing process is avoided.
>
> The Cataract Rubber Company guarantees its casings for 4000 miles and issues a signed certificate with each. We are pleased to state, however, that we have hundreds of users averaging better than 5000 miles on such cars as the Pierce-Arrow, Lozier, Simplex and Alco.
>
> Our company is producing two types of inner tubes.

One is a heavy, substantial red tube with a larger percentage of pure gum than usual. This is what we call the "come back." That is, it assumes its natural size after it has been inflated a month or two. We recommend this tube for high powered cars doing severe duty. The Cataract gray tube comprises what is known as a floating stock gum tube, having 90 per cent. of pure gum and making for resiliency and long life. It is our experience that this type outwears three casings.

Beginning with 50 tires a day the company will reach an output of 100 shortly, and it will not surprise the writer to see this increased to 500 a day within a year. In connection with our pneumatic production, we have, in the Cataract diagonal block truck tire, the solution most needed from the standpoint of economy and service in commercial vehicles. These are guaranteed for 10,000 miles and have shown over 12,000 miles on a three-ton Packard rear wheel. The truck is owned by the Adams Express Company and operated in New York City.

GOODYEAR GETS CONCESSION.

Ohio Tire Concern to Erect Large Factory at Rio de Janeiro, Brazil.

According to a recent announcement made in New York City, the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has entered into an agreement with the government of Brazil for the erection of a factory for the production of rubber articles in that country. The move is understood to be in accordance with an act passed by the Brazilian congress some time ago, under which the President was authorized to grant exceptional favors to the first concern to locate a plant of this character in Rio de Janeiro. These included a cash award of about $167,000, the right to expropriate land upon which to erect the factory, and exemption of all customs duties on chemicals and products used as compounding ingredients and fabrics of all sorts, as well as municipal, state and federal taxes.

Proposals were received after specific regulations defining the real intention and purpose of every clause bearing on these concessions were prepared by the minister of agriculture and commerce, and a committee was appointed to pass upon them. It appears from the report that the proposition presented by the Goodyear company was most acceptable.

TESTING MIXED FUELS.

Several Interesting Experiments Have Been Made by Concerns in England.

At least two of the omnibus companies in London are operating cars with mixed fuel. The British Motor Cab Company is using a mixture of 40 per cent. kerosene and 60 per cent. gasoline, while the London General Omnibus Company utilizes a mixture of benzol and kerosene. The former concern says that the only alterations to the carburetor found to be necessary are a slight increase in the size of the jet and an enlargement of the air inlet somewhat. An auxiliary attachment on the dash permits of using gasoline for starting.

Southern Automobiles, Ltd., Blackheath, London, has been testing a mixture of one-third benzol and two-thirds kerosene with very satisfactory results, as indicated by the following report:

> The car on which we conducted this experiment is a 14 horsepower Germain, now seven years old. The engine, although it is in fairly good condition, ought to have new pistons fitted. We have been using the mixture in an ordinary S. U. carburetor without any special vaporizer. We have, however, taken precautions to see that the whole of the jacketing on the carburetor is kept extremely warm, and the long induction pipe which is fitted to this type of car is so arranged as to be well and efficiently warmed.
>
> The only difficulty we have experienced is in starting, and we have found that when the car has been left standing overnight the benzol appeared to separate somewhat from the kerosene. We found we could get over the difficulty by fitting a tap so arranged as to draw a small quantity of benzol from the top of the tank for starting purposes, and after the car has been running, to change the supply over to draw from the lower portion of the tank, as the vibration of running is sufficient to keep the fuel mixed.
>
> With regard to carbon deposit we have never experienced any difficulty in this direction, either with benzol only or the mixture of benzol and kerosene, except in cases where the carburetor was obviously at fault. The normal amount of deposit has proved to be not more than when gasoline has been used.
>
> We have during the last few days been experimenting with a still cruder fuel in the shape of a by-product obtained in the production of naphthaline; this we find mixes with benzol in equal proportions and works quite satisfactorily.

In this connection it is interesting to note that a company has been formed in Brussels for the production and introduction of a new motor fuel, known as La Perosine. This is described as consisting of "petroleum free from excess of carbon and constituents detrimental to its combustion." It is held to give off no smoke or deposit, and to require no modification of the carburetor.

SOUTHERN TIRE PLANT.

Seminole Rubber Company Selects Jacksonville, Fla., Because of Shipping Facilities.

According to plans which the incorporators state are practically completed, Jacksonville, Fla., will have a big industrial plant, employing 500 persons and producing 300 automobile tires a day, together with other automobile accessories in which rubber is used, to be known as the Seminole Rubber Company, a concern with $1,000,000 capital. The company is the first rubber manufacturing firm to be located in the South and the plans provide for the construction of a large building and the actual operation of the plant within 90 days.

George F. Hardy, George H. Lutz and J. J. Weyer are named in the application for charter as the incorporators. The principal inducements that attracted the new concern to Jacksonville are stated to be the immense field in the South for its product, the city's unequalled advantage as a port of entry for the crude rubber from South America and the shipping of the manufactured product by water, and proximity to the raw material from the cotton fields, especially the Sea Island product, which is used extensively in the manufacture of automobile tires.

Since the announcement that the Speedwell Motor Car Company, Dayton, O., would give an option of its new rotary valve or a poppet valve motor in its 1913 Speedwell cars, orders have been received which necessitate the operation of the factory with day and night shifts.

NEWS NOTES OF THE INDUSTRY

RECENT INCORPORATIONS.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

Westcott Motors Company, Boston; $3000; Orris W. Nelson, Harvey L. Kemp, George H. Learned.

Consumers Auto League, Boston; $50,000; Guy A. Ham, Harry H. Ham, Ralph H. Willard.

Puncture Cure Company, Chicago; $1000; to make and deal in automobiles, tires and supplies; Abraham Frank, William Church, Charles C. Johnson.

Rochester Automobile Exchange, Rochester, N. Y.; $500; Bertram Wilson, W. Hayes Mitchell, Owen D. DeWitt.

Petersen Motor Car & Garage Company, Chicago; $5000; Monroe T. Petersen, Nels H. Linquist, William D. Petzel.

Whitehouse-Le Compte Manufacturing Company, Newark, N. J.; $200,000; to deal in hardware, automobiles. etc.; H. G. Whitehouse, E. A. Whitehouse, F. W. Ehrlich.

Knox-Wyland Motor Car Company, Pittsburg, Penn.; $2000; O. E. Knox, W. J. Wyland, W. A. McCoy.

The Automobile Owners' & Drivers' Protective Association, Minneapolis, Minn.; $50,000; W. H. Seitzler, Richard Footman, E. G. C. Montgomery.

New York Simplex Auto School Company, South Orange, N. J.; $25,000; correspondence school, T. Preston Ward, Harry L. Smith, Richard W. Hollaman.

Montauk Motor Company of Brooklyn, Brooklyn, N. Y.; $10,000; Louis F. Ohse, James K. B. Webber, Morton Foster.

Park Garage of Victoria, Victoria, Tex.; $10,000; John Frazer, J. T. Linebaugh, W. H. Crain.

Macon Auto Company, Macon, Ga.; $6000; C. F. Calhoun, J. P. Stubbs, W. E. Henry.

Griffith Auto Company, Savannah. Ga.; $10,000; C. M. Griffith, J. H. Brown.

Cumberland Motor Company, Pineville, Ky.; $50,000; N. J. Weller, A. W. Bryant, M. J. Moss, John A. Pitman.

Entz Automobile & Battery Company, $10.000; T. B. Entz, Alice von S. Entz, Kenneth S. Walker.

Hirsch Motor Car Company, Chattanooga, Tenn.; $5000; M. Hirsch, H. Hirsch, J. S. Hirsch, J. L. Levine.

Loeb Automobile Company, Memphis, Tenn.; $5000; Henry Loeb, E. F. Goldsmith, Charles W. Hirsch.

Blomberg Automobile Company, Memphis, Tenn.; $5000; Robert York, P. A. Gates, L. H. Wise.

Galveston Motor Car Company, Galveston, Tex.; $3000; R. Carter, Mrs. Lora Carter, G. G. Lescher.

Hunter Motor Company, Roanoke, Va.; $15,000; Joseph L. Hunter, T. D. Hunter, W. E. Hunter.

Robinson-Lewis Company, Jersey City, N. J.; $25,000; general automobile business, G. H. E. Robinson, R. V. O. Lewis, J. C. Delatush.

Gibson Motor Car Company, Pittsburg, Penn.; $3,000,000; C. E. Gibson, J. H. Mahoney, E. D. Johnson.

Automobile Leather Manufacturing Company, Newark, N. J.; $150,000; W. A. Smith, F. I. Ennis, T. G. Woodruff.

Auto Combination Manufacturing Company, Chicago; $50,000; to manufacture automobile supplies and equipment; H. M. Snow, G. W. Nevlue, W. J. Liddy.

Whitestone Garage, Inc., Whitestone, N. Y.; $5000; to make and sell machinery for generation of steam, electricity, etc.; John A. O'Fee, Herbert A. Trotman, Mary A. O'Fee.

Dayton Automobile Repairing Company, Inc., New York City; $5000; Charles E. Holste, Victor Drummond, Valentine E. Mott.

Kirkham Aeroplane & Motor Company, Inc., Savona, N. Y.; $100,000; Charles B. Kirkham, Stanley I. Vaughn, Edwin H. Skinner.

F. & P. Auto Transportation Company, Inc., Brooklyn, N. Y.; $70,000; William O. Goddard, Frank K. Fairchild, George A. Logan.

Divine Tire Company, Inc., Utica, N. Y.; $225,000; automobile tires; Charles W. Wicks, A. James Eckert, Bradford H. Divine.

Texas Motor Car & Truck Company, Austin, Tex.; $10,000; John C. Fink, A. A. Ritcheson, W. H. Folts.

Summit Auto Company, Akron, O.; $10,000; to deal in pleasure cars and trucks; E. J. Eblen, J. M. Lauder, F. L. Matz, Rachel Lauder, Almira Eblen.

Page-Lester Company, Springfield, Ill.; $2500; automobile accessories; Harry L. Page, M. F. Frisch, Anna Hess.

Desert Motor Truck Company, Salt Lake City, Utah; $50,000; Ira Cole, Domine Burns, J. E. Fleige.

Lawrenceville Auto Company, Lawrenceville, Ill.; $16,000; Fred B. Childress, Allen C. Stoltz, Nellie S. Childress.

Mitchell & Smith, Boston; $10,000; automobile supplies; F. Robins Mitchell, William E. Smith, Albert E. Smith.

Brady Murray Motors Corporation, New York City; $55,000; motors, trucks, cars and automobiles; Arthur T. Murray, Samuel L. Marcus, Charles Wein.

Commer Truck Company of America, New York City; $3,000,000; J. F. Curtin, H. O. Coughlan, J. M. Satterfield.

The Bedford Motor Bus Company, Bedford, Ind.; $10,000; M. Wallner, A. E. Smith, C. K. Brock.

Krit Motor Car Company of Michigan, Indianapolis, Ind.; $500,000; capital in Indiana, $5000; to sell and deal in automobiles; C. S. Briggs, W. S. Piggins, B. C. Laughlin.

Severin Tire & Supply Company, Oklahoma City, Okla.; $10,000; A. L. Severin, L. H. Severin, J. H. Eagan.

United Rubber Tire Company, Chicago; $1000; F. M. Hutchinson, W. W. Cole, Jr., A. W. Smith.

Central Motor Car Company, Altoona, Penn.; $10,000; C. C. Baker, Albert C. Akers, G. M. Smith.

W. M. Caldwell Company, Waltham, Mass.; $5000; to sell and repair automobiles; William M. Caldwell, F. Jordan, T. F. Carey.

Akron Tire & Rubber Company of Boston, Boston; $15,000; Abraham Palder, Max Laserson, C. Braunstein.

Central Motor Supply Company, Inc., Rochester, N. Y.; $30,000; electrical and mechanical devices; B. B. Barager, R. F. Close, W. Wood, C. W. Galliger.

Lindsay Auto Parts Company, Indianapolis, Ind.; $250,000; to take over manufacturing business of Thomas J. Lindsay and handle patents he holds; Mahlon E. Bash, Matt W. Lowder, Joseph T. Head.

Motor Truck Manufacturing Corporation, Mt. Vernon, N. Y.; $150,000; H. Hilchenbach, L. Bertsch, A. J. Albert.

Henry Tobin Company, Inc., New York City; $50,000; automobiles; Henry Tobin, Richard F. Tobin, Joseph B. McDonough.

Androscoggin Motor Company, Boston, and Lewiston, Me.; $10,000; George A. Pulsifer, William G. Renwick, Gilbert Hodges, Jr.

Cleveland Motor Trucking Company, Cleveland, O.; $10,000; Henry Eckhoff, C. B. Goetzfeld, G. A. Cochran, R. W. Blake, J. Charles Ross.

John Berry Automobile Company, St. Louis, Mo.; $20,000; to make, rebuild and repair automobiles; John Berry, Louis J. Koenigstein, Albert Bommer.

Peerless Radiator & Auto Lamp Works, Inc., Brooklyn, N. Y.; $5000; Max Stadlen, Louis Schapiro, Bernard Wolfensohn.

Cleveland Speed Indicator Company, Cleveland, O.; $10,000; to make and deal in speed indicators of all kinds; Arthur Friedman, Leo Friedman, O. Friedman, Marshall R. Stewart.

Sedgwick Manufacturing Company, Richmond, Ind.; $10,000; to manufacture automobile jacks; J. R. Sedgwick. James M. Judson.

Blue Ribbon Garage, Richmond, Va.; $10,000; B. M. Jones, B. H. Grundy, C. B. Grundy.

T. M. S. Manufacturing Company, Indianapolis, Ind.; $25,000; to make a combination front fork and shock absorber; F. M. Strong, W. J. Gemmill, L. W. Mellette.

Motor Starter Manufacturing Company, Indianapolis, Ind.; $40,000; S. M. Brunage, W. J. Sylvester, H. J. Herff.

Arco Rubber Company, Boston; $15,000; William B. Hill, F. E. Black, H. G. Cressinger.

I. & W. Manufacturing Company, Chicago; $1000; automobile appliances and supplies; A. L. Currey, G. W. McIntyre, F. W. Nelson.

National Auto Radiator & Lamp Works, Inc., Brooklyn, N. Y.; $10,000; Julius Pasternack, Milton J. Gordon, Jacob Samas.

Peteler Shock Absorber Corporation, New York City, $50,000; C. L. Moreau, F. D. Lyon, J. L. Allen.

Lawter Tractor Company, Newcastle, Ind.; $10,000; to manufacture tractors; Benjamin H. Lawter, J. C. Goodwin, William H. Goodwin, Orville O. Carpenter.

Hartford Auto Pump & Supply Company, Hartford, Conn.; $50,000; to manufacture motor car supplies; H. F. Schrabe, Edward E. Tyron, T. Lockwood.

Tioma Oil & Grease Company, Inc., New York City; $50,000; to make and deal in oils and greases; F. J. Forhan, F. B. Knowlton, J. J. Harper.

Lister, Smith & Walsh Company, Providnece, R. I.: $50,000; general automobile business; James J. Lister, Herman R. Smith, Wilbur R. Walsh.

Harper Tire & Rubber Company, Canton, O.; $400,000; to manufacture and deal in automobile tires; James Thomas, Albert H. Vayo, Byron B. Baughman, Warren D. Harper, Carroll Brady Bour.

Kendall Auto Company, Pasadena, Cal.; $50,000; to deal in electric and gasoline automobiles; A. C. Kendall, E. A. Truby, S. S. Wilder, W. R. Civington, W. W. Kendall, Don C. Porter.

Fred M. Ross Spring Wheel Company, Cincinnati, O.; $100,000; to manufacture and deal in hubs, wheels, etc.;

Horace Horstman, Otto Huber, Theodore Horstman, Fred M. Ross, W. W. Baxter.

The Only Automobile Company, Charleston, S. C.; $200,000; Lawrence M. Pinckney, M. R. Rivers, Santo Sottile.

Arby Automobile Company, Mt. Pleasant, S. C.; $200,000; L. M. Pinckney, M. R. Rivers, Santo Sottile.

Auto Commission Manufacturing Company, Chicago; $50,000; George W. Nevins, Francis W. Robinson, William J. Liddy, Harry M. Snow.

Armstrong Motors Company, Cincinnati, O.; $10,000; Luella S. Armstrong, Clara M. Eggers, S. S. Stewart, Harry Bronworth.

Unique Engine & Manufacturing Company, Chicago; $2500; to manufacture engines and machinery; E. M. Christenson, Peter Walker, Charles W. Terrio.

United Auto Association, Los Angeles, Cal.; $10,000; Henry W. Bohrman, Burt Dequine, Clarence L. Robinson.

Oakland-Wisconsin Motor Company, Milwaukee, Wis.; $50,000; R. A. Creek, N. M. Creek, A. H. Small.

Rayfield Motor Sales Company of Illinois, Chicago; $41,000; automobiles and accessories; R. C. Wheeler, C. I. Cobb, C. Barnes.

Lacy Motor Delivery Company, Chicago; Herbert Decker, Samuel J. Richman, Franklin H. Lacy.

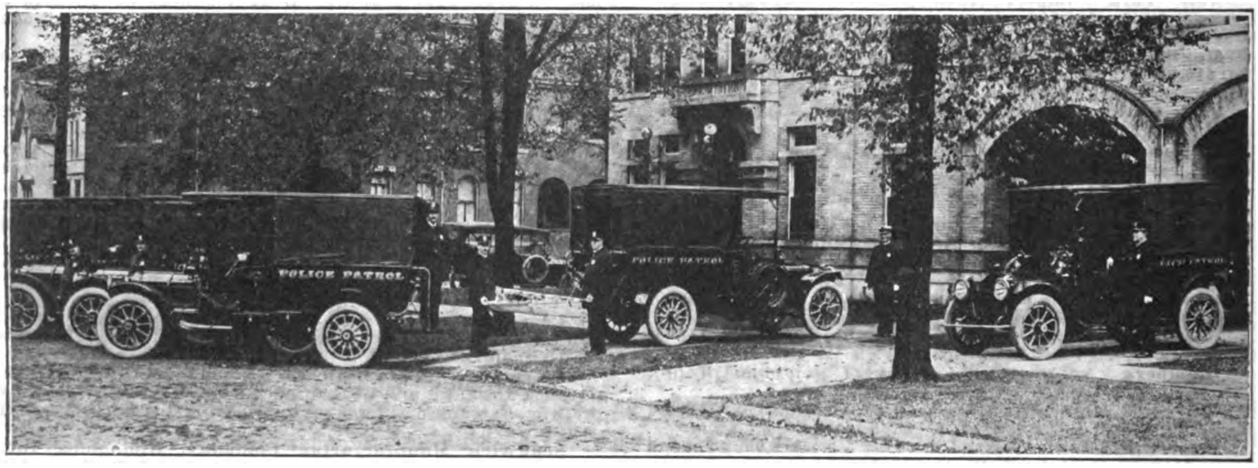
Lawrence Motor Mart, Lawrence, Mass.; $10,000; J. E. O'Neil, J. J. Hurley, D. F. Keefe.

Longwell Automobile Truck & Sales Company, El Paso, Tex.; $10,000; J. J. Longwell, H. M. Andreas, J. A. Tays.

Owners' Auto-Tire Company, Sacramento, Cal.; $5000; to deal in tires; H. C. Muddox, Frank Smith, W. W. Bassett.

Gallatin Motor Company, Jacksonville, Fla.; $10,000; H. T. Phillips, Harry Botts.

Timken-David Brown Company, Detroit, Mich.; $250,000; to manufacture worm gears and worm wheels; Lewis H. Paddock, Eugene W. Lewis, Herbert W. Alden.



A Portion of the Fleet of Packard Combination Ambulances and Patrol Wagons in Service with the Detroit Police Department.

K-E-W Manufacturing Company, New York City; $5000; to deal in automobiles; John Jacobs, W. W. Ward, J. A. Bednarik.

Alling & Miles, Inc., Rochester, N. Y.; $20,000; to deal in motor cars; Edmund M. Alling, Alice R. Alling, Milton B. Miles.

York Supply Company, Greenville, O.; $25,000; automobiles and supplies; C. F. York, A. Z. Heller, J. H. Byard, Lillie M. York.

International Automobile Supply Company, Chicago; $5000; to deal in automobile supplies; William L. Loeffel, Mark T. Adams, William E. Stephens.

Munnich's Garage, Inc., New York City; $500; Christopher Munnich, Elizabeth Munnich, John Munnich.

United States Auto Lock Company, Findlay, O.; $15,000; to manufacture and deal in locks; J. S. Van Tassell, E. B. Brokaw, J. H. Macklin, J. R. Harnahan, G. F. Burnap.

Diamond Stamping Works Company, Cleveland, O.; $35,000; to make motor car parts; J. C. Royon, Phelps Crum, H. H. Henry, M. T. Gorton, Rose L. McCarthy.

Cumberland Garage Company, Brooklyn, N. Y.; $25,000; Willard L. Gray, Alfred Wilmarth, Marie F. Wilmarth.

Dann-Gorman Company, Inc., New York City; $10,000; to deal in automobiles; Thomas F. Dann, John L. Gorman, John B. Gouger.

Gotham Sight Seeing Corporation, New York City; $1000; to operate motor 'buses; George Laury, Louis Brown, David Lebowitz.

Auto Adjunct Company, Melrose, Mass.; A. W. Eldredge, E. J. Sanderson, J. E. Knapp.

Paige-Detroit Auto Company, Little Rock, Ark.; $10,000; J. F. Jones, W. M. Rankin, W. M. Lewis.

Motor Oil & Gas Company, Tulsa, Okla.; $10,000; J. W. Hocker, John Rose, C. S. Walker.

Hobart Manufacturing Company, Troy, O.; motor driven machinery, purchasing assets of Hobart Electric Manufacturing Company; $1,600,000; H. L. Johnston, W. E. Bowyer, E. E. Edgar, W. W. Cope, J. M. Spencer, J. S. Combs.

Henschel Tire & Rubber Company, Inc., New York City; $10,000; Rudolph Henschel, Anna Henschel, William A. Wollman.

American Manufacturing & Distributing Company, Louisville, Ky.; automobile supplies; Harry L. Archey, P. H. Block, H. B. Morrow.

Peerless Tire Company, Inc., New York City; $15,000; Michael Schiavone, George P. Calenda, Louis Schiavone.

Associated Auto Mechanics, Inc., New York City, $100,000; automobile parts, etc.; H. Barnes, C. Tichsnor, W. J. Hoover.

Motor Sales Company, Fort Wayne, Ind.; $10,000; automobiles, supplies, accessories; Carl J. Weber, William J. Ross, William H. Bensman, Thomas M. Connell, Charles Galex, W. H. Hess.

Harbar Auto Heater Company, Augusta, Me.; $300,000; to construct, operate, market and deal in all kinds of motor vehicle attachments and accessories; R. S. Buzzell, L. J. Coleman.

Washington Street Garage Company, Green Bay, Wis.; $10,000; K. E. Fosha, L. R. Larson, F. L. Fosha.

Auto Service Company, Uniontown, Penn.; $5000; C. W. Johnson, Fred A. Close, F. B. Hess, R. M. Campbell, Max Hannan, E. G. Snyder, J. C. Donahue, G. T. Lewis, D. D. Haroder, A. E. Corns.

Stafford Illuminated Auto Lamp & Number Company, Chicago; $50,000; to make automobile accessories; F. S. Stafford, W. Doran, F. W. Schaub.

Norwalk Motor Car Company of New York, New York City; $35,000; P. Lyndon Bryce, Alfred L. Kirby, Edward S. Murphy.

Motor Coach Company, Inc., New York City; $500,000; automobiles, motor car hearses and burial coaches; Samuel Richenthal, Elbert R. Benyunes, Herman Miller.

Shepherd Auto Company, Inc., New York City; $5000; Irving R. Shepherd, Fannie R. Shepherd, Joseph A. Shepherd.

WITH THE MANUFACTURER.

The Packard Motor Car Company, Detroit, Mich., has placed a number of Packard combination ambulances and patrol wagons with the police department in that city. An accompanying illustration shows a portion of the fleet, concerning which the department officials express themselves as thoroughly satisfied in every particular. It has been found that these machines make a decided saving over the use of horse drawn vehicles.

The Torbensen Gear & Axle Company, Newark, N. J., maker of internal gear drive truck axles, has concluded arrangements with Brandenburg & Co., New York, Chicago and Detroit, to act as general sales agent and direct factory representative of the company's product.

The Allen Wrench & Tool Company, Providence, R. I., has closed a contract with W. A. Bryte, 788 Mission street, San Francisco, Cal., manufacturers' agent. Mr. Bryte will handle the Allen friction wrench in all the western territory, including the Pacific coast region.

R. B. Tracy, western manager of the Michelin Tire Company, Milltown, N. J., has opened a new branch at 1106 Hennepin street, Minneapolis, Minn. This branch will care for the territory of North and South Dakota, Minnesota and Northern Wisconsin.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, announces the appointment of Harry W. Doherty as northwest district manager with headquarters at Tacoma, Wash., Mr. Doherty enjoys a wide acquaintance in trade circles.

The Coronet Manufacturing Company, Wade building, Cleveland, O., has taken over the manufacture and sale of the Coronet hub mile recorder, which, it was announced several months ago, was made by the Servis Recorder Company of the same city. The Service travel recorder which the Servis Recorder Company has been marketing for the past two years is still controlled by that company. Both concerns are now entirely distinct, neither having an interest in the other or its products.

The Standard Roller Bearing Company, Philadelphia, Penn., maker of steel, brass and bronze balls, ball and roller bearings and axles and steel castings, has opened an office in the State Life building, Indianapolis, Ind., in charge of L. M. Watkin, Jr. Owing to the big demand for the company's product it was found necessary to divide the territory formerly covered by the Chicago office.

The American Motors Company, Indianapolis, Ind., maker of American cars, at a meeting of its stockholders, re-elected the entire board of directors and also the following officers: General manager and chairman of directors, V. A. Longaker; president, J. I. Handley; vice president, D. S. Menasco; treasurer, J. D. Bright.

The Dunlop Tire & Rubber Company, Toronto, Can., has acquired from the Century Rubber Company of New York the exclusive rights to manufacture and sell Fabricord tires in the Dominion, where the tires will be known as the Dunlop-Century Fabricord tires.

W. H. Rudd, proprietor of the Rudd Auto Top Company of Detroit, has purchased the business of the National Top & Curtain Company, formerly located at 865 Woodward avenue, that city, and has consolidated it with the Rudd establishment at 46 Bagg street.

The Federal Rubber Manufacturing Company, Milwaukee, Wis., has opened a branch at 1833-35 East 13th street, Cleveland, O. G. Couturier is in charge.

The Studebaker Corporation, Detroit, Mich., maker of Studebaker cars, is said to have secured profits for the year ending Dec. 31, 1912, for manufacturing and trading, amounting to $3,342,560, an increase of $650,712. The surplus, after making all charges, amounted to $2,212,245, an increase of $659,663.

The Fisk Rubber Company, Chicopee Falls, Mass., has announced the immediate construction of two more extensive additions to its factory. A large addition increasing the capacity of the plant 100 per cent. was recently completed, but further expansion became necessary to meet the demand for Fisk tires.

The Ohio Electric Company, Toledo, O., maker of Ohio electrics, is enlarging its plant to care for increased business.

The King Motor Car Company, Detroit, maker of King cars, will be partly conducted on the co-operative basis, as Artemas Ward, who holds 75 per cent. of the stock, will divide 10 per cent. of his earnings with the employees.

The Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, in accordance with the reorganization plans when it transferred its charter from Delaware to Massachusetts and increased its capital to $15,000,000, has increased its board of directors by the addition of R. B. McGraw and E. A. Luddington. The other directors are President H. T. Dunn, Vice President J. C. Cole and Treasurer H. G. Fisk, who constituted the original board.

The Benz Import Company, 248 West 50th street, New York City, announces that it has been informed that the Kaiser prize of 50,000 marks for the best aviation motor was won recently by the Benz company.

The Marion Motor Car Company, Indianapolis, Ind., has gathered together various newspaper and magazine articles relative to Marion cars and published them in a neat pamphlet, for distribution among its agencies.

The Republic Rubber Company, Youngstown, O., through its board of directors, has decided to erect a club house for the employees.

The Apperson Bros. Automobile Company, Kokomo, Ind., maker of Apperson cars, has announced a change in its New York representative, having closed a contract with the Shepherd Auto Company, 318-320 West 48th street, to handle Apperson cars in the metropolitan section, including a number of Hudson river counties and parts of Long Island, New Jersey and Connecticut.

The Etablissements Bergougnan, Clermont-Ferrand, France, is rapidly perfecting a system of distribution by states, following the recent establishment of an American selling branch at 49 West 64th street, New York City. It is understood that the French house is offering unusual inducements to jobbers and others, a sliding scale of discounts having been adopted with a view to hastening a general trial of Gaulois tires by users all over this country.

H. W. Miller has been added to the sales organization of the Lozier Motor Company, Detroit, maker of Lozier cars. Mr. Miller was formerly connected with the sales department of the Studebaker Corporation, Detroit, maker of Studebaker machines, under Paul Smith, now sales manager of the Lozier company.

William R. McCulla has taken a position with the Packard Motor Car Company, Detroit, maker of Packard cars and trucks, as assistant research engineer. Mr. McCulla has had a wide experience in the automobile industry.

William J. Hughey & Son, Chicago, maker of high grade limousine and automobile bodies, is to build a four-story concrete addition to its plant at a cost of $100,000.

NEW CONCERNS AND PROPRIETORS.

The Blair Auto Company, located at 414 South Main street, in the Beard building, Aberdeen, S. D., is a new concern which handles the Chalmers cars. Fred J. Ertz, who was formerly employed in the Chalmers factory at Detroit, is manager.

L. J. Graves has purchased of C. H. Walker a livery barn property which he has converted into a garage.

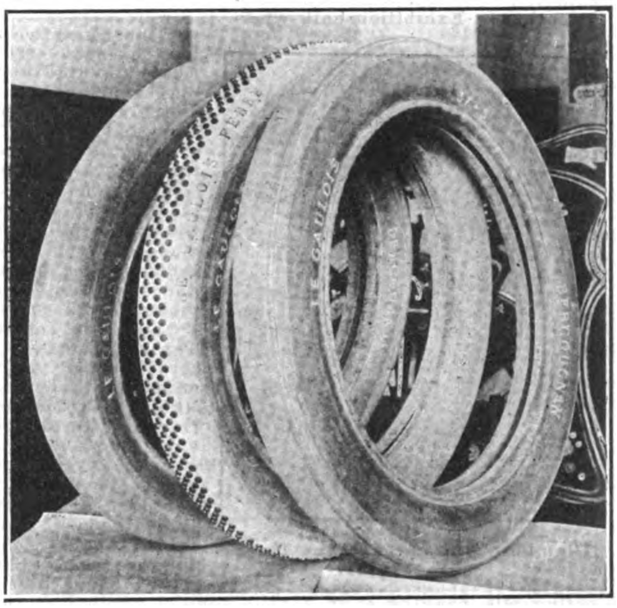
The Calcasieu Motor Car Company, Lake Charles, La., has opened for business at 210 Pujo street. Albert M. Miller is at the head of the firm and associated with him is H. B. Chambers, who will look after the mechanical department. In addition to the general garage and repair business the firm has the agencies for the Stutz and Speedwell cars.

Schiller & Creswell, Utica, N. Y., has purchased the brick gas storage building at Noyes and Francis street, which will be transformed into an up-to-date electric garage.

H. K. Boyles of Findlay, O., has purchased a half interest in the Main garage on North Main street, that city, of C. A. Burton, who was formerly sole owner. The garage will now be known as the Burton & Boyles Garage.

Henry Schultz, Ralph Peterson and Frank Hinshaw have purchased the Frank P. Fox garage at 811-818 Ohio street, Terre Haute, Ind. The two first named were former employees.

The Ferguson, Mohn Company, Phoenix, Ariz., has sold its automobile business, garage, agency and all accessories to the Arizona Land & Investment Company, which has taken two new members into the firm, R. D. Roper and H. L. Bird, well known business men.



Gaulois Tires of French Make Now Being Introduced in America.

The Auto Parts & Repair Company, Springfield, Mass., has been formed and has leased a part of the former plant of the Atlas Motor Car Company's plant in that city. The company is under the management of P. A. Williams, Jr., late of the Atlas company, and will repair Atlas cars as well as other makes.

Charles C. Diebold has retired from the Diebold-Peters Company, Cleveland, O., which made automobile parts, and with others has organized the Diebold Products Company in the same city. The concern will operate a plant on St. Clair avenue.

The Fourth Street Garage, San Francisco, Cal., said to be the largest ground floor garage west of Chicago, has changed hands and is now owned by the Pacific Sightseeing Company, Inc.

The Holt-Chandler Company, New York City, has opened a service department in the Galvin building, Long Island City, N. Y., in order to care for the service to Flanders and Maxwell cars. The service station will accommodate 75 machines.

W. H. Gragg has purchased the garage of R. R. Allen & Sons, Beloit, Wis., formerly known as the Vale Garage, and will fully equip it to do all kinds of repair work.

R. W. Wilmerton, C. C. Wilmerton and K. V. Johnson of Rock Island, Ill., have purchased the fixtures and accessories of the former Galena Auto & Manufacturing Company, South Main street, Galena, Ill. They have also rented the building and heavy machinery of the concern and have opened a modern garage and repair shop.

Sinclair & Horn, for several years in the service department of the Union Electric Company, former distributor of Rauch & Lang electrics, has opened a garage and repair shop at 4630 Olive street, St. Louis, Mo., and will give service to the owners of electric vehicles.

The Southwest Motor & Garage Works on West Third street, Carthage, Mo., has been purchased by C. H. Ziler and T. V. Grieb, from E. B. Jacobs, trustee. Mr. Grieb will not be actively engaged in the business.

William Gilligan, formerly of the Morgan Garage & Supply Company, and Edward Priebe, until recently of the Rhinelander Iron Company of Rhinelander, Wis., have entered partnership and have established a garage and repair business in that town under the firm name of Oneida Garage & Machine Company.

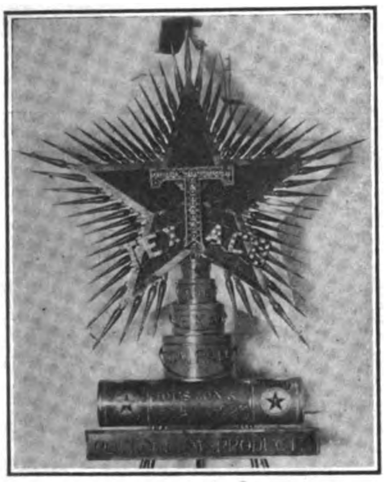
The Texas Oil Company, New York City, possessed an exhibit at the recent Boston show that attracted unusual attention in Exhibition hall, where the well known Texaco lubricants were to be seen. The centre of the display was the monster illuminated red star and green T, comprising the trade mark of this company. The large star, visible across the entire hall, was made of rich red Bohemian glass, and on this was mounted the green T and the name Texaco in brass letters studded with miniature electric lights. A nickeled frame outlined the star and bore a number of sockets, each of which was a holder for a ray shaped glass container. These containers were filled with various lubricating oils, ranging from a ruby colored product at the apex of each point to an almost white oil at the base. The whole was illuminated by powerful electric lights concealed behind a frosted glass star shaped background.



Illuminated Trade Mark at Texaco Oil Display.

The Colt-Stratton Company, New York City, eastern distributor of Cole cars, has established a used-car department at 1876 Broadway. It will have an organization of its own and will be under the management of W. H. Barnard, formerly of the Packard Motor Company.

The Jones Garage Company, Meriden, Conn., has taken the agency for Reo cars, and will handle that line in addition to its old lines, the Ford and White.

The E. B. Newton Auto Company, 649-651 Cass avenue, Detroit, has closed a contract with the Havers Motor Car Company, Port Huron, Mich., to handle the Havers line in and around Detroit.

The Borland-Grannis Company, Chicago, has announced the appointment of William C. Little as sales manager. Mr. Little is well known throughout the industry through his connection with the sale of both electric and gasoline machines. For several years he was special representative for one of the large manufacturers of electrics, and as such was called upon to take long trips, by reason of which he became well acquainted with a large number of dealers in every section of the United States. For some time past Mr. Little has been connected with the Lozier Motor Company, Detroit, maker of Lozier gasoline cars. With this concern he was a special representative in the sales department, and it was found that his former experience was of decided value in that position. There appears to be little doubt that in his appointment as sales manager of the Borland-Grannis Company, the maker of Borland electrics has secured an exceedingly valuable man.

W. C. Little, Sales Manager, Borland-Grannis Company.

The Pioneer Motor Truck Corporation, San Francisco, Cal., has closed a contract with the General Motors Truck Company, Pontiac, Mich., for the distribution of the G. M. C. trucks in the six Pacific coast states, the Hawaiian Islands and British Columbia, for a period of five years. It is said the Pioneer concern guarantees to purchase a minimum of $7,500,000 worth of trucks during this period.

The Marion Motor Sales Company, St. Louis, Mo., of which R. B. Ford is the head, is a new concern formed to handle Marion cars in the southwest. The company is a continuation of the Maxwell Automobile Company and for the present the salesrooms will remain at 308 North 12th street.

The Lewis Automobile Company of 4108 Olive street, St. Louis, Mo., has taken the agency for the Adams trucks, which are made by the Adams Bros. Company, Findlay, O.

The J. L. Bender Company, Chicago, distributor of Keeton cars and the Church electric, has also added the King car to its line.

The Stewart Motor Corporation, Buffalo, N. Y., maker of Stewart light delivery trucks, has appointed the following additional agents: Ontario Motor Car Company, Toronto and Ottawa, Can.; E. L. Jordan, Auburn, Me.

The Brown Commercial Car Company, Peru, Ind., maker of Brown trucks, has designated the following distributors: Engles Motor Company, Newark, N. J.; J. Fred Wilcox & Co., Joliet, Ill.; F. B. Price, Elizabeth, N. J.; South Brooklyn Auto & Livery Sales Company, Brooklyn, N. Y.; Norwalk Motor Car Company, New York City; Brown Car Corporation, New York City; Ritter Automobile Company, Madison, Wis.

The Hollander Motor Company, Boston, has closed a contract for the Boston agency of the Cartercar machines, made by the Cartercar Company, Pontiac, Mich. The acquirement of the exclusive rights to sell this car in this field means a greatly increased volume of business for that firm.

The Motor Parts Company, 185-187 Columbus avenue, Boston, has been appointed distributor for the products of the Bosch Magneto Company, New York City, maker of Bosch magnetos. A complete stock of magnetos, spare parts, spark plugs and other Bosch products will be carried in stock. F. W. Wilkening will be in charge of the Boston store, which is a branch of the Motor Parts Company of Philadelphia, Penn.

The Union Automobile Company, Wheeling, W. Va., is a new concern organized to handle the Abbott-Detroit cars, made by the Abbott Motor Company, Detroit. William F. Shaffer, secretary and treasurer of the Packers Motor Truck Company of the same city, was one of the organizers. Others were A. C. Shaffer, George P. Folmar, Albert M. Schenk.

The Cole Motor Car Company, Indianapolis, Ind., has appointed the following distributors: F. A. Wilson, Amherst, N. S.; J. P. Krall, Avon, S. D.; Davis Sparger Auto Company, Bristol, Tenn.; A. V. Hunt, Clarinda, Ia.; Lafayette Motor Car Company, Easton, Penn.; Swanson Bros., Lyons, Neb.; T. C. Maben, Northfield, Minn.; Pink, McVerty, Blackburn Company, Ottawa, Can.; C. Williams & Bros., Poplar Bluff, Mo.; Chamberlain Bros., Salem, Ore.; Trenton Motor Car Company, Trenton, N. J.; Buehr Bros., Wadona, Minn.; Morgan & Williams, Warren, O.

The Moon Motor Car Company, St. Louis, Mo., has appointed the following agents for Moon cars: Harry T. Erpenback, Atlantic City, N. J.; Dunham Auto Company, Brooklyn, N. Y.; Central Iowa Motors Company, Des Moines, Ia.; Tri-State Automobile Company, Minneapolis, Minn.; Montclair Garage & Machine Company, Montclair, N. J.; Sheely Motor Car Company, Passaic, N. J.; Reetz & Brown, Presho, S. D.; Fred H. Van Dorn, Red Bank, N. J.; Hessinius Auto Company, Sioux Falls, S. D.; Tabor Mercantile Company, Tabor, S. D.; Clifton Auto Company, Union Hill, N. J.; Moon Motor Car Company, Washington, D. C.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has designated the following agents for its product: G. Van Arsdale, Deer Lodge, Mont.; D. R. McKinney, Durango, Col.; C. W. Workman, Evart, Tex.; George B. Doyle, Lafayette, Ind.; Zwick Bros., Lake City, Minn.; Gadbois & Greenwood, Littleton, N. H.; R. W. Method, Milford, Ind.; J. Harry Schumacker & Co., Philadelphia, Penn.; James H. Maize, Jr., Redlands, Cal.; Miller Paulson, Redwood City, Cal.; Oliver B. Whipple, Saginaw, Mich.; E. C. Bigelow, San Diego, Cal.; Bert Snyder, Victor, Col.; Ernest R. King, Waltham, Mass.

L. M. Vordemberge Motor Company, Baltimore, Md., and the Pathfinder Motor Car Company, Minneapolis, Minn., have taken the agency in their respective territory for the Pathfinder cars, made by the Motor Car Manufacturing Company, Indianapolis, Ind.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure cars and trucks, has appointed the following distributors: Brooks Auto Company, Turlock, Cal.; F. H. Davis, Placerville, Cal.; Geyer & Boroski, Colusa, Cal.; J. S. Gill, Pleasanton, Cal.; W. W. Head, Chico, Cal.; W. J. Booth, Lebanon, Ore.; C. R. Canfield, Willamina, Ore.; John Gray, Roseberg, Ore.; E. E. Leas, Oakland, Ore.; W. J. Benbenick, Bremerton, Wash.; G. A. Thomas, White Salmon, Wash.; B. N. House, Cle Elum, Wash.; McGhee Auto Company, Kent, Wash.; Hugo A. Gutenkunst, Owen Sound, Ont.; Morrin-Thompson Company, Phoenix, B. C.; J. F. Austin, Monterey, Mexico; C. R. Miller, Stockholm, Sweden; Saskatchewan Garage, Moose Jaw, Saskatchewan; B. E. Munson, Crow's Landing, Cal.; E. T. Neal, Paso Robles, Cal.; W. A. Platt, Mt. View, Cal.; T. W. Thomson, Santa Cruz, Cal.; F. O. Taylor, Ukiah, Cal.; Wisnom-Bonner Hardware Company, San Mateo, Cal.; F. M. Wyatt, Winters, Cal.; Western Auto Supply Company, Reno, Nev.; Elko Auto Company, Elko, Nev.; McCoy & Veazie, St. Helena, Ore.; S. A. Mills, New Berg, Ore.; Newmith Auto Company, Cottage Grove, Ore.; C. L. Rose Company, Salem, Ore.; A. Wilhelm & Sons, Monroe, Ore.; J. J. Wirtz, Forest Grove, Ore.; Ernest Peterson, Mt. Vernon, Wash.; M. M. Stewart, Aberdeen, Wash.; Twin City Auto Company, Chehalis, Wash.; Yakima Auto & Supply Company, North Yakima, Wash.; Knueppel & Ott, Davenport, Ia.; Barre KisselKar Company, Barre, Vt.; Johnson & Stevens, Booneville, Mo.; Hedge's Garage, Greenpoint, N. Y.; Edward J. Deasy, Glen Cove, N. Y.; Hackensack Auto Service, Hackensack, N. J.; O. R. Hukle & Co., Lexington, Ky.; Chandler & Hightower, Ft. Worth, Tex.; Boulevard Garage, Bridgeport, Conn.; Taximeter Auto Company, Paterson, N. J.

The following are some of the recent agency contracts closed by various concerns in the country and the cars they will handle: A. Trust Poehlmann, Baltimore, Md., Stoddard-Dayton; Westcott Motors Company, Boston, Westcott; Clifford Alexander, Bradley, S. D., Detroiter; Samuel Hirtz, Bucyrus, O., Hudson; Mutual Motor Car Company, Buffalo, N. Y., Westcott; National Motor Car Company, Chicago, Garford; Charles Ross, Columbus, O., Great Western; Central Motor Car Company, Canton, O., Cartercar, Studebaker; Lyen, Christianson & Swanson Company, Des Moines, Ia., Regal; J. I. McFarland, Lodi, Wis., Studebaker; Williams Auto Sales Company, Indianapolis, Ind., Jackson; Arenz-Weihaupt Auto Company, La-Crosse, Wis., Marathon, Detroiter; J. I. McFarland, Lodi, Wis., Ford; Gage Automobile Company, Logan, O., Hudson, Ford, Overland; J. J. Caffrey, Louisville, Ky.; Mc-

Farland, M. C. Westfall, McArthur, O., Ford; J. M. Biddison, Milwaukee, Wis., Case; Barclay Automobile Company, Minneapolis, Minn., King; Rivet Motor Garage Company, Montreal, Can., Cartercar; C. W. Doheny, Montreal, Ohio; Universal Electric Company, Montreal, Buffalo; Stockwell Motor Car Company, Montreal, Standard; Provincial Motors, Ltd., Montreal, Locomobile; John V. Metz, Norwalk, O., Mitchell, Paige, Hupmobile; J. E. Snable, Norwalk, O., Detroiter; Westcott Motor Sales Company, Pittsburg, Penn., Westcott; Norman DeVaux, San Francisco, Cal., Little, Chevrolet; Lamping & Garfield, Seattle, Wash., Flanders; Hiter-Logan American Sales Company, Shelbyville, Ky., American; W. R. Shaw, Syracuse, N. Y., Alco; Syracuse Garage, Syracuse, N. Y., White; Syracuse Motor Car Company, Syracuse, N. Y., Paige; Charles G. Hanna, Syracuse, N. Y., Cutting; A. L. Bowen, Van Wert, O., Hudson.

The Michigan Motor Car Company, Kalamazoo, Mich., is planning to build a five-story office building to include a large concrete garage, dining room, library and other features, at a cost of $250,000.

PROPOSED NEW GARAGES.

W. H. Johnson, proprietor of the Windsor Hotel garage, Cedar Rapids, Ia., has awarded a contract for the erection of a new garage at 114-116 North First street.

The Western Automobile Company, St. Paul, Minn., has plans for a garage at Rice and Fuller streets to be modern in every particular.

The New York Sales Company, Binghamton, N. Y., has purchased large lots fronting 52.5 feet on both Collier and State streets and having a depth of 173. A ground floor garage to cover the entire plot will be erected at a cost of $35,000.

Black's Garage Company, New York City, will build a garage on the north side of 64th street, to cost $10,000.

The Beloit Auto & Machinery Company, Beloit, Wis., has plans for a garage to be equipped with modern machinery.

The Intersection Garage Company, Milwaukee, Wis., will erect a $10,000 garage on North avenue, near 12th street.

The Swaney Auto Company, Des Moines, Ia., will build a garage on West Sixth street, to be ready for occupancy by July 1.

A. Ehrbar, Cleveland, O., has plans for a new garage to be erected soon.

J. F. Grace, vice president and treasurer of Housum, Grace & Co., Cleveland, O., has awarded the contract for the erection of a modern garage to E. J. Andrews.

William F. Kees, Lakewood, O., contemplates building a new 1.5-story garage, 30 by 16 feet.

F. Wooling, Indianapolis, Ind., is having plans prepared for a large one-story garage.

C. K. Atlass, 509 North Ninth street, Lafayette, Ind., will soon erect a new garage.

Thomas Seeds, Jr., and F. B. Davis, Philadelphia, Penn., are estimating on plans for a two-story garage and stable at 6811 Quincy street for C. L. Betz.

William Dolpke, Canal and Main streets, Cincinnati, O., has plans under way for a garage.

The Radel Auto & Carriage Company, 652 State street, Cincinnati, O., will build a one-story garage to cost $15,000.

Charles Seibold, Alton, Ill., has announced his intention of building a one-story garage in that town this spring.

John P. Indorf, 160 St. Ann's street, New York City, has plans for a two-story garage to be 50 by 100 feet and to cost $20,000.

Anton Charvat, Chicago, contemplates building a one-story garage in a short time.

S. E. Arnold, Chicago, has let the contract for a new garage to the Moraw Building Company, 127 North Dearborn street.

William P. Clancy, 5539 South Green street, Chicago, has let the contract for a new garage.

A. E. Sward, 5142 Ellis avenue, Chicago, is asking for bids for the erection of a one-story garage.

William O'Connor, Milwaukee, Wis., is planning a garage, store and flat building, four stories high, with basement, to cost $80,000.

William H. Pueping, Fond du Lac, Wis., has announced that he will build a two-story garage to cost $25,000.

The O'Donovan Place Garage Company, South Omaha, Neb., is erecting a one-story brick garage at a cost of $6500.

J. A. Hutchinson, St. Louis, Mo., has plans for a two-story automobile supply house.

Mrs. Virginia P. Johnson, 2002 Linwood avenue, Kansas City, Mo., contemplates building a two or more story garage and business building at a cost of $25,000 as soon as losses are adjusted as a result of a recent fire.

Judge August Kassebaum, Clayton, Mo., has let the contract for the building of a two-story garage to cost $4000. The building will be at Maltese, Mo.

A. H. Beardsley, Elkhart, Ind., is to build a one-story garage and salesroom, 40 by 60 feet. The building has been leased to the Ford Automobile Company, Goshen, Ind.

J. W. Rodgers, Logansport, Ind., has let a contract for a one-story garage and work will be started soon.

J. C. Truett, Lagrange, Ga., has plans under way for a two-story garage, 40 by 70 feet, to cost $4500.

C. M. Wallace, Huntington, W. Va., is contemplating a new one-story garage.

J. P. Walter, Palmer House, Culver, Ind., is planning a two-story garage to accommodate 20 machines. Sleeping quarters will be included in the building for the employees.

W. P. Brown, Coffeyville, Kan., will remodel the first floor of a business block into a modern garage.

E. Morris, 421 Campbell street, Wichita, Kan., has started work on a one-story garage. The foundations of the structure are such that additional stories can be added. The building has been leased to George W. Denton, who will conduct a general automobile business.

Edward M. Dale has let the contract to David McCrock, Flourtown, Penn., for alterations and additions to a one-story garage, to cost $3000.

The Ideal Garage Company has let the contract for a substantial addition to its garage at Frederick, Md.

Judge Wheeler McGee, Louisville, Ky., has awarded the contract to the Alfred Struck Company for a two-story garage. There will be two buildings, one 78 by 200 feet and the other 60 by 200 feet. Both have been leased to the Southern Motors Company, 900 South Third street.

Myerscough & Buchan, Andover, Mass., has plans in progress for a one-story public garage.

L. B. Sanders, shown in an accompanying illustration, has been appointed sales manager of the Abbott Motor Company, Detroit, maker of Abbott-Detroit cars. For the past two years he was sales manager of the Lion Motor Car Company, Adrian, Mich., and was responsible in a large degree for bringing that company to the front. After the destruction of its plant by fire Mr. Sanders was actively engaged in the company's re-establishment until the project was abandoned in December. Previous to his connection with the Lion company, Mr. Sanders had held important sales positions with the United States Motor Company and the Reliance Motor Truck Company. Prior to the last named connection he conducted a thriving garage and sales business in New York City. While still a young man he has had a very wide business experience and is recognized as a man of decided executive ability. He is constructive in his methods and has a firmly established record as a business producer.

L. B. Sanders, Sales Manager, Abbott Motor Company.

Hawthorne Development Company, Paterson, N. J., will make alterations to its garage to cost $6000.

George S. Couch, Charleston, W. Va., has plans for a garage and flat building. It will be two stories high with basement and will cost $2500.

Stanley Ashbrook, Fort Mitchell, Ky., has let the contract for his new one-story garage.

B. H. Kroger Grocery & Baking Company, Cincinnati, O., is having plans prepared for a two-story garage, 150 by 200 feet, which will cost $50,000.

J. E. McLaughlin, 52 Howard avenue, Utica, N. Y., is having part of a residence building recently purchased at Clinton, N. Y., converted into a garage at a cost of $4000.

The Adirondack Motor Car Company, Hudson Falls, N. Y., has let the contract for its new two-story garage, which will be 40 by 125 feet.

F. S. Prince, Mamaroneck, N. Y., has let the contract for a new garage to the Lincoln, Steele, Fleming Company, 17 Madison avenue, New York City.

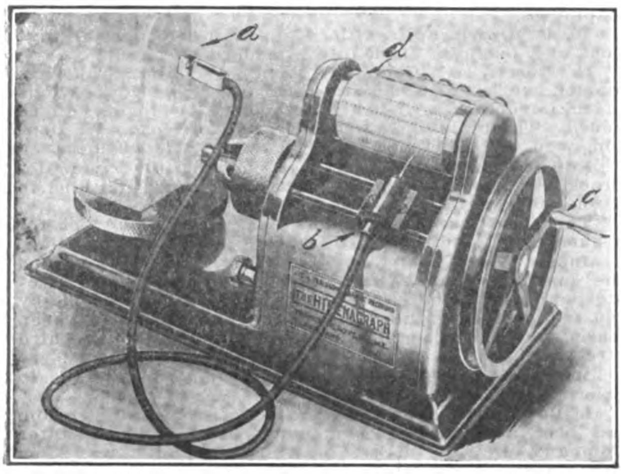
Edward C. Schagger, 190 Bowery, New York City, has awarded the contract for a two-story garage and greenhouse to be built at New Rochelle, N. Y.

The New York Transportation Company, 10 East 102d street, New York City, has let a contract for a three-story garage.

Cornelius N. Bliss, Jr., 14 East 36th street, New York City, is having plans prepared for a garage and stable to be erected at Wheatley Hills, L. I.

HITENAGRAPH, A DEVICE FOR TESTING IGNITION.

EFFICIENCY with multiple-unit internal combustion motors depends largely upon the synchronization of the spark. A device for testing and locating faulty operation of ignition systems is the Hitenagraph, announcement of which is made by Francis R. Hoyt of Cleveland, O. The name is derived from its function, that of creating a graphic record of the high-tension or secondary current.



The Hitenagraph, Designed for Testing High-Tension Currents, Magnetos, Etc.

The device is shown in an accompanying illustration testing a magneto for accuracy of performance. The Hitenagraph is simply constructed and its base is provided with a stand for mounting the magneto. The armature shaft of the latter is secured to the driving shaft of the testing device by a coupling similar in construction to the chuck of a drilling machine. The connection is so designed that the tapered shaft of the magneto may be held securely.

Rotating the driving wheel C revolves the armature of the magneto. The wheel is fitted with a handle, although its periphery has a V groove, permitting drive by a belt if desired. The drive is direct, there being no reduction. The chart drum revolves at an increased speed and the design is such that the spark index b which travels (through connection with a worm) longitudinally across the drum, is always diametrically adjacent, at the time the discharge should occur, to the ordinate on the chart itself on which the last produced spark registered. In this manner is shown, by the alignment of the sparks on the chart, the relative timing or synchronism of each cylinder. also the intensity of the spark by the area effected by it on the chemically prepared chart.

Two sections of the chart are reproduced herein, that marked A illustrating a typical case of lack of synchronism. The lines across the chart represent degrees of crankshaft rotation, or in other words, the chart as attached to the drum, is divided into 180 degrees and travels twice as fast as the magneto being tested. Each time the latter produces a spark, which is ordinarily twice a revolution or 180 degrees apart, the chart makes a complete revolution and each succeeding spark should fall on the same line of the chart as the one preceding it. In the illustration at A the record shows that the magneto is five degrees out of time. The difference in the size of the spark at retard and advance, is also indicated. At B is presented a record of the same magneto after being repaired and adjusted.

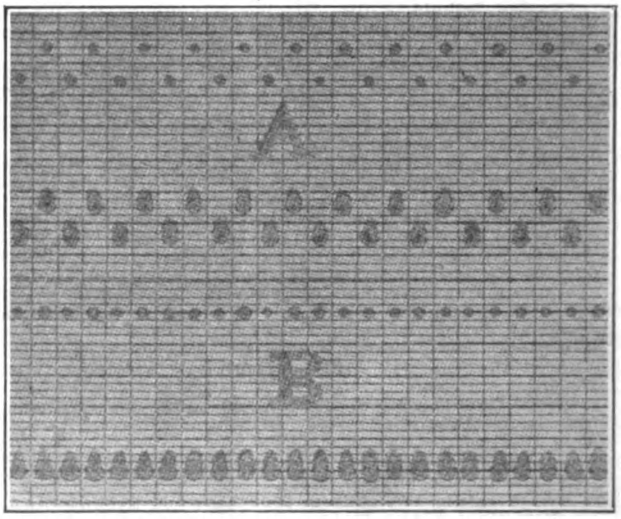
The Hitenagraph may be utilized for testing a magneto without removing the latter from the car, a smaller model being manufactured especially for garage service. The larger or bench model is for use in factories and it is stated that it will test 20 machines an hour. This latter design is equipped with a variable speed device, and a tachometer giving graphically the revolutions a minute.

NEW INSURANCE COMPANY.

Connecticut Concern Will Undertake to Assume Risks on Automobiles and Aeroplanes.

The Automobile Insurance Company, Hartford, Conn., has been organized under Connecticut laws with a capital of $2,000,000. The company is said to embody a new idea in indemnity and among its unusual powers will be authority to write policies on aeroplanes and automobiles and to cover them against every hazard, including fire.

The company assumes and revivifies the six-year-old charter of the Manufacturers Fire & Marine Company, which never was organized. Former United States Senator Morgan G. Bulkeley, president of the Aetna Life Insurance Company, secured the old charter. Associated with him will be John H. Hale, public utilities commissioner of Connecticut and several others well known in that state.



Chemically Prepared Chart Recording Lack of Synchronization at A and Proper Timing at B.

ANOTHER PERU FACTORY.

Will H. Brown Is Instrumental in Securing Accessory Concern for That City.

Through the efforts of Will H. Brown and the directors of his company, the Brown Commercial Car Company, Peru, Ind., the Crum-Wiley Manufacturing Company, which has been enjoying an increase of business the past year, has been induced to locate at Peru. The company will manufacture all automobile accessories made in brass, its specialty being grease cups and other small parts used in the building of motor vehicles.

Besides Mr. Brown, the directors of the new concern are: President E. L. Crum, Vice President Max Krauss, Secretary-Treasurer S. A. Shesler and J. R. Woodring. The company was formerly located at Decatur, Ill.

QUADRUPLED FORMER OUTPUT.

Annual Reports Show Business of Castle Lamp Company on Satisfactory Basis.

The annual meeting of the stockholders of the Castle Lamp Company, an Ohio corporation with its factory at Battle Creek, Mich., was held recently at Toledo, O., practically all the stock being represented. The reports of the officers were submitted and evidenced an improved condition of the company, the management of which was changed a short time ago. The concern is now a subsidiary of the Willys-Overland interests.

Under the new regime the output has been very much increased, being now four times what it was previously. The directors elected by the stockholders were: E. A. Williams, Jr.; Walter Stewart, Royal R. Scott, Rathbun Fuller and C. B. Mertz, who afterwards held a meeting and elected the following officers: President, E. A. Williams; vice president and treasurer, Walter Stewart; chairman of the board and secretary, Royal R. Scott.

FORMS CHAUFFEUR'S BUREAU.

New Haven Club Will Supply Members with Information Concerning Drivers.

The governing board of the Automobile Club of New Haven, Conn., has established a chauffeur's bureau, through which members will be supplied with information concerning men who are seeking employment. It is pointed out that the object is to enable chauffeurs to secure good positions, as well as owners to obtain satisfactory service.

Information as to the chauffeur's age, nationality, habits, etc., is filed by his employer, and provision is made for revising this from time to time as occasion requires. Members who desire employees are permitted to call upon the secretary for this information without expense.

CASE LEAVES LANSDEN COMPANY.

Succeeded by Blakesley, Giving Rise to an Entirely New Set of Consolidation Rumors.

W. L. Case, vice president and general manager of the Lansden Company, Newark, N. J., maker of Lansden electric vehicles, has resigned his position and his place has been taken by George E. Blakesley. It is understood that Mr. Case has disposed of his holdings in the company and will return to his consulting engineering practise after a trip through the South.

The Lansden Company was established about 10 years ago to develop an electric truck utilizing the Edison nickel iron batteries. After the International Motor Company took over the Mack plants at Allentown, Penn., a number of those interested in the latter business formed a syndicate to buy the Lansden Company, and it was taken over from Edison in January, 1912, when Mr. Case, who had a considerable part in the formation of the International company, was placed in charge.

Mr. Case's resignation would appear to set at rest rumors which have been circulated that the International company was to absorb the Lansden Company. That this supposition is without foundation seems to be further confirmed in the eyes of those interested, by the fact that Mr. Blakesley is said to be closely associated with John M. Mack, who although at one time a strong factor in the International company, has for the past few months been inactive in its management.

There is said to be some prospect of the formation of a new consolidation of the Lansden, the Mack and the Webb companies, all of which are owned by Mr. Mack and his associates. This possibility, however, has to date received no encouragement by those most intimately interested.

GOODYEAR INTERESTS INVOLVED.

Purchase Control of the Killingly Company, Engaged in Manufacturing Cotton Goods.

Interests identified with the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, have purchased the control of the Killingly Manufacturing Company, which has a plant at Williamsville, in the town of Killingly, Conn., for the manufacture of cotton goods. These men have entered the directorate, which has elected a new set of officers.

The official roster of the firm follows: President, Benjamin F. Smith of the B. F. Smith Construction Company, Pawtucket, R. I.; vice president, P. W. Litchfield, Akron, O.; treasurer, W. E. Palmer, Akron, O.; assistant treasurer, W. Irving Bullard, Danielson, Conn. These men and W. T. Teagan of Boston and A. M. Bannister of Providence, R. I., make up the new board of directors. Material improvements and additions to the plant will be made in the near future.

THE ACCESSORY —AND— GARAGE JOURNAL
Devoted Exclusively to the Automobile Trade and Allied Interests

VOL. II. APRIL, 1913. NO. 12.

AUTOMOBILE JOURNAL PUBLISHING CO.
Times Building Pawtucket, R. I.
William H. Black, Treasurer. D. O. Black, Jr., Secretary.

Publisher of
THE AUTOMOBILE JOURNAL THE MOTOR TRUCK

Offices in New York, Chicago, Detroit and Boston

SUBSCRIPTIONS:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Fifteen cents the copy.

CONTRIBUTIONS.
Anonymous communications not considered. Correspondence on subjects relating to the motor industry and the trade will receive attention. Stamps must be enclosed to insure return of unsolicited contributions.

ADVERTISING:
Information supplied at request.

Advertising Copy for the ACCESSORY and GARAGE JOURNAL requiring submission of proof must be received by 5th of month to insure publication in issue of the 15th of month.

Advertising Copy, proof not required, accepted to morning of the day before publishing day (unless such day is Sunday or holiday, when previous day is limit) of each publication.

Entered as second class matter Dec. 30, 1911, at the post-office at Pawtucket, R. I., under the Act of March 3, 1879.

MODERN BUSINESS METHODS.

The manufacturers are paying increasing attention to the dealers who handle their products and probably the reasons are not far to seek. There is no doubt that the future of the motor car industry lies with the dealers, since they come into direct contact with the purchasing public. Sharp practises that excited no comment in the early days of automobile building have become obsolete and a new standard is being established.

The dealers have become cognizant of their most pressing needs and have shown not only a desire to save the consumer money, but to give satisfactory service as well. It is to the interest of each that he have what the motorists want and it is therefore desirable that all kinds of suitable accessories be carried.

Without them trade will go elsewhere and it has too often been the case that stores having no connection with the automobile industry have carried accessories and reaped a good profit. This trade properly belongs to the garage and it is vastly preferable that a dealer concentrate his efforts upon a large volume of sales with small profits, than to be content with few sales carrying large returns. Without the former business the latter is likely to show a decided falling off. The dealer who applies system and modern merchandising methods to his enterprise rarely complains that his business is not meeting expectations.

THE COMMISSION EVIL.

One of the great evils with which automobile dealers have had to contend is that of paying commissions for names of prospective purchasers, supplied by their so-called friends. Quite frequently one such friend will furnish the name to all the dealers in his city, thereby assuring himself of a commission from whichever dealer the purchase is made.

The most effective way to meet this situation is in organization and this has been accomplished in some cities. The dealers must forget business rivalry, at least to the extent where they can unite to protect their own joint interests, and with a central bureau to give information upon request the commission evil would be quickly wiped out. In one city, when a prospect is given to a garage the name and commission offered is telephoned to the central exchange. Should this prospect be given to another dealer, he also telephones to the exchange and is immediately informed whether or not the name has been presented elsewhere.

In this way the scheme is discovered and the informant's attempt to get the dealers to bid against each other is effectually defeated. It would be well, perhaps, if all dealers would unite in absolute refusal to give commissions of any kind in return for such information, but if a commission is to be paid, a uniform rate should be fixed in order to avoid the pitfall of ruinous competitive bidding. The major profits of a sale must inevitably, under those circumstances, go to the third party to the transaction. The central exchange, where established, can also be utilized to provide confidential information to the dealers of the financial credits of those with whom they engage in business dealings.

The fuel problem promises to be uppermost in the minds of manufacturers and owners during the next few months. The discovery of the new fuel, motor spirit, does not seem to offer the complete solution that is expected. Those who read carefully between the lines cannot help but gain the impression that the practical kerosene carburetor is shortly to make its appearance, and on some of the best known cars. In fact, several such carburetors are said to have reached an advanced state of development and manufacturers are experimenting with them.

Mechanical Pointers for Garagemen and Repairmen

HOME MADE MICROMETER.

A micrometer is a very useful tool in the garage equipment as by it fine measurements may be made. One may be produced at a very small expense, says Popular Mechanics, and the tool will fill all requirements. The frame is cut from heavy sheet metal and of the shape depicted at Fig. 1 B, the ends being rolled over to form openings .25 and .375 inch outside diameter. A piece of brass tubing, .375 inch outside diameter and two inches long, is fastened securely into the larger opening. On the other end of this tube is brazed a nut tapped with a .25-inch tap, having 40 threads. The sleeve is made of another piece of tubing large enough to go over this nut. Next a bushing is fitted in one end of this sleeve and the other is beveled to about 45 degrees. The bevel is divided on its circumference into 25 parts, numbering every fifth graduation, beginning with zero.

A four-inch rod is threaded about half way to fit the nut and fastened in the other end of the sleeve with a bushing. The anvil is a piece of .25-inch rod fastened on the opposite frame opening, and allowed to project .5 inch inside the frame. Next the sleeve is run down until the screw comes in contact with the anvil and a mark is made on the stationary tube to register with the zero mark on the sleeve and at right angles to it. The sleeve is turned one revolution and another mark is made. This operation is continued until the caliper is opened to its full capacity. One complete turn of the sleeve represents 1-40 inch. One-twenty-fifth of a turn equals 1-25 of 1-40 or 1-1000. Half and quarter-thousandths can be estimated readily.

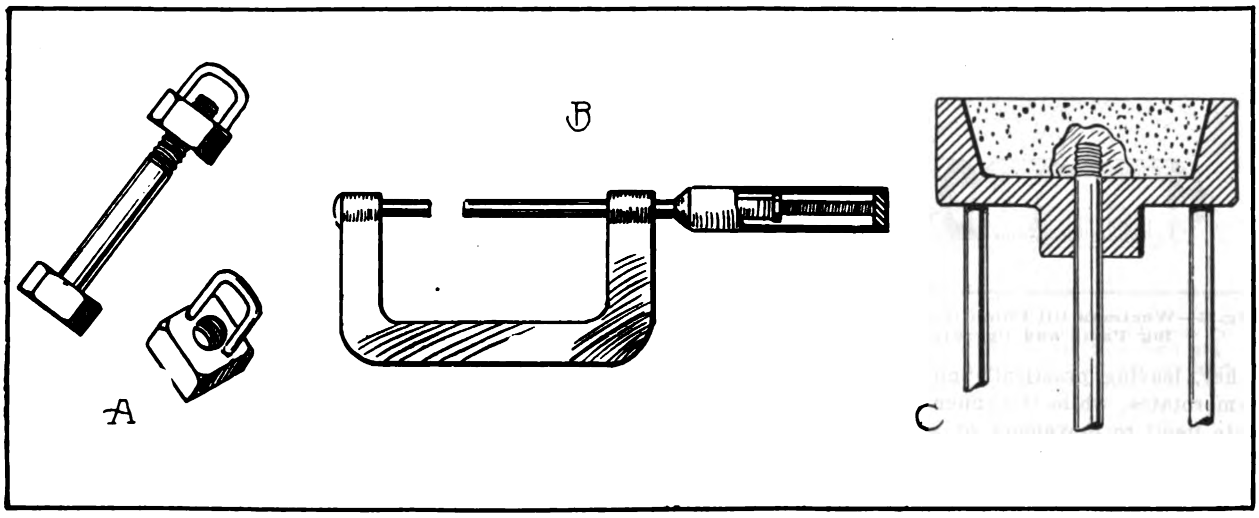


Fig. 1—Suggestions for the Repairman: A, Converting Ordinary Nuts into Wing Members; B, Inexpensive and Easily Made Micrometer; C, Method of Starting Stubborn Flywheel by Application of Molten Lead.

WING NUT KINK.

There are several places about the motor car where wing nuts would be desirable, as these members facilitate the removal and replacement of parts. A simple method of converting ordinary nuts into wing members is depicted at Fig. 1 A. It consists of drilling two holes in the nut and driving a staple through the openings, peining over the ends of the staple. The latter should be long enough to pass through the nut as well as to provide means for rotating it.

REMOVING STUBBORN FLYWHEELS.

A flywheel that has been shrunk on and keyed to a shaft presents difficulty in removal and when ordinary methods fail a recourse to heat must be made. At Fig. 1 C is presented a suggestion for removing the most obstinate members. It consists of two pieces of plank of a length slightly greater than that of the crankshaft. These are placed in a perpendicular position, with the flywheel resting on the top ends and the shaft hanging down between the braces.

A little clay is then packed around the end of the shaft as shown in the sketch, and the cavity in the wheel filled with very hot molten lead. If the shaft does not drop out under this treatment, a slight tap with a copper or lead mallet on its end will separate the two pieces.

SIMPLE SLOW SPEED OIL PUMP.

An oil pump with a minimum of moving parts, as well as being free from valves, springs or other similar mechanism, has been invented by G. E. Whetman, an English engineer. Among the features claimed for the device is that it will exhaust air and draw up oil from the start without the necessity of priming, and that all of its rotating parts practically constitute bearings of large surface, operating in a bath of lubricant.

The operating mechanism is exceedingly simple. At Fig. 2 is depicted a complete model and the intake sections will be noted on one side while the outflow is located on the opposite. Inside, the casing merely forms a cylindrical chamber, through which is a shaft driven from the engine. On this shaft, at each end of the chamber, are circular pieces of steel of such diameter as to be an oil floating fit in the pump chamber, but, while they fit in this compartment both on their circumference and at the outer end of the chamber, they are profiled on their inner ends so as practically to constitute side cams. The latter, at each end of the shaft, operate in conjunction with one placed between them in the centre of the chamber.

The outer cams rotate, though the centre member does not revolve but slides along a feather in the pump chamber so as to accommodate itself to the working of the two end cams as they rotate. This combination of sliding and rotating cams is such that in one position the profile of one fits against the other, leaving practically no space, but as the other cam rotates, while the inner cam can only accommodate itself to movement by sliding, it is obvious that the two will cease to fit into each other's profile, and space will occur between the two as soon as one begins to revolve. The position of this sliding cam is, therefore, so arranged that this space begins to open just opposite the intake in the casing, and thus oil is drawn in by suction to fill that space. Further movement finally shuts this space off from the inlet, and the oil filled space is then, by the revolution of the outer cam, transferred around the profile of the sliding cam to the delivery side of the pump. Moreover, the cam combination is so formed that, just as the oil filled space begins to reach a point opposite that of the delivery opening, the profile of the rotary cams again begins to butt up against that of the slider, so that the profiles of the two again tend to fit each other. This has the effect of squeezing the oil out from between the cams, and so force it through the delivery openings.

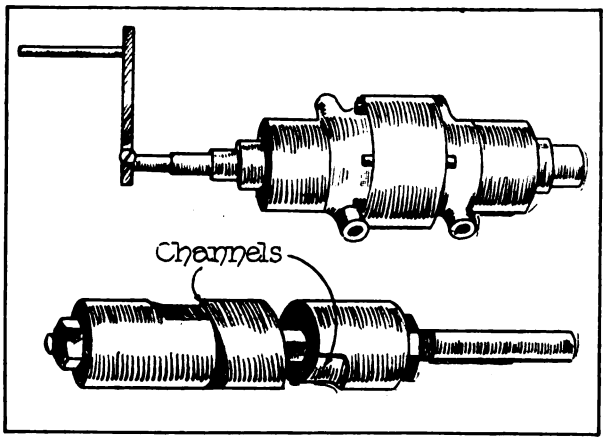

Fig. 2—Whetman Oil Pump Having a Minimum of Working Parts and Operating at Low Speeds.

The internal cam arrangement is also shown, and it will be noted that the divided line between the rotary and sliding cams does not lie absolutely opposite the intake and delivery openings, because space has been allowed between these for the use of a wrench on the union nuts, and therefore channels are cut on the rotary cams to connect the openings with the internal cam spaces.

The device is designed to be operated at slow speeds, the inventor pointing out that the shaft should not exceed 120 revolutions a minute. Tests developed the fact that at extremely low speeds, even at nine revolutions a minute, Vacuum A oil was pumped with excellent results.

ANNEALING SPINDLE PINS.

In replacing worn spindle pins with new members a repairman noticed that the threads of the part broke away at the slightest contact. A further examination of the bolt revealed the fact that the threaded end had been tempered too hard. Had the pin been utilized an accident might have ensued. The bearing portions of the pin were wrapped with a wet cloth and the temper drawn from the threaded end, and when replaced in the spindle gave efficient service. When these members have the appearance of being too highly tempered on the threaded end, they should be tested and the metal annealed.

FILTERING OLD LUBRICANTS.

It is surprising the amount of lubricating oil that is wasted in the average shop during the year and that more is not seen or heard of devices for economizing the lubricant. Many repairmen make it a practise when overhauling a car to throw away the old oil. In the course of a year this amounts to considerable and it could be saved if filtered properly. One owner of a shop who watches small details very carefully to keep down the overhead expense, devised a filter which, he states, proved practical and was the means of saving many gallons of oil during a season.

The device consists of a round tank, two ordinary tin funnels, waste, an extra vessel and some metal tubing. The tank holds several gallons and on the inside are soldered rings, these forming projections on the walls to retain the funnels. A fine mesh brass screen is fitted to the upper part of the container and so constructed as to be removed, this being necessary when the filtering material is renewed.

The bottom of the tank is drilled, a .25-inch copper tube soldered and led to a container. A pet cock is installed in the line so that the dripping oil may be shut off while the receiving member is being emptied or any part of its contents is being used. The waste is fitted loosely in the funnels and when the old oil is poured in at the top of the strainer the wire screen separates bits of metal and foreign elements. The fluid then passes to the first funnel, is filtered, and thence flows to the second member where the process is repeated. The oil resulting from the process is remarkably clear and the inventor of the device states that he employs it in his car where it has given satisfactory service.

TO HARDEN SMALL ARTICLES.

To harden small tools or articles that are likely to warp in the process, the following method is recommended: Heat the part very carefully and insert in a raw potato, then draw the temper as usual.

HEAT RADIATION AND PAINT.

It is generally believed that there is a great loss in efficiency from painting radiators. A series of experiments conducted by Prof. C. L. Norton of Boston upon the transmission of heat through and from painted surfaces shows that the color has little or no effect upon the radiation of heat, though the condition of the surface with respect to glossiness or dullness has quite a sensible influence. Taking the amount of heat radiated from a new pipe as 100, Prof. Norton obtains the following values for heat radiation, under similar conditions, from pipe which was treated as indicated in the table:

New pipe	100
Fair condition	116
Rusty and black	119
Painted dull white	120
Painted glossy white	100
Coated with cylinder oil	116
Painted dull black	120
Painted glossy black	101

It will be noted that a dull surface, whether it be white or black, has a radiative power of 120, and a glossy surface of either color, has a corresponding value of only about 101.

STRETCHING VALVE SPRINGS.

Sometimes the clattering noise of the valve mechanism is due to the weakness of the springs. When such a condition exists the best method is to fit new members. Sometimes an owner will object to the expense and the only alternative for the repairman is to renovate the old springs. This may be accomplished by removing and stretching the members, by securing one end in a vise and tying a cord to the other extremity.

Great care should be exercised, however, so as not to increase the tension to a point where the springs will close the valve with so much force as to break the stems. In addition, too stiff a spring consumes extra power.

Another method is to insert washers under the lower end of the spring.

VARNISH FOR COPPER.

An excellent varnish for copper and one that will prevent the metal from oxidization may be made by mixing one part of disulphide of carbon, one part benzine, one part oil of turpentine, two parts methyl alcohol and one part hard copal. Several coats of this mixture should be applied to the metal surfaces to be protected.

ANNEALING COPPER OR BRASS.

In fitting brass or copper tubing to the car when the material is not flexible it may split or crack in the operation. This may be prevented by annealing. Heat the piece to a dull red and plunge it in cold water. easily.

Care should be exercised so as not to heat the tubing too hot.

HOW TO SOFTEN FILES.

Occasionally a file will be purchased which upon trial is found to be tempered too hard and which tears the work. This trouble may be overcome by softening the tool. Cover the member with a thin coating of light oil and hold it over the fire until the lubricant blazes. As soon as the flame runs all over the file, it should be plunged into water.

FORMULAE AND USEFUL MECHANICAL TABLES.

Use of Water on Cutting Tool.

With the best high speed steel tools a gain of 16 per cent in cutting speed can be made in cutting cast iron, steel or wrought iron by throwing a heavy stream of water directly on the chip at the point where it is being removed from the forging by the tool. Not less than three gallons a minute should be used for a two by 2.5-inch tool. The gain is practically the same for all qualities of steel, regardless of hardness and whether thick or thin chips are being cut.

Lubricant for Milling Cutters.

An excellent lubricant for milling cutters when used with a pump is made by mixing together and boiling for one-half hour, one-quarter pound sal soda, one-half pint lard oil, one-half pint soft soap and water enough to make 10 quarts.

Grades of Emery.

The numbers representing the grades of emery run from eight to 120, and the degree of smoothness of surface they leave may be compared to that left by files as follows: Eight and 10, represent the cut of a wood rasp; 16 and 20, represent the cut of a coarse rough; 24 and 30, represent an ordinary rough; 36 and 40, bastard; 46 and 60, a second cut; 70 and 80, smooth; 90 and 100, a superfine; 120 F and FF, a dead smooth file.

Patching Cement.

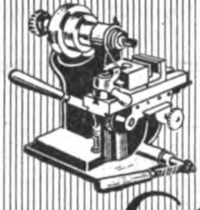
A cement for patching rubber boots and which will unite leather to leather, India rubber, etc., may be made by taking 100 parts of finely chopped India rubber, 15 parts rosin and 10 parts shellac, and dissolving in carbon disulphide. The vessel in which the solution is made should be kept tightly closed and should be shaken from time to time. Carbon disulphide is highly volatile and should not be exposed to a naked flame.

S. A. E. Horsepower Formula.

The standard formula for the rating of gasoline engines used in automobiles in this country is that adopted by the Society of Automobile Engineers, in which the bore is squared, multiplied by the number of cylinders and divided by 2.5.

The following table will be found to be of service in ascertaining the S. A. E. horsepower of four and six-cylinder motors, the bore being given in both inches and millimeters:

Bore		Horsepower	
Inches	Millimeters	Four-Cylinder	Six-Cylinder
2.500	64	10.000	15.0000
2.625	68	11.000	16.5000
2.750	70	12.100	18.2000
2.875	73	13.250	19.8750
3.000	76	14.400	21.6000
3.125	79	15.625	23.4375
3.250	83	16.900	25.4000
3.375	85	18.250	27.4000
3.500	89	19.600	29.4000
3.625	92	20.250	31.6000
3.750	95	22.500	33.7500
3.875	99	24.000	36.0625
4.000	102	25.600	38.4000
4.125	105	27.250	40.9000
4.250	108	28.900	43.8000
4.375	111	30.625	45.9375
4.500	114	32.400	48.6000
4.625	118	34.850	51.6000
4.750	121	36.100	54.1000
4.875	124	38.000	57.0000
5.000	127	40.000	60.0000
5.125	130	42.000	63.0000
5.250	133	44.100	66.2000
5.375	137	46.000	69.1000
5.500	140	48.400	72.6000
5.625	143	50.625	75.9375
5.750	146	53.000	79.5000
5.875	149	55.250	82.9000
6.000	152	57.600	86.4000



Up-To-Date Shop & Garage Equipment

SELECTING TOOL EQUIPMENT.

The small repair shop, and there are many of these, must always exist. Many owners of motor cars favor these establishments, because of the practical and skillful workmen, and the high class work performed at reasonable charges. This is due in a measure to the fact that the overhead expense is not as great as with the larger and completely equipped plant in the heart of the city.

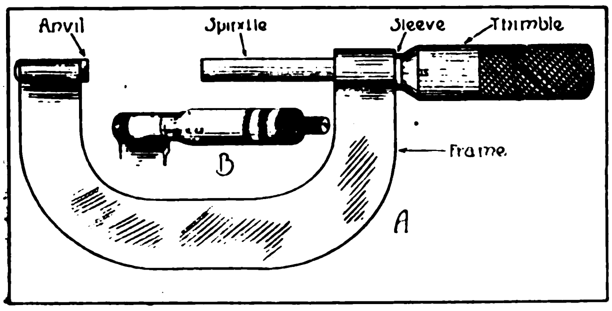


Fig. 1—Measuring Devices: A, Standard Form of Micrometer; B, Ratchet Stop.

These small shops usually make it a practise to send the greater portion of the machine work required to some outside firm, the amount of this depending largely upon the character of the work and the equipment of the garage. Some are fitted with a small foot lathe for light work while others are provided with better facilities for handling different grades.

In a thorough overhauling job there are more or less renewals to be made and some of these cannot be effected with new parts owing to their peculiar relation to one another. When the lathe is utilized to handle the piece, it is essential that the work be turned accurately and to accomplish this it is necessary that the operator be equipped with the proper measuring devices and have a knowledge of their use. It is the intention of the writer to present from time to time a description of the various tools needed to complete the equipment of the small garage, as well as to describe the uses to which they are adapted.

Micrometers.

Considering first the measuring devices: The workman should learn to understand thoroughly the necessity of close or accurate measurements. With the aid of a micrometer he will soon be able to detect differences in measurement down to one-thousandth of an inch. These instruments provide convenient as well as accurate means for fine external measurements and are made in different sizes and styles. They are graduated to read to thousandths of an inch, and one-half and one-quarter as well are estimated readily. Some of these instruments have verniers by which a still finer measurement may be made.

The chief mechanical principle embodied in the construction of a micrometer is that of a screw free to move in a fixed nut. An opening to receive the work to be measured, is provided by the backward movement of the screw and the size of the opening is indicated by graduations. A standard form is shown at Fig. 1 A, this tool enabling measurements up to one inch by thousandths.

Method of Use.

To use the micrometer the article to be measured is placed between the anvil and the spindle. The frame being held stationary, the thimble is revolved by the thumb and finger. The spindle being attached to the thimble revolves with it, and moves through a nut in the frame, approaching or receding from the anvil. The measurement of the opening is indicated by lines and figures on the sleeve and thimble.

The pitch of the screw threads on the concealed part of the spindle is 40 to an inch. One complete revolution of the spindle therefore moves it longitudinally one-fortieth or 25 thousandths of an inch. The sleeve is marked with 40 lines to the inch, corresponding to the number of threads on the spindle.

When the instrument is closed, the beveled edges of the thimble correspond with the line marked 0 on the sleeve, and the 0 line on the thimble coincides with the horizontal line on the former. If the micrometer be opened by rotating the thimble one full turn, or until the 0 line on the thimble coincides with the line of the sleeve, the distance between the anvil and spindle is .025 inch, and the beveled edge of the thimble will coincide with the second vertical line on the sleeve. Each of the latter indicates a distance of .025, and every fourth line is made longer and is numbered 0, 1, 2, 3, etc. Each numbered line denotes a distance of four times .025 inch or .1.

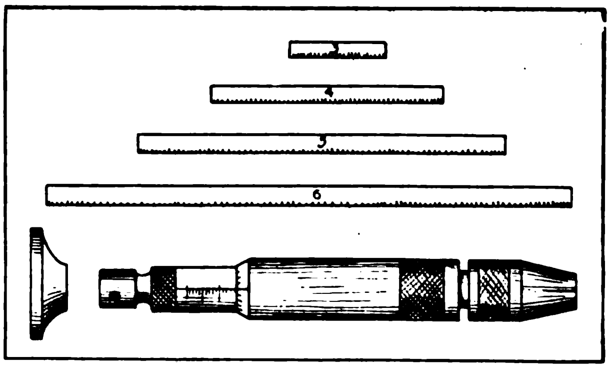

Fig. 2—Inside Micrometer Gauge for Making Internal Measurements, Such as Rings, Cylinders, Etc.

The beveled edge of the thimble is marked in 25 divisions, and every fifth line is numbered, from 0 to 25. Rotating the thimble from one of these marks to the next moves the spindle longitudinally one twenty-fifth of twenty-five thousandths, or one thousandth of an inch. Rotating it two divisions indicates two thousandths, etc. Twenty-five divisions will indicate a complete revolution, .0125 inch.

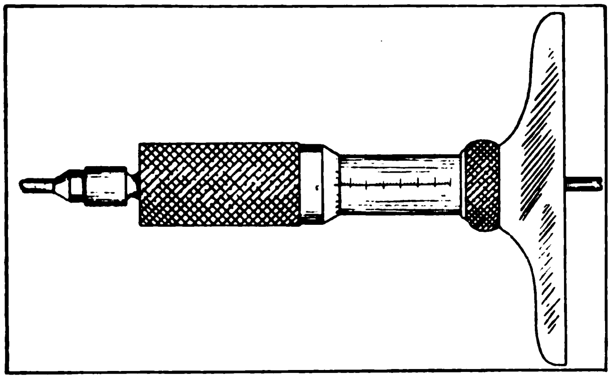

Fig. 3—Depth Gauge, Employed for Measuring Holes, Grooves and Irregular Parts.

To read the micrometer: Multiply the number of vertical divisions on the sleeve by 25, and add the number of divisions on the bevel of the thimble, from 0 to the line which coincides with the horizontal line on the sleeve. For example: If there are 10 divisions visible on the sleeve, multiply this number by 25, then add the number of divisions shown on the bevel of the thimble, which is 10. The micrometer is therefore opened 10 × 25 = 250 + 10 = 260, or 260 thousandths.

Ratchet Stop.

At B is depicted a ratchet stop. When using this device the ratchet slips by the pawl when more than a certain amount of pressure is applied, thereby preventing the measuring spindle from turning farther and perhaps springing the instrument. It is adaptable where a number of measurements must be taken quickly and especially where they are taken by more than one person with the same device, as by its use the same amount of pressure is applied to the article to be measured, in every case.

Inside Micrometer Gauges.

The inside micrometer gauge shown at Fig. 2 is designed for making internal measurements, such as rings, cylinders, setting calipers, comparing gauges, etc. It is also well adapted for measuring parallel surfaces. It consists of a holder provided with a micrometer screw and thimble, and the former has a movement of .3 of an inch. By the use of the extension rods, measurements from three to six inches may be made by thousandths. The extension member varies by inches, and should be readjusted only when the points have become worn.

Depth Gauge.

The gauge depicted at Fig. 3 is utilized for measuring the depth of grooves, holes or irregular parts. It has a one-half inch movement of the screw, reading in thousandths, and with two one-half inch and one one-inch standard collars to slip off or on the spindle 2.5 inches, readings in thousandths may be obtained. The split nut is covered and protected by a graduated sleeve, which not only protects the nut from the dirt, but provides a quick and accurate way of taking up wear and adjusting the device to insure correct reading. The sleeves being held by stiff friction, may be rotated with a spanner wrench, so that the zero lines will always coincide for correct reading. The head carries with it a knurled set screw for locking the spindle which serves to prevent changing after being set.

Other Measuring Devices.

In equipping the shop with measuring devices, calipers should not be overlooked as these tools are very essential. They are made in several forms and are not expensive, although in purchasing these members it is poor economy to select cheap instruments.

Those shown at Fig. 4 A may be used either plain or with a spring nut. The device depicted at C is an inside transfer caliper and may be obtained either with a spring or a solid nut. The bow is stiff, making the instrument reliable. It is especially adapted for calipering the inside of a chambered cavity and this is accomplished by springing in the legs so that the tool may be withdrawn. Upon releasing the grip the legs will spring back to their original position, showing the exact size of the opening calipered.

Adjustable Firm Joint Calipers.

The calipers shown at B are made in various sizes and can be instantly adjusted to their full extent, as quickly locked firmly in the joint, and are fitted with means for making a sensitive adjustment. These are an improvement over ordinary forms inasmuch as they are made with a tapering socket joint, locked or released by a partial turn of the knurled disc drawing it together. A spring washer which is fitted under the disc maintains an easy friction in the joint when it is unlocked.

In the underside of the short arm is a slot containing a stiff spring. Riveted into the middle leg and projecting through an opening in the arm, is a threaded stud on which is a knurled nut having a beveled hub, bearing against the cone in the arm. The action of the spring holding them together turns the nut, presses them apart and adjusts the legs when the point is locked. As the spring takes up all backlash the legs consequently are firm.

Calipers of Conventional Type.

Calipers of the ordinary type, yet having a well constructed joint, are illustrated at Fig. 5 A. The joint is drawn together by means of a screw and the main stud is squared and fitted to one leg, thus preventing the former from turning when loosening and tightening, insuring a smooth and more uniform friction and more or less tension to suit the user. Screw thread calipers are similar to the members depicted at Fig. 4 with the exception that the points are constructed to fit the threads to be measured.

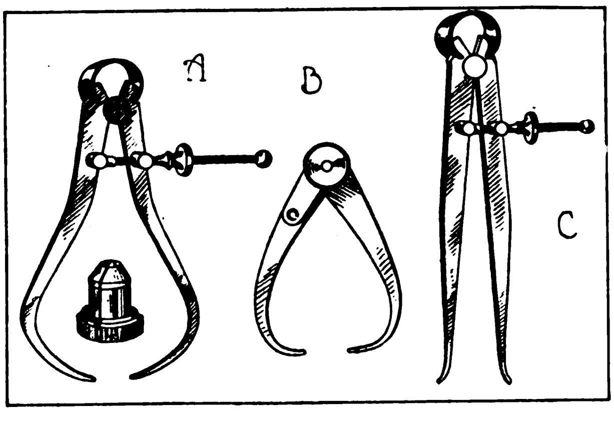

Fig. 4—Some Measuring Devices: A, Calipers; B, Adjustable Firm Joint Members; C, Inside Transfer Calipers.

Regarding gauges, these are optional and will depend on how complete the equipment is to be made. For accurate work with twist drills, and when these members are constructed in the shop, a gauge such as shown at Fig. 5 B will be useful. This provides means for measuring the members in sizes from .25 to .5 inch in diameter. Each size of the drill is designated by both common fractions, also by decimals. Number drills from one to 60 are measured by a similar instrument and the size of each drill is given in decimal fractions. Gauges are also made for sheet metal and plates, standard wire, etc.

That shown at C is a screw pitch gauge and provides for measurement of a large number of different sized members. The teeth are sharp and clean cut, and can be used inside of a nut as well as on the outside of a bolt or screw. It also provides a convenient and reliable tool to use as a 60-degree centre gauge or to test the grinding of either an inside or outside threading tool.

A machinist's pocket scale or rule should be included in every equipment. These are constructed of steel and of different lengths and thicknesses. That illustrated at D is a conventional type and is graduated in inches or millimeters. At E is depicted a form of spring dividers with solid adjusting nuts and equipped with a small handle or twirler. A spring nut may be utilized instead of the solid members.

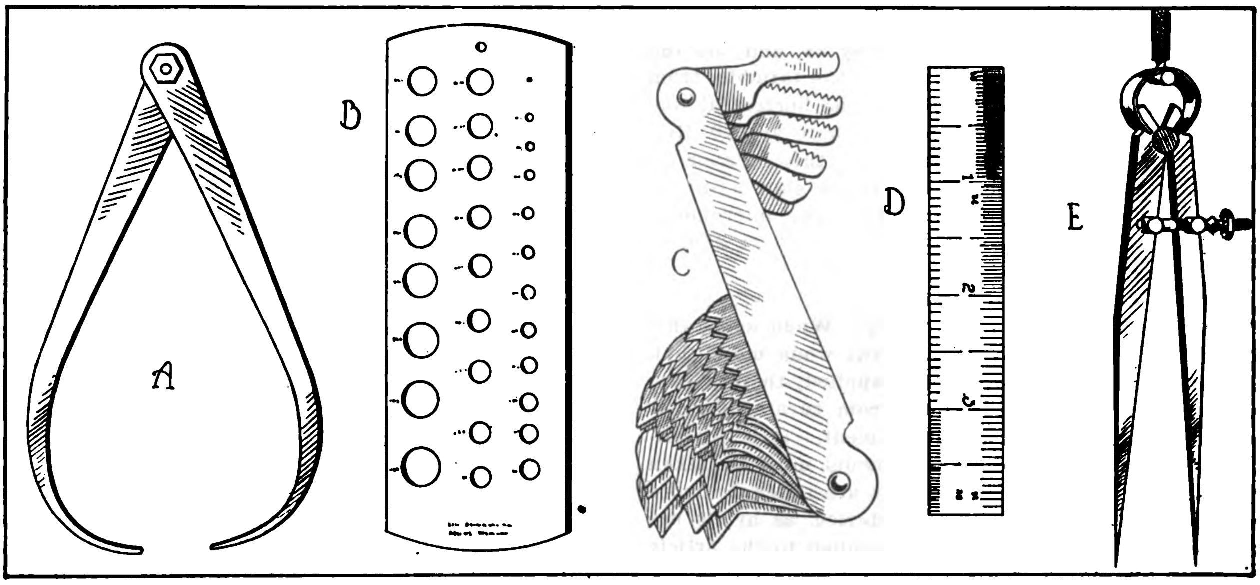

Fig. 5—Measuring Devices: A, Ordinary Form of Callipers; B, Twist Drill Gauge; C, Screw Pitch Gauge; D, Machinist's Steel Rule; E, Spring Dividers.

PROPER CARE OF CHAINS.

With the rapid development of the commercial vehicle a new branch of repairing is opened to the shop and the increasing number of mechanical transports will have a stimulating effect upon the garage. The progressive owner of the repair shop is already making preparations for this line of business and there is no reason why a well equipped shop should not be able to handle the work as satisfactorily as pleasure machines.

As the majority of the motor trucks utilize chains for final drive it is an excellent idea for the repairman to brush up his knowledge of sprockets and chains. Many workmen who graduated from the ranks of bicycle repairers will discover that their experiences with the chain driven mount will be of value.

The secret of a chain drive, aside from lining up the sprockets, etc., is proper lubrication. Chains should be removed from the sprockets and washed thoroughly in gasoline or kerosene, removing every particle of dirt. A mixture of beef or mutton tallow and flake graphite is prepared in a large receptacle and the ingredients heated over a fire. The chain is then placed in the vessel and boiled. Upon removal it should be hung up to cool. The tallow and mixture will penetrate to all crevices, filling these completely, making an ideal lubricant. Chains cared for in this manner will give efficient service.

USING TINNER'S SNIPS.

The proper use of tinner's snips requires considerable skill. These tools are not only more difficult to manipulate than a file, but far more dangerous, as if handled carelessly or clumsily the pointed blades may cause a dangerous cut to say nothing of pinched fingers. In cutting sheet metal considerable strength is required as well as skill, and experts utilize a peculiar action of the palm and thumb to open the blades after each cut.

The proper way to use these instruments is to hold the tool so that the upper handle rests against the palm of the hand and the thumb bridges the handle. The fingers are placed below the lower handle and the end of the thumb bears upon this handle just above the position of the index finger. Unless one is familiar with the use of the snips, and heavy material is to be cut, the safest and easiest method is to clamp one handle in the vise, on the principle of the stock shears, and work with the other by hand.

BALL BEARING LUBRICATION.

In assembling components of the car fitted with ball bearings some repairmen employ any kind of oil or grease, usually that which is the handiest. Makers of ball bearings state that the parts must be protected from the atmosphere and that the lubricant should be a small amount of light oil. The latter should be particularly efficacious against the action of water and one having a very small percentage of oleic acid. When the bearings are small, they should be lubricated with an oil recommended by the maker of these components.

LOCK NUT WASHER HINT.

A repairman was called on to fit some form of locking device to the bolts securing the flanged extension of the flywheel of the motor to a similar member of a planetary transmission. The owner complained that lock and other types of washers worked loose. The problem was solved easily by the workman who proceeded to take a piece of .0625-inch sheet metal which he cut to the size of the locking nut.

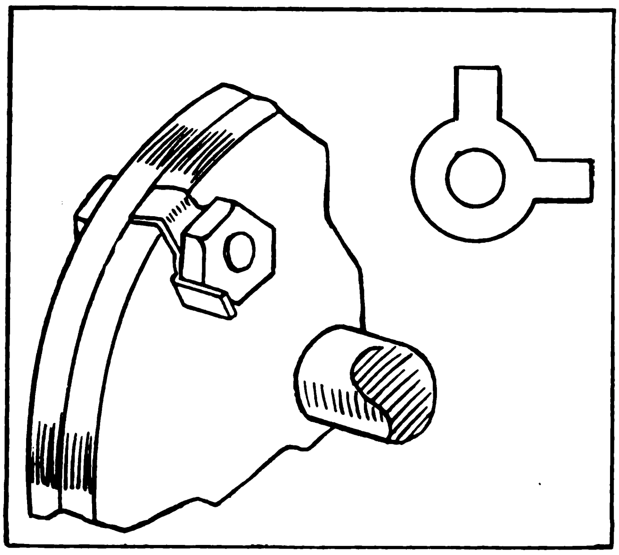

Fig. 6—Locking Device Constructed of Sheet Metal, Having Flanges to Prevent Nut from Turning.

Two arms or extensions were left on the metal and a hole drilled to fit the bolt. The device was slipped over the bolt and the nut screwed up tightly after which one of the ends of the attachment was bent over the flange of the wheel as depicted at Fig. 6, and the other projection bent to the face of the nut. This arrangement worked satisfactorily as the flange member on the nut prevented the latter from moving while the body of the washer was prevented from turning by the other extension gripping the rim of the wheel.

METHOD OF DRILLING GLASS.

Although the repairman is seldom called upon to make repairs to the accessories constructed of glass such as the windshield and lamps, the fitting of sight feed oiler tubes and dials requires a knowledge of how to handle glass, such as cutting, drilling, etc. Where a slight crack appears in a windshield further damage is prevented by drilling two small holes and fitting a device similar to that utilized on large store windows. It may be possible that an owner desires an opening cut in the windshield for use in stormy weather.

Glass may be drilled with a small tool by using turpentine as a lubricant, but this has its disadvantages inasmuch as the tool has to be resharpened frequently as well as that the diameter of the hole is apt to be larger at the top than at the bottom, also it is difficult to drill holes of equal size.

Drilling may be accomplished successfully by utilizing a brass tube of the diameter of the desired hole. The end of the pipe is trued up to secure an even bearing upon the glass and a small opening made in the side of the tube through which the abrasive is introduced during the process, this being done so that the tool will not have to be lifted during the work.

In starting the drill a piece of wood is utilized having an opening of the same diameter as the tube and the guide is attached to the work. The drill may be operated by a drill press or hand drill and during the operation the cutting paste may be fed to the tube by an oil can. If a sharp edged hole is desired, a thin piece of glass may be placed over the work and held in position by French copal varnish.

In fitting glasses to lamps, such as head or side members, if the circles be cut by the repairman the edges are likely to be jagged or rough. It is essential that the glass fit accurately and sometimes a trifle has to be removed. The rough edges may be smoothed by utilizing a bastard file kept liberally moistened with the following solution: Pulverized camphor, two ounces; sulphuric acid, six drams, and enough oil of turpentine to fill the remainder of a six-ounce bottle.

SPRING STEERING CONNECTIONS.

While provision is made in the modern car for the absorption of road shocks to the steering system, many of the older types are not thus equipped. A method of fitting a spring device to the reach rod connections as well as those connecting the steering mechanism was noted by the writer recently. The car was an old model and the steering connections were of the ball and socket type as outlined at Fig. 7. Considerable play existed which wear was taken out, and as the owner complained of these parts rattling the repairman devised the kink outlined in the drawing.

The screw bolt holes in the half to which is attached the rod, were enlarged slightly to remove the thread and a new bolt fitted, one having the thread cut up about half way from its end to the socket member. A stiff spring was placed over the bolt and a nut screwed on and up to obtain the desired tension. Cotter pin holes were then drilled and retaining members fitted as depicted in the drawing. The job was not expensive and reduced road shocks to a minimum as well as serving to eliminate objectionable rattling.

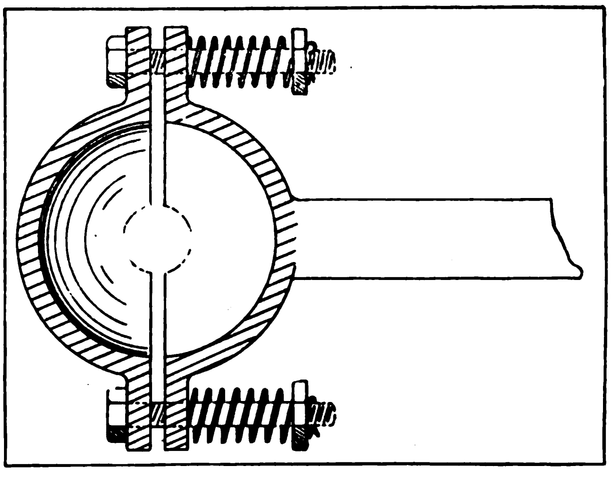

Fig. 7—Simple Method of Fitting Springs to Ball Socket Joints of Steering System.

Boxes of sawdust or fine sand are useful and should be included in the equipment of the garage, particularly as the material possesses absorbing qualities.

CORRESPONDENCE WITH THE READER.

Noting Battery Discharge.

(148)—To ascertain the condition of dry cells we use an ammeter. For testing storage battery cells a voltmeter is employed. We are told that the ammeter cannot be used for measuring the storage battery, yet we can use the voltmeter on dry cells. And I note that some lighting systems on cars using dynamos have ammeters on the dash. This point is not very clear to me and I should like to have an explanation. If the ammeter can be employed in lighting systems why cannot it be used with the straight storage battery system?

REASON.

Malden, Mass., March 30.

The use of an ammeter for testing dry cells by short circuiting it across its terminals for an instant, has proved sufficiently satisfactory for a continuation of the method. Because it is done it is difficult for the layman to understand why the same instrument is not applicable to the storage battery.

Some idea of the difference may be gained by remembering that the internal resistance of dry cells is comparatively high and the chemical action comparatively slow, while the chemical action of the storage battery is very rapid and internal resistance very low when its elements are connected, and that rapid chemical action is productive of heat. It should be borne in mind that in charging a storage battery a difference in potential between the plates (positive and negative), is created, and that if the plates were joined together the difference of potential would instantly become equalized. It is this process of equalizing that gives off the current making the battery useful. Thus it will be seen that it is desirable that the cells be discharged slowly.

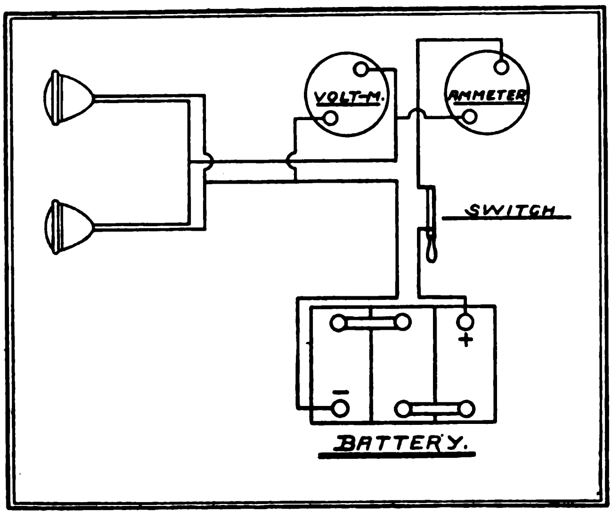

Fig. 1—Illustrating Use of Voltmeter and Ammeter in Straight Storage Battery System of Lighting.

An ammeter is of such low resistance that to all intents and purposes connecting it across the terminals of a storage battery would bring about practically the same conditions as connecting the plates directly. For this reason a voltmeter is employed because it has high resistance and requires practically no current to operate it.

Regarding the ammeters utilized in connection with dynamo lighting systems on automobiles, it will be noted that the maximum reading of the scale is from 15 to 20 and that provision is made for denoting the charge and discharge rates. These instruments indicate the amount of current being drawn from the cells, not their capacity.

Regarding the question as to whether an ammeter can be employed with the straight storage battery system, the diagram presented at Fig. 1 will show the method of incorporating both instruments in the circuits. In this installation the voltmeter would indicate the strength of the current and the ammeter the amount being drawn for heating the filaments of the lamps, which would be small in comparison with that capable of being supplied by the battery.

Irreversible Steering Gear.

(149)—Is the Ross steering gear for trucks of the reversible or irreversible type and how is the latter obtained? A. J. WHITMAN.

White Plains, N. Y., April 4.

The Ross Gear & Tool Company, Lafayette, Ind., manufactures two models of steering gears for commercial vehicles and both are of the irreversible type. The steering wheel is tapered and keyed to a tube, the lower end of which carries a steel screw, which when turned by the wheel gives a phosphor bronze sleeve longitudinal motion. The bronze sleeve, which is threaded to receive the screw, has spirals on its external face. These spirals have a very long lead in comparison to the threads on the steel screw. The malleable iron housing has spirals on its interior which engage the spirals on the bronze sleeve.

When the sleeve is given longitudinal motion by the steel screw, it also is given a rotative motion by the spirals on its exterior. The bronze sleeve, in addition to being interiorly threaded, contains a number of straight internal keyways. The lower steering arm, which projects half way up into the gear, has keys milled on its surface which fit keyways within the phosphor bronze sleeve so that when the sleeve is given rotative and longitudinal motion it operates the steering arm. The difference in pitch of the steel screw and the bronze sleeve causes the gears to be irreversible in their action.

T Head and L Head Motors.

(150)—What is the advantage, if any, of the T head type of motor over the L head design? Is either type more efficient than the other or more accessible for adjustment, repairing, etc.? INTERESTED READER.

Oswego, N. Y., April 2.

Among the advantages claimed for the T head type of motor is that its external components are accessible, such as the magneto, carburetor, water pump, etc. There are, however, many L type motors which are equally accessible as the T type and some are more easy to work upon. With the T type the valves are divided, the intake being on one side and the exhaust on the other. With the L type, the valves are all located on one side. With some designs of the latter type the valves are even more accessible than with some of the other design. Regarding efficiency as well as accessibility, it would depend upon their respective design and construction.

Specific Gravity.

(151)—I note reference made to specific gravity. What is it and how is it figured out? CURIOUS.
Newark, N. J., March 14.

The specific gravity of a substance is its weight as compared with that of an equal bulk of pure water. To ascertain the specific gravity of a substance, W = weight of body in air; w = weight of body submerged in water.

$$\text{Specific gravity} = \frac{W}{W - w}$$

If the substance be lighter than the water, sink it by means of a heavy substance, and deduct the weight from the heavier material.

Specific gravity determinations are usually referred to the standard of the weight of water at 62 degrees Fahrenheit, 62.355 pounds a cubic foot. Some experimenters have used 60 degrees Fahrenheit as the standard, and others 32 and 39.1 degrees. There is no general agreement.

Given specific gravity referred to water at 62 degrees Fahrenheit, to find weight a cubic foot, multiply by 62.355. Given weight a cubic foot, to ascertain specific gravity, multiply by .016037. With specific gravity known and weight a cubic inch desired, multiply by .036085.

Specific gravity is utilized in chemistry, and when the density of liquids, such as gasoline for example, is desired, an instrument known as a hydrometer is employed. It is usually made of glass and consists of three parts, an upper stem or fine tube of uniform diameter; a bulb or enlargement of the tube, containing air; and a small bulb at the bottom, containing shot or mercury. The last is for the purpose of making the instrument float in the liquid in a vertical position. The stem is graduated and the figures may represent either specific gravities, or the number of an arbitrary scale, as in Baume's, Twaddle's, Beck's or other hydrometers.. There is a general tendency to discard all hydrometers with arbitrary scales and to utilize only those which read in terms of specific gravity alone.

Focal Adjustment of Electric Lamps.

(152)—I have fitted a pair of electric lamps to my Ford car, but the light is not satisfactory; that is, it does not cover the road as well as did my acetylene lamps. What is the trouble and how can it be remedied? ELECTRICITY.
Cincinnati, O., March 17.

The trouble may be due to improper focal adjustment or the design of the lamp. It is possible that the former condition exists and it may be ascertained by changing the position of the lamp provided it is of the adjustable type.

Correct focal adjustment is very necessary for maximum service with electric headlights having parabola reflectors. In a gas lamp the position of the burner is usually fixed by the maker. With the electric units the manufacturer, as a rule, provides means for moving the bulb backward or forward.

Assuming that the point of travel is 1.5 inches; that is, from extreme rear position to the maximum front location. When the bulb is placed in the centre the geometrical focus of the paraboloid, for example, the reflected rays are parallel and a far reaching beam is produced. If the lamp be moved to the extreme rear point, the light rays will diverge and give more light to the side. When at the extreme front position the rays not only diverge, but cross in the process. The usual practise is to locate the focal length between .775 and 1.25 inches. Shorter focal lengths are prohibited because of certain mechanical requirements in incandescent lamps utilized.

In the case mentioned it would appear that the bulb is located too far forward and by moving it back slightly it may be possible to secure the light desired. One maker suggests the following simple method of adjusting the bulbs on the road: Place a newspaper about 100 yards from the car and adjust the position of the bulbs by means of the mechanism provided for this purpose, until the best illumination is obtained on the paper. Each lamp should be adjusted separately. This is advised as the filament of the bulbs will vary slightly. The moving of the bulb about .125 inch will make a considerable difference in the diffusion of the light.

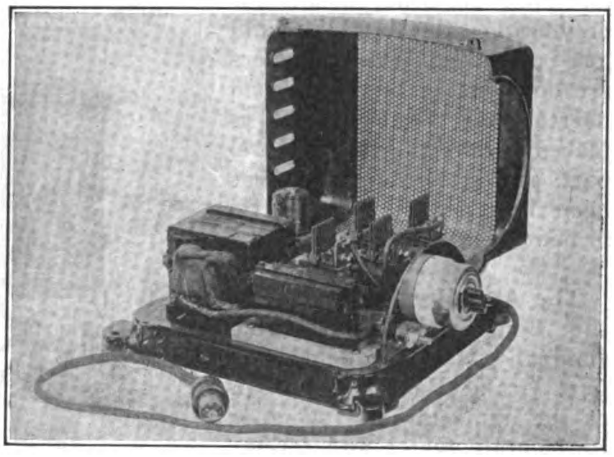

Fig. 2—Edison Alternating Current Rectifier, Adapted for Charging Storage Batteries.

Current Rectifying.

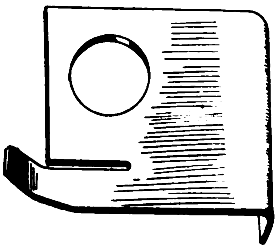
(153)—I understand that you printed an article on charging lighting batteries by an automatic rectifier. Can you give me information concerning the same and who is the maker of the device? F. A. B.
Jackson, Mich., March 17.

The article appeared in the November Accessory and Garage Journal and the instrument was an Edison alternating current rectifier which is presented at Fig. 2. It is made in two sizes, one providing a charging capacity of eight amperes and the other 16, and with the unit shown a regulating rheostat is provided. Complete information will be forwarded free of charge by the maker, Thomas A. Edison, Inc., Orange, N. J.

DESIRABLE ACCESSORIES FOR THE DEALER.

Descriptions of the Newest and Most Popular Lines Which the Up-to-Date Agent May Handle with Profit.

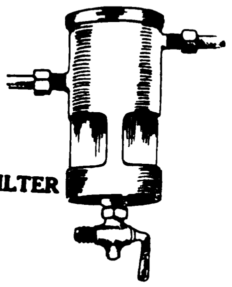
The Bartley Nut Lock and bolt fastener is the product of the Bartley Nut & Bolt Fastener Company, Pittsburg, Penn., and the maker holds that the device eliminates the use of double nuts, keys, cotter pins or other means for preventing the loosening and loss of nuts. The fasteners are constructed of mild open hearth steel. The device is placed between the nut and part, and after the former has been tightened the locking arm is bent easily into position.



BARTLEY NUT LOCK

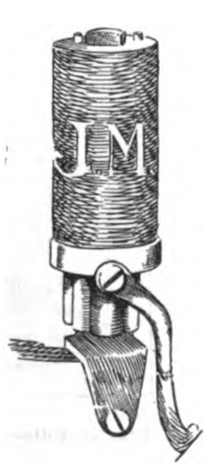
★

The Autofilter, marketed by the Bousman Manufacturing Company, 18 Plainfield avenue, Grand Rapids, Mich., is as the name implies, designed to separate water and foreign elements from the fuel and is incorporated between the supply tank and the carburetor. It presents interesting features in that the lower part of the device is provided with glass windows, making it a simple matter for the operator to note if the filter needs draining of sediment, etc. It is constructed of brass and the sight members are so secured that they are leak proof and protected from injury.

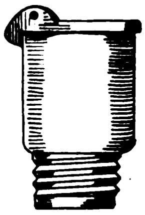


AUTOFILTER

The Ford J. M. Shock Absorbers are manufactured by the J. M. Shock Absorber Company, 210 South 17th street, Philadelphia, and are designed expressly for model T Ford automobiles. They comprise the same features of construction and material as the larger sizes. They are attached easily to the rear spring and the work does not require any change or the use of special tools. They not only serve as an auxiliary spring, making for easy riding qualities, but hold the rear wheels to the ground, insuring continuous traction. The absorbers are moderately priced and the company issues an interesting booklet which will be sent free.



J. M. FORD SHOCK ABSORBER

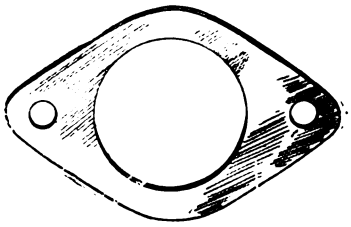


WAHLSTROM OIL CUP

★

The Wahlstrom Oil Cup, manufactured by the Wahlstrom Tool Company, 346 Carroll street, Brooklyn, N. Y., is a dust proof oiling device which is fitted by means of a screw driver, the cup having a slot for this purpose. The cover is retained by a spring which may be lifted by the spout of the oil can when lubricant is being inserted. The oil aperture is straight, permitting of cleaning with a wire. The cup comes in sizes from .25-inch, 32 threads, to .5 inch, 24 threads.

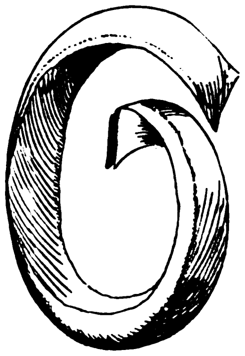
The Wilmington Gasket is the product of the Wilmington Fibre Specialty Company, Wilmington, Del., which concern specializes in hard vulcanized fibre in different forms. Although the gaskets are constructed of fibre, the material is flexible, making it an easy matter to utilize them on poor fitting joints. They are designed especially for parts subject to considerable heat and are made to meet individual requirements.



WILMINGTON GASKET

★

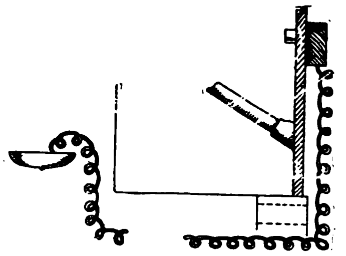
Security Reliners are manufactured by the Security Reliner Company, Inc., Montgomery, N. Y., and as the name implies are designed for insertion in the shoe to strengthen tires which have become worn and are subject to a blow-out. The reliners are constructed of high grade material and of such thickness that ordinary punctures are prevented. They come neatly rolled, are inexpensive and may be easily fitted into place.



SECURITY RELINER

The International Thief Alarm is being marketed by the International Automobile

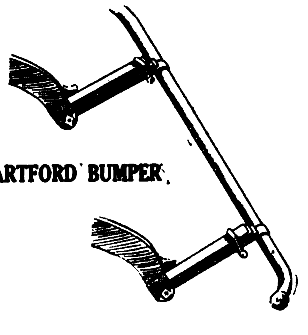
Thief Alarm Manufacturing Company, 151 West Sixth street, St. Paul, Minn., and presents interesting features in that a concealed gong of liberal size is sounded by electricity if the car is started. The device comprises in addition to the alarm, a Yale lock and a switch, the former being actuated by a key. On leaving the car the switch is locked, cutting out the current from either the magneto or battery. If an attempt is made to start the motor with the switch locked the current is diverted to the gong, which continues to ring until the switch is unlocked with the key. The working parts being concealed, there is nothing to indicate that the machine has an alarm. The equipment is complete and is accompanied by full instructions.



INTERNATIONAL THIEF ALARM

* * *

The Hartford Bumper is a recent product of the Hartford Suspension Company, Jersey City, N. J., and one of its qualities is its simplicity, both in construction and attachment. It is of the friction spring design and comprises in addition to the conventional bumper bar, two friction spring arms, two spring mounting saddle sockets, two clips or U bolts, two clip yokes and four clip nuts. Each spring arm has four leaves, which distribute the shock of collision, and not only prevent the colliding object from coming in contact with the car, but absorb the greater part of the impact, thereby saving the machine from undesirable stresses. One of the qualities of the Hartford device is that it may be attached easily by anyone, being clamped to the top of the side members of the frame, requiring but a monkey wrench to fit. It is made in four models, large, medium, small and special. The last named is designed for model T Ford cars. The maker lays great emphasis upon the fact that the construction is such that it cannot rattle.



HARTFORD BUMPER.

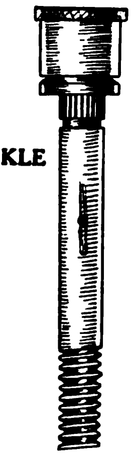
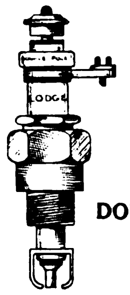
Spring and Shackle Bolts are subject to considerable wear and when not lubricated properly require replacement. The Electric Welding Products Company, Cleveland, O., is manufacturing spring and shackle bolts of high grade open hearth steel, machined, case hardened and ground to size. The bolt is provided with a grease cup with screws over the top of the bolt bed and when rotated forces lubricant through the bolt into a groove. The cap is prevented from loosening by a spring in the bolt head which engages with recesses inside the cap each quarter turn. These spring and shackle bolts are manufactured in any diameter or length to meet the requirements of the purchaser and can be utilized on cars not equipped with lubricating devices.



COMBINED SPRING AND SHACKLE BOLT

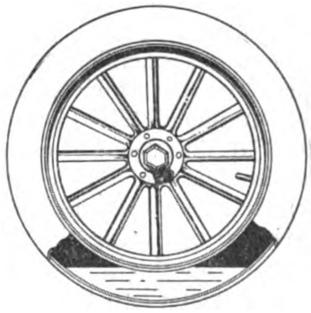
Lodge Double-Pole Spark Plugs permit of dual sparks in the combustion chamber of the explosive type of motors and without altering the ignition system, thereby increasing the efficiency of the power plant. The plug is so constructed electrically that two simultaneous flames are produced by the high-tension circuit, the installation being made easily. This is made possible by two secondary connections or terminals on the plug, to which the wires from coil or magneto are secured. The plug is constructed of high grade material and the Kimball Manufacturing Company, Motor Mart, Park Square, Boston, is agent.



LODGE DOUBLE-POLE PLUG

* * *

Sealo, manufactured by the Sealo Tire Company, 1409 Michigan avenue, Chicago, is a fluid which is injected into the inner tube through the valve stem and the maker claims that it will instantly and automatically seal punctures without loss of normal pressure. It is stated that the fluid preserves the rubber, does not cause sticking of the inner tube to the shoe, will not freeze or evaporate, and is not injurious to the paint or varnish. It is introduced by a special injection gun which is loaned by the maker.



SEALO

Recent Patents of Interest

Craig Tire Cooling Device.

Friction creates heat and to prevent the pneumatic tire from becoming overheated, Andrew B. Craig, Tarkio, Mo., has invented and patented a cooling device. The wheel is provided with a circumferential cooling tube of less diameter than the shoe and located within the latter, having ends spaced from each other. A short tube is connected with one end of the cooling tube and extends through the rim, communicating with the outside air. A pump actuated by an electric motor is located on the wheel, and is connected by tubing to the other end of the cooling tube. Cool, fresh air is thus circulated through the cooling member.

Haas Gasoline Strainer.

Cyrus A. Haas, St. Louis, Mo., has been granted a patent for a gasoline strainer which differs radically from the usual filter in that it is a tubular casing, internally threaded at one end and having a polygonal shaped plug with a reduced exteriorly screw threaded portion. A head is provided at the opposite end of the casing and means fitted for the attachment of the fuel line. The strainer is a sack of wire gauze, having an open contracted end and being secured within the bore of the plug, it being intended to prevent the release of foreign particles within the sack. The latter is fluted longitudinally and is expanded throughout its entire length beyond the contracted portion to the rounded end of same, and is adapted for movable contact with the inner periphery of the casing, an arrangement claimed by the inventor to permit of the insertion of the sack as well as turning of same.

Zwolinski Automobile Lock.

The large number of thefts of automobiles has been responsible for many locking devices to prevent operation of the car by others than those intended. Thaddeus Zwolinski, San Francisco, Cal., has been granted a patent for an automobile lock which is designed to secure the gear shifting lever in a neutral position and thereby prevent operating the machine under its own power. The device comprises a supporting bar which is secured to the frame of the chassis and has a suitable opening into which the lever is placed when in the neutral position. The supporting member has a U shaped hasp, having one leg hinged to the end of the bar and a locking mechanism carried by the other extremity. When not in service the locking member may be swung back out of the way.

Newbold Battery Terminal.

Roger M. Newbold, Chicago, assignor to the Adams & Westlake Company of that city, has been granted a patent for a storage battery terminal. It comprises flattened posts having apertures in one of their faces, these being in the form of a channel extending through the post face, and threaded studs set through each post and passing through and beyond the aperture thereof. A pair of line terminals is provided, each with an eye for engaging one of the studs, this having a flat face for bearing against the post, while the other terminal has lateral lugs for entering the post channel and nuts engaging the studs.

Green Tire Casing.

Walter R. Green, Chicago, has been granted a patent for a protective casing for pneumatic tires. It comprises a sheet metal member conforming to the shape of the shoe and means for embracing or fitting the same. The device is made in sections, two of which overlap the air valve stem and the parts are hinged. A plurality of apertured segments are provided and so shaped as to fit into the outer tire casing. The casings are secured by a nut locking arrangement and provision is made for adjustment.

Marston Signalling Device.

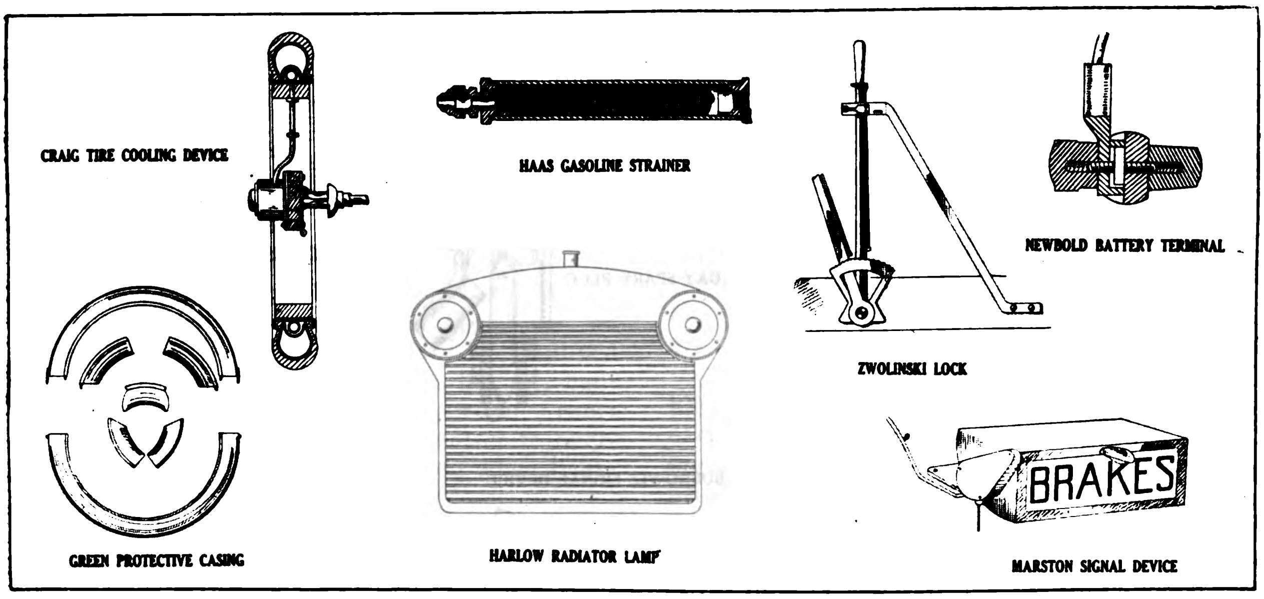
Among the inventions designed to prevent rear end collisions by notifying an approaching vehicle is the Marston signalling device, patented by Charles F. Marston, Great Neck, N. Y. It is mounted at the rear of the machine and is so arranged that when the brakes are applied for stopping the word "brakes" is shown upon a casing member. Within the latter is a journalled shaft with one end extending exteriorly and having a toothed wheel which is free to rotate. A drum turns on the casing and has an integral toothed wheel in mesh with the gear upon the shaft. The signal is mounted in the casing and is adapted to be swung by the shaft member. A flexible connection is made between the drum and the brake mechanism and operated as above described. A spiral spring is employed for returning the signal to normal position when the brakes are released. Means are provided for illumination at night by an electric lamp.

Harlow Radiator Lamp.

Don W. Harlow, Cleveland, O., has been granted a patent for a radiator lamp, the feature of which is its location in the radiator. Two are mounted in this manner and the cooler is specially constructed for the design. The lamp casing is rigidly mounted and contains the usual reflector and bulb retaining mechanism, but the glass front of the light is flush with the casing. Means are provided for adjusting the lamp.

Clark Spring Protector.

A patent for a spring protector and shock absorber has been granted Robert P. and William H. Clark, Fresno, Cal. A rigid bar is fitted and secured to the usual spring member by clips at the centre and the shape of the bar is such that a space is provided at its ends. To the latter are pivotally connected links having rollers which bear and move on the upper face of the spring when the latter is depressed. The bar device is also equipped with elastic bumpers to check the downward movement of the spring. It is claimed that the roller controls the movement of the spring in such manner that violent shocks are eliminated.



Some Recent Patents Applicable to the Motor Car, Including Protective Tire Casing, Rear Signalling Device, Fuel Filter, Radiator Lamp, Lock and Battery Terminal.

Lloyd-Horry Muffler.

A muffler for internal combustion engines that presents novel features, inasmuch as one of its walls is flexible, has been patented by Alfred Lloyd-Horry, assignor of one-half to Horace Otto Little, San Francisco, Cal. It comprises a chamber having a wall of flexible material which is clamped along its edge portions, and having its body portion free to move under varying pressures within the chamber. The usual inlet and outlet openings are provided, the outlet pipe extending into the chamber and being provided with a number of perforations. The expanding chamber is enclosed in a casing.

Burrowes Horn Device.

Edward T. Burrowes, Portland, Me., has patented an attachment for the bulb type of signal horn which is designed to prevent operation of the member when the machine is left unattended in the street or garage. A valve is incorporated between the bulb and horn, in proximity to the former, and means are incorporated for locking the valve. The latter is locked by moving the bulb into a stated position, the mechanism including a co-operating lug notch and also a spring for retaining the lug in engagement with the notch. The spring is so arranged and located between a part of the valve and wall of the casing that a constant air passage is provided. The valve structure is provided with a large opening when service of the signal is desired, and a smaller discharge aperture for egress of the air when the device is locked.

Stuller Motor Starter.

A self-starting device for internal combustion motors and utilizing compressed air, has been patented by William L. Stuller, Detroit, assignor of one-fourth to George W. Soules, one-sixth to Edward C. Campau, one-sixth to Thomas R. Bell and one-sixth to William H. Soules of the same city. The periphery of the flywheel of the explosive motor is provided with gear teeth which mesh with a pinion on the driving shaft of the starting device which is an air motor, being operated by a tank of compressed air. The pinion is attached to the shaft which moves it into or out of engagement with the flywheel as desired. The piston of the air motor actuates the pinion and the energy is controlled by a manually operated valve and means are incorporated for returning the piston to normal position.

Day Protected Spark Plug.

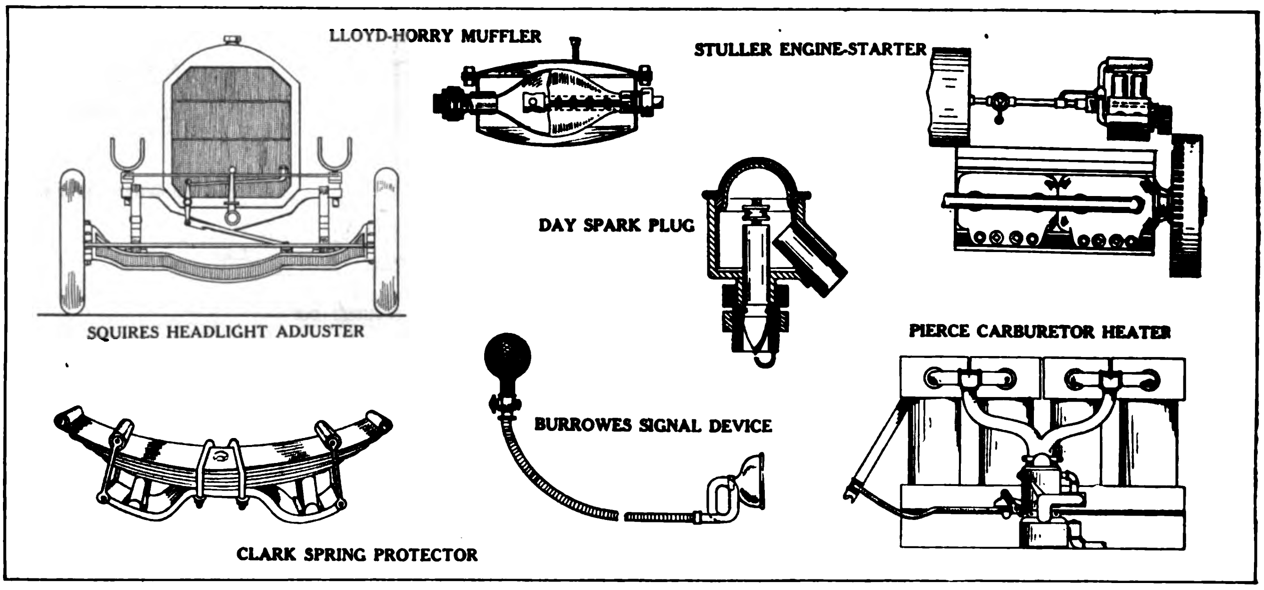
George F. Day, Winthrop, Mass., has been granted a patent for a protected spark plug, the plug proper being similar in construction to the ordinary members, but is equipped with a protective cover or hood. Instead of utilizing the usual packing nut a circular housing is screwed into the shell and the former serves for a dome like cover or cap. The cable is led through an opening in the side of the circular housing and the aperture being inclined, prevents the entrance of water or foreign elements.

Pierce Carburetor Heater.

A novel method of heating the carburetor is noted in the patent granted Burt Neulon-Pierce, Indianapolis, Ind. The heat of the exhaust of the motor is utilized, it being taken from the exhaust pipe and led through a valve and tube to the vaporizer. A valve is incorporated in the connection at the exhaust member and is operated simultaneously with the throttle of the carburetor, its object being to increase the amount of heat in proportion to the fuel utilized.

Squires Headlight Device.

Among the more recent devices for controlling the direction of the headlights in proportion to the movement of the front wheels, is the invention of Pembroke N. Squires, Canon City, Col., to whom letters patent have been granted. The lamps are pivotally mounted and connected by a rod which is actuated by another rod secured to a pivotally mounted arm on the front cross member of the frame. Mounted on the axle is an arm secured at its middle, and attached to this member is an operating rod secured to the steering mechanism. Another rod connects the axle lever with that on the frame.



Some of the More Recent Inventions Applicable to the Motor Car, Including a Muffler with Flexible Wall, Self-Starter Operated by Compressed Air, Novel Shock Absorber, Locking Device for Horn, Etc.

OTHER PATENTS GONE TO ISSUE.

Tire Mail, Joseph B. Duhring, Chestnut Hill, Penn. A tire mail comprising crossed strands of chain links, the links of one strand inclosing a single loop in the adjacent link of said strand and the superimposed link of a crossing strand.

Oil Can, Ralph A. Wakefield, Sacramento, Cal. The can is similar to those of conventional construction, but carries a spring actuated pin projecting from the bottom to the top of snout. By compressing the bottom of the oiler the pin is forced away from snout opening, allowing the lubricant to flow. Normally the spring retains the head member upon its seat, closing the aperture.

Ignition System, Edwin S. Lincoln, Brookline, Mass. An ignition system comprising a generator, an induction coil, a circuit breaker having normally contacting separable contacts, and an electro-magnet for separating said contacts, a non-interruptible circuit connecting the generator with the coil through the magnet, and an interruptible circuit including said separable contacts and connected across the terminals of said coil.

Sanding Device for Cars, George F. A. McDougall, Dorchester, Mass., assignor of one-third to Christos John Scoulikas, Boston. The mudguards are utilized to carry the sand which is released by a lever member through a multiplicity of spouts, spraying the sand in front of the traction wheels. The lever is mounted convenient to the operator of the automobile.

Fastening Device for Tires, William Robert Morrison, Chicago. A tire fastening device embracing in combination with the felloe and rim an expansible and a contractible clamping ring between the wheel rim and the expansible clamping ring on each side of said wheel rim. The rings act mutually to draw a tire about the wheel, and an angled guard ring secured on each side partly covers the rings and co-operates in retaining the guard rings, which are anti-skidding members.

Valve Spring Compressor, Axel Peterson, New York City. The device is a valve spring lifter comprising a beam having a laterally projected fork at one end to engage the valve spring, while the other extremity has a pivoted rod and a lever. Moving the lever contracts and retains the valve spring as well as locks the tool.

Rubber Tire Protector, Joseph A. Utter, Crawfordsville, Ind., assignor of one-half to John F. Utter, San Francisco, Cal. It comprises an annular, trough shaped tire protector having interengaging notches in its opposite edges adjacent its ends, the bases of the notches being located in the median line of the protector.

Inner Tube Guard, Siegfried Goodman, Bayonne, N. J. It comprises a casing of strips of textile fabric cut diagonally to the weaves thereof and having V shaped incisions formed at both edges. The latter are brought together by strap devices arranged in pairs.

Automobile Buffer, Allan L. McGregor, Chicago. An automobile bumper device having a buffer bar, clamps for securing to side bars and slidably mounted cushioning springs on arms.

Exhaust Silencer, Franz Emil Wolf, Nowawes, near Potsdam, Germany. A muffler having a plurality of plates fastened together in space relation and so arranged that the noise of the exhaust is throttled.

Puncture Proof Inner Casing, Thomas F. Shiels and Willis Ray Bolter, Lowell, Mich. An inner casing for pneumatic tires comprising a puncture proof fabric formed of an outer layer of canvas, layers of woven cane and other layers of fabric and rubber, the members being vulcanized together. A ring device is utilized for securing the casing.

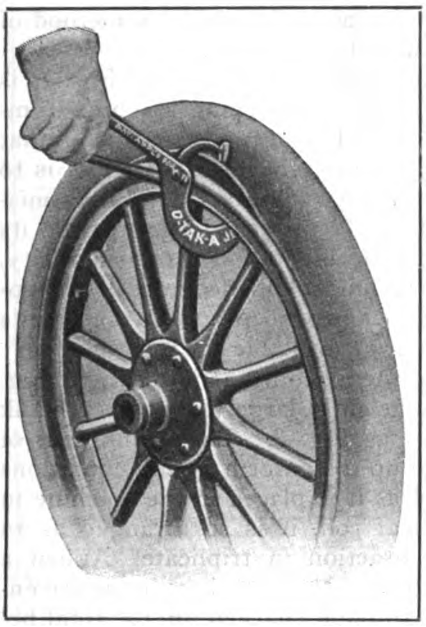
Wrench, Charles A. Bancroft, Norfolk, Va. A wrench having a nut engaging device mounted in the body portion, a pawl pivotally mounted and means for engaging rotating member operated in either direction.

Nut Lock, Charles Thomas Hunt, Los Angeles, Cal. A nut lock comprising a thin annular washer, with a narrow slot therein, and a tooth at each end of the slot projecting inwardly and adapted to engage the bolt.

Carburetor Temperature Regulator, Davis Barnard, Los Angeles, Cal. A thermostatic air regulator, a casing, means to conduct cold or hot air to casing, one inlet being regulated by a manually operated shutter while the other side is actuated by a thermostatically operative damper, and a thermostat to operate said damper.

O-TAK-A TIRE REMOVERS.

Regular Tool Is Supplemented by a Junior Adapted for Cars with Clincher Tires.



Showing the Application of O-Tak-A Junior to a Clincher Tire.

Announcement is made by J. W. Grumiaux, sales agent, Le Roy, N. Y., of the O-Tak-A Junior, a special tool for removing clincher shoes, designed and specially adapted for Ford, Metz and Brush cars. It is suited for all clincher shoes and the principle is identical to that employed on the O-Tak-A tire tool. It will loosen a clincher shoe from the rim and push it back far enough so that the bead may be pried out easily. As will be noted by an accompanying illustration the tool is equipped with two tong like extremities having handles which when brought together exert such pressure that it is a simple matter to overcome the resistance of the shoe even when badly rusted to the rim.

A feature of the design is that one tong fits the inside rim while the other has a projection so designed that when pressure is applied the bead is forced slightly downward and back. This prevents the tool slipping and at the same time energy is applied to the bead and not the walls of the casing. After the contact between the bead and rim is broken a further movement of the tool carries the shoe up and away from the rim, making it an easy matter to remove it. The O-Tak-A Junior is not only inexpensive, but it will not injure the paint, and being compact may be easily stored in the tool box. The method of applying the device is shown in an accompanying illustration.

The O-Tak-A differs from the Junior in that it is adapted to quick detachable and demountable rims. It may also be employed for large clincher tires, a small attachment being slipped over the nose of the plunger converting the tool into one suitable for this work. The large design is made in two sizes, the No. 1 fitting tires up to and including four inches and the No. 2 four inches and over.

The tool in service is shown in an accompanying illustration and it will be seen that the nose of the plunger passes over the locking ring of the tire and acts at right angles to the plane of the wheel. The tool locks at its extreme inthrow, being set so as to hold the inner ring just back of the flange of the locking ring, permitting easy removal of the latter and the tire. As it locks automatically the operator has both hands free to handle the shoe and locking ring. The yoke carries an extension which comes in contact with the under side of the rim extending beyond the felloe. This acts as a shoulder and prevents the tool from slipping.

A quality of the device is that tires may be removed from demountable rims easily and quickly either on the car or in the garage, a task usually involving considerable labor, especially some types of rims that require considerable pressure. The O-Tak-A, either large or small, is constructed of high grade material and is guaranteed to perform the work claimed of it. It is finished in aluminum or nickel.

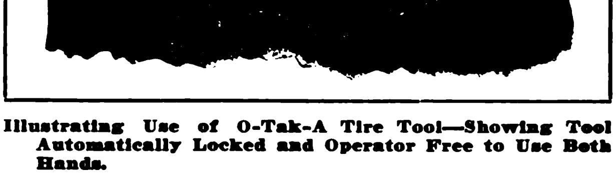
SECURES MANUFACTURING PLANT.

New Detroit Concern to Produce Automobile Fenders and Stamped Steel Goods.

John W. Murray, formerly connected with the Michigan Steel Stamping Company, Detroit, has purchased the buildings and site at Clay and Michigan Central streets, formerly occupied by the Old Crown White Lead Company, and will begin the manufacture there of automobile fenders and other articles in stamped steel.

Machinery has been installed and operations have been begun. There are two brick buildings, each two stories high, and a frame structure, giving a total floor space of 22,000 square feet. The property, which was formerly owned by the Acme White Lead Works, is valued at $50,000.

Bringing to a fitting close a day at the factory, the Ford Motor Company, Detroit, maker of Ford cars, recently entertained more than 500 branch managers, dealers, bankers and others from Indianapolis, Ind., Columbus, O., and Pittsburg, Penn., at the Hotel Tuller, Detroit. Norval A. Hawkins, sales manager of the company, was toastmaster.



Illustrating Use of O-Tak-A Tire Tool—Showing Tool Automatically Locked and Operator Free to Use Both Hands.

AUTOMATIC GARAGE ACCOUNTING SYSTEM.

New Bookkeeping Machine Is Ingenious Monitor of Owner's Business—Prevents Irregularities, Compels Honesty, Eliminates Lost Charges Through Carelessness.

WHEN a garage proprietor arrives at the conclusion that he is not securing the profits to which he believes his investment entitles him he immediately institutes an inquiry into his business in an effort to locate the difficulty. Possibly he may discover it, but unless he has been keeping close account of the activities of the various departments he will be confronted with a difficult task. He may conclude that locating the leak is impossible, but he is not pleased with the idea of again facing the deficit he has just encountered. Logically, he begins another and different kind of search, that of securing a corrective.

He realizes that his only certain remedy for leaks, which cause a severe drain upon his resources, if not an actual deficit, is the inauguration of a system of account keeping, which he may have neglected principally because he was too busy to consider the matter and because his business was in a flourishing condition. It is only when he is confronted by a big leak that he appreciates the need of system, but his most serious concern is then found to lie in its selection.

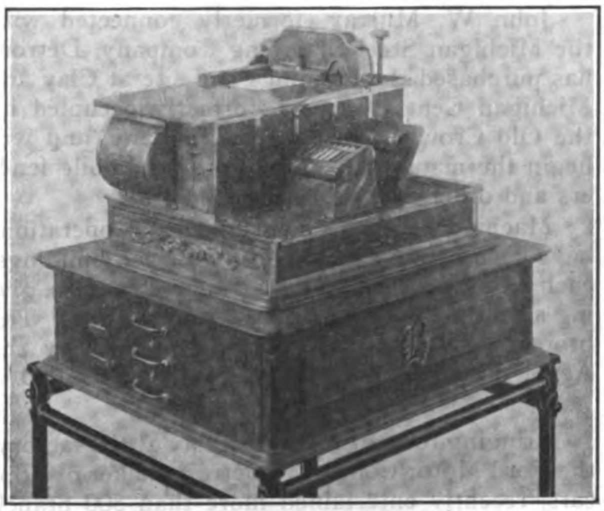


Fig. 1—The Hainer Bookkeeping Machine, with Index Drawers Forming Base.

There are many systems. Some of them are efficient. Others are unwieldy and cumbersome, and the garage man's concern is in adopting one that is simple and at the same time amply efficient. Numerous good systems, suitable for large and small garages alike, have been presented in these columns. All of these methods of account keeping have been simple and easy to understand, and their efficiency has been demonstrated by usage in prosperous garages.

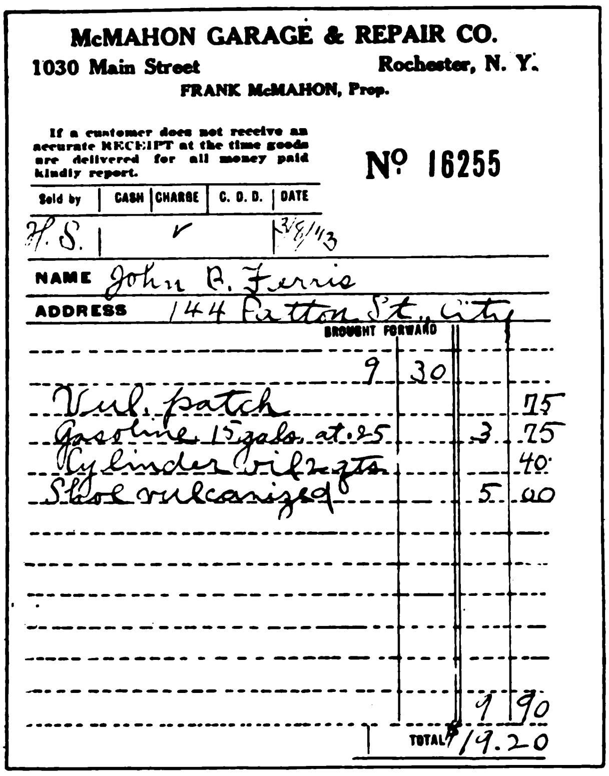
The system here introduced is in all essentials extremely simple and is applicable to the largest as well as to the smallest garage in existence. It consists of a bookkeeping machine that eliminates the necessity of maintaining a set of books, such as ledger, day book, cash book and the numerous other books incidental to the ordinary method of tabulating business transactions.

This machine, which is shown at Fig. 1, is made by the Hainer Bookkeeping Machine Company, Providence, R. I., and is so constructed that it may be applied to any business. Its aim is to provide against the possibility of leaks or mistakes in accounts. Its principal features are its compactness, practicability and utter simplicity, and it needs no technical knowledge of bookkeeping to operate so as to keep accurate accounts that instantly can be available for reference.

In the top of the machine, as is shown at Fig. 1, is a space sufficiently large to expose a blank form, illustrated as Fig. 2. This blank can, of course, be made up to conform to any conditions of business, and as it is placed in the machine in a large, loose leaf roll, it is so arranged as to record each transaction in triplicate. When a transaction is concluded the various items are entered upon this roll and charged up, the total being placed at the bottom of the sheet in the space provided. A lever at the left side of the machine is then turned and the apparatus automatically discharges two duplicate sheets into the hands of the operator, one of which is of white paper and the other pink. The triplicate yellow leaf is simultaneously deposited in a locked record chamber at the rear of the machine. The key to this locked compartment is usually kept by the proprietor of the garage, while the employee files the pink sheet in any place which may be so designated, giving the white sheet to the customer to serve in the nature of a receipt or as a bill for the transaction.

Thus it will be seen that the proprietor of the establishment can utilize the yellow sheets taken from the locked chamber to check against the pink slips placed on file by the employee or employees. There is also the record given to the customer, who may or may not keep this for his own use to check against his bill when it is submitted to him. If he does not retain it, it is obvious that he can have no legitimate complaint against a bill, inasmuch as he possessed a record of the transaction at one time expressly for such a contingency.

The Hainer bookkeeping machines can be purchased, at the option of the buyer, with a base composed of three or more drawers, the number of the latter depending upon the amount of business which is to be intrusted to them. In them an account file is arranged. In the view at Fig. 1 three drawers are shown. The cash drawer forms the base of the machine itself, at the top of the stand containing the three drawers. If the business is of such magnitude that many hundreds of accounts are maintained, it is obvious that a greater number of drawers will be needed. At Fig. 3 is shown the interior arrangement of the drawers. In this specific instance 100 automatic accounts are shown.



McMAHON GARAGE & REPAIR CO.

	BROUGHT FORWARD		
	9	30	
Vul. patch			.75
Gasoline 15 gals. at .25		3	.75
Cylinder oil 2 qts.			.40
Shoe vulcanized		5	.00
		9	90
		TOTAL $	19.20

Fig. 2—Complete Bill, Showing Amount Brought Forward, Itemized Account of New Transaction, the Total and Beneath It the Grand Total of Bill.

Each account occupies but a single line and it never needs any more space. With this arrangement, when an employee gives a record to a customer, the pink slip is inserted beneath the name in the file. For instance, in the case shown at Fig. 3, when John B. Ferris' account is totalled and the amount, $19.20, placed in the space at the bottom of the blank, the name plate is raised, the blank is slipped beneath it and the plate is restored to its former position, leaving only the total amount visible. Under the slip just inserted are the items of the preceding slips. When looking at the index the employee also is looking at the account without having to search it out afterwards. Space is conserved by each account underlapping the one just above it.

It must be admitted that many garage owners do not care to have their accounts available for employees to inspect, thus enabling them to determine exactly the status of the business as well as can the proprietor himself. In this event the lower portion of the machine can be placed in the office, the machine itself being left where the employees may operate it. The blanks are then deposited in a box or other suitable receptacle, from which they may be taken by the proprietor once or twice daily and filed in the cabinet in the office. He thus is able to preserve his accounts up to the minute and upon inquiry can inform a customer the status of his bill without delay. He has no books to maintain and needs none, all transactions being recorded in the machine.

At the right of the blank form in the top of the machine is a cash tally roll. After an entry is made a plunger, which may be seen in the right of the machine at Fig. 1, is pressed down, and the cash drawer immediately opens. Cash transactions are registered on the blanks similar to charge or C. O. D. accounts and record of these is also made in triplicate, a yellow sheet being deposited in the locked chamber. Thus an accurate record can be kept of cash receipts and it is impossible for an unscrupulous employee to alter an account without detection. Should he do so it would be discovered when checking up the slips filed in the index with those deposited in the locked compartment. It is obviously impossible for an employee to accept payment of an account and place it in his pocket without registering upon the machine, for no customer will pay a bill without receiving a receipt. In order to secure this the machine must be operated, thus disclosing the transaction. Furthermore, the garage management makes it plain to patrons that they must take a receipt for all items as a safeguard against possible errors.

Whether it be a cash or charge account, each blank is made out in detail and the proper charge recorded against each item. Thus, these itemized bills can be used to check against the various other departments, such as stock and supplies, etc. Most large garages maintain a system of stock requisition and receipt, in order that it may be known when and for what the stock is used. The stock clerk gives a receipt to the mechanic in return for the stock requisition sheet presented by the latter. These are checked against each other in order to keep track of supplies used. Since stock is usually required for certain jobs, it is charged up on the bill which passes through

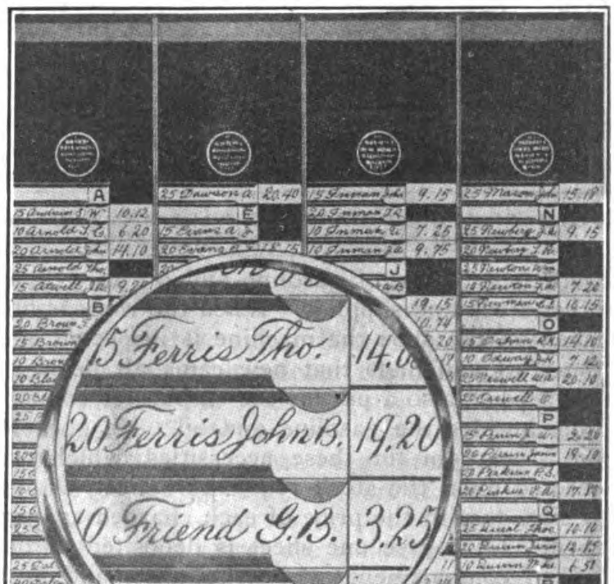

Fig. 3—Interior Arrangement of Index Drawer, Showing Appearance of Account at Fig. 2 After Filing.

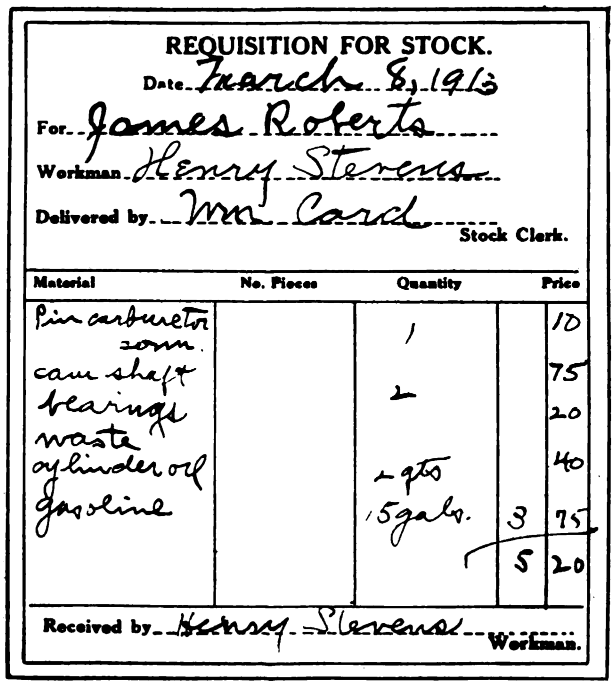
the bookkeeping machine. These bills can be checked against the stock sheets to determine the correctness of the stock tally.

In one large garage a second machine is also used in the stock department, in addition to the one used for cash and charge accounts. This machine is fitted with a blank arranged as a stock requisition sheet, which is filled out by the stock clerk, who also affixes the price of each article opposite. As the blank is made in triplicate the workman and clerk each retain one to prove that the material was delivered and received.

To show the process of a job, James Roberts drives his machine into the garage and requests that a shoe be vulcanized, his carburetor readjusted and the machine generally inspected. He also wants 15 gallons of gasoline and two quarts of cylinder oil. These items are placed upon a repair tag which is attached to the car. To facilitate business, it is assumed that the stock clerk has charge of gasoline and oil as well as other stock and supplies. When the work is finished on the shoe the machine is inspected and the workman finds that new camshaft bearings are needed, also a pin for the carburetor connection, besides the gasoline and oil. He goes to the stockroom for these necessities, which are entered upon the stock requisition sheet, shown at Fig. 4, with the price of each charged against them. Of course one sheet is deposited in the locked compartment, while the white and pink sheets are received by the clerk. The latter retains one and gives the other to the workman as a receipt. It will be seen that three records are kept of each transaction for comparison, the clerk's, the workman's and the proprietor's.



REQUISITION FOR STOCK.

Date March 8, 1913

For James Roberts

Workman Henry Stevens

Delivered by Wm Card Stock Clerk.

Material	No. Pieces	Quantity	Price	
Pin carburetor conn.		1		10
cam shaft bearings		2		75
waste				20
cylinder oil		2 qts		40
gasoline		15 gals.	3	75
			5	20

Received by Henry Stevens Workman.

Fig. 4—Stock Requisition Blank, Which Also Serves as Receipt to Workman and Stock Clerk.

When a job is completed the workman enters the various items upon the customer's bill in the bookkeeping machine, utilizing the stockroom prices as put upon his receipt by the stock clerk. The latter has an index file in his machine also and each slip is placed where it can be immediately available for comparison with the accounts maintained in the office machine. Charges for storage, washing, polishing, etc., are familiar to the workmen, information of doubtful charges for special repairs being secured from the foreman.

In the event of a record being lost, there is no possibility of a lost charge as is the case with many systems of bookkeeping. If all were lost there is still the record in the locked chamber to reveal the transaction, while at the same time it prevents collusion between dishonest employees. Happily, these are infrequently encountered, but the human equation is a possibility that a business man cannot afford to overlook.

In a small garage such an elaborate system is not necessary, for the proprietor is usually at hand to attend to the business himself, and the machine adequately and effectively cares for all accounts with a minimum of labor and with no necessity of keeping books. Once installed it is easy to manipulate. There is no complicated machinery to keep in order and when one roll of paper is exhausted another may be inserted by merely lifting the top of the machine, which swings upward on a hinge, thus exposing the interior. When the roll has been inserted in position the yellow sheet is drawn over the writing base at the top, a piece of carbon paper being placed above it. The same process is repeated with the pink sheet and the white sheet is placed over last, as this sheet receives the first pencil impression. At the side of the writing base is a sort of clamp, which fits closely over the edge. The carbon paper is folded under and around the edge of the base and the clamps at the sides securely fasten it. As the paper roll is of less width than the base, it escapes the clamp and with each turn of the machine it slides along easily, while the carbon paper is held in position for use on the next sheet.

This is considered the best method of taking the triplicate, although if a purchaser desires, carbonized paper can be furnished. This is a matter of individual taste and the results obtainable are the same. Each roll contains 15,000 sales slips and orders for these can be placed according to the volume of business done. The machines can be adapted to any condition of business and are furnished according to the desires of the customer. The machine itself is separated from the base if desired, in order that the index file may be maintained apart from prying eyes. In short, the advantages of the system may be summed up as follows: There are no books requiring after work on accounts, which are always up to the minute; a lost slip does not endanger an account; protection against the failure to make a record and against errors in accounting and swiftness in recording an account. The machines can be purchased upon favorable terms and in any style desired, the price for a complete equipment being exceptionally reasonable.

MAXWELL ABSORBS FLANDERS.

Formal Announcement Indicates That Previous Information Was Somewhat Premature.

Announcement is made by the Maxwell Motor Company, Inc., that arrangements have been completed for the acquisition by it of the property and business of the Flanders Motor Company, subject to the necessary corporate action on the part of the two companies, which it is expected will be obtained shortly. Pending the transfer to the Maxwell company of the property of the Flanders company, the latter will be operated as a branch of the Maxwell Motor Company.

Commenting upon the formal announcement, a prominent officer of the Maxwell company stated that while it was generally understood in the trade that the Flanders company was already a part of the Maxwell concern, this was not so, action being delayed until inventories were taken, audits made and other matters straightened out. Simultaneous with the absorption of the Flanders Motor Company, the financial and accounting officers of the Maxwell company were removed to Detroit. That city now becomes the centre of operations for the new concern.

PURCHASES DETROIT FACTORY.

Peninsular Lead Works Plant Acquired by Syndicate Interested in Automobile Parts.

K. S. Morgan, representing a syndicate which will manufacture automobile parts, has purchased the three-story solid brick factory at Lieb and Guoin streets, Detroit, of Edward J. Schmidt, who made the sale as president of Traugott Schmidt & Sons. The consideration is said to have been $40,000 cash.

The plant, which has a frontage of 250 feet and a depth of 125 feet, was erected by the Peninsular White Lead Works, and has been successively occupied by the Schmidt company and Keen & Co., maker of automobile parts. Improvements to the property are being made with a view to beginning immediate operations.

BRANCH FACTORY IN TOLEDO.

Perfection Spring Company to Erect Plant Near Willys-Overland Property.

It is announced that the Perfection Spring Company of Cleveland, O., is to build an automobile spring plant at Toledo, O., and construction work will begin in a few weeks. The Perfection company recently purchased six acres of land, situated between the Willys-Overland company and the boulevard, with railroad frontage.

According to Christian Girl, president of the company, the capacity of the plant when finished will be 9000 tons a year. A large portion will be run exclusively for the Willys-Overland company, with which the spring concern has long time contracts. About 100 men will be employed at the start, but later it is expected that fully 800 men will be engaged.

MILLER'S ANNUAL CATALOGUE.

Attractive Cover Design Adequately Forecasts Nature of Its Contents.

The 25th annual catalogue issued by Chas. E. Miller, 97-103 Reade street, New York City, still further accentuates the pioneer position occupied by this house in the automobile accessory field. This edition was ready for distribution about April 10. A reproduction of the front cover is presented herewith, and it will be conceded that it is one of the most artistic yet developed by that concern. The appearance thereon of the automobile, motorcycle, motor boat and aeroplane, indicates in a striking manner the nature of the accessories carried in stock.

Presenting the Cover Design on Chas. E. Miller's Annual Catalogue.

The year 1913 marks a new departure, in that the policy of the house has been extended to include delivery of goods to any part of the United States by freight, express or parcel post. Although 15 branch stores are maintained in New York City, Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.: Detroit, Mich.; Cleveland, O.; Philadelphia, Penn.; Atlanta, Ga.; New Orleans, La., and Newark, N. J., in addition to the main headquarters, this plan virtually places the immense Miller service in direct reach of all. The catalogue is complete in every respect, Miller's position as manufacturer, jobber, importer and exporter, being somewhat novel in the industry.

NEW YORK SEEKS DETROIT'S PLACE.

SEVERAL cities throughout the country have envied the position held by Detroit in the automobile industry, and during the past year or more chambers of commerce and merchants' associations have been exceedingly busy in an attempt to secure additional motor car factories. Early in the month the industrial bureau of the merchants' association in New York City held an informal dinner at the Hotel Brevoort, at which a number of automobile manufacturers and dealers were present by invitation. The object of the meeting was to discuss fully the possibilities for encouraging the motor car industry to locate in that city.

As a result of this conference, the industrial bureau, of which Henry Morganthau is chairman, has issued an appeal to the industry comparing the advantages offered by Detroit and New York City. In this it is admitted that Detroit now is the predominant centre for the manufacture of automobiles, but the reasons do not appear to be exactly clear to the committee. The statement reads in part as follows:

Advantages Offered by Detroit.

Two or three of the large manufacturers began operations in Detroit, but there seems to have been no special advantages over other cities in the Middle West. Having acquired an early lead in the industry, Detroit became more and more advantageous to the manufacturer on account of the many lines of subsidiary industries which have been built up there, inasmuch as the manufacturing of automobiles is largely becoming a process of assembling.

The labor market in Detroit is said to be excellent, because the mechanics there are largely specialized. During the last two or three years the trend of the automobile market has been westward and now the great consumption of pleasure cars is in the Middle West; hence Detroit is conveniently situated as regards the large market for pleasure cars. Detroit is also near the raw materials. In addition to these many advantages, Detroit offers the automobile manufacturer a liberal banking policy.

Some Disadvantages.

While these advantages are in the main true of Detroit, many of them are passing away because of the very concentration of the single industry there and the points mentioned are becoming positive disadvantages. These disadvantages may be briefly enumerated:

1—The demand for labor is greatly in excess of the supply. A statement has just come, backed by the authority of the employment exchange conducted by the State of Michigan, that the price on common labor will reach 30 cents an hour in Detroit before the end of this year. The demand for every kind of skilled labor, which is so large in the automobile industry, is becoming acute in Detroit.

2—The housing facilities of Detroit are absolutely inadequate to meet the demand and the building operations of the city are not being carried on with sufficient rapidity to offset the increase in population.

3—Detroit has grown so rapidly that it is quite unprepared to cope with its new responsibility. The street car lines, for example, are inadequate and many of the workers in the factories at some distance from the residential section of the city are held up for long periods in the evenings before they are able to get cars.

4—Shortages of freight cars in Detroit which have been in evidence during the past year and up to the present, have proved a great handicap to the automobile manufacturer.

5—While it is true that the banking institutions in Detroit have been on the whole favorable to the automobile industry, the soundness of the financial condition there is questioned by some. The resources of the banks are perhaps too intimately bound up with the automobile industry. Liberal loans to comparatively insecure automobile manufacturers are said to be uncomfortably common, and one or two failures among either the manufacturers or the banks would cause trouble.

6—In short, the very concentration of the industry in Detroit has brought with it serious disadvantages. The automobile industry is in the same situation as the man who put all his eggs in a single basket.

Attractions in New York.

Now, can New York become a great centre for the manufacture of automobiles? Perhaps, to the casual observer New York might not seem to offer many advantages, but to the manufacturer who is carefully studying the situation New York does offer many advantages which are scarcely equalled by any in the Middle West.

Land values in New York—if we mean Manhattan—are pretty high, and it would not be good policy to locate in Manhattan a plant covering large acreage. But in the wide areas in Brooklyn, Queens, Bronx and Richmond land can be purchased and carried almost as cheaply as in any city in the country.

New York City is not distant from the raw materials, either the raw stuffs which go into the automobile, or the manufacturers who make the various parts. Many of the best automobile steels are made in Pennsylvania, near Philadelphia, and many of the most superior parts are manufactured in and about New York—castings, forgings, drop forgings, etc. New York is becoming a greater and greater centre for the manufacture of accessories, which go into the automobile.

Labor Situation and Market.

It is often urged that labor is high in New York. Labor may be somewhat higher than in a small country town, but it is not higher than in many of the automobile manufacturing centres of the Middle West, where the demand for labor has become acute. In addition to this, the supply of labor in New York, both skilled and unskilled, is large and diversified, and the amount of labor which a manufacturer in New York can command at his doors gives him the ability to "pick and choose." The unions are not recognized in the metal trades in New York City.

In addition to these advantages, New York is the centre of a tremendous market. Within 200 miles of New York City there lives almost one-fourth of the total population of the entire United States. Within 400 miles of New York there is almost one-third of the total population of the country, and within a 200-mile radius there is probably one-half of the producing power of the entire United States. Probably not less than 10 to 15 per cent. of all pleasure cars manufactured in the United States are marketed in a territory within 100 miles of New York City.

Financial and Selling Advantages.

The financial advantages of New York are absolutely the best in the country. If the New York banks have seemed somewhat unresponsive to the automobile industries, it is unresponsiveness born of experience. The New York banks are willing to extend credit to the automobile industry on exactly the same conditions and principles as to other industries.

More important, perhaps, than many of these advantages is the possibility of the New York manufacturer reducing his heavy selling expenses because he can combine under his immediate supervision the manufacturing, selling and service divisions of his business. The advertising value of a location in New York City is of tremendous advantage. It is natural that the citizens of New York should look to the New York manufacturer.

The Export Trade.

The American made automobile is already invading the foreign market and the lowered tariff which is likely to come in the near future will increase our commercial relations with European countries. The New York manufacturer of automobiles will reap the immediate advantages.

New York City offers large natural inducements to the manufacturers of automobiles, even though there may be some disadvantages. It may be that land values and rentals are somewhat higher in New York than in some small western town, but there are advantages on the other hand which compensate. There are acres and acres of comparatively cheap land in the immediate vicinity of New York—in Queens, in Brooklyn, in the Bronx and in Richmond—which will furnish sites for some successful automobile manufacturers who realize the great advantages which the New York market has to offer.

A Correction.

In the February issue the address of the Planhard Manufacturing Company, maker of the Planhard carburetor, was given as Kokomo, Ind., and Philadelphia. It should have read 1790 Broadway, New York City, with factory at Kokomo, Ind.

A half interest in the Pumpelly Battery Company, Indianapolis, Ind., has been purchased by Sidney W. Elston, who becomes secretary and treasurer.

FISK RUBBER WINS SUIT.

Thropp Tire Patent Held to Be Invalid by Reason of Anticipation.

The United States court of appeals for thefirst district, New York City, has rendered an important decision affirming the decree of the district court, which held that the claims of United States patent 822,561 to P. D. Thropp were invalid by reason of anticipation. Suit was brought against the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, for infringement of this patent, which it was alleged covered the form of mold used in the manufacture of tire casings by the one-cure wrapped tread process.

This case has been before the courts for nearly four years and the two decisions in favor of the defendant company are of great interest to the tire makers of this country by whom the one-cure wrapped tread process and the apparatus involved in this suit have been used very extensively.

MOTORISTS WERE WASTEFUL.

Vice President Studebaker Thinks Price of Fuel Made Everybody Careless.

That the price of motor fuel rests to a great extent with each individual motorist, and that the industry in general is under a deep obligation to the big oil companies, is the opinion of Clement Studebaker, Jr., first vice president of the Studebaker Corporation, Detroit. He writes as follows:

> I have recently noted several articles, quoting automobile manufacturers and others as deprecating the recent increases in the price of gasoline. Some have even professed to see, in the advance, a menace to automobile popularity and industry. As a matter of fact the difference amounts to but a fraction of a cent for each mile a car and should not, in a season's running of 5000 miles, exceed a total of $25. On the other hand, it is high time that motordom should consider the debt it owes the big oil companies, without whose magnificent organization motoring would never have achieved its present popularity.
>
> Before the internal combustion motor, gasoline was virtually a by-product, on sale at central stations for perhaps 10 cents a gallon. The cost of delivery fell on the buyer and often amounted to more than this figure. The oil companies were glad to sell the gasoline at almost any price, for this enabled them to manufacture at a profit, greater quantities of oils, greases and lubricants. While this condition prevailed the buyers of the staples paid a large share of the motorist's fuel bill.
>
> But gasoline motor cars multiplied and eventually the demand for fuel equalled that for the other products. A year or so ago the old balance was reversed. Now the demand for gasoline greatly exceeds that for the staple oils and greases. And in place of the old method of distribution, the oil companies have established a system which covers the entire country, bringing to the very door of each garage a refined product which has often travelled thousands of miles. When one considers the cost of drilling, pumping, transportation, refining and delivering, he must admit that there is no manufactured product sold as cheaply as gasoline. Even at its present price it costs the consumer less than an equal quantity of most brands of spring water.
>
> When the demand for gasoline came to exceed that for the other crude oil products the manufacturers faced a dilemma. They could not produce gasoline and throw away the other products; such a process would have made the fuel prohibitive in cost. To advance the price of gasoline and to lower the price of the other products was the only available means of regaining the balance. So now we pay more for gasoline and less for oils and greases.
>
> As a matter of fact we have all wasted gasoline; it has been so cheap. A little economy will hurt none of us. Automobile manufacturers have built wasteful cars—cars with motors much larger than necessity demanded; cars that lacked efficiency. But the manufacturer is seeing the light. The recent shows emphasized a new tendency—a tendency toward motors that yield more in miles a gallon. But these cars will fail to save gasoline unless their owners do their part.
>
> Just as a wasteful car raises the cost of gasoline, so every motorist who fails to make his car efficient, makes fuel cost more. Owners of automobiles owe it to each other to start a united effort, keeping track of gallon-miles, watching carburetion, learning the art of controlling a car more by the clutch and less by the brakes. A campaign along this line will save enough gasoline to more than balance the recent increase in cost.
>
> Our office files contain hundreds of letters from tourists whose cars have averaged from 15 to 25 miles a gallon on ordinary country roads, and a car should yield at least 10 miles a gallon in city traffic where there are many more starts and stops. If motorists generally would regard these averages as standard and would strive to exceed them, the condition would be immediately relieved.
>
> The cost of gasoline will advance no further than the necessities of the oil companies' production require. These necessities are, to a large degree, in the hands of motorists themselves.

OFFERS FUEL ECONOMY TROPHY.

Chas. E. Miller Deeply Interested in Holding Contest of This Character.

In view of the present interest in the price and quality of motor fuel, Chas. E. Miller, the pioneer accessory man of 97-103 Reade street, New York City, announces his intention to donate a suitable trophy to be awarded to the car and carburetor which makes the best showing in fuel economy in a series of road tests to be conducted throughout the country. He believes that the award should be made on the basis of ton-miles a gallon, as the final test of efficiency.

Mr. Miller recalls that four years ago, during the automobile carnival in New York City, a fuel economy test was conducted by the local dealers' association under the direction of a committee of engineers. Later a similar event was held by the Automobile Club of Buffalo, utilizing the same set of rules and conditions. He believes that a series of tests of this character will do much to call attention to the economy possible by utilizing the devices now in the market. He says:

"During 1912 automobiles used 12,000,000 barrels of gasoline, which is an increase of 40 per cent. over the previous year. Notwithstanding the increased use of automobiles, if this large consumption of gasoline is not kept down by better mechanical outfits, the price of gasoline must increase. There are a host of good carburetors on the market, some of which are used by the makers of cars and some are not. Many of them, as well as the attachments called 'gas-savers,' really save from 20 to 40 per cent., so that their use more than pays for their extra cost and the expense of changing carburetors. Surely, every user of an automobile is interested in reducing the cost of maintenance, in which gasoline figures so largely."

Stockholders of the Lozier Motor Company, Detroit, maker of Lozier cars, at a recent meeting authorized an increase in the company's capital from $3,000,000 to $5,000,000.

FRONTIER COMPANY EXPANDING.

Buffalo Tire Concern Seeking Representation in Numerous States for Active Sales Campaign.

The Frontier Company, Buffalo, N. Y., maker of Frontier tires for several years, has been very successful in the introduction of its product, which has been very favorably received and has given excellent service and satisfaction. The company is now planning the inauguration of an energetic sales campaign and is seeking representation in various states throughout the country, preparatory to greatly extending its scope.

The Frontier plant is equipped with the latest machinery for washing, drying, mixing and compounding the rubber and also for drying and frictioning the fabric, but the company deems best to continue the manufacture of hand made tires until such time as it has been demonstrated that they can be made as well or better by machinery, the latter method being considered by it as still in an experimental stage. The concern states that it will not sacrifice quality in any respect, but will maintain the high standard which has been established since it commenced doing business.

RADIATOR LEAK-PROOF CEMENT.

New Nickel Polish Also Being Produced by the International Metal Polish Company.

The International Metal Polish Company, Quill street and Belt railway, Indianapolis, Ind., maker of the well known Blue Ribbon cream metal polish and auto body gloss, has brought out a new material known as the Blue Ribbon radiator leak proof cement, which the manufacturer claims will stop any ordinary leak. It is introduced into the radiator when the latter is full of water, and the engine is operated until the cement is thoroughly circulated. If the radiator is dirty and rusty it is necessary to first flush it out and clean it, after which it is refilled before introducing the cement, which is guaranteed to close up every crevice. As the solution comes into contact with the air at the leak point it immediately closes the fracture and mends it by forming a permanent and lasting cement filling. It also is held to clean out the circulating system and to prevent scale and rust from forming, thus preserving the metal and increasing the cooling capacity.

The International company also is producing a new polish especially adapted to nickel surfaces which will be appreciated by motorists. To dress the car up right the maker recommends this article as being high class in every respect. The many years of experience of the company in the manufacture of gold and silver polishes and other polish specialties has enabled it to produce a nickel polish which is not an experiment and one which is guaranteed to give perfect results.

The company's Blue Ribbon auto body polish is held to be particularly desirable for use on a high class automobile. It dries dust proof immediately, leaving no grease on the surface and makes the machine look like new. It is also valuable for cleaning, preserving and brightening leather trimmings. The well known Blue Ribbon cream metal polish does not require shaking, the ingredients being carefully blended and in the form of an emulsion. The liquid is greaseless and being free from any sediment it is said not to collect in crevices no matter how liberally applied. It is designed to remove quickly and easily all tarnish from metals and not to soil fabric. It is put up in five and 10-gallon cans for garage and service stations and in smaller containers for car owners.

WOULD ORGANIZE BUYERS.

H. E. Gilman Has Plans for a National Association of Purchasing Agents.

The following communication is submitted by H. E. Gilman, now with the Marathon Motor Works, Nashville, Tenn., maker of Marathon cars. He believes there is opportunity for the organization of the buyers in the industry and his letter is self-explanatory.

About three years ago—when residing in the East—I conceived the idea of the formation of "The Buyer's Club of America" and carried this project almost to the point of incorporation, but when I left and went to the Middle West to reside, temporarily, gave up the idea.

At the time I endeavored to promote this scheme I wrote several hundred letters to leading buyers of the country, and practically every reply received showed that the scheme was met with great enthusiasm; in fact, a great number of buyers congratulated me on taking the initiative to bring together those affiliated with the buying interests of this country. It is manifest that the benefits to be derived are manifold.

It would be my idea to have the headquarters of this club either in New York or Chicago; using the top floor of some hotel centrally located, fitting it up in the most modern way and having everything connected with it up-to-the-minute. The object of this club would be—tersely speaking—to bring closer together those connected with the purchasing end of our organizations. There would undoubtedly be a mutual helpfulness resulting.

There is no such organization in existence today, and if the traffic men, engineers and men of other vocations of life can maintain a club, why cannot we purchasing agents do the same thing? Anybody connected with the metal industry would be eligible to membership. This organization, when once perfected, will not only be national, but will be international in its scope.

At the time I originally thought of this idea the Iron Age gave me an editorial, and numerous letters, both foreign and domestic, were written me on the subject, showing that great interest was manifested. What I want you to do is to give me a small space in your editorial columns and request any purchasing agent who might read the article to communicate with me direct, in care of the Marathon Motor Works, Nashville, Tenn., and I would be most pleased to receive your comments and criticisms pro and con on this subject.

I have the by-laws drawn up and the certificate of incorporation ready to be executed.

The Mohawk Rubber Company, capitalized at $350,000, has been organized at Akron, O., and has purchased the Stein Double Cushion Tire Company's plant and machinery. Of the capital, $250,000 is common and $100,000 is 7 per cent. cumulative preferred, redeemable at 110 with accrued interest after Jan. 1, 1916. The Stein company has discontinued and liquidated its business.

PUBLISHER'S PAGE

Advertisers, especially those using motoring publications, purchase space with the purpose of producing the greatest results possible from the money expended. The standard is 100 per cent. circulation value. A magazine with a distribution of from 15,000 to 18,000, divided between trade and owners, has an advertising value proportionate to the classes it reaches, with the possibility of a considerable part, remote from the home office of the advertiser and his branches, being unproductive. The publication devoted to several classes cannot have the productiveness it would have were it specialized for one class only. No magazine can vary its classes of readers with reference to advertising value. To become established and recognized requires time and development expense. To change is to acknowledge weakness.

No publication in America other than the ACCESSORY and GARAGE JOURNAL has a distribution exclusively to the motor vehicle and allied industries and the trade. This circulation is guaranteed in any manner requested by an advertiser to be 12,000 a month. It is a trade magazine and, dealing with business, it is read by business men. To reach the same number of business interests it would be necessary to use all other motoring magazines in combination, which would involve duplication of circulation and entail a cost that would be prohibitive. Should a mailing list of 12,000 names be maintained and used the cost of circularizing would be 10 times the price of page space per issue in the ACCESSORY and GARAGE JOURNAL.

The mailing list of the ACCESSORY and GARAGE JOURNAL is the most authentic compilation of trade interests in existence. To reach the trade, trade propositons should be made. Advertising to reach owners is an entirely different propositon. The ACCESSORY and GARAGE JOURNAL is the only print advertisers can use and know they are receiving a service that reaches every trade interest. Its readers are buyers, for they are business men.

The next issue of the ACCESSORY and GARAGE JOURNAL will be mailed May 15. Its art department is at the service of its advertising patrons, and no charge is made for designs furnished that are used in advertising in its pages.

THE ACCESSORY and GARAGE JOURNAL

TIMES BUILDING PAWTUCKET, R. I.

AUTOMOBILE JOURNAL ANNUAL TOURING NUMBER

The Annual Touring Number of the Automobile Journal will issue July 10, and, as in past years, it will be an encyclopedia of touring information. The demands for this edition have been enormous, and the number of copies printed has been at least equal to the distribution of any route or guide book.

The Annual Touring Number of the Automobile Journal will be extensively advertised. It will be the most comprehensive ever published. Its information will relate to every section of the country. The data will include more than 500 distinct tours. It will be invaluable to every motorist desiring to tour.

As an advertising medium this number will have remarkable value. Having all the qualities of any route or guide book, and selling for 10 cents the copy, the distribution will be in excess of 30,000. It will be preserved because it has a distinct use in the hands of the readers, and its publicity will continue until the issuance of a number to replace it.

The Automobile Journal is the most widely read motoring publication in America. Its circulation is more than 90 per cent. to motor car owners. The distribution outside of New England, New York, Pennsylvania, New Jersey, Delaware and Maryland exceeds 5000 copies. Advertisers in its pages reach the greatest motor vehicle and accessory market in the country, as well as a general distribution to motor car owners throughout the United States.

AUTOMOBILE JOURNAL PUBLISHING COMPANY

TIMES BUILDING PAWTUCKET, R. I.

1913 1914

AUTOMOBILE AND TECHNICAL SCHOOLS

The AUTOMOBILE MECHANICAL BOOKS published by this company, completely rewritten and revised to the minute, are ready for distribution.

The series now comprises 10 books, containing 800 pages of text and more than 1500 illustrations, and it is the most complete library of motor vehicle information ever published.

Write for 1913-14 School Proposition and Rights.

More than 80 per cent. of the AUTOMOBILE and TECHNICAL SCHOOLS of the United States and Canada now use these books—MORE THAN 500,000 COPIES WERE SOLD LAST YEAR.

We Want School Patronage. These Books Are Especially Valuable For School Requirements.

TO THE TRADE

That schools and educational institutions use these books in connection with regular courses of tuition establishes their value. The works are equally as valuable to agents for cars and service wagons, repairers and those who deal in motor vehicle equipment and supplies.

The practical information contained in these books, relating to design, construction, care, maintenance and operation of all forms of motor driven wagons and trucks cannot be acquired through a life time by experience. The books are non-technical and all illustrations can be comprehended by the novice.

The full series includes the following:

The Automobile Journal (Subscription, one year)	$1
The Motor Truck (Subscription, one year)	$1
The Accessory and Garage Journal (Subscription, one year)	$1
The A B C of Internal Combustion Engine Maintenance and Repair	35c
The A B C of Magneto Ignition Systems	35c
The A B C of Carburetor Construction, Maintenance and Repair	35c
The A B C of Battery Ignition Systems	35c
The A B C of Motor Car Operation	50c
Overhauling, Rebuilding and Repairing the Motor Car	50c
Lighting the Motor Car by Electricity	50c
The A B C of Motor Car Chassis Maintenance and Repair	25c
Maintenance and Repair of Motor Car Tires	25c
The Motorcycle, Maintenance, Repair and Construction	35c
The A B C of Aerial Navigation	$1

The 10 books constitute a complete library of automobile mechanical information. All books are fully indexed for instant reference.

AIR COSTS LESS THAN RUBBER

The Dewey Power Tire Pump

Makes it easy to keep your tires at economical pressure with pure, untainted air.

Our Price—$10—Is For a Complete Pump Which Has Special Advantages That Will Interest You.

The cost of a pump is literally nothing as compared with the hundreds of dollars it can save you.

The Dewey, in addition to advantages not found in other pumps, is the only one that requires no oil. It can't spray grease into your tires to rot them. It pumps pure air only.

The Dewey isn't simply a lazy man's makeshift. To the saving it makes in your tire bill, you must add the saving to the car itself by the use of tires that are properly inflated at all times.

The Dewey, with high grade Dial and all connections, including 12 feet of Special Hose, tested to 1000 lbs., sold everywhere under a year's rigid guaranty for **$10**

Write us if your dealer cannot promptly supply you with the Dewey.

TEXACO
MOTOR OIL
More Power-Less Consumption-No Carbon
ALL TEXACO Bulletins Occupy Head-on Positions

Signs Like This Are Selling Oil

Are they selling oil for you? They are for your competitors.

Placed at advantageous points along the main motor roads running from New York, Philadelphia, Boston, Atlantic City, Narragansett Pier, and other cities where motorists congregate are Texaco Motor Oil Bulletins.

The background of these bulletins is red. The letters are white. They can't be overlooked. Every one of the thousands of motorists who use the main roads sees these signs many times. The result is larger sales of

TEXACO
MOTOR OIL

The dealer who handles Texaco Motor Oil is assured of three things—satisfied customers, fair profits, prompt delivery. Each one of these points is important to you. Do you give them sufficient consideration when you order lubricants?

There is another reason why you should stock Texaco Motor Oil. At present you are carrying three or four, perhaps more, different lines of lubricants. The effort you devote to purchase, handling and selling is multiplied by the number of lines you carry.

Each customer of yours who uses Texaco once will use it always. Eventually you will be able to reduce your oil stock to just one line. You'll save money in several ways.

Think these facts over. Then get in touch with us and learn more about Texaco Motor Oil. Address: Department Two,
